
SMART Genomics API

-- Standardizing genomics API to facilitate utilization of genetic data in clinics and laboratories

Yishen Chen

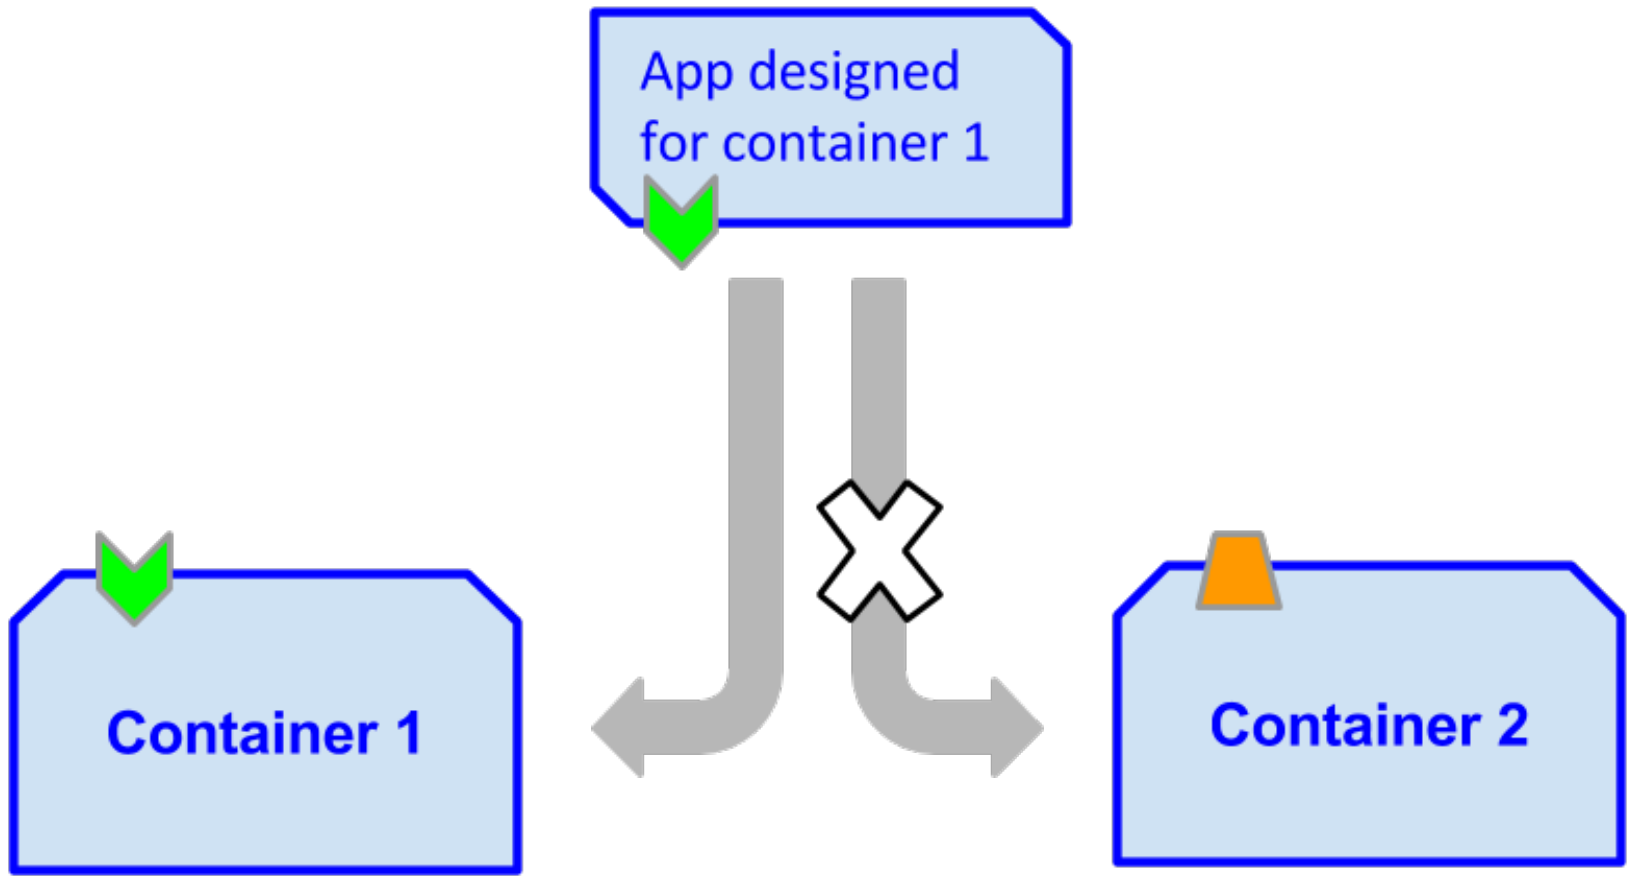

Mentor: Dr. Gil Alterovitz

Third PRIMES Annual Conference

May 19th, 2013

Problems of Current Genomics Communication

- No standard **API** (**A**pplication **P**rogramming **I**nterface)
 - Lack means of communication
 - Not integrated with clinical network
-

App designed for container 1

Container 1

Container 2

"Plug" doesn't work

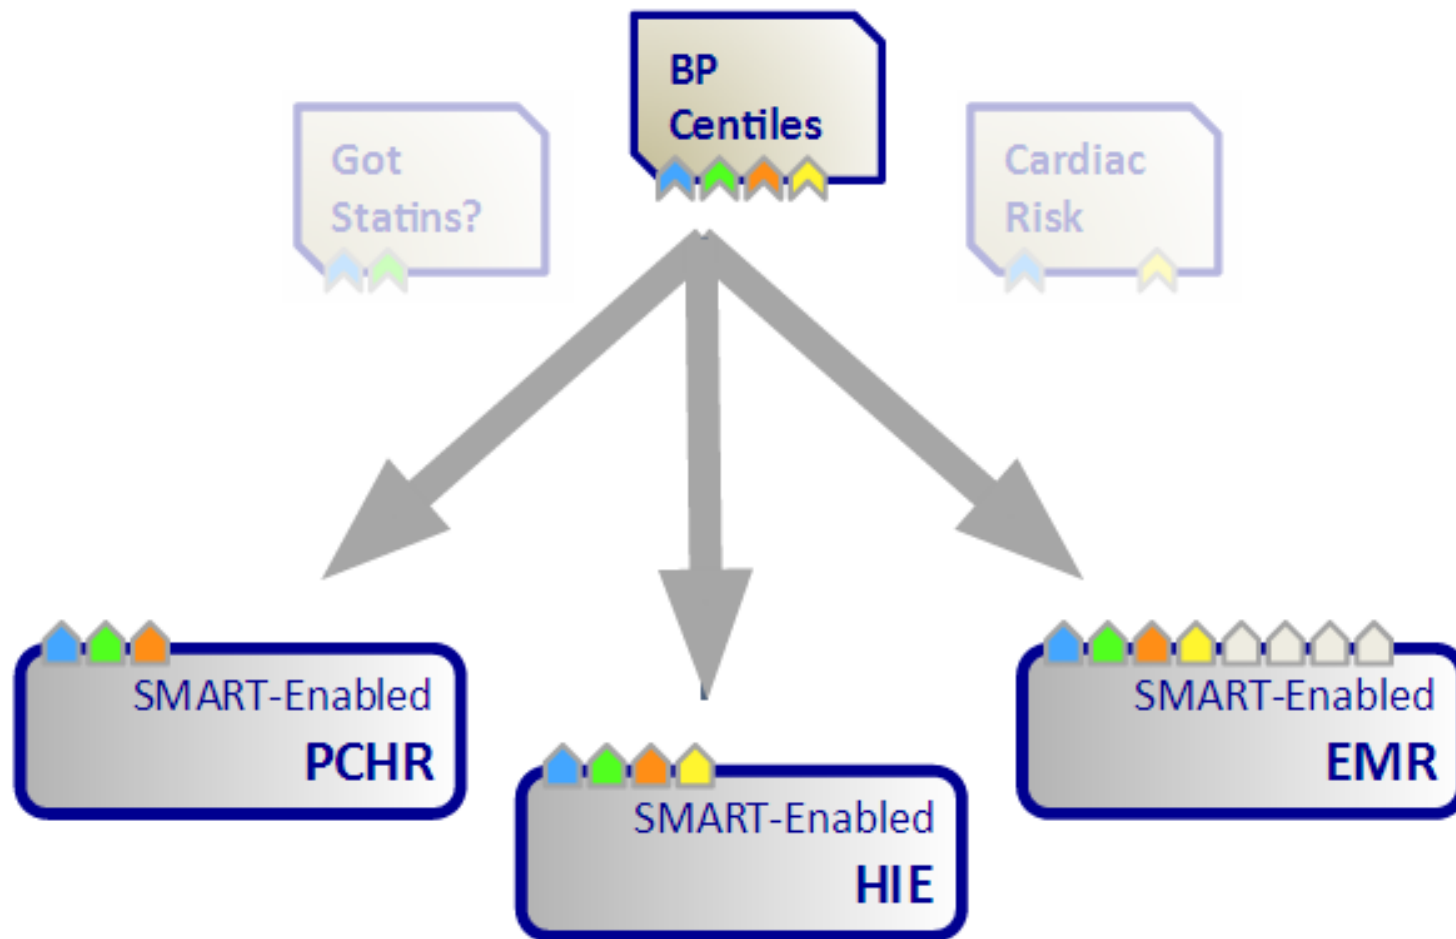

Representation of Genetic Data

- Contents are essentially the same
 - Sequences (ATGC..) and genetic files
 - Data are structured differently
 - Different approaches of authentication
 - Most follow OAuth but implement differently
-

SMART Provides a Solution

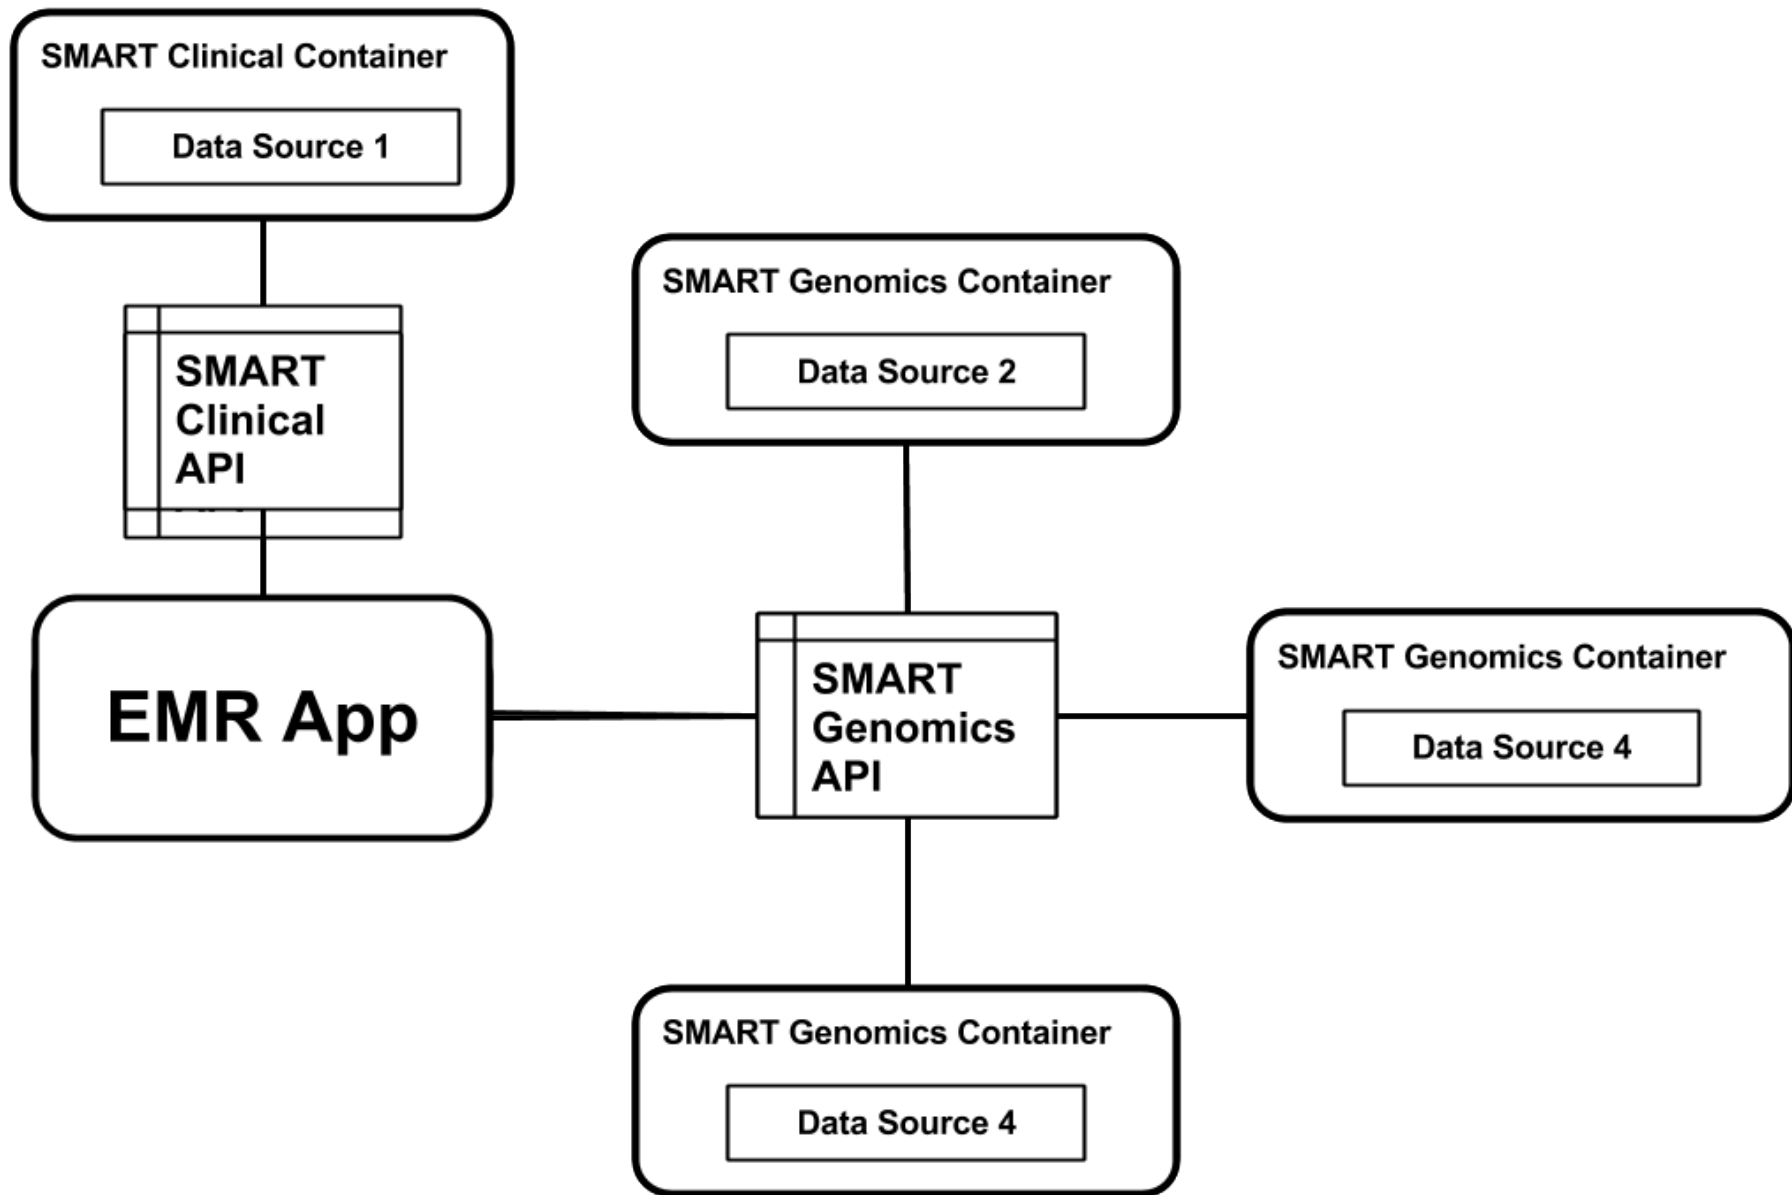

- **Substitutability Medical Applications Reuseable Technology**
- **Generic design of API**
 - Developers focus on the app
- **Integration with clinical data**

SMART Genomics API

- **Approaches substitutability differently because of differences between clinical and genomic data**
 - **Integration of genetic data among heterogeneous sources**
 - **Bridging clinics by providing CCDA Genomics**
 - **CCDA(Consolidated Clinical Document Architecture)** -- an adopted format for transferring medical documents
 - Summary of a patient's genetic report
-

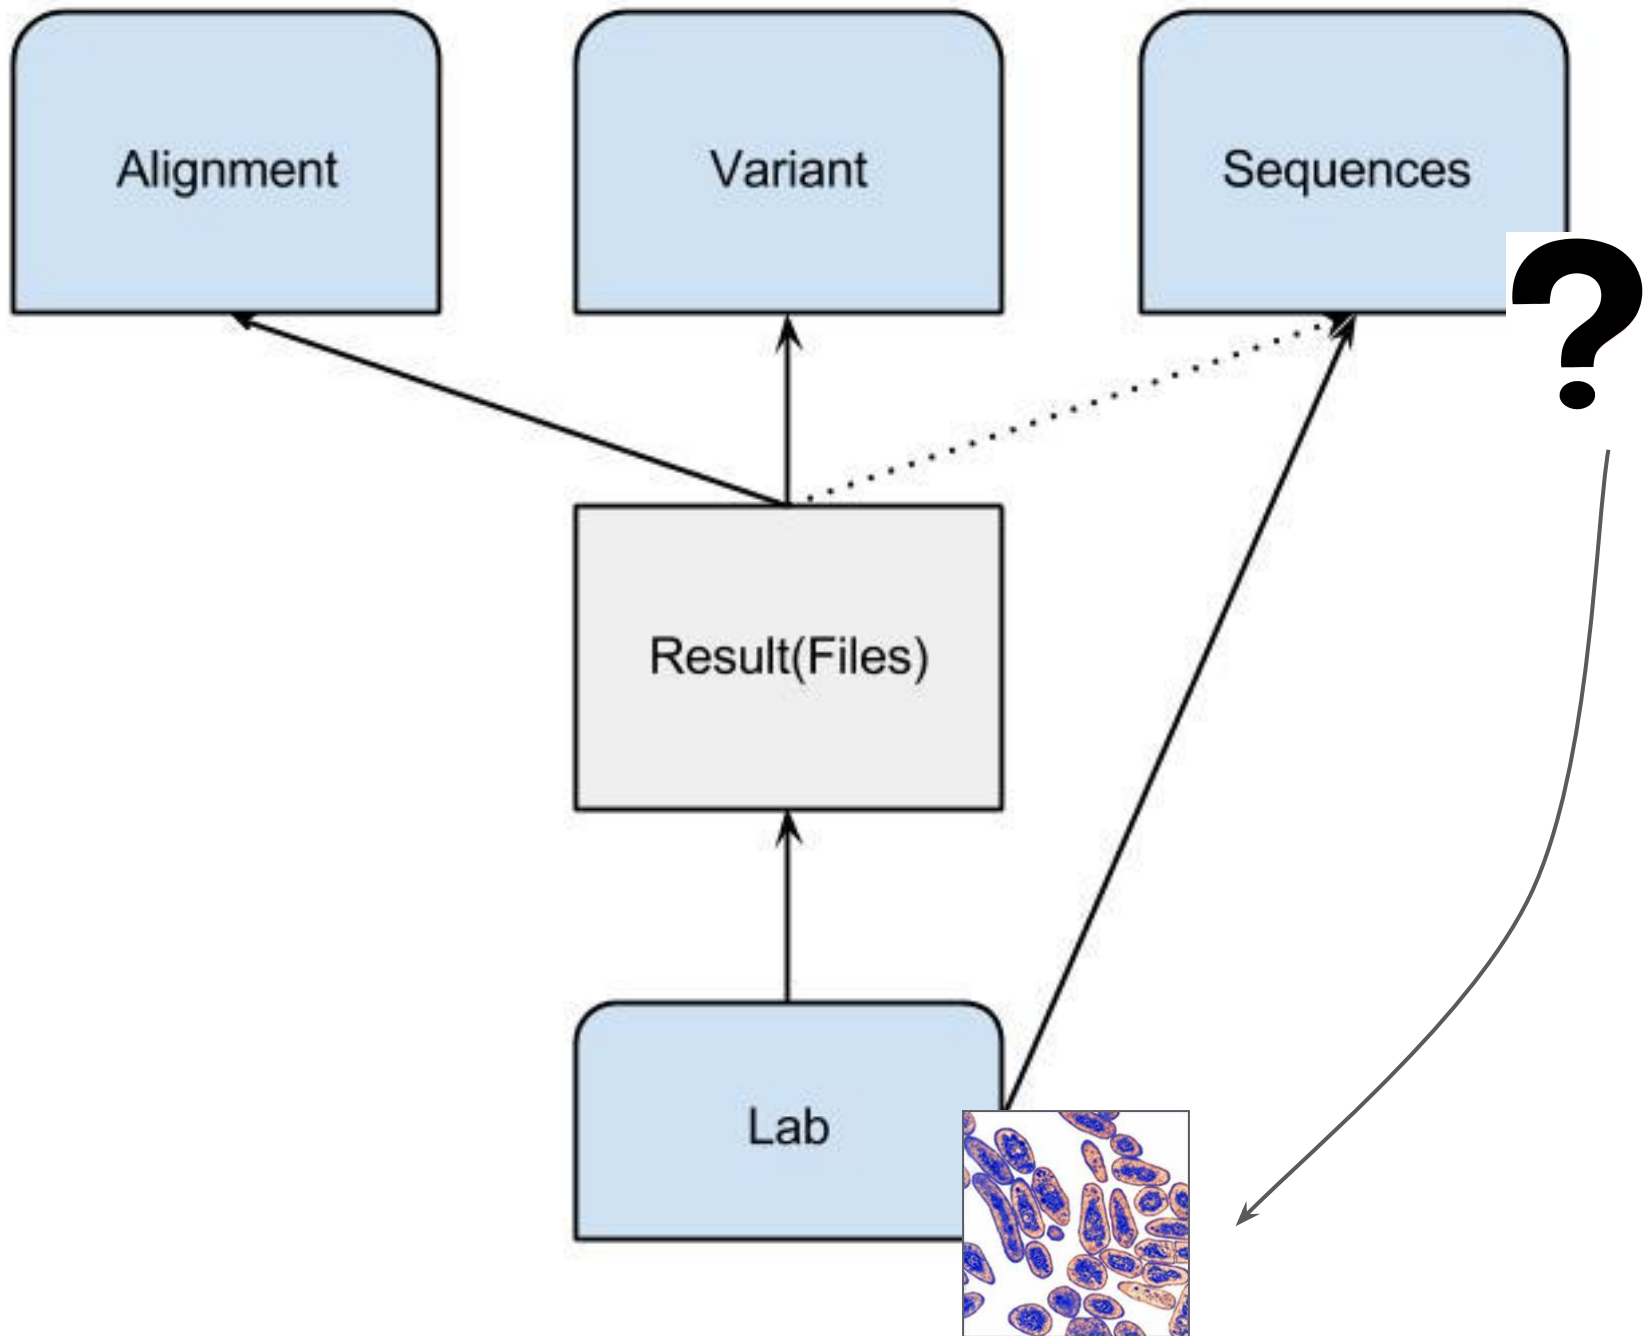

SMART Genomics API

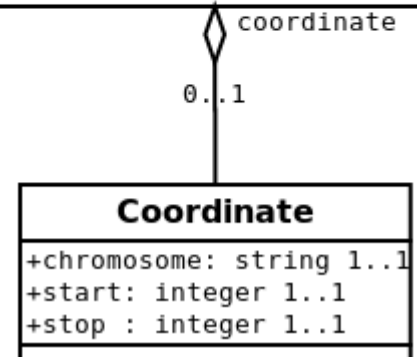

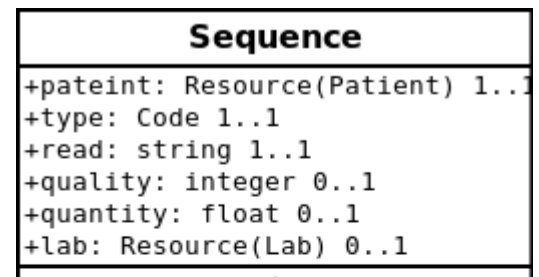

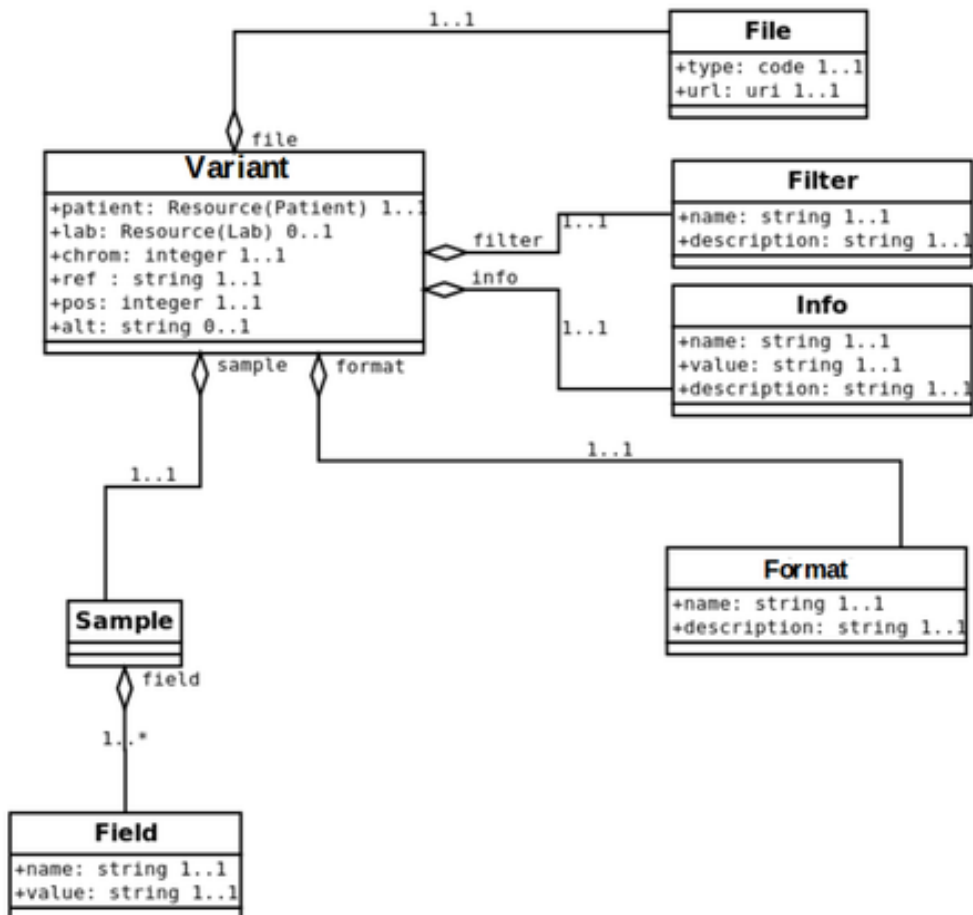

- **Authentication**

- OAuth2 - open standard for authentication
- Two versions
 - Container - Container
 - App - Container

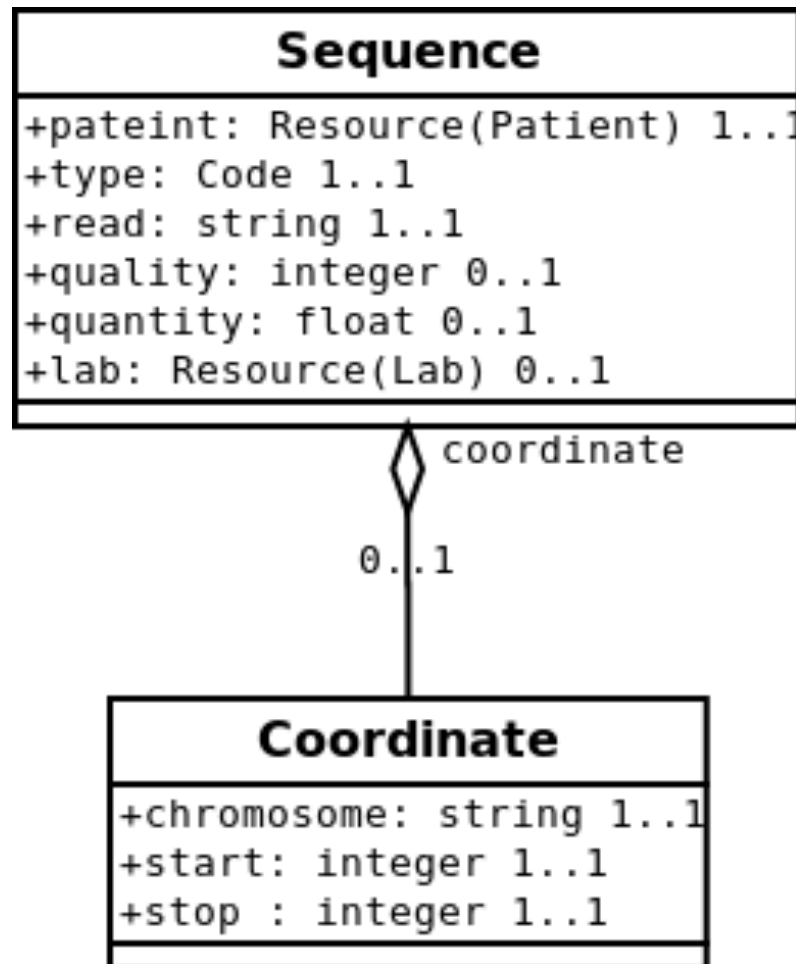

- **Data representation**

- Structured in FHIR-style (Fast Health Interoperability Resource)
 - Interlinked data models
 - Grouped by **records**
-

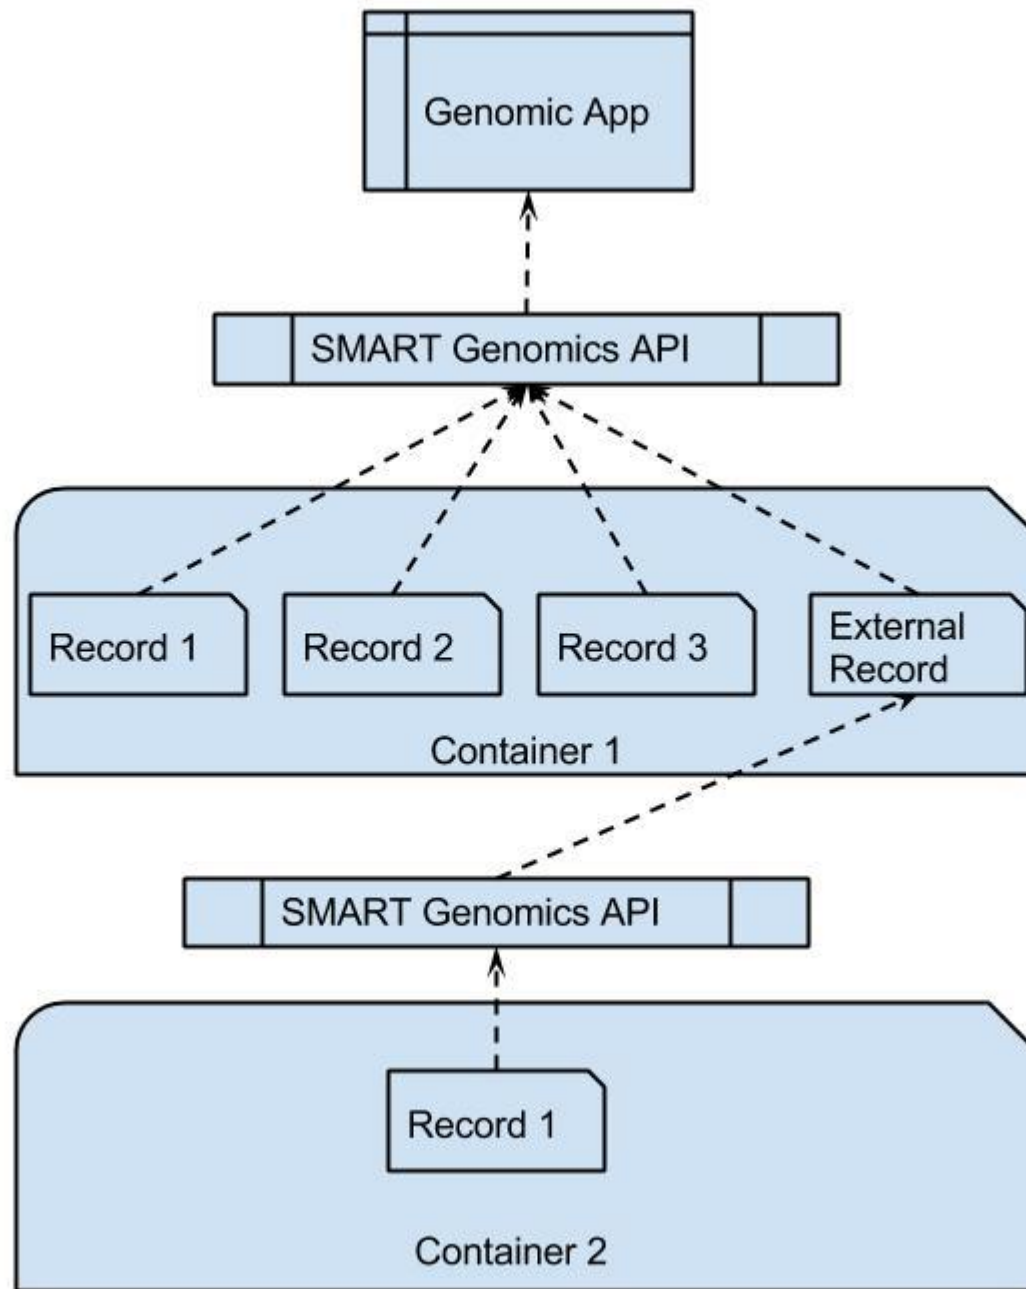

Resource Example

SMART Genomics API

Resources are organized by '**record**':

- A **record** groups all resources owned by a patient
 - An account contains one or more **records**
 - A **record** can either be internal or external
 - Both are perceived as the same by external source
-

Current Implementation

- **Imports data from cloud services and translates to SMART Genomics' format**

 - **Demo app**
 - Genomics Advisor (collaboration with Peijin Zhang)
-

Button to import data

- Create New Project
- Import Genetic Data
- Genomics Advisor

Available Records

Record Id	Patient Name	23andme Profile Id
1	Mike Polcari	e82ef7a3c2dcc585
2	Lilly Demo	SP1_MOTHER_V3
3	Lilly Demo	SP1_FATHER_V3

Imported data

App

- Create New Project
- Import Genetic Data
- Genomics Advisor

Demo, Lilly

DOB 1999-12-08 AGE 13 SEX FEMALE

SNP	Locus	CHRM	Code	Risk	Frequency
Type 1 Diabetes

Genomics Data

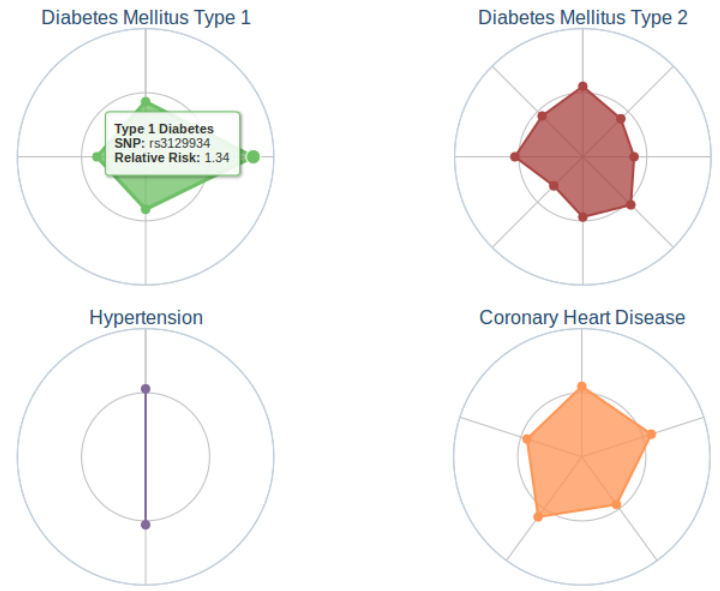

Patient ID: 3
 Data format: SMART Genomics

Current Medications

Amoxicillin, Amoxicillin

Radar Graphs

Disease Information

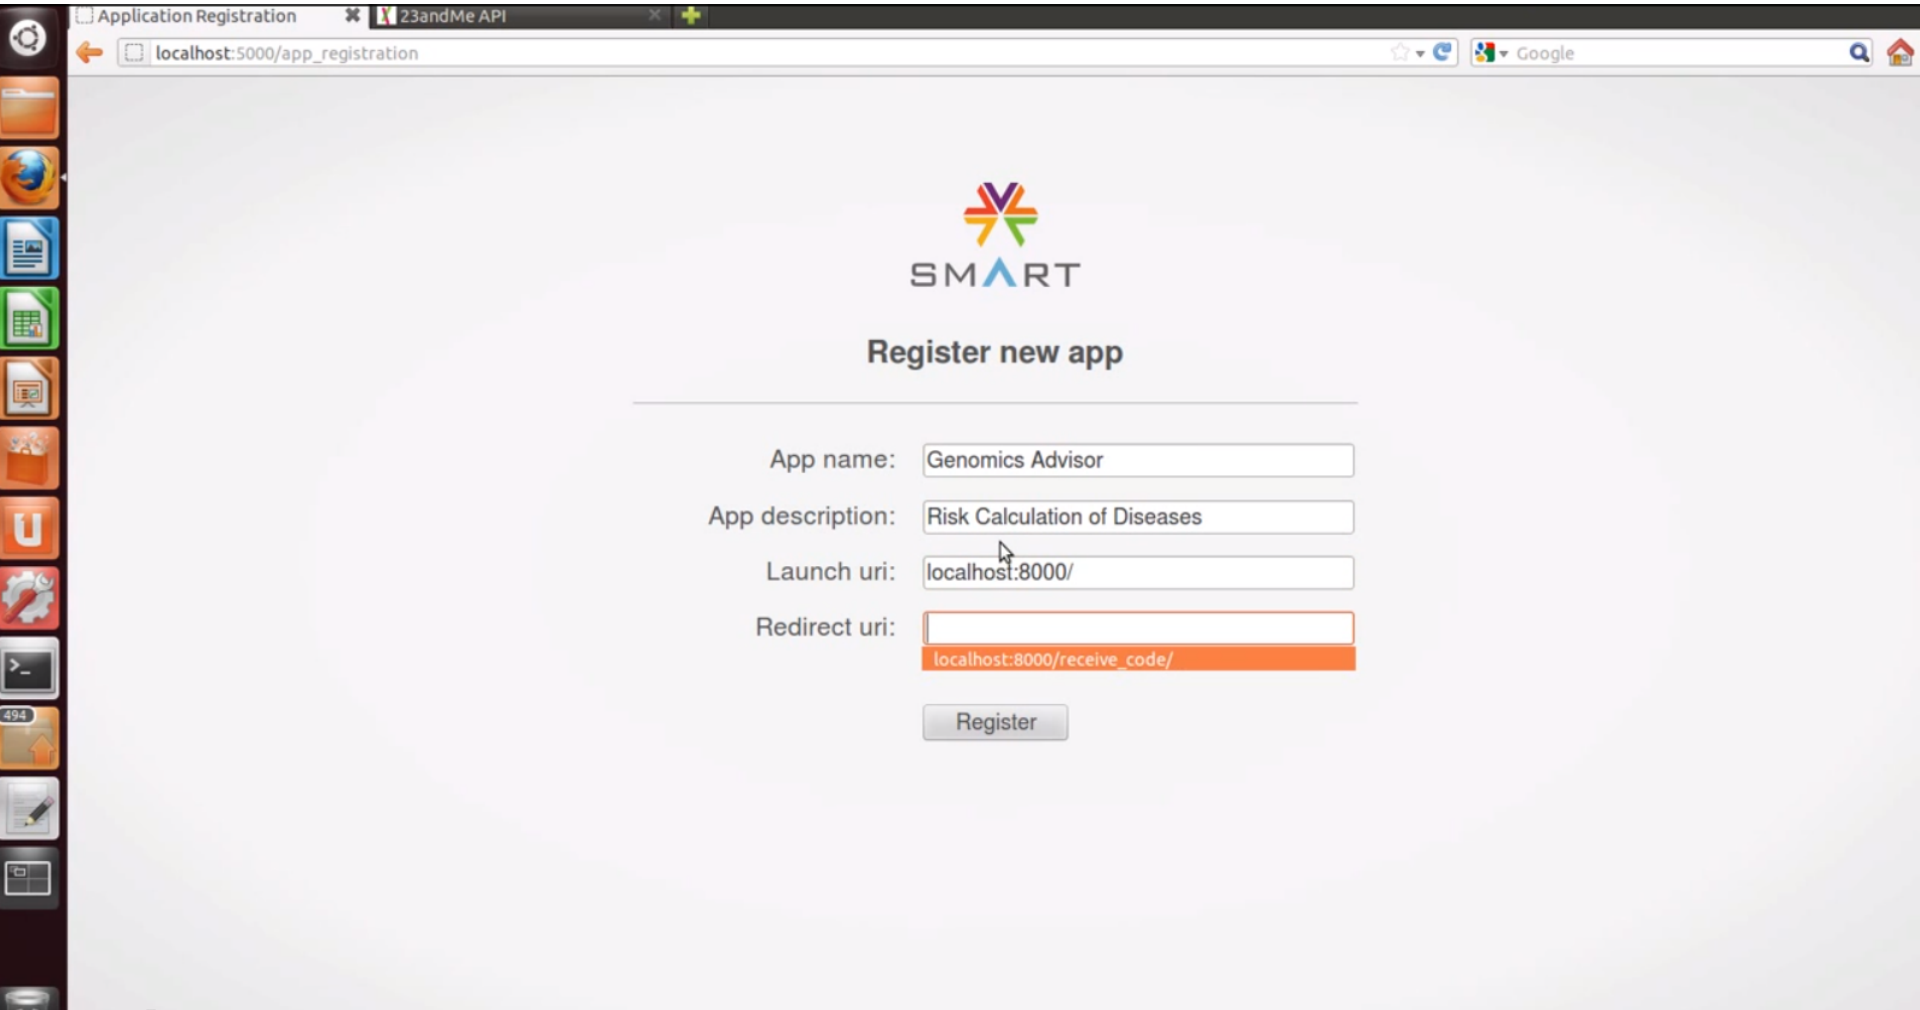

Patient is not at increased genomic risk for any Diabetes related comorbidities

Drug Advice

No information available

Future plans

- **Design more data models**
 - Planning to add microarray (lab for gene expression)
 - **Write more apps to demonstrate the API's functionalities**
 - A user friendly API playground for developer to understand basic aspects of the API
 - **Distribute the code for the community to adopt**
 - **Deploy as a reference container**
 - Developers can register their app and try it out
-

Register new app

App name:

Acknowledgements

- Dr. Gil Alterovitz for initiating this project and giving me advices
 - Jason Evans for advices on designing the API calls
 - Dr. Khovanova and other organizers of PRIMES for providing me this valuable opportunity
 - Peijin Zhang for writing the demo app, Genomics Advisor
 - My parents for supporting me
-

END

SMART Genomics API

Two aspect of the API

- **Authentication**

- OAuth2 - open standard for authentication

- **Data representation**

- use gene coordinate as identifier -- e.g. chr13_123_124
 - Implemented FHIR
 - Resources grouped by **records**
-

Authentication

- Follows OAuth2 protocol
 - access token
 - refresh token
 - Two versions
 - app-container -- throwaway access without refresh-token
 - container-container -- permanent access
 - Enables data sharing
-
