Random variable properties

Say X is a continuous random variable if there exists a probability density function  $f = f_X$  on  $\mathbb{R}$  such that  $P\{X \in B\} = \int_B f(x) dx := \int 1_B(x) f(x) dx$ .

- Say X is a continuous random variable if there exists a probability density function  $f = f_X$  on  $\mathbb{R}$  such that  $P\{X \in B\} = \int_B f(x)dx := \int 1_B(x)f(x)dx$ .
- We may assume  $\int_{\mathbb{R}} f(x) dx = \int_{-\infty}^{\infty} f(x) dx = 1$  and f is non-negative.

- Say X is a continuous random variable if there exists a probability density function  $f = f_X$  on  $\mathbb{R}$  such that  $P\{X \in B\} = \int_B f(x) dx := \int \mathbb{1}_B(x) f(x) dx$ .
- We may assume  $\int_{\mathbb{R}} f(x) dx = \int_{-\infty}^{\infty} f(x) dx = 1$  and f is non-negative.
- ▶ Probability of interval [a, b] is given by  $\int_a^b f(x) dx$ , the area under f between a and b.

- Say X is a continuous random variable if there exists a probability density function  $f = f_X$  on  $\mathbb{R}$  such that  $P\{X \in B\} = \int_B f(x) dx := \int \mathbb{1}_B(x) f(x) dx$ .
- We may assume  $\int_{\mathbb{R}} f(x) dx = \int_{-\infty}^{\infty} f(x) dx = 1$  and f is non-negative.
- ▶ Probability of interval [a, b] is given by  $\int_a^b f(x) dx$ , the area under f between a and b.
- Probability of any single point is zero.

- We may assume  $\int_{\mathbb{R}} f(x) dx = \int_{-\infty}^{\infty} f(x) dx = 1$  and f is non-negative.
- ▶ Probability of interval [a, b] is given by  $\int_a^b f(x) dx$ , the area under f between a and b.
- Probability of any single point is zero.
- Define cumulative distribution function  $F(a) = F_X(a) := P\{X < a\} = P\{X \le a\} = \int_{-\infty}^a f(x) dx.$

Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[X] = \sum_{x:p(x)>0} p(x)x.$$

Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[X] = \sum_{x:p(x)>0} p(x)x.$$

How should we define E[X] when X is a continuous random variable?

Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[X] = \sum_{x:p(x)>0} p(x)x.$$

- How should we define E[X] when X is a continuous random variable?
- Answer:  $E[X] = \int_{-\infty}^{\infty} f(x) x dx$ .

Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[X] = \sum_{x:p(x)>0} p(x)x.$$

- How should we define E[X] when X is a continuous random variable?
- Answer:  $E[X] = \int_{-\infty}^{\infty} f(x) x dx$ .
- Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[g(X)] = \sum_{x:p(x)>0} p(x)g(x).$$

Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[X] = \sum_{x:p(x)>0} p(x)x.$$

- How should we define E[X] when X is a continuous random variable?
- Answer:  $E[X] = \int_{-\infty}^{\infty} f(x) x dx$ .
- Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[g(X)] = \sum_{x:p(x)>0} p(x)g(x).$$

What is the analog when X is a continuous random variable?

Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[X] = \sum_{x:p(x)>0} p(x)x.$$

- How should we define E[X] when X is a continuous random variable?
- Answer:  $E[X] = \int_{-\infty}^{\infty} f(x) x dx$ .
- Recall that when X was a discrete random variable, with p(x) = P{X = x}, we wrote

$$E[g(X)] = \sum_{x:p(x)>0} p(x)g(x).$$

What is the analog when X is a continuous random variable?
 Answer: we will write E[g(X)] = ∫<sup>∞</sup><sub>-∞</sub> f(x)g(x)dx.

Suppose X is a continuous random variable with mean  $\mu$ .

- Suppose X is a continuous random variable with mean μ.
- We can write Var[X] = E[(X − µ)<sup>2</sup>], same as in the discrete case.

- Suppose X is a continuous random variable with mean  $\mu$ .
- We can write Var[X] = E[(X − µ)<sup>2</sup>], same as in the discrete case.

• Next, if 
$$g = g_1 + g_2$$
 then  
 $E[g(X)] = \int g_1(x)f(x)dx + \int g_2(x)f(x)dx = \int (g_1(x) + g_2(x))f(x)dx = E[g_1(X)] + E[g_2(X)].$ 

- Suppose X is a continuous random variable with mean  $\mu$ .
- We can write Var[X] = E[(X − µ)<sup>2</sup>], same as in the discrete case.

• Next, if 
$$g = g_1 + g_2$$
 then  
 $E[g(X)] = \int g_1(x)f(x)dx + \int g_2(x)f(x)dx = \int (g_1(x) + g_2(x))f(x)dx = E[g_1(X)] + E[g_2(X)].$ 

Furthermore, E[ag(X)] = aE[g(X)] when a is a constant.

- Suppose X is a continuous random variable with mean  $\mu$ .
- We can write Var[X] = E[(X − µ)<sup>2</sup>], same as in the discrete case.
- Next, if  $g = g_1 + g_2$  then  $E[g(X)] = \int g_1(x)f(x)dx + \int g_2(x)f(x)dx = \int (g_1(x) + g_2(x))f(x)dx = E[g_1(X)] + E[g_2(X)].$

Furthermore, E[ag(X)] = aE[g(X)] when a is a constant.

Just as in the discrete case, we can expand the variance expression as Var[X] = E[X<sup>2</sup> − 2µX + µ<sup>2</sup>] and use additivity of expectation to say that Var[X] = E[X<sup>2</sup>] − 2µE[X] + E[µ<sup>2</sup>] = E[X<sup>2</sup>] − 2µ<sup>2</sup> + µ<sup>2</sup> =

$$Var[X] = E[X^2] - 2\mu E[X] + E[\mu^2] = E[X^2] - 2\mu^2 + \mu^2 = E[X^2] - E[X]^2.$$

- Suppose X is a continuous random variable with mean  $\mu$ .
- We can write Var[X] = E[(X − µ)<sup>2</sup>], same as in the discrete case.
- Next, if  $g = g_1 + g_2$  then  $E[g(X)] = \int g_1(x)f(x)dx + \int g_2(x)f(x)dx = \int (g_1(x) + g_2(x))f(x)dx = E[g_1(X)] + E[g_2(X)].$

Furthermore, E[ag(X)] = aE[g(X)] when a is a constant.

Just as in the discrete case, we can expand the variance expression as Var[X] = E[X<sup>2</sup> − 2µX + µ<sup>2</sup>] and use additivity of expectation to say that Var[X] = E[X<sup>2</sup>] − 2µE[X] + E[µ<sup>2</sup>] = E[X<sup>2</sup>] − 2µ<sup>2</sup> + µ<sup>2</sup> = E[X<sup>2</sup>] − E[X]<sup>2</sup>.

Expectation of square minus square of expectation.

- Suppose X is a continuous random variable with mean  $\mu$ .
- We can write Var[X] = E[(X − µ)<sup>2</sup>], same as in the discrete case.
- Next, if  $g = g_1 + g_2$  then  $E[g(X)] = \int g_1(x)f(x)dx + \int g_2(x)f(x)dx = \int (g_1(x) + g_2(x))f(x)dx = E[g_1(X)] + E[g_2(X)].$

Furthermore, E[ag(X)] = aE[g(X)] when a is a constant.

Just as in the discrete case, we can expand the variance expression as Var[X] = E[X<sup>2</sup> − 2µX + µ<sup>2</sup>] and use additivity of expectation to say that Var[X] = E[X<sup>2</sup>] − 2µE[X] + E[µ<sup>2</sup>] = E[X<sup>2</sup>] − 2µ<sup>2</sup> + µ<sup>2</sup> = E[X<sup>2</sup>] − E[X]<sup>2</sup>.

Expectation of square minus square of expectation.

This formula is often useful for calculations.

- ▶ Poisson point process: toss one  $\lambda/n$  coin during each length 1/n time increment, take  $n \to \infty$  limit.
- **Exponential**: time till first event in  $\lambda$  Poisson point process.
- Gamma distribution: time till *n*th event in λ Poisson point process.

Sum of two independent binomial random variables with parameters  $(n_1, p)$  and  $(n_2, p)$  is itself binomial  $(n_1 + n_2, p)$ .

- Sum of two independent binomial random variables with parameters  $(n_1, p)$  and  $(n_2, p)$  is itself binomial  $(n_1 + n_2, p)$ .
- Sum of *n* independent geometric random variables with parameter *p* is negative binomial with parameter (*n*, *p*).

- Sum of two independent binomial random variables with parameters  $(n_1, p)$  and  $(n_2, p)$  is itself binomial  $(n_1 + n_2, p)$ .
- Sum of n independent geometric random variables with parameter p is negative binomial with parameter (n, p).
- Expectation of geometric random variable with parameter p is 1/p.

- Sum of two independent binomial random variables with parameters  $(n_1, p)$  and  $(n_2, p)$  is itself binomial  $(n_1 + n_2, p)$ .
- Sum of n independent geometric random variables with parameter p is negative binomial with parameter (n, p).
- Expectation of geometric random variable with parameter p is 1/p.
- Expectation of binomial random variable with parameters (n, p) is np.

- Sum of two independent binomial random variables with parameters  $(n_1, p)$  and  $(n_2, p)$  is itself binomial  $(n_1 + n_2, p)$ .
- Sum of n independent geometric random variables with parameter p is negative binomial with parameter (n, p).
- Expectation of geometric random variable with parameter p is 1/p.
- Expectation of binomial random variable with parameters (n, p) is np.
- Variance of binomial random variable with parameters (n, p) is np(1-p) = npq.

Sum of *n* independent exponential random variables each with parameter  $\lambda$  is gamma with parameters  $(n, \lambda)$ .

- Sum of *n* independent exponential random variables each with parameter  $\lambda$  is gamma with parameters  $(n, \lambda)$ .
- Memoryless properties: given that exponential random variable X is greater than T > 0, the conditional law of X T is the same as the original law of X.

- Sum of *n* independent exponential random variables each with parameter  $\lambda$  is gamma with parameters  $(n, \lambda)$ .
- Memoryless properties: given that exponential random variable X is greater than T > 0, the conditional law of X T is the same as the original law of X.
- ▶ Write  $p = \lambda/n$ . Poisson random variable expectation is  $\lim_{n\to\infty} np = \lim_{n\to\infty} n\frac{\lambda}{n} = \lambda$ . Variance is  $\lim_{n\to\infty} np(1-p) = \lim_{n\to\infty} n(1-\lambda/n)\lambda/n = \lambda$ .

- Sum of *n* independent exponential random variables each with parameter  $\lambda$  is gamma with parameters  $(n, \lambda)$ .
- Memoryless properties: given that exponential random variable X is greater than T > 0, the conditional law of X T is the same as the original law of X.
- ▶ Write  $p = \lambda/n$ . Poisson random variable expectation is  $\lim_{n\to\infty} np = \lim_{n\to\infty} n\frac{\lambda}{n} = \lambda$ . Variance is  $\lim_{n\to\infty} np(1-p) = \lim_{n\to\infty} n(1-\lambda/n)\lambda/n = \lambda$ .
- Sum of λ<sub>1</sub> Poisson and independent λ<sub>2</sub> Poisson is a λ<sub>1</sub> + λ<sub>2</sub> Poisson.

- Sum of *n* independent exponential random variables each with parameter  $\lambda$  is gamma with parameters  $(n, \lambda)$ .
- Memoryless properties: given that exponential random variable X is greater than T > 0, the conditional law of X T is the same as the original law of X.
- ▶ Write  $p = \lambda/n$ . Poisson random variable expectation is  $\lim_{n\to\infty} np = \lim_{n\to\infty} n\frac{\lambda}{n} = \lambda$ . Variance is  $\lim_{n\to\infty} np(1-p) = \lim_{n\to\infty} n(1-\lambda/n)\lambda/n = \lambda$ .
- Sum of λ<sub>1</sub> Poisson and independent λ<sub>2</sub> Poisson is a λ<sub>1</sub> + λ<sub>2</sub> Poisson.
- Times between successive events in λ Poisson process are independent exponentials with parameter λ.

- Sum of *n* independent exponential random variables each with parameter  $\lambda$  is gamma with parameters  $(n, \lambda)$ .
- Memoryless properties: given that exponential random variable X is greater than T > 0, the conditional law of X T is the same as the original law of X.
- ▶ Write  $p = \lambda/n$ . Poisson random variable expectation is  $\lim_{n\to\infty} np = \lim_{n\to\infty} n\frac{\lambda}{n} = \lambda$ . Variance is  $\lim_{n\to\infty} np(1-p) = \lim_{n\to\infty} n(1-\lambda/n)\lambda/n = \lambda$ .
- Sum of λ<sub>1</sub> Poisson and independent λ<sub>2</sub> Poisson is a λ<sub>1</sub> + λ<sub>2</sub> Poisson.
- Times between successive events in λ Poisson process are independent exponentials with parameter λ.
- Minimum of independent exponentials with parameters λ<sub>1</sub> and λ<sub>2</sub> is itself exponential with parameter λ<sub>1</sub> + λ<sub>2</sub>.

DeMoivre-Laplace limit theorem (special case of central limit theorem):

$$\lim_{n\to\infty} P\{a\leq \frac{S_n-np}{\sqrt{npq}}\leq b\}\to \Phi(b)-\Phi(a).$$

DeMoivre-Laplace limit theorem (special case of central limit theorem):

$$\lim_{n\to\infty} P\{a \leq \frac{S_n - np}{\sqrt{npq}} \leq b\} \to \Phi(b) - \Phi(a).$$

This is Φ(b) − Φ(a) = P{a ≤ X ≤ b} when X is a standard normal random variable.

Toss a million fair coins. Approximate the probability that I get more than 501,000 heads.

- Toss a million fair coins. Approximate the probability that I get more than 501,000 heads.
- Answer: well,  $\sqrt{npq} = \sqrt{10^6 \times .5 \times .5} = 500$ . So we're asking for probability to be over two SDs above mean. This is approximately  $1 \Phi(2) = \Phi(-2)$ .

- Toss a million fair coins. Approximate the probability that I get more than 501,000 heads.
- Answer: well, √npq = √10<sup>6</sup> × .5 × .5 = 500. So we're asking for probability to be over two SDs above mean. This is approximately 1 − Φ(2) = Φ(−2).
- Roll 60000 dice. Expect to see 10000 sixes. What's the probability to see more than 9800?

- Toss a million fair coins. Approximate the probability that I get more than 501,000 heads.
- Answer: well, √npq = √10<sup>6</sup> × .5 × .5 = 500. So we're asking for probability to be over two SDs above mean. This is approximately 1 − Φ(2) = Φ(−2).
- Roll 60000 dice. Expect to see 10000 sixes. What's the probability to see more than 9800?

• Here 
$$\sqrt{npq} = \sqrt{60000 \times \frac{1}{6} \times \frac{5}{6}} \approx 91.28.$$

- Toss a million fair coins. Approximate the probability that I get more than 501,000 heads.
- Answer: well,  $\sqrt{npq} = \sqrt{10^6 \times .5 \times .5} = 500$ . So we're asking for probability to be over two SDs above mean. This is approximately  $1 \Phi(2) = \Phi(-2)$ .
- Roll 60000 dice. Expect to see 10000 sixes. What's the probability to see more than 9800?
- Here  $\sqrt{npq} = \sqrt{60000 \times \frac{1}{6} \times \frac{5}{6}} \approx 91.28.$
- And  $200/91.28 \approx 2.19$ . Answer is about  $1 \Phi(-2.19)$ .

Say X is a (standard) normal random variable if 
$$f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$
.

Say X is a (standard) normal random variable if 
$$f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$
.

Mean zero and variance one.

Say X is a (standard) normal random variable if 
$$f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$
.

- Mean zero and variance one.
- The random variable  $Y = \sigma X + \mu$  has variance  $\sigma^2$  and expectation  $\mu$ .

- Say X is a (standard) normal random variable if  $f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$ .
- Mean zero and variance one.
- The random variable  $Y = \sigma X + \mu$  has variance  $\sigma^2$  and expectation  $\mu$ .
- ► Y is said to be normal with parameters  $\mu$  and  $\sigma^2$ . Its density function is  $f_Y(x) = \frac{1}{\sqrt{2\pi\sigma}} e^{-(x-\mu)^2/2\sigma^2}$ .

- Say X is a (standard) normal random variable if  $f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$ .
- Mean zero and variance one.
- The random variable  $Y = \sigma X + \mu$  has variance  $\sigma^2$  and expectation  $\mu$ .
- ► Y is said to be normal with parameters  $\mu$  and  $\sigma^2$ . Its density function is  $f_Y(x) = \frac{1}{\sqrt{2\pi\sigma}} e^{-(x-\mu)^2/2\sigma^2}$ .
- Function  $\Phi(a) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{a} e^{-x^2/2} dx$  can't be computed explicitly.

- Say X is a (standard) normal random variable if  $f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$ .
- Mean zero and variance one.
- The random variable  $Y = \sigma X + \mu$  has variance  $\sigma^2$  and expectation  $\mu$ .
- ► Y is said to be normal with parameters  $\mu$  and  $\sigma^2$ . Its density function is  $f_Y(x) = \frac{1}{\sqrt{2\pi\sigma}} e^{-(x-\mu)^2/2\sigma^2}$ .
- Function  $\Phi(a) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{a} e^{-x^2/2} dx$  can't be computed explicitly.
- ► Values:  $\Phi(-3) \approx .0013$ ,  $\Phi(-2) \approx .023$  and  $\Phi(-1) \approx .159$ .

- Say X is a (standard) normal random variable if  $f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$ .
- Mean zero and variance one.
- The random variable  $Y = \sigma X + \mu$  has variance  $\sigma^2$  and expectation  $\mu$ .
- ► Y is said to be normal with parameters  $\mu$  and  $\sigma^2$ . Its density function is  $f_Y(x) = \frac{1}{\sqrt{2\pi\sigma}} e^{-(x-\mu)^2/2\sigma^2}$ .
- Function  $\Phi(a) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{a} e^{-x^2/2} dx$  can't be computed explicitly.
- ► Values:  $\Phi(-3) \approx .0013$ ,  $\Phi(-2) \approx .023$  and  $\Phi(-1) \approx .159$ .
- Rule of thumb: "two thirds of time within one SD of mean, 95 percent of time within 2 SDs of mean."

Say X is an exponential random variable of parameter  $\lambda$  when its probability distribution function is  $f(x) = \lambda e^{-\lambda x}$  for  $x \ge 0$  (and f(x) = 0 if x < 0).

Say X is an exponential random variable of parameter  $\lambda$  when its probability distribution function is  $f(x) = \lambda e^{-\lambda x}$  for  $x \ge 0$  (and f(x) = 0 if x < 0).

▶ For a > 0 have

$$F_X(a) = \int_0^a f(x) dx = \int_0^a \lambda e^{-\lambda x} dx = -e^{-\lambda x} \Big|_0^a = 1 - e^{-\lambda a}.$$

- Say X is an exponential random variable of parameter λ when its probability distribution function is f(x) = λe<sup>-λx</sup> for x ≥ 0 (and f(x) = 0 if x < 0).</p>
- For a > 0 have

$$F_X(a) = \int_0^a f(x) dx = \int_0^a \lambda e^{-\lambda x} dx = -e^{-\lambda x} \Big|_0^a = 1 - e^{-\lambda a}.$$

• Thus  $P\{X < a\} = 1 - e^{-\lambda a}$  and  $P\{X > a\} = e^{-\lambda a}$ .

- Say X is an exponential random variable of parameter λ when its probability distribution function is f(x) = λe<sup>-λx</sup> for x ≥ 0 (and f(x) = 0 if x < 0).</p>
- For a > 0 have

$$F_X(a) = \int_0^a f(x) dx = \int_0^a \lambda e^{-\lambda x} dx = -e^{-\lambda x} \Big|_0^a = 1 - e^{-\lambda a}.$$

- Thus  $P\{X < a\} = 1 e^{-\lambda a}$  and  $P\{X > a\} = e^{-\lambda a}$ .
- Formula  $P\{X > a\} = e^{-\lambda a}$  is very important in practice.

- Say X is an exponential random variable of parameter λ when its probability distribution function is f(x) = λe<sup>-λx</sup> for x ≥ 0 (and f(x) = 0 if x < 0).</p>
- For a > 0 have

$$F_X(a) = \int_0^a f(x) dx = \int_0^a \lambda e^{-\lambda x} dx = -e^{-\lambda x} \Big|_0^a = 1 - e^{-\lambda a}.$$

- Thus  $P\{X < a\} = 1 e^{-\lambda a}$  and  $P\{X > a\} = e^{-\lambda a}$ .
- Formula  $P\{X > a\} = e^{-\lambda a}$  is very important in practice.
- Repeated integration by parts gives  $E[X^n] = n!/\lambda^n$ .

- Say X is an exponential random variable of parameter λ when its probability distribution function is f(x) = λe<sup>-λx</sup> for x ≥ 0 (and f(x) = 0 if x < 0).</p>
- For a > 0 have

$$F_X(a) = \int_0^a f(x) dx = \int_0^a \lambda e^{-\lambda x} dx = -e^{-\lambda x} \Big|_0^a = 1 - e^{-\lambda a}.$$

- Thus  $P\{X < a\} = 1 e^{-\lambda a}$  and  $P\{X > a\} = e^{-\lambda a}$ .
- Formula  $P\{X > a\} = e^{-\lambda a}$  is very important in practice.
- Repeated integration by parts gives  $E[X^n] = n!/\lambda^n$ .
- ▶ If  $\lambda = 1$ , then  $E[X^n] = n!$ . Value  $\Gamma(n) := E[X^{n-1}]$  defined for real n > 0 and  $\Gamma(n) = (n-1)!$ .

Say that random variable X has gamma distribution with parameters 
$$(\alpha, \lambda)$$
 if  $f_X(x) = \begin{cases} \frac{(\lambda x)^{\alpha-1}e^{-\lambda x}\lambda}{\Gamma(\alpha)} & x \ge 0\\ 0 & x < 0 \end{cases}$ .

- Say that random variable X has gamma distribution with parameters  $(\alpha, \lambda)$  if  $f_X(x) = \begin{cases} \frac{(\lambda x)^{\alpha-1}e^{-\lambda x}\lambda}{\Gamma(\alpha)} & x \ge 0\\ 0 & x < 0 \end{cases}$ .
- Same as exponential distribution when α = 1. Otherwise, multiply by x<sup>α-1</sup> and divide by Γ(α). The fact that Γ(α) is what you need to divide by to make the total integral one just follows from the definition of Γ.

- Say that random variable X has gamma distribution with parameters  $(\alpha, \lambda)$  if  $f_X(x) = \begin{cases} \frac{(\lambda x)^{\alpha-1}e^{-\lambda x}\lambda}{\Gamma(\alpha)} & x \ge 0\\ 0 & x < 0 \end{cases}$ .
- Same as exponential distribution when α = 1. Otherwise, multiply by x<sup>α-1</sup> and divide by Γ(α). The fact that Γ(α) is what you need to divide by to make the total integral one just follows from the definition of Γ.
- Waiting time interpretation makes sense only for integer α, but distribution is defined for general positive α.

#### Continuous random variables

#### Problems motivated by coin tossing

Random variable properties

#### Continuous random variables

#### Problems motivated by coin tossing

Random variable properties

Suppose X is a random variable with probability density  
function 
$$f(x) = \begin{cases} \frac{1}{\beta - \alpha} & x \in [\alpha, \beta] \\ 0 & x \notin [\alpha, \beta]. \end{cases}$$

## Distribution of function of random variable

Suppose  $P\{X \le a\} = F_X(a)$  is known for all a. Write  $Y = X^3$ . What is  $P\{Y \le 27\}$ ?

### Distribution of function of random variable

- Suppose  $P\{X \le a\} = F_X(a)$  is known for all *a*. Write  $Y = X^3$ . What is  $P\{Y \le 27\}$ ?
- Answer: note that  $Y \le 27$  if and only if  $X \le 3$ . Hence  $P\{Y \le 27\} = P\{X \le 3\} = F_X(3)$ .

### Distribution of function of random variable

- Suppose  $P\{X \le a\} = F_X(a)$  is known for all *a*. Write  $Y = X^3$ . What is  $P\{Y \le 27\}$ ?
- Answer: note that  $Y \le 27$  if and only if  $X \le 3$ . Hence  $P\{Y \le 27\} = P\{X \le 3\} = F_X(3)$ .
- Generally  $F_Y(a) = P\{Y \le a\} = P\{X \le a^{1/3}\} = F_X(a^{1/3})$

#### Distribution of function of random variable

- Suppose  $P\{X \le a\} = F_X(a)$  is known for all *a*. Write  $Y = X^3$ . What is  $P\{Y \le 27\}$ ?
- Answer: note that  $Y \le 27$  if and only if  $X \le 3$ . Hence  $P\{Y \le 27\} = P\{X \le 3\} = F_X(3)$ .

• Generally  $F_Y(a) = P\{Y \le a\} = P\{X \le a^{1/3}\} = F_X(a^{1/3})$ 

This is a general principle. If X is a continuous random variable and g is a strictly increasing function of x and Y = g(X), then F<sub>Y</sub>(a) = F<sub>X</sub>(g<sup>-1</sup>(a)).

▶ If X and Y assume values in  $\{1, 2, ..., n\}$  then we can view  $A_{i,j} = P\{X = i, Y = j\}$  as the entries of an  $n \times n$  matrix.

- ▶ If X and Y assume values in  $\{1, 2, ..., n\}$  then we can view  $A_{i,j} = P\{X = i, Y = j\}$  as the entries of an  $n \times n$  matrix.

- Question: if I tell you the two parameter function F, can you use it to determine the marginals F<sub>X</sub> and F<sub>Y</sub>?
- Answer: Yes.  $F_X(a) = \lim_{b\to\infty} F(a, b)$  and  $F_Y(b) = \lim_{a\to\infty} F(a, b)$ .

• Density: 
$$f(x, y) = \frac{\partial}{\partial x} \frac{\partial}{\partial y} F(x, y)$$
.

We say X and Y are independent if for any two (measurable) sets A and B of real numbers we have

 $P\{X \in A, Y \in B\} = P\{X \in A\}P\{Y \in B\}.$ 

We say X and Y are independent if for any two (measurable) sets A and B of real numbers we have

$$P\{X \in A, Y \in B\} = P\{X \in A\}P\{Y \in B\}.$$

When X and Y are discrete random variables, they are independent if P{X = x, Y = y} = P{X = x}P{Y = y} for all x and y for which P{X = x} and P{Y = y} are non-zero. We say X and Y are independent if for any two (measurable) sets A and B of real numbers we have

$$P\{X \in A, Y \in B\} = P\{X \in A\}P\{Y \in B\}.$$

- When X and Y are discrete random variables, they are independent if P{X = x, Y = y} = P{X = x}P{Y = y} for all x and y for which P{X = x} and P{Y = y} are non-zero.
- When X and Y are continuous, they are independent if f(x, y) = f<sub>X</sub>(x)f<sub>Y</sub>(y).

Say we have independent random variables X and Y and we know their density functions f<sub>X</sub> and f<sub>Y</sub>.

- Say we have independent random variables X and Y and we know their density functions f<sub>X</sub> and f<sub>Y</sub>.
- Now let's try to find  $F_{X+Y}(a) = P\{X + Y \le a\}$ .

- Say we have independent random variables X and Y and we know their density functions f<sub>X</sub> and f<sub>Y</sub>.
- Now let's try to find  $F_{X+Y}(a) = P\{X + Y \le a\}$ .
- ► This is the integral over {(x, y) : x + y ≤ a} of f(x, y) = f<sub>X</sub>(x)f<sub>Y</sub>(y). Thus,

- Say we have independent random variables X and Y and we know their density functions f<sub>X</sub> and f<sub>Y</sub>.
- Now let's try to find  $F_{X+Y}(a) = P\{X + Y \le a\}$ .
- ► This is the integral over {(x, y) : x + y ≤ a} of f(x, y) = f<sub>X</sub>(x)f<sub>Y</sub>(y). Thus,

$$P\{X + Y \le a\} = \int_{-\infty}^{\infty} \int_{-\infty}^{a-y} f_X(x) f_Y(y) dx dy$$
$$= \int_{-\infty}^{\infty} F_X(a-y) f_Y(y) dy.$$

- Say we have independent random variables X and Y and we know their density functions f<sub>X</sub> and f<sub>Y</sub>.
- Now let's try to find  $F_{X+Y}(a) = P\{X + Y \le a\}$ .
- ► This is the integral over {(x, y) : x + y ≤ a} of f(x, y) = f<sub>X</sub>(x)f<sub>Y</sub>(y). Thus,

$$P\{X + Y \le a\} = \int_{-\infty}^{\infty} \int_{-\infty}^{a-y} f_X(x) f_Y(y) dx dy$$
$$= \int_{-\infty}^{\infty} F_X(a-y) f_Y(y) dy.$$

► Differentiating both sides gives  $f_{X+Y}(a) = \frac{d}{da} \int_{-\infty}^{\infty} F_X(a-y) f_Y(y) dy = \int_{-\infty}^{\infty} f_X(a-y) f_Y(y) dy.$ 

- Say we have independent random variables X and Y and we know their density functions f<sub>X</sub> and f<sub>Y</sub>.
- Now let's try to find  $F_{X+Y}(a) = P\{X + Y \le a\}$ .
- ► This is the integral over {(x, y) : x + y ≤ a} of f(x, y) = f<sub>X</sub>(x)f<sub>Y</sub>(y). Thus,

$$P\{X + Y \le a\} = \int_{-\infty}^{\infty} \int_{-\infty}^{a-y} f_X(x) f_Y(y) dx dy$$
$$= \int_{-\infty}^{\infty} F_X(a-y) f_Y(y) dy.$$

- Differentiating both sides gives  $f_{X+Y}(a) = \frac{d}{da} \int_{-\infty}^{\infty} F_X(a-y) f_Y(y) dy = \int_{-\infty}^{\infty} f_X(a-y) f_Y(y) dy.$
- Latter formula makes some intuitive sense. We're integrating over the set of x, y pairs that add up to a.

#### Let's say X and Y have joint probability density function f(x, y).

- Let's say X and Y have joint probability density function f(x, y).
- We can *define* the conditional probability density of X given that Y = y by  $f_{X|Y=y}(x) = \frac{f(x,y)}{f_Y(y)}$ .

- Let's say X and Y have joint probability density function f(x, y).
- We can *define* the conditional probability density of X given that Y = y by  $f_{X|Y=y}(x) = \frac{f(x,y)}{f_Y(y)}$ .
- This amounts to restricting f(x, y) to the line corresponding to the given y value (and dividing by the constant that makes the integral along that line equal to 1).

Suppose I choose *n* random variables X<sub>1</sub>, X<sub>2</sub>,..., X<sub>n</sub> uniformly at random on [0, 1], independently of each other.

- But what about that delightful "area under  $1 F_X$ " formula for the expectation?

- For both discrete and continuous random variables X and Y we have E[X + Y] = E[X] + E[Y].
- ▶ In both discrete and continuous settings, E[aX] = aE[X]when *a* is a constant. And  $E[\sum a_i X_i] = \sum a_i E[X_i]$ .
- But what about that delightful "area under  $1 F_X$ " formula for the expectation?
- When X is non-negative with probability one, do we always have E[X] = ∫<sub>0</sub><sup>∞</sup> P{X > x}, in both discrete and continuous settings?

- For both discrete and continuous random variables X and Y we have E[X + Y] = E[X] + E[Y].
- ▶ In both discrete and continuous settings, E[aX] = aE[X]when *a* is a constant. And  $E[\sum a_i X_i] = \sum a_i E[X_i]$ .
- But what about that delightful "area under  $1 F_X$ " formula for the expectation?
- When X is non-negative with probability one, do we always have E[X] = ∫<sub>0</sub><sup>∞</sup> P{X > x}, in both discrete and continuous settings?
- ▶ Define g(y) so that 1 − F<sub>X</sub>(g(y)) = y. (Draw horizontal line at height y and look where it hits graph of 1 − F<sub>X</sub>.)

- For both discrete and continuous random variables X and Y we have E[X + Y] = E[X] + E[Y].
- ▶ In both discrete and continuous settings, E[aX] = aE[X]when *a* is a constant. And  $E[\sum a_i X_i] = \sum a_i E[X_i]$ .
- But what about that delightful "area under  $1 F_X$ " formula for the expectation?
- When X is non-negative with probability one, do we always have E[X] = ∫<sub>0</sub><sup>∞</sup> P{X > x}, in both discrete and continuous settings?
- ▶ Define g(y) so that 1 − F<sub>X</sub>(g(y)) = y. (Draw horizontal line at height y and look where it hits graph of 1 − F<sub>X</sub>.)
- Choose Y uniformly on [0,1] and note that g(Y) has the same probability distribution as X.

- For both discrete and continuous random variables X and Y we have E[X + Y] = E[X] + E[Y].
- ▶ In both discrete and continuous settings, E[aX] = aE[X]when *a* is a constant. And  $E[\sum a_i X_i] = \sum a_i E[X_i]$ .
- But what about that delightful "area under  $1 F_X$ " formula for the expectation?
- When X is non-negative with probability one, do we always have E[X] = ∫<sub>0</sub><sup>∞</sup> P{X > x}, in both discrete and continuous settings?
- ▶ Define g(y) so that 1 − F<sub>X</sub>(g(y)) = y. (Draw horizontal line at height y and look where it hits graph of 1 − F<sub>X</sub>.)
- Choose Y uniformly on [0,1] and note that g(Y) has the same probability distribution as X.
- ► So  $E[X] = E[g(Y)] = \int_0^1 g(y) dy$ , which is indeed the area under the graph of  $1 F_X$ .

#### • If X and Y are independent then E[g(X)h(Y)] = E[g(X)]E[h(Y)].

#### If X and Y are independent then E[g(X)h(Y)] = E[g(X)]E[h(Y)].

• Just write  $E[g(X)h(Y)] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} g(x)h(y)f(x,y)dxdy$ .

- If X and Y are independent then E[g(X)h(Y)] = E[g(X)]E[h(Y)].
- Just write  $E[g(X)h(Y)] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} g(x)h(y)f(x,y)dxdy$ .
- Since  $f(x, y) = f_X(x)f_Y(y)$  this factors as  $\int_{-\infty}^{\infty} h(y)f_Y(y)dy \int_{-\infty}^{\infty} g(x)f_X(x)dx = E[h(Y)]E[g(X)].$

# Now define covariance of X and Y by Cov(X, Y) = E[(X - E[X])(Y - E[Y]).

- Now define covariance of X and Y by Cov(X, Y) = E[(X E[X])(Y E[Y]).
- Note: by definition Var(X) = Cov(X, X).

- Now define covariance of X and Y by Cov(X, Y) = E[(X E[X])(Y E[Y]).
- Note: by definition Var(X) = Cov(X, X).
- Covariance formula E[XY] E[X]E[Y], or "expectation of product minus product of expectations" is frequently useful.

- Now define covariance of X and Y by Cov(X, Y) = E[(X E[X])(Y E[Y]).
- Note: by definition Var(X) = Cov(X, X).
- Covariance formula E[XY] E[X]E[Y], or "expectation of product minus product of expectations" is frequently useful.
- If X and Y are independent then Cov(X, Y) = 0.

- Now define covariance of X and Y by Cov(X, Y) = E[(X E[X])(Y E[Y]).
- Note: by definition Var(X) = Cov(X, X).
- Covariance formula E[XY] E[X]E[Y], or "expectation of product minus product of expectations" is frequently useful.
- If X and Y are independent then Cov(X, Y) = 0.
- Converse is not true.

$$\blacktriangleright \operatorname{Cov}(X,Y) = \operatorname{Cov}(Y,X)$$

$$\triangleright \operatorname{Cov}(X,Y) = \operatorname{Cov}(Y,X)$$

 $\blacktriangleright \operatorname{Cov}(X,X) = \operatorname{Var}(X)$ 

$$\triangleright \operatorname{Cov}(aX,Y) = a\operatorname{Cov}(X,Y).$$

$$\blacktriangleright \operatorname{Cov}(X,Y) = \operatorname{Cov}(Y,X)$$

 $\blacktriangleright \operatorname{Cov}(X,X) = \operatorname{Var}(X)$ 

$$\blacktriangleright \operatorname{Cov}(aX,Y) = a\operatorname{Cov}(X,Y).$$

 $\blacktriangleright \operatorname{Cov}(X_1 + X_2, Y) = \operatorname{Cov}(X_1, Y) + \operatorname{Cov}(X_2, Y).$ 

$$\blacktriangleright \operatorname{Cov}(X,Y) = \operatorname{Cov}(Y,X)$$

 $\blacktriangleright \operatorname{Cov}(X,X) = \operatorname{Var}(X)$ 

$$\triangleright \operatorname{Cov}(aX,Y) = a\operatorname{Cov}(X,Y).$$

- $\blacktriangleright \operatorname{Cov}(X_1 + X_2, Y) = \operatorname{Cov}(X_1, Y) + \operatorname{Cov}(X_2, Y).$
- General statement of bilinearity of covariance:

$$\operatorname{Cov}(\sum_{i=1}^m a_i X_i, \sum_{j=1}^n b_j Y_j) = \sum_{i=1}^m \sum_{j=1}^n a_i b_j \operatorname{Cov}(X_i, Y_j).$$

$$\blacktriangleright \operatorname{Cov}(X,Y) = \operatorname{Cov}(Y,X)$$

 $\blacktriangleright \operatorname{Cov}(X,X) = \operatorname{Var}(X)$ 

$$\triangleright \operatorname{Cov}(aX,Y) = a\operatorname{Cov}(X,Y).$$

- $\operatorname{Cov}(X_1 + X_2, Y) = \operatorname{Cov}(X_1, Y) + \operatorname{Cov}(X_2, Y).$
- General statement of bilinearity of covariance:

$$\operatorname{Cov}(\sum_{i=1}^m a_i X_i, \sum_{j=1}^n b_j Y_j) = \sum_{i=1}^m \sum_{j=1}^n a_i b_j \operatorname{Cov}(X_i, Y_j).$$

Special case:

$$\operatorname{Var}(\sum_{i=1}^n X_i) = \sum_{i=1}^n \operatorname{Var}(X_i) + 2\sum_{(i,j):i < j} \operatorname{Cov}(X_i, X_j).$$

• Again, by definition Cov(X, Y) = E[XY] - E[X]E[Y].

# Defining correlation

- Again, by definition Cov(X, Y) = E[XY] E[X]E[Y].
- **Correlation** of *X* and *Y* defined by

$$\rho(X,Y) := \frac{\operatorname{Cov}(X,Y)}{\sqrt{\operatorname{Var}(X)\operatorname{Var}(Y)}}.$$

# Defining correlation

- Again, by definition Cov(X, Y) = E[XY] E[X]E[Y].
- Correlation of X and Y defined by

$$\rho(X, Y) := \frac{\operatorname{Cov}(X, Y)}{\sqrt{\operatorname{Var}(X)\operatorname{Var}(Y)}}$$

Correlation doesn't care what units you use for X and Y. If a > 0 and c > 0 then ρ(aX + b, cY + d) = ρ(X, Y).

# Defining correlation
