# An Interesting Puzzle

We have a collection of dominos:

$$\left\{ \left[ \frac{onsb}{sb} \right], \left[ \frac{a}{an} \right], \left[ \frac{nas}{as} \right], \left[ \frac{i}{ni} \right], \left[ \frac{ni}{on} \right], \left[ \frac{m}{mi} \right], \left[ \frac{n}{\epsilon} \right] \right\}.$$

Post-  
Correspondence  
Problem

Turing  
Machines

$A_{TM}$  and  
Reducibility

Reducing  
 $A_{TM}$  to PCP

Conclusion

## Our Reduction

To show PCP is undecidable,

we simulate an accepting  
Turing machine configuration  
through a PCP match

and prove  $A_{TM}$  is undecidable.

## Urg's Reduction

To show he can't steal a shrink  
ray,

Urg hypothetically shrinks the  
moon

and proves stealing the moon is  
impossible.

Reducing  
 $A_{TM}$  to PCP

Conclusion

We must first convert PCP to Modified PCP (MPCP).

## Definition

**MPCP** is the language of instances of  $PCP$  whose matches start with  $[\frac{t_1}{b_1}]$ :

$$MPCP = \{ \langle P' \rangle \mid P' \text{ is a collection of dominos} \\ \text{with a match starting with the first domino} \}.$$

Circle,  
Mentor:  
Alexandra  
Hoey

Post-  
Correspondence  
Problem

Turing  
Machines

$A_{TM}$  and  
Reducibility

Reducing  
 $A_{TM}$  to PCP

Conclusion

We can force the match to start with the first domino by adding  $\star$ 's:

Let

$$\star U = \star U_1 \star U_2 \star U_3 \cdots \star U_n,$$

$$U \star = U_1 \star U_2 \star U_3 \cdots \star U_n \star,$$

$$\star U \star = \star U_1 \star U_2 \star U_3 \cdots \star U_n \star.$$

Since  $P'$  (MPCP) is  $\left\{ \left[ \frac{t_1}{b_1} \right], \left[ \frac{t_2}{b_2} \right], \left[ \frac{t_3}{b_3} \right], \dots, \left[ \frac{t_k}{b_k} \right] \right\}$ ,

we can let  $P$  (PCP) be  $\left\{ \left[ \frac{\star t_1}{\star b_1 \star} \right], \left[ \frac{\star t_2}{\star b_2 \star} \right], \left[ \frac{\star t_3}{\star b_3 \star} \right], \dots, \left[ \frac{\star t_k}{\star b_k \star} \right], \left[ \frac{\star \diamond}{\diamond} \right] \right\}$ ,  
where  $\left[ \frac{\star \diamond}{\diamond} \right]$  is there to add the extra  $\star$ .

Post-  
Correspondence  
Problem

Turing  
Machines

$A_{TM}$  and  
Reducibility

Reducing  
 $A_{TM}$  to PCP

Conclusion

## Theorem

$A_{TM}$  is undecidable.

## Proof

First, let's assume that  $A_{TM}$  is decidable. Then, by the definition of decidable Turing machines, there must exist some decider  $H$ , where  $L(H) = A_{TM}$ , such that for an input string  $\langle M, w \rangle$ , it

- 1 accepts if  $M$  accepts  $w$ , and
- 2 rejects if  $M$  rejects  $w$ .

## Proof

Now, consider a new Turing machine  $D$ , which takes Turing machines  $\langle M \rangle$  as inputs. It

- 1 accepts when  $H$  rejects  $\langle M, \langle M \rangle \rangle$ , and
- 2 rejects when  $H$  accepts  $\langle M, \langle M \rangle \rangle$

## Proof

Consider a case when  $D$  takes in itself,  $\langle D \rangle$ , as an input. Then by construction,  $D$  will

- 1 reject  $\langle D \rangle$  when  $H$  accepts  $\langle D, \langle D \rangle \rangle$ , and
- 2 accept  $\langle D \rangle$  when  $H$  rejects  $\langle D, \langle D \rangle \rangle$

However, because  $H$  accepts  $\langle D, \langle D \rangle \rangle$  if and only if  $D$  accepts  $\langle D \rangle$ , we see that there exists a contradiction either way:

- 1  $D$  rejects  $\langle D \rangle$  if and only if  $D$  accepts  $\langle D \rangle$ , or
- 2  $D$  accepts  $\langle D \rangle$  if and only if  $D$  rejects  $\langle D \rangle$ .

Therefore, such a decider  $H$  cannot exist, so  $A_{TM}$  is undecidable.
