18.440 PROBLEM SET TWO, FEBRUARY 24

A. FROM ROSS 8TH EDITION CHAPTER TWO:

- 1. **Problem 25:** A pair of dice is rolled until a sum of either 5 or 7 appears. Find the probability that a 5 occurs first. *Hint.* Let E_n denote the event that a 5 occurs on the *n*th roll and no 5 or 7 occurs on the first (n-1) rolls. Compute $P(E_n)$ and argue that $\sum_{i=1}^{\infty} P(E_n)$ is the desired probability.
- 2. **Problem 48:** Given 20 people, what is the probability that, among the 12 months in the year, there are 4 months containing exactly 2 birthdays and 4 containing exactly 3 birthdays?
- 3. **Problem 49:** A group of 6 men and 6 women is randomly divided into 2 groups of size 6 each. What is the probability that both groups will have the same number of men?
- 4. Theoretical Exercise 10: Prove that $P(E \cup F \cup G) = P(E) + P(F) + P(G) P(E^cFG) P(E^cFG) P(E^cFG) 2P(E^cFG).$
- 5. Theoretical Exercise 15: An urn contains M white and N black balls. If a random sample of size r is chosen, what is the probability that it contains exactly k white balls?
- 6. Theoretical Exercise 20: Consider an experiment whose sample space consists of a countably infinite number of points. Show that not all points can be equally likely. Can all points have a positive probability of occurring?

B. A deck of cards contains 30 cards with labels $1, 2, \ldots, 30$. Suppose that somebody is randomly dealt a set of 7 cards of these cards (numbered with seven distinct numbers).

- 1. Find the probability that 3 of the cards contain odd numbers and 4 contain even numbers.
- Find the probability each of the numbers on the seven cards ends with a different digit. (For example, the cards could be 3, 5, 14, 16, 22, 29, 30.)

C. (Just for fun - not to hand in.) The following is a popular and rather instructive puzzle. A standard deck of 52 cards (26 red and 26 black) is

shuffled so that all orderings are equally likely. We then play the following game: I begin turning the cards over one at a time so that you can see them. At some point (before I have turned over all 52 cards) you say "I'm ready!" At this point I turn over the next card and if the card is red, you receive one dollar; otherwise you receive nothing. You would like to design a strategy to maximize the probability that you will receive the dollar. How should you decide when to say "I'm ready"?
