

Description

These problems are related to material from Lectures 12–15. Your solutions should be written in latex and submitted as a pdf-file to [Gradescope](#) by midnight on the date due.

Collaboration is permitted/encouraged, but you must identify your collaborators or the name of your group on [pset partners](#), as well any references you consulted that are not listed in the course syllabus. If there are none write “**Sources consulted: none**” at the top of your solution. Note that each student is expected to write their own solutions; it is fine to discuss the problems with others, but your work must be your own.

The first person to spot each typo/error in any of the problem sets or lecture notes will receive 1–5 points of extra credit, depending on the severity of the error

Instructions: First do the warm up problems, then pick a set of Problems 1–6 that sum to 96 points Finally, complete the survey problem.

Problem 0.

These are warm up problems that do not need to be turned in.

- (a) Prove that a cubic field K is Galois if and only if D_K is a perfect square.
- (b) Prove that our two definitions of a lattice Λ in $V \simeq \mathbb{R}^n$ are equivalent: Λ is a \mathbb{Z} -submodule generated by an \mathbb{R} -basis for V if and only if it is a discrete cocompact subgroup of V .
- (c) Let $n \in \mathbb{Z}_{>0}$ and assume $n^2 - 1$ is squarefree. Prove that $n + \sqrt{n^2 - 1}$ is the fundamental unit of $\mathbb{Q}(\sqrt{n^2 - 1})$.

Problem 1. Classification of global fields (64 points)

Let K be a field and let M_K be the set of places of K (equivalence classes of nontrivial absolute values). We say that K has a (strong) *product formula* if M_K is nonempty for each $v \in M_K$ there is an absolute value $|\cdot|_v$ in its equivalence class and a positive real number m_v such that for all $x \in K^\times$ we have

$$\prod_{v \in M_K} |x|_v^{m_v} = 1,$$

where all but finitely many factors in the product are equal to 1. Equivalently, if we fix *normalized absolute values* $\| \cdot \|_v := |x|_v^{m_v}$ for each $v \in M_K$, then for all $x \in K^\times$ we have

$$\prod_{v \in M_K} \|x\|_v = 1,$$

with $\|x\|_v = 1$ for all but finitely many $v \in M_K$.

Definition. A field K is a *global field* if it has a product formula and the completion K_v of K at each place $v \in M_K$ is a local field.

In Lectures 10 and 13 we proved every finite extension of \mathbb{Q} and $\mathbb{F}_q(t)$ is a global field. In this problem you will prove the converse, a result due to Artin and Whaples [1].

Let K be a global field with normalized absolute values $\|\cdot\|_v$ for $v \in M_K$ that satisfy the product formula. As we defined in lecture, an M_K -divisor is a sequence of positive real numbers $c = (c_v)$ indexed by $v \in M_K$ with all but finitely many $c_v = 1$ such that for each $v \in M_K$ there is an $x \in K_v^\times$ for which $c_v = \|x\|_v$. For each M_K -divisor c we define the set

$$L(c) := \{x \in K : \|x\|_v \leq c_v \text{ for all } v \in M_K\}.$$

- (a) Let E/F be a finite Galois extension. Prove E is a global field if and only if F is.
- (b) Extend your proof of (a) to all finite extensions E/F .
- (c) Prove that M_K is infinite but contains only finitely many archimedean places.
- (d) Assume K has an archimedean place. Prove that $L(c)$ is finite for every M_K -divisor c (we proved this in class for number fields, but here K is a global field as defined above).
- (e) Extend your proof of (d) to the case where K has no archimedean places.
- (f) Prove that if M_K contains an archimedean place then K is a finite extension of \mathbb{Q} (hint: show $\mathbb{Q} \subseteq K$ and use (d) to show that K/\mathbb{Q} is a finite extension).
- (g) Prove that if M_K does not contain an archimedean place then K is a finite extension of $\mathbb{F}_q(t)$ for some finite field \mathbb{F}_q (hint: by choosing an appropriate M_K -divisor c , show that $L(c)$ is a finite field $k \subseteq K$ and that every $t \in K - k$ is transcendental over k ; then show that K is a finite extension of $k(t)$).
- (h) In your proofs of (a)-(g) above, where did you use the fact that the completions of K are local fields? Show that if K has a product formula and K_v is a local field for any place $v \in M_K$ then K_v is a local field for every place $v \in M_K$ (so we could weaken our definition of a global field to only require one K_v to be a local field). Are there fields with a product formula for which no completion is a local field?

Problem 2. Finiteness of global class groups (64 points)

A commutative ring R with finite quotients by all nonzero ideals is a *finite quotient domain*; to rule out trivial cases we further assume R is not a field. For such R we define the *absolute ideal norm* $N_R(I) := \#R/I$ for each nonzero R -ideal I , let $N_R((0)) := 0$, and put $N_R(r) := N_R((r))$ for $r \in R$.

Recall our standard *AKLB* assumption: A is a Dedekind domain, K is its fraction field, L/K is finite separable, and B is the integral closure of A in L .

- (a) Assume *AKLB*. Show that if A is a finite quotient domain then so is B , and we have the identity $N_B(\alpha) = N_A(N_{L/K}(\alpha))$ for all $\alpha \in B$.

Definition. A PID is *basic* if it is a finite quotient domain and $\exists c_1, c_2 \in \mathbb{Z}_{>0}$ such that

- (i) $\#\{x \in A : N_A(x) \leq c_1 m\} \geq m$ for all integers m ,

- (ii) $N_A(x + y) \leq c_2(N_A(x) + N_A(y))$ for all $x, y \in A$.
- (b) Show that \mathbb{Z} is a basic PID but $\mathbb{Z}[\sqrt{5}]$ is not. Is $\mathbb{Z}[i]$ a basic PID?
- (c) Show that $\mathbb{F}_q[t]$ is a basic PID.

Definition. A *global Dedekind domain* (over A) is a Dedekind domain that is free of finite rank as a module over a subring A that is a basic PID.

- (d) Assume *AKLB*. Show that if A is a basic PID then B is a global Dedekind domain. Conclude that every global field is the fraction field of a global Dedekind domain.
- (e) Assume *AKLB* with A a basic PID and let e_1, \dots, e_n be an A -basis for B . Prove there exists a homogeneous $f \in A[x_1, \dots, x_n]$ of degree n such that for any $\alpha \in B$,

$$N_{L/K}(\alpha) = f(a_1, \dots, a_n),$$

where $\alpha = a_1e_1 + \dots + a_n e_n$ with $a_i \in A$. Prove there exists $c \in \mathbb{Z}_{>0}$ such that

$$N_B(\alpha) \leq c \max(N_A(a_1), \dots, N_A(a_n))^n$$

for all $\alpha = a_1e_1 + \dots + a_n e_n \in B$.

- (f) Let B be a global Dedekind domain. Prove that there is a real number m such that for every nonzero B -ideal I there is a nonzero $\alpha \in I$ for which $N_B(\alpha) \leq mN_B(I)$.
- (g) Prove that the ideal class group of a global Dedekind domain over \mathbb{Z} or $\mathbb{F}_q(t)$ is finite (in fact all global Dedekind domains are global Dedekind domains over one of these basic PIDs, but you are not asked to prove this).
- (h) In the case that B is the ring of integers of a number field L , how does the constant m in (f) compare to the Minkowski constant m_L defined in [Theorem 14.17](#)?

Remark. Given (d) and the terminology we have chosen, you might wonder if the fraction field of a global Dedekind domain is necessarily a global field. The answer is yes! You can find a proof of this in [\[2, §4\]](#), but I urge you to wait until you have solved this problem before reading it (this problem is adapted from [\[2, §2-3\]](#) and [\[3, §3\]](#)).

Problem 3. Some applications of the Minkowski bound (32 points)

For a number field K , let

$$m_K := \frac{n!}{n^n} \left(\frac{4}{\pi}\right)^s \sqrt{|D_K|}$$

denote the Minkowski constant and let $h_K := \#\text{cl } \mathcal{O}_K$ denote the class number. You may wish to use a computer to help with some of the calculations involved in this problem, but if you do so, please describe your computations (preferably in words or pseudo-code).

- (a) Prove that if \mathcal{O}_K contains no prime ideals \mathfrak{p} of norm $N(\mathfrak{p}) \leq m_K$ other than inert primes, then $h_K = 1$, and show that when K is an imaginary quadratic field the converse also holds.

- (b) Let K be an imaginary quadratic field. Show that if $h_K = 1$ then $|D_K|$ is a power of 2 or a prime congruent to 3 mod 4, and then determine all imaginary quadratic fields K of class number one with $|D_K| < 200$ (this is in fact all of them).
- (c) Prove that there are no totally real cubic fields of discriminant less than 20 and that every totally real cubic field K with $D_K < M$ can be written as $K = \mathbb{Q}(\alpha)$, where α is an algebraic integer with minimal polynomial $x^3 + ax^2 + bx + c$ whose coefficients satisfy $|a| < \sqrt{M} + 2$, $|b| < 2\sqrt{M} + 1$, and $|c| < \sqrt{M}$.
- (d) Determine all totally real cubic fields K that are ramified only at a prime $p < 10$ and give a defining polynomial for each field that arises. You may find the Sage function `pari.polredabs` useful: given a monic irreducible polynomial in $\mathbb{Z}[x]$ it will output another monic irreducible polynomial that defines the same number field but may have smaller discriminant (it will never be larger).
- (e) Prove that a totally real cubic field ramified at only one prime is Galois if and only if it is totally ramified at that prime.

Problem 4. A non-solvable quintic extension (32 points)

Let $f(x) := x^5 - x + 1$, let $K := \mathbb{Q}[x]/(f) =: \mathbb{Q}[\alpha]$ and let L be the splitting field of f .

- (a) Prove that f is irreducible in $\mathbb{Q}[x]$, thus K is number field. Determine the number of real and complex places of K , and the structure of \mathcal{O}_K^\times as a finitely generated abelian group (both torsion and free parts).
- (b) Prove that the ring of integers of K is $\mathcal{O}_K := \mathbb{Z}[\alpha]$ and compute $\text{disc } \mathcal{O}_K$, which you should find is squarefree. Use this to prove that for each prime p dividing $\text{disc } \mathcal{O}_K$ exactly one of $\mathfrak{q}|p$ is ramified, and it has ramification index $e_{\mathfrak{q}} = 2$ and residue field degree $f_{\mathfrak{q}} = 1$. Conclude that K/\mathbb{Q} is tamely ramified (this means that for all places p of \mathbb{Q} and places $v|p$ of K the extension K_v/\mathbb{Q}_p is tamely ramified).
- (c) Using the fact that any extension of local fields has a unique maximal unramified subextension, prove that for any monic irreducible polynomial $g \in \mathbb{Z}[x]$ the splitting field of g is unramified at all primes that do not divide the discriminant of g . Conclude that L/\mathbb{Q} is unramified away from primes dividing $\text{disc } \mathcal{O}_K$ and tamely ramified everywhere, and show that every prime dividing $\text{disc } \mathcal{O}_K$ has ramification index 2. Use this to compute $\text{disc } \mathcal{O}_L$.
- (d) Show that \mathcal{O}_K has no ideals of norm 2 or 3 and use this to prove that the class group of \mathcal{O}_K is trivial and therefore \mathcal{O}_K is a PID.
- (e) Prove that $\text{Gal}(L/\mathbb{Q}) \simeq S_5$, and that it is generated by the Frobenius elements σ_2 and σ_5 (here σ_2 and σ_5 denote conjugacy class representatives).

Problem 5. Unit groups of real quadratic fields (64 points)

A (simple) *continued fraction* is a (possibly infinite) expression of the form

$$a_0 + \frac{1}{a_1 + \frac{1}{a_2 + \dots}}$$

with $a_n \in \mathbb{Z}$ and $a_n > 0$ for $n > 0$. They are more compactly written as $(a_0; a_1, a_2, \dots)$. For any $t \in \mathbb{R}_{>0}$ the *continued fraction expansion* of t is defined recursively via

$$t_0 := t, \quad a_n := \lfloor t_n \rfloor, \quad t_{n+1} := 1/(t_n - a_n),$$

where the sequence $a(t) := (a_0; a_1, a_2, \dots)$ terminates at a_n if $t_n = a_n$, in which case we say that $a(t) = (a_0; a_1, \dots, a_n)$ is *finite*, and otherwise call $a(t) = (a_0; a_1, a_2, \dots)$ *infinite*. If $a(t)$ is infinite and there exists $\ell \in \mathbb{Z}_{>0}$ such that $a_{n+\ell} = a_n$ for all sufficiently large n , we say that $a(t)$ is *periodic* and call the least such integer $\ell := \ell(t)$ the *period* of $a(t)$.

For an infinite continued fraction $a(t) := (a_0; a_1, a_2, \dots)$, we define $P_n, Q_n \in \mathbb{Z}_{\geq 0}$ via

$$\begin{aligned} P_{-2} &= 0, & P_{-1} &= 1, & P_n &= a_n P_{n-1} + P_{n-2}; \\ Q_{-2} &= 1, & Q_{-1} &= 0, & Q_n &= a_n Q_{n-1} + Q_{n-2}. \end{aligned}$$

Note that $P_{n+2} > P_{n+1} \geq P_n > 0$ and $Q_{n+1} > Q_n \geq Q_{n-1} > 0$ for all $n \geq 1$.

- (a) Prove that $a(t)$ is finite if and only if $t \in \mathbb{Q}$, in which case $t = a(t)$.
- (b) Prove that if $a(t)$ is infinite then $P_n/Q_n = (a_0; a_1, \dots, a_n)$ with $|Q_n^2 t - P_n Q_n| < 1$ and $a(t_n) = (a_n; a_{n+1}, a_{n+2}, \dots)$, for all $n \geq 0$. Conclude that $t = \lim_{n \rightarrow \infty} P_n/Q_n = a(t)$.
- (c) Prove that $a(t)$ is periodic if and only if t is a real quadratic irrational.
(Hint: show that if $At^2 + Bt + C = 0$ with $A, B, C \in \mathbb{Z}$ then $A_n t_n^2 + B_n t_n + C_n = 0$ with $A_n, B_n, C_n \in \mathbb{Z}$ and $B_n^2 - 4A_n C_n = B^2 - 4AC$ and $|A_n|, |C_n| \leq 2|At| + |A| + |B|$).

Now let $D > 0$ be a squarefree integer that is not congruent to 1 mod 4 and let $K = \mathbb{Q}(\sqrt{D})$. As shown on previous problem sets, $\mathcal{O}_K = \mathbb{Z}[\sqrt{D}]$, and it is clear that $(\mathcal{O}_K^\times)_{\text{tors}} = \{\pm 1\}$. Every $\alpha = x + y\sqrt{D} \in \mathcal{O}_K^\times$ has $N(\alpha) = \pm 1$, and (x, y) is thus an (integer) solution to the *Pell equation*

$$X^2 - DY^2 = \pm 1 \tag{1}$$

- (d) Prove that if (x_1, y_1) and (x_2, y_2) are solutions to (1) with $x_1, y_1, x_2, y_2 \in \mathbb{Z}_{>0}$ then $x_1 + y_1\sqrt{D} < x_2 + y_2\sqrt{D}$ if and only if $x_1 < x_2$ and $y_1 \leq y_2$. Conclude that the fundamental unit $\epsilon = x + y\sqrt{D}$ of \mathcal{O}_K^\times is the unique solution (x, y) to (1) with $x, y > 0$ and x minimal.

Definition. Let t be a real quadratic irrational with Galois conjugate t' and continued fraction $a(t) = (a_0; a_1, a_2, \dots)$ of period $\ell = \ell(t)$. We say that t is *purely periodic* if we have $a_i = a_{\ell+i}$ for all $i \geq 0$ and call t *reduced* if $t > 1$ and $-1 < t' < 0$,

Lemma (Galois). *A real quadratic irrational t that is reduced is also purely periodic.*

Proof. Suppose $t_0 = t$ is reduced. Then so is $t_1 = 1/(t - \lfloor t \rfloor) > 1$, since $t'_1 = 1/(t' - \lfloor t \rfloor)$, as are all t_i . Let i be the least $i \geq 0$ with $t_i = t_{\ell+i}$. If $i > 0$ then $t_i = 1/(t_{i-1} - a_{i-1})$ and $t_{\ell+i} = 1/(t_{\ell+i-1} - a_{\ell+i-1})$, which implies $a_{i-1} = t'_{i-1} - 1/t'_i$ and $a_{\ell+i-1} = t'_{\ell+i-1} - 1/t'_{\ell+i}$, hence $a_{i-1} = \lfloor -1/t'_i \rfloor = \lfloor -1/t'_{\ell+i} \rfloor = a_{\ell+i-1}$, since $-1 < t'_{i-1}, t'_{\ell+i-1} < 0$, but this contradicts the minimality of i , so we must have $i = 0$ and t is purely periodic. \square

Lemma. *Let $t > 0$ be irrational with P_n, Q_n defined as above. If $P, Q \in \mathbb{Z}_{>0}$ satisfy $|tQ - P| < 1/(2Q)$ then $P/Q = P_n/Q_n$ for some $n \geq 0$.*

Proof. Choose n so $Q_n \leq Q < Q_{n+1}$ (note $Q > 0$). Choose $u, v \in \mathbb{Z}$ so $uP_n + vP_{n+1} = P$ and $uQ_n + vQ_{n+1} = Q$ (note $\begin{bmatrix} P_n & P_{n+1} \\ Q_n & Q_{n+1} \end{bmatrix} \in \text{GL}_2(\mathbb{Z})$ because $P_nQ_{n+1} - P_{n+1}Q_n = \pm 1$). We must have $u \neq 0$ since $0 < Q < Q_{n+1}$. If $v = 0$ then $P/Q = uP_n/uQ_n = P_n/Q_n$. Otherwise $uv < 0$. We always have $(tQ_n - P_n)(tQ_{n+1} - P_{n+1}) < 0$, so if we write $tQ - P = u(tQ_n - P_n) + v(tQ_{n+1} - P_{n+1})$, both terms on the RHS have the same sign. Thus $|tQ - P| > |u(tQ_n - P_n)| \geq |tQ_n - P_n|$ and we have $|tQ_n - P_n| < |tQ - P| < 1/(2Q)$. If $P/Q \neq P_n/Q_n$ then $QP_n - PQ_n \in \mathbb{Z}_{\neq 0}$, so $|QP_n - PQ_n| \geq 1$, and we have

$$\begin{aligned} \frac{1}{QQ_n} &\leq \frac{|QP_n - PQ_n|}{QQ_n} = \left| \frac{P_n}{Q_n} - \frac{P}{Q} \right| = \left| \frac{tQ_n - P_n}{Q_n} - \frac{tQ - P}{Q} \right| \\ &\leq \frac{|tQ - P|}{Q_n} + \frac{|tQ - P|}{Q} < \frac{1}{2QQ_n} + \frac{1}{2Q^2} \leq \frac{1}{QQ_n}, \end{aligned}$$

but this is a contradiction, so $v = 0$ and $P/Q = uP_n/uQ_n = P_n/Q_n$. \square

(e) Let $a(\sqrt{D}) = (a_0; a_1, a_2, \dots)$, and define t_n, P_n, Q_n as above. Prove that

$$P_{n-2}Q_{n-1} - P_{n-1}Q_{n-2} = \pm 1 \quad \text{and} \quad \frac{t_n P_{n-1} + P_{n-2}}{t_n Q_{n-1} + Q_{n-2}} = \sqrt{D}$$

for all $n \geq 0$, and that $t_{kl} = a_0 + \sqrt{D}$. Use this to show that $(P_{k\ell-1}, Q_{k\ell-1})$ is a solution to (1) for all $k \geq 0$, where $\ell := \ell(\sqrt{D})$. Conclude that $\epsilon = P_{\ell-1} + Q_{\ell-1}\sqrt{D}$.

(f) Compute the fundamental unit ϵ for each of the real quadratic fields $\mathbb{Q}(\sqrt{19})$, $\mathbb{Q}(\sqrt{570})$, and $\mathbb{Q}(\sqrt{571})$; in each case give the period $\ell(\sqrt{D})$ as well as ϵ .

Problem 6. S -class groups and S -unit groups (32 points)

Let K be a number field with ring of integers \mathcal{O}_K , and let S be a finite set of places of K including all archimedean places. Define the *ring of S -integers* $\mathcal{O}_{K,S}$ as the set

$$\mathcal{O}_{K,S} := \{x \in K : v_{\mathfrak{p}}(x) \geq 0 \text{ for all } \mathfrak{p} \notin S\}.$$

- (a) Prove that $\mathcal{O}_{K,S}$ is a Dedekind domain containing \mathcal{O}_K with the same fraction field.
- (b) Define a natural homomorphism between $\text{cl } \mathcal{O}_{K,S}$ and $\text{cl } \mathcal{O}_K$ (it is up to you to determine which direction it should go) and use it to prove that $\text{cl } \mathcal{O}_{K,S}$ is finite.
- (c) Prove that there is a finite set S for which $\mathcal{O}_{K,S}$ is a PID and give an explicit upper bound on $\#S$ that depends only on $n = [K : \mathbb{Q}]$ and $|\text{disc } \mathcal{O}_K|$.
- (d) Prove the *S -unit theorem*: $\mathcal{O}_{K,S}^\times$ is a finitely generated abelian group of rank $\#S - 1$.

Problem 7. Survey (4 points)

Complete the following survey by rating each problem you attempted on a scale of 1 to 10 according to how interesting you found it (1 = “mind-numbing,” 10 = “mind-blowing”), and how difficult you found it (1 = “trivial,” 10 = “brutal”). Also estimate the amount of time you spent on each problem to the nearest half hour.

	Interest	Difficulty	Time Spent
Problem 1			
Problem 2			
Problem 3			
Problem 4			
Problem 5			
Problem 6			

Please rate each of the following lectures that you attended, according to the quality of the material (1=“useless”, 10=“fascinating”), the quality of the presentation (1=“epic fail”, 10=“perfection”), the pace (1=“way too slow”, 10=“way too fast”, 5=“just right”) and the novelty of the material to you (1=“old hat”, 10=“all new”).

Date	Lecture Topic	Material	Presentation	Pace	Novelty
11/1	Dirichlet’s unit theorem				
11/3	Prime number theorem				

Please feel free to record any additional comments you have on the problem sets and the lectures, in particular, ways in which they might be improved.
