# Decomposing Tensor Products of Verma Modules

Shashwat Kishore Mentor: Gus Lonergan Fourth Annual MIT PRIMES Conference

May 17, 2014

▲ロト ▲冊ト ▲ヨト ▲ヨト - ヨー の々ぐ

# Outline

## Background & Goals

- Introduction to *sl*(2)
- Construction of Verma modules
- Construction of signature characters
- Decomposition of tensor product

## **Results & Discussion**

- Complete solutions for two special cases
- Asymptotically correct approximation for the general case
- Current & future work

# Introduction to sl(2)

## Definition: sl(2)

The Lie algebra sl(2) consists of the set of  $2 \times 2$  matrices over  $\mathbb{C}$  with trace 0. The standard basis for sl(2) is:

$$e = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$$
$$f = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$$
$$h = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

・ロト ・ 同 ト ・ 三 ト ・ 三 ・ うへつ

# Representation theory of sl(2)

## Representation of sl(2)

• A representation of *sl*(2) is a vector space *V* equipped with three operators, *E*, *F*, *H*, that satisfy:

HE - EH = 2EHF - FH = -2FEF - FE = H.

▲ロ ▶ ▲ 理 ▶ ▲ 国 ▶ ▲ 国 ■ ● ● ● ● ●

# Representation theory of sl(2)

## Representation of sl(2)

• A representation of *sl*(2) is a vector space *V* equipped with three operators, *E*, *F*, *H*, that satisfy:

HE - EH = 2EHF - FH = -2FEF - FE = H.

• This representation has an associated linear homomorphism  $\rho: sl(2) \rightarrow \text{End } V$ . The homomorphism maps e to E, h to H, and f to F.

# Combining representations

・ロト ・ 日 ・ モ ト ・ モ ・ うへぐ

# Combining representations

## Direct sum of representations

Given two representations V and W of sI(2), the direct sum  $V \oplus W$  is also a representation. Its homomorphism is given by:

$$\rho_{V\oplus W}(l) = \begin{bmatrix} \rho_V(l) & 0\\ 0 & \rho_W(l) \end{bmatrix}$$

▲ロト ▲冊 ト ▲ ヨ ト ▲ ヨ ト ● の へ ()

# Combining representations

#### Direct sum of representations

Given two representations V and W of sI(2), the direct sum  $V \oplus W$  is also a representation. Its homomorphism is given by:

$$\rho_{V\oplus W}(l) = \begin{bmatrix} \rho_V(l) & 0\\ 0 & \rho_W(l) \end{bmatrix}$$

#### Tensor product of representations

Given two representations V and W of a s/(2), the tensor product  $V \otimes W$  is also a representation. Its homomorphism is given by:

$$\rho_{V\otimes W}(I) = \rho_V(I) \otimes \mathsf{Id} + \mathsf{Id} \otimes \rho_W(I).$$

# Representation theory of sl(2)

#### Infinite dimensional representations of sl(2)

- A common class of infinite dimensional representations of sl(2) is the class of Verma modules.
- For any complex λ, there exists a unique Verma module, denoted Δ<sub>λ</sub>.
- Δ<sub>λ</sub> is the union of 1-d weight spaces V<sub>λ</sub>, V<sub>λ-2</sub>, V<sub>λ-4</sub>, ... corresponding to H. Here each V<sub>i</sub> is a weight space with weight *i*.
- The operator E moves any v ∈ V<sub>i</sub> to a vector in V<sub>i+2</sub> (and moves v ∈ V<sub>λ</sub> to 0).
- The operator F moves any  $v \in V_i$  to a vector in  $V_{i-2}$ .
- We will only deal with real, nonintegral  $\lambda$ .

# Signature characters of Verma modules

### Signature characters of Verma modules

- Every real highest weight Verma module has a signature character that encodes (a) information about its weight spaces and (b) the signature of its Hermitian form.
- This signature character is an element of  $\mathbb{Z}[s]/(s^2-1)$ .

# Signature characters of Verma modules

### Signature characters of Verma modules

- Every real highest weight Verma module has a signature character that encodes (a) information about its weight spaces and (b) the signature of its Hermitian form.
- This signature character is an element of  $\mathbb{Z}[s]/(s^2-1)$ .
- For  $\lambda$  negative the signature character of  $\Delta_{\lambda}$  is:

$$\sum_{i\geq 0}e^{\lambda-2i}\cdot s^i.$$

## Signature characters of Verma modules

#### Signature characters of Verma modules

- Every real highest weight Verma module has a signature character that encodes (a) information about its weight spaces and (b) the signature of its Hermitian form.
- This signature character is an element of  $\mathbb{Z}[s]/(s^2-1)$ .
- For  $\lambda$  negative the signature character of  $\Delta_{\lambda}$  is:

$$\sum_{i\geq 0}e^{\lambda-2i}\cdot s^i.$$

• For  $\lambda$  positive the signature character of  $\Delta_{\lambda}$  is:

$$\sum_{i\geq 0}^{\lfloor\lambda\rfloor} e^{\lambda-2i} + \sum_{i\geq \lceil\lambda\rceil} e^{\lambda-2i} \cdot s^{\lceil\lambda\rceil-i}$$

Denote the signature character (if it exists) of a representation V of sl(2) by  $ch_s(V)$ . The signature character obeys some natural rules for direct sums and tensor products.

Relations for the signature character

• 
$$\operatorname{ch}_{s}(V \oplus W) = \operatorname{ch}_{s}(V) + \operatorname{ch}_{s}(W).$$

• 
$$\operatorname{ch}_{s}(V \otimes W) = \operatorname{ch}_{s}(V) \cdot \operatorname{ch}_{s}(W).$$

In particular, tensor products of Verma modules admit a signature character.

## Tensor products of Verma modules

#### Decomposition of the tensor product

Consider the tensor product of the Verma modules  $\Delta_{\lambda_1}, \Delta_{\lambda_2}, ..., \Delta_{\lambda_n}$ . It decomposes uniquely as a direct sum:

$$\bigotimes_i \Delta_{\lambda_i} \cong \bigoplus_{k \ge 0} \Delta_{(\sum \lambda_i) - 2k} \otimes E_k$$

where each multiplicity space  $E_k$  has a signature character in  $\mathbb{Z}[s]/(s^2-1)$  and experiences the null action in the representation.

## Tensor products of Verma modules

#### Decomposition of the tensor product

Consider the tensor product of the Verma modules  $\Delta_{\lambda_1}, \Delta_{\lambda_2}, ..., \Delta_{\lambda_n}$ . It decomposes uniquely as a direct sum:

$$\bigotimes_i \Delta_{\lambda_i} \cong \bigoplus_{k \ge 0} \Delta_{(\sum \lambda_i) - 2k} \otimes E_k$$

where each multiplicity space  $E_k$  has a signature character in  $\mathbb{Z}[s]/(s^2-1)$  and experiences the null action in the representation.

#### Motivating question

For a given tensor product decomposition, which multiplicity spaces have definite signature characters? Is there a formula for the signature characters of the multiplicity spaces? Consider the tensor product of  $\Delta_{\lambda_1}, \Delta_{\lambda_2}, ..., \Delta_{\lambda_n}$ , where each  $\lambda_i$  is negative.

Theorem 1 (Decomposition for negative factors case).

In the decomposition

$$\bigotimes_i \Delta_{\lambda_i} \cong \bigoplus_{k>0} \Delta_{(\sum \lambda_i)-2k} \otimes E_k$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

each multiplicity space  $E_k$  has signature character  $s^k \cdot {\binom{k+n-2}{n-2}}$ .

Idea of Proof. Standard counting argument.

## Results: Two special cases

Consider the tensor product of two arbitrary Verma modules  $\Delta_{\lambda_1}, \Delta_{\lambda_2}.$ 

Theorem 2 (Decomposition for two factors case).

In the decomposition

$$\Delta_{\lambda_1}\otimes\Delta_{\lambda_2}\cong igoplus_{k\ge 0}\Delta_{(\sum\lambda_i)-2k}\otimes E_k$$

the signature character of each  $E_k$  is given by a known piecewise defined function.

Idea of proof. For  $\lambda$  positive, define  $L_{\lambda} = ch_s(\Delta_{\lambda}) - ch_s(\Delta_{\lambda-2\lceil\lambda\rceil})$ . Compute  $L_{\lambda} \cdot ch_s(\Delta_{\mu})$  for  $\lambda$  positive and  $\mu$  negative.

▲ロ ▶ ▲ 理 ▶ ▲ 国 ▶ ▲ 国 ■ ● ● ● ● ●

Consider the tensor product of Verma modules  $\Delta_{\lambda_1}, \Delta_{\lambda_2}, ..., \Delta_{\lambda_n}$ , where  $\lambda_i$  is positive for  $i \leq p$  and negative for i > p.

Theorem 3 (Polynomial behavior in general case).

In the decomposition

$$\bigotimes_i \Delta_{\lambda_i} \cong \bigoplus_{k \ge 0} \Delta_{(\sum \lambda_i) - 2k} \otimes E_k$$

there exist polynomials P and Q such that for all sufficiently large k, the signature character of  $E_k$  is  $s^{n+k}(P(k) + sQ(k))$ . If the number of even floor positive weights is even, then P has degree n - 2 and Q has degree n - 3. Otherwise, P has degree n - 3 and Q has degree n - 2.

## Results: The general case

## Theorem 4 (Asymptotic approximation in general case).

The leading terms of the polynomials P(x) and Q(x) from Theorem 3 are

$$\frac{1}{(n-2)!} \cdot x^{n-2}$$

and

$$\frac{\sum_{i\leq p}\left\lceil\frac{\lambda_i}{2}\right\rceil}{(n-3)!}\cdot x^{n-3}$$

in some order.

*Corollary.* In an arbitrary tensor product of Verma modules, there are finitely many definite multiplicity spaces iff  $n \ge 3$  and  $p \ge 1$ .

# Summary and future work

## Summary of results

- Computed decomposition in two specific cases
- Described asymptotic behavior in general case

Sac

# Summary and future work

#### Summary of results

- Computed decomposition in two specific cases
- Described asymptotic behavior in general case

## Current and future work

- Currently working on explicitly computing the number of definite multiplicity spaces in the general case
- In the future, it would be nice to describe the short term behavior
