

# Beta Distributions

## Class 14, 18.05

### Jeremy Orloff and Jonathan Bloom

## 1 Learning Goals

1. Be familiar with the 2-parameter family of beta distributions and its normalization.
2. Be able to update a beta prior to a beta posterior in the case of a binomial likelihood.

## 2 Beta distribution

The [beta distribution](#)  $\text{beta}(a, b)$  is a [two-parameter](#) distribution with range  $[0, 1]$  and pdf

$$f(\theta) = \frac{(a + b - 1)!}{(a - 1)!(b - 1)!} \theta^{a-1} (1 - \theta)^{b-1}$$

We have made an applet so you can explore the shape of the Beta distribution as you vary the parameters:

<http://mathlets.org/mathlets/beta-distribution/>.

As you can see in the applet, the beta distribution may be defined for any real numbers  $a > 0$  and  $b > 0$ . In 18.05 we will stick to integers  $a$  and  $b$ , but you can get the full story here: [http://en.wikipedia.org/wiki/Beta\\_distribution](http://en.wikipedia.org/wiki/Beta_distribution)

In the context of Bayesian updating,  $a$  and  $b$  are often called [hyperparameters](#) to distinguish them from the unknown parameter  $\theta$  representing our hypotheses. In a sense,  $a$  and  $b$  are ‘one level up’ from  $\theta$  since they parameterize its pdf.

### 2.1 A simple but important observation!

If a pdf  $f(\theta)$  has the form  $c\theta^{a-1}(1-\theta)^{b-1}$  then  $f(\theta)$  is a  $\text{beta}(a, b)$  distribution and the normalizing constant must be

$$c = \frac{(a + b - 1)!}{(a - 1)!(b - 1)!}.$$

This follows because the constant  $c$  must normalize the pdf to have total probability 1. There is only one such constant and it is given in the formula for the beta distribution.

A similar observation holds for normal distributions, exponential distributions, and so on.

### 2.2 Beta priors and posteriors for binomial random variables

**Example 1.** Suppose we have a bent coin with unknown probability  $\theta$  of heads. We toss it 12 times and get 8 heads and 4 tails. Starting with a flat prior, show that the posterior pdf is a  $\text{beta}(9, 5)$  distribution.

**answer:** This is nearly identical to examples from the previous class. We'll call the data from all 12 tosses  $x_1$ . In the following table we call the leading constant factor in the posterior column  $c_2$ . Our simple observation will tell us that it has to be the constant factor from the beta pdf.

The data is 8 heads and 4 tails. Since this comes from a binomial(12,  $\theta$ ) distribution, the likelihood  $p(x_1|\theta) = \binom{12}{8} \theta^8 (1 - \theta)^4$ . Thus the Bayesian update table is

hypothesis	prior	likelihood	Bayes numerator	posterior
$\theta$	$1 \cdot d\theta$	$\binom{12}{8} \theta^8 (1 - \theta)^4$	$\binom{12}{8} \theta^8 (1 - \theta)^4 d\theta$	$c_2 \theta^8 (1 - \theta)^4 d\theta$
total	1		$T = \binom{12}{8} \int_0^1 \theta^8 (1 - \theta)^4 d\theta$	1

Our simple observation above holds with  $a = 9$  and  $b = 5$ . Therefore the posterior pdf

$$f(\theta|x_1) = c_2 \theta^8 (1 - \theta)^4$$

follows a beta(9, 5) distribution and the normalizing constant  $c_2$  must be

$$c_2 = \frac{13!}{8!4!}.$$

Note: We explicitly included the binomial coefficient  $\binom{12}{8}$  in the likelihood. We could just as easily have given it a name, say  $c_1$  and not bothered making its value explicit.

**Example 2.** Now suppose we toss the same coin again, getting  $n$  heads and  $m$  tails. Using the posterior pdf of the previous example as our new prior pdf, show that the new posterior pdf is that of a beta( $9 + n$ ,  $5 + m$ ) distribution.

**answer:** It's all in the table. We'll call the data of these  $n + m$  additional tosses  $x_2$ . This time we won't make the binomial coefficient explicit. Instead we'll just call it  $c_3$ . Whenever we need a new label we will simply use  $c$  with a new subscript.

hyp.	prior	likelihood	Bayes posterior	numerator
$\theta$	$c_2 \theta^8 (1 - \theta)^4 d\theta$	$c_3 \theta^n (1 - \theta)^m$	$c_2 c_3 \theta^{n+8} (1 - \theta)^{m+4} d\theta$	$c_4 \theta^{n+8} (1 - \theta)^{m+4} d\theta$
total	1		$T = \int_0^1 c_2 c_3 \theta^{n+8} (1 - \theta)^{m+4} d\theta$	1

Again our simple observation holds and therefore the posterior pdf

$$f(\theta|x_1, x_2) = c_4 \theta^{n+8} (1 - \theta)^{m+4}$$

follows a beta( $n + 9$ ,  $m + 5$ ) distribution.

**Note: Flat beta.** The beta(1, 1) distribution is the same as the uniform distribution on  $[0, 1]$ , which we have also called the flat prior on  $\theta$ . This follows by plugging  $a = 1$  and  $b = 1$  into the definition of the beta distribution, giving  $f(\theta) = 1$ .

**Summary:** If the probability of heads is  $\theta$ , the number of heads in  $n + m$  tosses follows a binomial( $n + m, \theta$ ) distribution. We have seen that if the prior on  $\theta$  is a beta distribution then so is the posterior; only the parameters  $a, b$  of the beta distribution change! We summarize precisely how they change in a table. We assume the data is  $n$  heads in  $n + m$  tosses.

hypothesis	data	prior	likelihood	posterior
$\theta$	$x = n$	beta( $a, b$ )	binomial( $n + m, \theta$ )	beta( $a + n, b + m$ )
$\theta$	$x = n$	$c_1 \theta^{a-1} (1 - \theta)^{b-1} d\theta$	$c_2 \theta^n (1 - \theta)^m$	$c_3 \theta^{a+n-1} (1 - \theta)^{b+m-1} d\theta$

### 2.3 Conjugate priors

In the literature you'll see that the beta distribution is called a [conjugate prior](#) for the binomial distribution. This means that if the likelihood function is binomial, then a beta prior gives a beta posterior. In fact, the beta distribution is a conjugate prior for the Bernoulli and geometric distributions as well.

We will soon see another important example: the normal distribution is its own conjugate prior. In particular, if the likelihood function is normal with known variance, then a normal prior gives a normal posterior.

Conjugate priors are useful because they reduce Bayesian updating to modifying the parameters of the prior distribution (so-called hyperparameters) rather than computing integrals. We saw this for the beta distribution in the last table. For many more examples see: [http://en.wikipedia.org/wiki/Conjugate\\_prior\\_distribution](http://en.wikipedia.org/wiki/Conjugate_prior_distribution)
