

# Topology Seminar

**Denis Nardin**

of MIT will be speaking on

## Stability and distributivity over an orbital $\infty$ -category

on April 10 at 4:30 in  
MIT Room 2-131

The category of  $G$ -spectra plays an important role in homotopy theory, even when a group action is not obviously involved. In this talk we will present a universal property for it providing an alternate proof of the Guillou-May theorem. If time permits, we will use it to provide a uniqueness theorem for the norm functors.
