Ergodicity and stationarity

## Outline

Markov chains

## Examples

## Ergodicity and stationarity

## Markov chains

- Consider a sequence of random variables $X_{0}, X_{1}, X_{2}, \ldots$ each taking values in the same state space, which for now we take to be a finite set that we label by $\{0,1, \ldots, M\}$.

## Markov chains

- Consider a sequence of random variables $X_{0}, X_{1}, X_{2}, \ldots$ each taking values in the same state space, which for now we take to be a finite set that we label by $\{0,1, \ldots, M\}$.
- Interpret $X_{n}$ as state of the system at time $n$.

## Markov chains

- Consider a sequence of random variables $X_{0}, X_{1}, X_{2}, \ldots$ each taking values in the same state space, which for now we take to be a finite set that we label by $\{0,1, \ldots, M\}$.
- Interpret $X_{n}$ as state of the system at time $n$.
- Sequence is called a Markov chain if we have a fixed collection of numbers $P_{i j}$ (one for each pair $i, j \in\{0,1, \ldots, M\}$ ) such that whenever the system is in state $i$, there is probability $P_{i j}$ that system will next be in state $j$.

## Markov chains

- Consider a sequence of random variables $X_{0}, X_{1}, X_{2}, \ldots$ each taking values in the same state space, which for now we take to be a finite set that we label by $\{0,1, \ldots, M\}$.
- Interpret $X_{n}$ as state of the system at time $n$.
- Sequence is called a Markov chain if we have a fixed collection of numbers $P_{i j}$ (one for each pair $i, j \in\{0,1, \ldots, M\}$ ) such that whenever the system is in state $i$, there is probability $P_{i j}$ that system will next be in state $j$.
- Precisely,

$$
P\left\{X_{n+1}=j \mid X_{n}=i, X_{n-1}=i_{n-1}, \ldots, X_{1}=i_{1}, X_{0}=i_{0}\right\}=P_{i j}
$$

## Markov chains

- Consider a sequence of random variables $X_{0}, X_{1}, X_{2}, \ldots$ each taking values in the same state space, which for now we take to be a finite set that we label by $\{0,1, \ldots, M\}$.
- Interpret $X_{n}$ as state of the system at time $n$.
- Sequence is called a Markov chain if we have a fixed collection of numbers $P_{i j}$ (one for each pair $i, j \in\{0,1, \ldots, M\}$ ) such that whenever the system is in state $i$, there is probability $P_{i j}$ that system will next be in state $j$.
- Precisely,

$$
P\left\{X_{n+1}=j \mid X_{n}=i, X_{n-1}=i_{n-1}, \ldots, X_{1}=i_{1}, X_{0}=i_{0}\right\}=P_{i j}
$$

- Kind of an "almost memoryless" property. Probability distribution for next state depends only on the current state (and not on the rest of the state history).

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.
- If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny.

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.
- If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny.
- If it's sunny one day, there's a .8 chance it will be sunny the next day, a .2 chance it will be rainy.

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.
- If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny.
- If it's sunny one day, there's a .8 chance it will be sunny the next day, a .2 chance it will be rainy.
- In this climate, sun tends to last longer than rain.

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.
- If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny.
- If it's sunny one day, there's a .8 chance it will be sunny the next day, a .2 chance it will be rainy.
- In this climate, sun tends to last longer than rain.
- Given that it is rainy today, how many days to I expect to have to wait to see a sunny day?

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.
- If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny.
- If it's sunny one day, there's a .8 chance it will be sunny the next day, a .2 chance it will be rainy.
- In this climate, sun tends to last longer than rain.
- Given that it is rainy today, how many days to I expect to have to wait to see a sunny day?
- Given that it is sunny today, how many days to I expect to have to wait to see a rainy day?

## Simple example

- For example, imagine a simple weather model with two states: rainy and sunny.
- If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny.
- If it's sunny one day, there's a .8 chance it will be sunny the next day, a .2 chance it will be rainy.
- In this climate, sun tends to last longer than rain.
- Given that it is rainy today, how many days to I expect to have to wait to see a sunny day?
- Given that it is sunny today, how many days to I expect to have to wait to see a rainy day?
- Over the long haul, what fraction of days are sunny?

## Matrix representation

- To describe a Markov chain, we need to define $P_{i j}$ for any $i, j \in\{0,1, \ldots, M\}$.

## Matrix representation

- To describe a Markov chain, we need to define $P_{i j}$ for any $i, j \in\{0,1, \ldots, M\}$.
- It is convenient to represent the collection of transition probabilities $P_{i j}$ as a matrix:

$$
A=\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)
$$

## Matrix representation

- To describe a Markov chain, we need to define $P_{i j}$ for any $i, j \in\{0,1, \ldots, M\}$.
- It is convenient to represent the collection of transition probabilities $P_{i j}$ as a matrix:

$$
A=\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)
$$

- For this to make sense, we require $P_{i j} \geq 0$ for all $i, j$ and $\sum_{j=0}^{M} P_{i j}=1$ for each $i$. That is, the rows sum to one.

## Transitions via matrices

- Suppose that $p_{i}$ is the probability that system is in state $i$ at time zero.

## Transitions via matrices

- Suppose that $p_{i}$ is the probability that system is in state $i$ at time zero.
- What does the following product represent?

$$
\left(\begin{array}{llll}
p_{0} & p_{1} & \ldots & p_{M}
\end{array}\right)\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)
$$

## Transitions via matrices

- Suppose that $p_{i}$ is the probability that system is in state $i$ at time zero.
- What does the following product represent?

$$
\left(\begin{array}{llll}
p_{0} & p_{1} & \ldots & p_{M}
\end{array}\right)\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)
$$

- Answer: the probability distribution at time one.

## Transitions via matrices

- Suppose that $p_{i}$ is the probability that system is in state $i$ at time zero.
- What does the following product represent?

$$
\left(\begin{array}{llll}
p_{0} & p_{1} & \ldots & p_{M}
\end{array}\right)\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)
$$

- Answer: the probability distribution at time one.
- How about the following product?

$$
\left(\begin{array}{llll}
p_{0} & p_{1} & \ldots & p_{M}
\end{array}\right) A^{n}
$$

## Transitions via matrices

- Suppose that $p_{i}$ is the probability that system is in state $i$ at time zero.
- What does the following product represent?

$$
\left(\begin{array}{llll}
p_{0} & p_{1} & \ldots & p_{M}
\end{array}\right)\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)
$$

- Answer: the probability distribution at time one.
- How about the following product?

$$
\left(\begin{array}{llll}
p_{0} & p_{1} & \ldots & p_{M}
\end{array}\right) A^{n}
$$

- Answer: the probability distribution at time $n$.

## Powers of transition matrix

- We write $P_{i j}^{(n)}$ for the probability to go from state $i$ to state $j$ over $n$ steps.

## Powers of transition matrix

- We write $P_{i j}^{(n)}$ for the probability to go from state $i$ to state $j$ over $n$ steps.
- From the matrix point of view

$$
\left(\begin{array}{cccc}
P_{00}^{(n)} & P_{01}^{(n)} & \ldots & P_{0 M}^{(n)} \\
P_{10}^{(n)} & P_{11}^{(n)} & \ldots & P_{1 M}^{(n)} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0}^{(n)} & P_{M 1}^{(n)} & \ldots & P_{M M}^{(n)}
\end{array}\right)=\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)^{n}
$$

## Powers of transition matrix

- We write $P_{i j}^{(n)}$ for the probability to go from state $i$ to state $j$ over $n$ steps.
- From the matrix point of view

$$
\left(\begin{array}{cccc}
P_{00}^{(n)} & P_{01}^{(n)} & \ldots & P_{0 M}^{(n)} \\
P_{10}^{(n)} & P_{11}^{(n)} & \ldots & P_{1 M}^{(n)} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0}^{(n)} & P_{M 1}^{(n)} & \ldots & P_{M M}^{(n)}
\end{array}\right)=\left(\begin{array}{cccc}
P_{00} & P_{01} & \ldots & P_{0 M} \\
P_{10} & P_{11} & \ldots & P_{1 M} \\
\cdot & & & \\
\cdot & & & \\
\cdot & & & \\
P_{M 0} & P_{M 1} & \ldots & P_{M M}
\end{array}\right)^{n}
$$

- If $A$ is the one-step transition matrix, then $A^{n}$ is the $n$-step transition matrix.

## Questions

- What does it mean if all of the rows are identical?

## Questions

- What does it mean if all of the rows are identical?
- Answer: state sequence $X_{i}$ consists of i.i.d. random variables.

## Questions

- What does it mean if all of the rows are identical?
- Answer: state sequence $X_{i}$ consists of i.i.d. random variables.
- What if matrix is the identity?

## Questions

- What does it mean if all of the rows are identical?
- Answer: state sequence $X_{i}$ consists of i.i.d. random variables.
- What if matrix is the identity?
- Answer: states never change.

## Questions

- What does it mean if all of the rows are identical?
- Answer: state sequence $X_{i}$ consists of i.i.d. random variables.
- What if matrix is the identity?
- Answer: states never change.
- What if each $P_{i j}$ is either one or zero?

## Questions

- What does it mean if all of the rows are identical?
- Answer: state sequence $X_{i}$ consists of i.i.d. random variables.
- What if matrix is the identity?
- Answer: states never change.
- What if each $P_{i j}$ is either one or zero?
- Answer: state evolution is deterministic.

## Outline

## Markov chains

Examples

Ergodicity and stationarity

## Outline

## Markov chains

## Examples

## Ergodicity and stationarity

## Simple example

- Consider the simple weather example: If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny. If it's sunny one day, there's a .8 chance it will be sunny the next day, a 2 chance it will be rainy.

## Simple example

- Consider the simple weather example: If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny. If it's sunny one day, there's a .8 chance it will be sunny the next day, a 2 chance it will be rainy.
- Let rainy be state zero, sunny state one, and write the transition matrix by

$$
A=\left(\begin{array}{ll}
.5 & .5 \\
.2 & .8
\end{array}\right)
$$

## Simple example

- Consider the simple weather example: If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny. If it's sunny one day, there's a .8 chance it will be sunny the next day, a 2 chance it will be rainy.
- Let rainy be state zero, sunny state one, and write the transition matrix by

$$
A=\left(\begin{array}{ll}
.5 & .5 \\
.2 & .8
\end{array}\right)
$$

- Note that

$$
A^{2}=\left(\begin{array}{ll}
.64 & .35 \\
.26 & .74
\end{array}\right)
$$

## Simple example

- Consider the simple weather example: If it's rainy one day, there's a .5 chance it will be rainy the next day, a .5 chance it will be sunny. If it's sunny one day, there's a .8 chance it will be sunny the next day, a 2 chance it will be rainy.
- Let rainy be state zero, sunny state one, and write the transition matrix by

$$
A=\left(\begin{array}{ll}
.5 & .5 \\
.2 & .8
\end{array}\right)
$$

- Note that

$$
A^{2}=\left(\begin{array}{ll}
.64 & .35 \\
.26 & .74
\end{array}\right)
$$

- Can compute $A^{10}=\left(\begin{array}{ll}.285719 & .714281 \\ .285713 & .714287\end{array}\right)$

## Does relationship status have the Markov property?

## Does relationship status have the Markov property?

- Can we assign a probability to each arrow?

## Does relationship status have the Markov property?

- Can we assign a probability to each arrow?
- Markov model implies time spent in any state (e.g., a marriage) before leaving is a geometric random variable.

## Does relationship status have the Markov property?

- Can we assign a probability to each arrow?
- Markov model implies time spent in any state (e.g., a marriage) before leaving is a geometric random variable.
- Not true... Can we make a better model with more states?

## Outline

## Markov chains

Examples

Ergodicity and stationarity

## Outline

## Markov chains

## Examples

Ergodicity and stationarity

## Ergodic Markov chains

- Say Markov chain is ergodic if some power of the transition matrix has all non-zero entries.

## Ergodic Markov chains

- Say Markov chain is ergodic if some power of the transition matrix has all non-zero entries.
- Turns out that if chain has this property, then $\pi_{j}:=\lim _{n \rightarrow \infty} P_{i j}^{(n)}$ exists and the $\pi_{j}$ are the unique non-negative solutions of $\pi_{j}=\sum_{k=0}^{M} \pi_{k} P_{k j}$ that sum to one.

## Ergodic Markov chains

- Say Markov chain is ergodic if some power of the transition matrix has all non-zero entries.
- Turns out that if chain has this property, then $\pi_{j}:=\lim _{n \rightarrow \infty} P_{i j}^{(n)}$ exists and the $\pi_{j}$ are the unique non-negative solutions of $\pi_{j}=\sum_{k=0}^{M} \pi_{k} P_{k j}$ that sum to one.
- This means that the row vector

$$
\pi=\left(\begin{array}{llll}
\pi_{0} & \pi_{1} & \ldots & \pi_{M}
\end{array}\right)
$$

is a left eigenvector of $A$ with eigenvalue 1, i.e., $\pi A=\pi$.

## Ergodic Markov chains

- Say Markov chain is ergodic if some power of the transition matrix has all non-zero entries.
- Turns out that if chain has this property, then $\pi_{j}:=\lim _{n \rightarrow \infty} P_{i j}^{(n)}$ exists and the $\pi_{j}$ are the unique non-negative solutions of $\pi_{j}=\sum_{k=0}^{M} \pi_{k} P_{k j}$ that sum to one.
- This means that the row vector

$$
\pi=\left(\begin{array}{llll}
\pi_{0} & \pi_{1} & \ldots & \pi_{M}
\end{array}\right)
$$

is a left eigenvector of $A$ with eigenvalue 1, i.e., $\pi A=\pi$.

- We call $\pi$ the stationary distribution of the Markov chain.

## Ergodic Markov chains

- Say Markov chain is ergodic if some power of the transition matrix has all non-zero entries.
- Turns out that if chain has this property, then $\pi_{j}:=\lim _{n \rightarrow \infty} P_{i j}^{(n)}$ exists and the $\pi_{j}$ are the unique non-negative solutions of $\pi_{j}=\sum_{k=0}^{M} \pi_{k} P_{k j}$ that sum to one.
- This means that the row vector

$$
\pi=\left(\begin{array}{llll}
\pi_{0} & \pi_{1} & \ldots & \pi_{M}
\end{array}\right)
$$

is a left eigenvector of $A$ with eigenvalue 1, i.e., $\pi A=\pi$.

- We call $\pi$ the stationary distribution of the Markov chain.
- One can solve the system of linear equations $\pi_{j}=\sum_{k=0}^{M} \pi_{k} P_{k j}$ to compute the values $\pi_{j}$. Equivalent to considering $A$ fixed and solving $\pi A=\pi$. Or solving $(A-I) \pi=0$. This determines $\pi$ up to a multiplicative constant, and fact that $\sum \pi_{j}=1$ determines the constant.

## Simple example

- If $A=\left(\begin{array}{cc}.5 & .5 \\ .2 & .8\end{array}\right)$, then we know

$$
\pi A=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)\left(\begin{array}{cc}
.5 & .5 \\
.2 & .8
\end{array}\right)=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)=\pi
$$

## Simple example

- If $A=\left(\begin{array}{cc}.5 & .5 \\ .2 & .8\end{array}\right)$, then we know

$$
\pi A=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)\left(\begin{array}{cc}
.5 & .5 \\
.2 & .8
\end{array}\right)=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)=\pi
$$

- This means that $.5 \pi_{0}+.2 \pi_{1}=\pi_{0}$ and $.5 \pi_{0}+.8 \pi_{1}=\pi_{1}$ and we also know that $\pi_{0}+\pi_{1}=1$. Solving these equations gives $\pi_{0}=2 / 7$ and $\pi_{1}=5 / 7$, so $\pi=\left(\begin{array}{cc}2 / 7 & 5 / 7\end{array}\right)$.

## Simple example

- If $A=\left(\begin{array}{cc}.5 & .5 \\ .2 & .8\end{array}\right)$, then we know

$$
\pi A=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)\left(\begin{array}{cc}
.5 & .5 \\
.2 & .8
\end{array}\right)=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)=\pi
$$

- This means that $.5 \pi_{0}+.2 \pi_{1}=\pi_{0}$ and $.5 \pi_{0}+.8 \pi_{1}=\pi_{1}$ and we also know that $\pi_{0}+\pi_{1}=1$. Solving these equations gives $\pi_{0}=2 / 7$ and $\pi_{1}=5 / 7$, so $\pi=\left(\begin{array}{cc}2 / 7 & 5 / 7\end{array}\right)$.
- Indeed,

$$
\pi A=\left(\begin{array}{ll}
2 / 7 & 5 / 7
\end{array}\right)\left(\begin{array}{ll}
.5 & .5 \\
.2 & .8
\end{array}\right)=\left(\begin{array}{ll}
2 / 7 & 5 / 7
\end{array}\right)=\pi
$$

## Simple example

- If $A=\left(\begin{array}{cc}.5 & .5 \\ .2 & .8\end{array}\right)$, then we know

$$
\pi A=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)\left(\begin{array}{cc}
.5 & .5 \\
.2 & .8
\end{array}\right)=\left(\begin{array}{ll}
\pi_{0} & \pi_{1}
\end{array}\right)=\pi
$$

- This means that $.5 \pi_{0}+.2 \pi_{1}=\pi_{0}$ and $.5 \pi_{0}+.8 \pi_{1}=\pi_{1}$ and we also know that $\pi_{0}+\pi_{1}=1$. Solving these equations gives $\pi_{0}=2 / 7$ and $\pi_{1}=5 / 7$, so $\pi=\left(\begin{array}{cc}2 / 7 & 5 / 7\end{array}\right)$.
- Indeed,

$$
\pi A=\left(\begin{array}{ll}
2 / 7 & 5 / 7
\end{array}\right)\left(\begin{array}{ll}
.5 & .5 \\
.2 & .8
\end{array}\right)=\left(\begin{array}{ll}
2 / 7 & 5 / 7
\end{array}\right)=\pi
$$

- Recall that

$$
A^{10}=\left(\begin{array}{ll}
.285719 & .714281 \\
.285713 & .714287
\end{array}\right) \approx\left(\begin{array}{ll}
2 / 7 & 5 / 7 \\
2 / 7 & 5 / 7
\end{array}\right)=\binom{\pi}{\pi}
$$
