- Let there be v_i chips on node i of our graph G. Define a chip configuration, $v = [v_0, v_1, .., v_l]^t \in \mathbb{N}^{l+1}$.
- A firing on a graph G is defined by sending a single chip from a node *i* to all of its neighbours.
- Stable Configurations are chip configurations $v < d^C$ which do not permit additional firings.
- *Recurrent Configurations* are stable configurations v such that for all chip-configurations w, selectively adding chips to w and stabilizing yields v.

A Laplacian Matrix, L(G) = D - A, where D is the degree matrix such that $D_{ij} = deg(\text{node i})$ if i = j and $D_{ij} = 0$ if $i \neq j$. A is an adjacency matrix such that A_{ij} is the number of edges from node i to node j.

Define a dynamical firing on node *i* that sends *v* to $v - r_i$, where r_i corresponds to the *i*th row of L(G), the Laplacian Matrix of *G*. Let d^C be the diagonal of L(G).

Example of Graph Laplacian

$$L(G) = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix} - \begin{bmatrix} 0 & 0 & 0 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ -1 & 2 & -1 \\ -1 & -1 & 2 \end{bmatrix}$$
$$[0, 0, 4]^{t} \qquad [1, 1, 2]^{t} \qquad [2, 2, 0]^{t} \qquad [3, 0, 1]^{t}$$

イロト イ団ト イヨト イヨト 三日

Definition

Let G be a digraph on n vertices with global sink s. The critical group of G is the group quotient:

$$K(G) = \mathbb{Z}^n / \operatorname{im}(L^t(G))$$

Theorem

Let G be a digraph with a global sink. The set of all recurrent chip on G is an abelian group under the operation $(v, w) \rightarrow stab(v + w)$, and it is isomorphic via the inclusion map to the critical group L(G).

Revisiting the Graph Example

$$L(G) = \begin{bmatrix} 0 & 0 & 0 \\ -1 & 2 & -1 \\ -1 & -1 & 2 \end{bmatrix}$$
$$K(G) = \mathbb{Z}/3\mathbb{Z}$$
Recurrent Configurations:
$$\begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

Each recurrent must have order 3: $[1,1]^t$ is the zero recurrent of order 1 $[0,1]^t$ has order 3 since $stab([0,3]^t) = [1,1]$ $[1,0]^t$ has order 3 since $stab([3,0]^t) = [1,1]$

Introduction to Representation Theory

• A group *G* is a set of elements that are closed under a certain binary operator (the group operation), associativity, identity, and invertibility. For example, the 3rd roots of unity form a group under the operation of normal multiplication.

イロト 人間ト イヨト イヨト

Introduction to Representation Theory

- A group *G* is a set of elements that are closed under a certain binary operator (the group operation), associativity, identity, and invertibility. For example, the 3rd roots of unity form a group under the operation of normal multiplication.
- A representation of a group G on a vector space V, is a homomorphism or map p : G → GL(V) such that:

$$p(g_1)p(g_2)=p(g_1g_2)$$

for all $g_1, g_2 \in G$

Introduction to Representation Theory

- A group G is a set of elements that are closed under a certain binary operator (the group operation), associativity, identity, and invertibility. For example, the 3rd roots of unity form a group under the operation of normal multiplication.
- A representation of a group G on a vector space V, is a homomorphism or map p : G → GL(V) such that:

$$p(g_1)p(g_2)=p(g_1g_2)$$

for all $g_1, g_2 \in G$

• An explicit example for the cyclic group C_3 with elements $1, g, g^2$ is: $1 \rightarrow \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \qquad g \rightarrow \begin{bmatrix} 0 & -1 \\ 1 & -1 \end{bmatrix} \qquad g^2 \rightarrow \begin{bmatrix} -1 & 1 \\ -1 & 0 \end{bmatrix}$

For a representation V of the group G: Define the McKay-Cartan Matrix to be $\tilde{C} = nI - M$, where n is the dimension of V and:

$$\chi_V \chi_i = \sum m_{ij} \chi_j$$

The chip-firing game applies to any \mathbb{Z} -matrices and we introduce the McKay-Cartan marix here instead of the graph Laplacian Matrix. The reduced McKay-Cartan Matrix can be defined as the submatrix by removing the first row and column. In this way, the critical group is defined analagously as:

$$K(V) = \mathbb{Z}^n / \mathrm{im}(C^t(V))$$

The Abelian Group Case

In the case of abelian groups, we have a complete classification of the map p and found an exact correspondance of p to regular covering maps on graphs. From Reiner-Tseng, we also have a combinatorial interpretation of the kernel of our map. In fact, we have discovered the following theorem:

Definition

The Cayley Graph of a group G with generating set S has elements of the group as its node and edges between g and gs for elements $s \in S$. The nodes of our Cayley Graph are the irreducible representations of G and the edges correspond to the choice of our faithful representation V.

Theorem

There is a surjection of critical groups from K(V) to $K(\operatorname{Res}_{H}^{G} V)$ corresponding to the map p, a graph covering map on the Cayley Graphs of each group.

Cyclic Group Example

Let $G = C_6 = \langle g | g^6 = e \rangle$ and consider the representation $V = V_{w^2} \oplus V_w$, where V_{w^k} sends $g \to w^k$ where $w^6 = 1$. Consider the subgroup $H = C_2$ and the regular covering can be depicted by:

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

General Maps Between Critical Groups

Define the map $p: \mathbb{Z}^{l+1} \to \mathbb{Z}^{l'+1}$, with standard matrix A, such that:

$${\it ResV_i}=\oplus W_j^{\oplus A_{ij}}$$

Theorem

The following diagrams commute:

Hence, we have a map, $\pi : K(V) \to K(ResV)$ on cosets: $\pi : u + im(C^t(V)) \to p(u) + im(C^t(ResV))$ • From characters, p corresponds to restriction of virtual representations, considered in \mathbb{Z}^{l+1}

- From characters, p corresponds to restriction of virtual representations, considered in \mathbb{Z}^{l+1}
- p^t corresponds to induction of virtual representations in $\mathbb{Z}^{l'+1}$.

- From characters, p corresponds to restriction of virtual representations, considered in \mathbb{Z}^{l+1}
- p^t corresponds to induction of virtual representations in $\mathbb{Z}^{l'+1}$.
- Check that $ResV_1 \otimes ResV \cong Res(V_1 \otimes V)$ (Commutativity with M)

- From characters, p corresponds to restriction of virtual representations, considered in \mathbb{Z}^{l+1}
- p^t corresponds to induction of virtual representations in $\mathbb{Z}^{l'+1}$.
- Check that $ResV_1 \otimes ResV \cong Res(V_1 \otimes V)$ (Commutativity with M)
- Check that $IndW_1 \otimes V \cong Ind(W_1 \otimes ResV)$

It is known that p is surjective as a linear map and also as a map of cosets: p : K(S_n) → K(S_{n-1}).

3

イロト イポト イヨト イヨト

- It is known that p is surjective as a linear map and also as a map of cosets: p : K(S_n) → K(S_{n-1}).
- Whenever p is surjective as a linear map, p^t must be injective as a map of cosets:p^t : K(S_{n-1}) → K(S_n).

イロト イポト イヨト イヨト 二日

- It is known that p is surjective as a linear map and also as a map of cosets: p : K(S_n) → K(S_{n-1}).
- Whenever p is surjective as a linear map, p^t must be injective as a map of cosets:p^t : K(S_{n-1}) → K(S_n).
- Induction and restriction of irreducible representations is well-understood with the concept of Young Diagrams (Binary Matrix for p).

Symmetric Case Continued

Theorem from Gaetz

Let γ be the reflection representation of S_n and let p(j) denote the number of partitions of the integer j. Then:

$$\mathcal{K}(\gamma)\cong igoplus_{i=2}^{p(n)-p(n-1)}\mathbb{Z}/q_i\mathbb{Z}$$

where

$$q_i = \prod_{1 \le j \le n, p(j) - p(j-1) \ge i} j$$

Lemma

The kernel of our map, p, for γ is as follows:

$$ker(p) = (\mathbb{Z}/n\mathbb{Z})^{p(n)-p(n-1)-1}$$

• Describe the kernels of our maps in terms of "voltage critical groups," with some combinatorial structure (group elements in the graph case)

(日) (周) (三) (三)

- Describe the kernels of our maps in terms of "voltage critical groups," with some combinatorial structure (group elements in the graph case)
- Give explicit formulas and/or bounds on critical groups for specific representations of the symmetric group (Using repeated character values and injectivity of p^t)

Theorem from Gaetz

If χ_{γ} is real-valued, as in the symmetric group case, and $\chi_{\gamma}(c)$ is an integer character value achieved by *m* different conjugacy classes, then $K(\gamma)$ contains a subgroup isomorphic to $(\mathbb{Z}/(n-\chi_{\gamma}(c))\mathbb{Z})^{m-1}$

- Describe the kernels of our maps in terms of "voltage critical groups," with some combinatorial structure (group elements in the graph case)
- Give explicit formulas and/or bounds on critical groups for specific representations of the symmetric group (Using repeated character values and injectivity of p^t)

Theorem from Gaetz

If χ_{γ} is real-valued, as in the symmetric group case, and $\chi_{\gamma}(c)$ is an integer character value achieved by *m* different conjugacy classes, then $K(\gamma)$ contains a subgroup isomorphic to $(\mathbb{Z}/(n-\chi_{\gamma}(c))\mathbb{Z})^{m-1}$

 Investigate other potential maps such as dualization (commutes with the same diagram)

- Describe the kernels of our maps in terms of "voltage critical groups," with some combinatorial structure (group elements in the graph case)
- Give explicit formulas and/or bounds on critical groups for specific representations of the symmetric group (Using repeated character values and injectivity of p^t)
