# 5. Triple Integrals

# 5A. Triple integrals in rectangular and cylindrical coordinates

**5A-1** a) 
$$\int_0^2 \int_{-1}^1 \int_0^1 (x+y+z) dx \, dy \, dz$$
 Inner:  $\frac{1}{2}x^2 + x(y+z) \Big]_{x=0}^1 = \frac{1}{2} + y + z$ 

Middle: 
$$\frac{1}{2}y + \frac{1}{2}y^2 + yz\Big]_{y=-1}^{1} = 1 + z - (-z) = 1 + 2z$$
 Outer:  $z + z^2\Big]_{0}^{2} = 6$ 

b) 
$$\int_0^2 \int_0^{\sqrt{y}} \int_0^{xy} 2xy^2 z \, dz \, dx \, dy \qquad \text{Inner: } xy^2 z^2 \Big]_0^{xy} = x^3 y^4$$

Middle: 
$$\frac{1}{4}x^4y^4\Big]_0^{\sqrt{y}} = \frac{1}{4}y^6$$
 Outer:  $\frac{1}{28}y^7\Big]_0^2 = \frac{32}{7}$ .

5A-2

a) (i) 
$$\int_0^1 \int_0^1 \int_0^{1-y} dz \, dy \, dx$$
 (ii)  $\int_0^1 \int_0^{1-y} \int_0^1 dx \, dz \, dy$  (iii)  $\int_0^1 \int_0^1 \int_0^{1-z} dy \, dx \, dz$ 

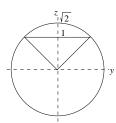

2

c) In cylindrical coordinates, with the polar coordinates r and  $\theta$  in xz-plane, we get

$$\iiint_R r \, dy \, dr \, d\theta = \int_0^{\pi/2} \int_0^1 \int_0^2 r \, dy \, dr \, d\theta$$

The cone has equation  $z^2 = r^2$ , or z = r. The circle in which they intersect has a radius r found by solving the two equations z = r and  $z^2 + r^2 = 2$  simultaneously; eliminating z we get  $r^2 = 1$ , so r = 1. Putting it all together, we get

y + z = 1

$$\int_{0}^{2\pi} \int_{0}^{1} \int_{r}^{\sqrt{2-r^2}} r \, dz \, dr \, d\theta.$$

**5A-3** By symmetry,  $\bar{x} = \bar{y} = \bar{z}$ , so it suffices to calculate just one of these, say  $\bar{z}$ . We have

$$z\text{-moment} = \iiint_D z \, dV = \int_0^1 \int_0^{1-x} \int_0^{1-x-y} z \, dz \, dy \, dx$$

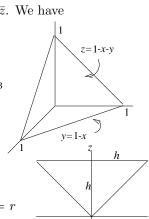

Inner: 
$$\frac{1}{2}z^2\Big]_0^{1-x-y} = \frac{1}{2}(1-x-y)^2$$
 Middle:  $-\frac{1}{6}(1-x-y)^3\Big]_0^{1-x} = \frac{1}{6}(1-x)^3$ 

Outer: 
$$-\frac{1}{24}(1-x)^4\Big]_0^1 = \frac{1}{24} = \bar{z}$$
 moment.

mass of 
$$D=$$
 volume of  $D=\frac{1}{3}(\text{base})(\text{height})=\frac{1}{3}\cdot\frac{1}{2}\cdot 1=\frac{1}{6}.$ 

Therefore 
$$\bar{z} = \frac{1}{24} / \frac{1}{6} = \frac{1}{4}$$
; this is also  $\bar{x}$  and  $\bar{y}$ , by symmetry.

**5A-4** Placing the cone as shown, its equation in cylindrical coordinates is z=r and the density is given by  $\delta=r$ . By the geometry, its projection onto the xy-plane is the interior R of the origin-centered circle of radius h.

vertical cross-section

a) Mass of solid 
$$D = \iiint_D \delta \, dV = \int_0^{2\pi} \int_0^h \int_r^h r \cdot r \, dz \, dr \, d\theta$$
  
Inner:  $(h-r)r^2$ ; Middle:  $\frac{hr^3}{3} - \frac{r^4}{4} \Big|_0^h = \frac{h^4}{12}$ ; Outer:  $\frac{2\pi h^4}{12}$ 

b) By symmetry, the center of mass is on the z-axis, so we only have to compute its z-coordinate,  $\bar{z}$ .

**5A-5** Position S so that its base is in the xy-plane and its diagonal D lies along the x-axis (the y-axis would do equally well). The octants divide S into four tetrahedra, which by symmetry have the same moment of inertia about the x-axis; we calculate the one in the first octant. (The picture looks like that for 5A-3, except the height is 2.)

The top of the tetrahedron is a plane intersecting the x- and y-axes at 1, and the z-axis at 2. Its equation is therefore  $x + y + \frac{1}{2}z = 1$ .

The square of the distance of a point (x, y, z) to the axis of rotation (i.e., the x-axis) is given by  $y^2 + z^2$ . We therefore get:

moment of inertia = 
$$4 \int_0^1 \int_0^{1-x} \int_0^{2(1-x-y)} (y^2 + z^2) dz dy dx$$
.

**5A-6** Placing D so its axis lies along the positive z-axis and its base is the origin-centered disc of radius a in the xy-plane, the equation of the hemisphere is  $z = \sqrt{a^2 - x^2 - y^2}$ , or  $z = \sqrt{a^2 - r^2}$  in cylindrical coordinates. Doing the inner and outer integrals mentally:

$$z\text{-moment of inertia of }D = \iiint_D r^2 \, dV = \int_0^{2\pi} \int_0^a \int_0^{\sqrt{a^2-r^2}} r^2 \, dz \, r \, dr \, d\theta = 2\pi \int_0^a r^3 \sqrt{a^2-r^2} dr.$$

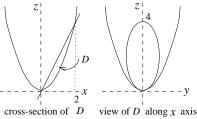

The integral can be done using integration by parts (write the integrand  $r^2 \cdot r \sqrt{a^2 - r^2}$ ), or by substitution; following the latter course, we substitute  $r = a \sin u$ ,  $dr = a \cos u \, du$ , and get (using the formulas at the beginning of exercises 3B)

$$\int_0^a r^3 \sqrt{a^2 - r^2} dr = \int_0^{\pi/2} a^3 \sin^3 u \cdot a^2 \cos^2 u \, du$$

$$= a^5 \int_0^{\pi/2} \left( \sin^3 u - \sin^5 u \right) du = a^5 \left( \frac{2}{3} - \frac{2 \cdot 4}{1 \cdot 3 \cdot 5} \right) = \frac{2}{15} a^5. \qquad \text{Ans: } \frac{4\pi}{15} a^5.$$

**5A-7** The solid D is bounded below by  $z=x^2+y^2$  and above by z=2x. The main problem is determining the projection R of D to the xy-plane, since we need to know this before we can put in the limits on the iterated integral.

The outline of R is the projection (i.e., vertical shadow) of the curve in which the paraboloid and plane intersect. This curve is made up of the points in which the graphs of z=2x and  $z=x^2+y^2$  intersect, i.e., the simultaneous solutions of the two equations. To project the curve, we omit the z-coordinates of the points on it. Algebraically, this amounts to solving the equations simultaneously by eliminating z from the two equations; doing this, we get as the outline of R the curve

$$x^2 + y^2 = 2x$$
 or, completing the square,  $(x-1)^2 + y^2 = 1$ .

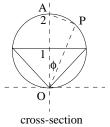

This is a circle of radius 1 and center at (1,0), whose polar equation is therefore  $r=2\cos\theta$ .

We use symmetry to calculate just the right half of D and double the answer:

$$\begin{aligned} \text{z-moment of inertia of } D &= 2 \int_0^{\pi/2} \int_0^{2\cos\theta} \int_{x^2+y^2}^{2x} r^2 \, dz \, r \, dr \, d\theta \\ &= 2 \int_0^{\pi/2} \int_0^{2\cos\theta} \int_{r^2}^{2r\cos\theta} r^3 \, dz \, dr \, d\theta = 2 \int_0^{\pi/2} \int_0^{2\cos\theta} r^3 (2r\cos\theta - r^2) \, dr \, d\theta \\ \text{Inner: } \frac{2}{5} r^5 \cos\theta - \frac{1}{6} r^6 \Big]_0^{2\cos\theta} &= \frac{2}{5} \cdot 32 \cos^6\theta - \frac{1}{3} \cdot 32 \cos^6\theta \\ \text{Outer: } \cdot \frac{32}{15} \int_0^{\pi/2} \cos^6\theta \, d\theta = \cdot \frac{32}{15} \cdot \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \cdot \frac{\pi}{2} = \frac{\pi}{3}. \end{aligned} \qquad \text{Ans: } \frac{2\pi}{3}$$

## 5B. Triple Integrals in spherical coordinates

- **5B-1** a) The angle between the central axis of the cone and any of the lines on the cone is  $\pi/4$ ; the sphere is  $\rho = \sqrt{2}$ ; so the limits are (no integrand given)::  $\int_0^{2\pi} \int_0^{\pi/4} \int_0^{\sqrt{2}} d\rho \, d\phi \, d\theta.$
- b) The limits are (no integrand is given):  $\int_0^{\pi/2} \int_0^{\pi/2} \int_0^\infty d\rho \, d\phi \, d\theta$
- c) To get the equation of the sphere in spherical coordinates, we note that AOP is always a right triangle, for any position of P on the sphere. Since AO=2 and  $OP=\rho$ , we get according to the definition of the cosine,  $\cos \phi = \rho/2$ , or  $\rho = 2\cos \phi$ . (The picture shows the cross-section of the sphere by the plane containing P and the central axis AO.)

The plane z=1 has in spherical coordinates the equation  $\rho\cos\phi=1$ , or  $\rho=\sec\phi$ . It intersects the sphere in a circle of radius 1; this shows that  $\pi/4$  is the maximum value of  $\phi$  for which the ray having angle  $\phi$  intersects the region. Therefore the limits are (no integrand is given):

$$\int_0^{2\pi} \int_0^{\pi/4} \int_{\sec\phi}^{2\cos\phi} d\rho \, d\phi \, d\theta.$$

**5B-2** Place the solid hemisphere D so that its central axis lies along the positive z-axis and its base is in the xy-plane. By symmetry,  $\bar{x}=0$  and  $\bar{y}=0$ , so we only need  $\bar{z}$ . The integral for it is the product of three separate one-variable integrals, since the integrand is the product of three one-variable functions and the limits of integration are all constants.

$$\bar{z}\text{-moment} = \iiint_D z \, dV = \int_0^{2\pi} \int_0^{\pi/2} \int_0^a (\rho \cos \phi) \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta$$
$$= 2\pi \cdot \left(\frac{1}{4} \rho^4\right)_0^a \cdot \left(\frac{1}{2} \sin^2 \phi\right)_0^{\pi/2} = 2\pi \cdot \frac{1}{4} a^4 \cdot \frac{1}{2} = \frac{\pi a^4}{4}.$$

Since the mass is  $\frac{2}{3}\pi a^3$ , we have finally  $\bar{z} = \frac{\pi a^4/4}{2\pi a^3/3} = \frac{3}{8}a$ .

**5B-3** Place the solid so the vertex is at the origin, and the central axis lies along the positive z-axis. In spherical coordinates, the density is given by  $\delta = z = \rho \cos \phi$ , and referring to the picture, we have

M. of I. = 
$$\iiint_{D} r^{2} \cdot z \, dV = \iiint_{D} (\rho \sin \phi)^{2} (\rho \cos \phi) \, \rho^{2} \sin \phi \, d\rho \, d\phi \, d\theta$$

$$= \int_{0}^{2\pi} \int_{0}^{\pi/6} \int_{0}^{a} \rho^{5} \sin^{3} \phi \cos \phi \, d\rho \, d\phi \, d\theta$$

$$= 2\pi \cdot \frac{a^{6}}{6} \cdot \frac{1}{4} \sin^{4} \phi \Big]_{0}^{\pi/6} = 2\pi \cdot \frac{a^{6}}{6} \cdot \frac{1}{4} \left(\frac{1}{2}\right)^{4} = \frac{\pi a^{6}}{2^{6} \cdot 3}.$$

**5B-4** Place the sphere so its center is at the origin. In each case the iterated integral can be expressed as the product of three one-variable integrals (which are easily calculated), since the integrand is the product of one-variable functions and the limits are constants.

a) 
$$\int_0^{2\pi} \int_0^{\pi} \int_0^a \rho \cdot \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta = 2\pi \cdot 2 \cdot \frac{1}{4} a^4 = \pi a^4;$$
 average  $= \frac{\pi a^4}{4\pi a^3/3} = \frac{3a}{4}.$ 

b) Use the z-axis as diameter. The distance of a point from the z-axis is  $r = \rho \sin \phi$ .

$$\int_0^{2\pi} \int_0^\pi \int_0^a \rho \sin \phi \cdot \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta = 2\pi \cdot \frac{\pi}{2} \cdot \frac{1}{4} \, a^4 = \frac{\pi^2 a^4}{4}; \qquad \text{average} = \frac{\pi^2 a^4/4}{4\pi a^3/3} = \frac{3\pi a}{16}.$$

c) Use the xy-plane and the upper solid hemisphere. The distance is  $z = \rho \cos \phi$ .

$$\int_0^{2\pi} \int_0^{\pi/2} \int_0^a \rho \cos \phi \cdot \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta = 2\pi \cdot \frac{1}{2} \cdot \frac{1}{4} \, a^4 = \frac{\pi a^4}{4}; \qquad \text{average} = \frac{\pi a^4/4}{2\pi a^3/3} = \frac{3a}{8}.$$

#### 4

## 5C. Gravitational Attraction

**5C-2** The top of the cone is given by z=2; in spherical coordinates:  $\rho\cos\phi=2$ . Let  $\alpha$  be the angle between the axis of the cone and any of its generators. The density  $\delta = 1$ . Since the cone is symmetric about its axis, the gravitational attraction has only a k-component, and is

$$G \int_0^{2\pi} \int_0^{\alpha} \int_0^{2/\cos\phi} \sin\phi\cos\phi\,d\rho\,d\phi\,d\theta.$$

Inner: 
$$\frac{2}{\cos\phi}\sin\phi\cos\phi$$

Inner: 
$$\frac{2}{\cos\phi}\sin\phi\cos\phi$$
 Middle:  $-2\cos\phi\Big|_{0}^{\alpha} = -2\cos\alpha + 2$  Outer:  $2\pi \cdot 2(1-\cos\alpha)$ 

Outer: 
$$2\pi \cdot 2(1-\cos\alpha)$$

Ans: 
$$4\pi G \left(1 - \frac{2}{\sqrt{5}}\right)$$
.

**5C-3** Place the sphere as shown so that Q is at the origin. Since it is rotationally symmetric about the z-axis, the force will be in the k-direction.

Equation of sphere:  $\rho = 2\cos\phi$ 

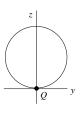

Density: 
$$\delta = \rho^{-1/2}$$

$$F_z = G \int_0^{2\pi} \int_0^{\pi/2} \int_0^{2\cos\phi} \rho^{-1/2} \cos\phi \sin\phi \, d\rho \, d\phi \, d\theta$$

Inner: 
$$\cos \phi \sin \phi \ 2\rho^{1/2} \bigg]_0^{2\cos \phi} = 2\sqrt{2} \ \cos^{3/2} \phi \ \sin \phi$$

Middle: 
$$2\sqrt{2} \left[ -\frac{2}{5} \cos^{5/2} \phi \right]_0^{\pi/2} = \frac{4\sqrt{2}}{5}$$
 Outer:  $2\pi G \frac{4\sqrt{2}}{5} = \frac{8\sqrt{2}}{5} \pi G$ .

Outer: 
$$2\pi G \frac{4\sqrt{2}}{5} = \frac{8\sqrt{2}}{5} \pi G$$

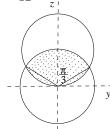

**5C-4** Referring to the figure, the total gravitational attraction (which is in the k direction, by rotational symmetry) is the sum of the two integrals

$$G \int_0^{2\pi} \int_0^{\pi/3} \int_0^1 \cos\phi \sin\phi \,d\rho \,d\phi \,d\theta + G \int_0^{2\pi} \int_{\pi/3}^{\pi/2} \int_0^{2\cos\phi} \cos\phi \sin\phi \,d\rho \,d\phi \,d\theta$$
$$= 2\pi G \cdot \frac{1}{2} \left(\frac{\sqrt{3}}{2}\right)^2 + 2\pi G \cdot \frac{2}{3} \left(\frac{1}{2}\right)^3 = \frac{3}{4}\pi G + \frac{1}{6}\pi G = \frac{11}{12}\pi G.$$

The two spheres are shown in cross-section. The spheres intersect at the points where  $\phi = \pi/3$ .

The first integral respresents the gravitational attraction of the top part of the solid, bounded below by the cone  $\phi = \pi/3$  and above by the sphere  $\rho = 1$ .

The second integral represents the bottom part of the solid, bounded below by the sphere  $\rho = 2\cos\phi$  and above by the cone.
