For a ring R, the shuffle algebra  $A^R$  is the subset of the set of symmetric rational functions in arbitrarily many variables with coefficients in R, generated by 1 variable functions.

The **shuffle product** takes a function in k variables and a function in l variables and "shuffles" their variables to get a function in k + l variables:

For a ring R, the shuffle algebra  $A^R$  is the subset of the set of symmetric rational functions in arbitrarily many variables with coefficients in R, generated by 1 variable functions.

The **shuffle product** takes a function in k variables and a function in l variables and "shuffles" their variables to get a function in k + l variables:

$$F(a, b) * G(c, d) = F(a, b)G(c, d) + F(a, c)G(b, d) + F(a, d)G(b, c)$$
$$+F(b, c)G(a, d) + F(b, d)G(a, c) + F(c, d)G(a, b).$$

### The Integral Shuffle Algebra

#### Definition

The **integral shuffle algebra** is a subset of  $\bigoplus_{k\geq 0} \operatorname{Sym}_{\mathbf{R}}(z_1,...,z_k)$ and is the shuffle algebra over the ring  $\mathbf{R} = \mathbb{C}[q_1^{\pm 1}, q_2^{\pm 1}]$ .

The shuffle product is

$$P(z_1, \dots, z_k) * Q(z_1, \dots, z_l) = rac{1}{k! l!} \sum_{ ext{sym}} P(z_1, \dots, z_k) Q(z_{k+1}, \dots, z_{k+l}) \prod_{\substack{1 \le i \le k \\ k < j \le k+l}} rac{(z_i - q_1 q_2 z_j)(z_j - q_1 z_i)(z_j - q_2 z_i)}{z_i - z_j}.$$

We want to find conditions to determine whether a given symmetric rational function is in the integral shuffle algebra.

Frank Wang

The **fractional shuffle algebra** is the shuffle algebra over the ring  $\mathbf{K} = \mathbb{C}(q_1, q_2)$  with the same shuffle product as the integral shuffle algebra.

#### Theorem (Negut, 2014)

A symmetric rational function  $p(z_1, ..., z_k)$  is in the fractional shuffle algebra if and only if it is a Laurent polynomial ( $p \in \mathbf{K}[z_1^{\pm 1}, ..., z_k^{\pm 1}]$ ) and it satisfies the wheel conditions:

 $p(z_1, q_1z_1, q_1q_2z_1, z_4, z_5, \ldots, z_k) = p(z_1, q_2z_1, q_1q_2z_1, z_4, z_5, \ldots, z_k) = 0.$ 

These conditions are necessary but not sufficient for the integral shuffle algebra.

Ideal form of wheel conditions:  $p(z_1, q_1z_1, q_1q_2z_1, ...) = 0$  if and only if  $p \in (q_1q_2z_1 - z_3, q_1z_1 - z_2, q_2z_2 - z_3)$  of the ring of Laurent polynomials.

Ideals can also be thought of as *R*-modules that are contained in *R*.

Montgomery High School

#### Definition

A quotient R/I of a ring R by an ideal I is the ring of equivalence classes in the ring where two elements a and b are equivalent if  $a - b \in I$ .

Frank Wang

The Hilbert scheme Hilb<sub>n</sub> of n points in the plane is the set of ideals  $I \subset \mathbb{C}[x, y]$  such that the dimension of  $\mathbb{C}[x, y]/I$  as a vector space over  $\mathbb{C}$  is n. Examples:

The Hilbert scheme  $\text{Hilb}_n$  of n points in the plane is the set of ideals  $I \subset \mathbb{C}[x, y]$  such that the dimension of  $\mathbb{C}[x, y]/I$  as a vector space over  $\mathbb{C}$  is n. Examples:

$$\mathbb{C}[x,y]/(x,y) = \mathbb{C} \Rightarrow (x,y) \in \mathsf{Hilb}_1$$

The Shuffle Algebra of the Hilbert Scheme of Points of the Plane

The Hilbert scheme  $\text{Hilb}_n$  of n points in the plane is the set of ideals  $I \subset \mathbb{C}[x, y]$  such that the dimension of  $\mathbb{C}[x, y]/I$  as a vector space over  $\mathbb{C}$  is n. Examples:

$$\mathbb{C}[x,y]/(x,y) = \mathbb{C} \Rightarrow (x,y) \in \mathsf{Hilb}_1$$
$$\mathbb{C}[x,y]/(x^2,xy,y^2) = \{ax + by + c\} \Rightarrow (x^2,xy,y^2) \in \mathsf{Hilb}_3$$

The Shuffle Algebra of the Hilbert Scheme of Points of the Plane

The Hilbert scheme Hilb<sub>n</sub> of n points in the plane is the set of ideals  $I \subset \mathbb{C}[x, y]$  such that the dimension of  $\mathbb{C}[x, y]/I$  as a vector space over  $\mathbb{C}$  is *n*. Examples:

$$\mathbb{C}[x, y]/(x, y) = \mathbb{C} \Rightarrow (x, y) \in \mathsf{Hilb}_1$$
$$\mathbb{C}[x, y]/(x^2, xy, y^2) = \{ax + by + c\} \Rightarrow (x^2, xy, y^2) \in \mathsf{Hilb}_3$$
$$\mathbb{C}[x, y]/(x) = \{a + by + cy^2 + \dots\} \text{ so } (x) \notin \mathsf{Hilb}_n \text{ for any } n$$

Montgomery High School

Frank Wang

### Relation of Shuffle Algebra to Hilbert Scheme

### Theorem (Schiffmann and Vasserot, 2013)

Consider the equivariant K-theory group  $K^{T}(Hilb_{n})$  of the Hilbert scheme and let

$$L_{\mathbf{R}} = \bigoplus_{n \ge 0} \kappa^{\mathsf{T}}(\mathsf{Hilb}_n), \quad L_{\mathbf{K}} = L_{\mathbf{R}} \otimes_{\mathbf{R}} \mathbf{K}$$

where  $\mathbf{R} = \mathbb{C}[q_1^{\pm 1}, q_2^{\pm 1}]$  and  $\mathbf{K} = \mathbb{C}(q_1, q_2)$ . Then  $L_{\mathbf{R}}$  is a module over the integral shuffle algebra and  $L_{\mathbf{K}}$  is a module over the fractional shuffle algebra.

Frank Wang

#### Theorem

Let  $A_k^{\mathbf{R}}$  be the subset of the integral shuffle algebra consisting of functions in k variables. Then the following hold:

$$A_k^{\mathbf{R}}$$
 is an ideal of  $\mathbf{R}[z_1^{\pm 1}, \dots, z_k^{\pm 1}]$  for all k.  
 $A_2^{\mathbf{R}}$  is the ideal  $(z_1 * z_1^0, z_1^0 * z_1^0)$  of  $\mathbf{R}[z_1^{\pm 1}, z_2^{\pm 1}]$ .  
As an ideal of  $\mathbf{R}[z_1^{\pm 1}, z_2^{\pm 1}, z_3^{\pm 1}]$ ,  $A_3^{\mathbf{R}}$  is generated by the elements  $z_1^{d_1} * z_1^{d_2} * z_1^0$  for  $0 \le d_1 \le 2, 0 \le d_2 \le 1$ .

## **Ongoing Work**

Recall the ideal form of the wheel conditions:

$$p \in (q_1q_2z_1 - z_3, q_1z_1 - z_2, q_2z_2 - z_3),$$

$$p \in (q_1q_2z_1-z_3, q_2z_1-z_2, q_1z_2-z_3).$$

We create a similar condition from the generators of  $A_2^{\mathbf{R}}$ :

#### Theorem

 $A_k^{\mathbf{R}}$  is contained in the ideal

$$(z_1 * z_1^0, z_1^0 * z_1^0)$$

of 
$$\mathbf{R}[z_1^{\pm 1}, \dots, z_k^{\pm 1}]$$
 for  $k \ge 2$ .
