# Dihedral Groups

The **dihedral group** of order  $2n$ ,  $D_{2n}$ , is the group of symmetries of a regular  $n$ -gon, consisting of  $n$  rotations and  $n$  reflections.

## Dihedral Groups

The **dihedral group** of order  $2n$ ,  $D_{2n}$ , is the group of symmetries of a regular  $n$ -gon, consisting of  $n$  rotations and  $n$  reflections.

## Dihedral Groups

The **dihedral group** of order  $2n$ ,  $D_{2n}$ , is the group of symmetries of a regular  $n$ -gon, consisting of  $n$  rotations and  $n$  reflections.

How can we present the group above?

## Dihedral Groups

The **dihedral group** of order  $2n$ ,  $D_{2n}$ , is the group of symmetries of a regular  $n$ -gon, consisting of  $n$  rotations and  $n$  reflections.

How can we present the group above? One option is,  $s_1 = d_1$  and  $s_2 = v$ , then  $D_8 = \langle s_1, s_2 \mid s_1^2 = s_2^2 = (s_1 s_2)^4 = e \rangle$ .

## Symmetric Group

Can we have this nice structure in the presentation of other groups?

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

The **symmetric group**  $\mathfrak{S}_n$  is the group of all permutations of  $n$  elements. For  $\mathfrak{S}_4$ , using cycle notation, we see that

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

The **symmetric group**  $\mathfrak{S}_n$  is the group of all permutations of  $n$  elements. For  $\mathfrak{S}_4$ , using cycle notation, we see that

$$(12)^2 = (23)^2 = (34)^2 = e,$$

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

The **symmetric group**  $\mathfrak{S}_n$  is the group of all permutations of  $n$  elements. For  $\mathfrak{S}_4$ , using cycle notation, we see that

$$(12)^2 = (23)^2 = (34)^2 = e,$$
$$((12) \circ (34))^2 = e,$$

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

The **symmetric group**  $\mathfrak{S}_n$  is the group of all permutations of  $n$  elements. For  $\mathfrak{S}_4$ , using cycle notation, we see that

$$\begin{aligned}(12)^2 &= (23)^2 = (34)^2 = e, \\ ((12) \circ (34))^2 &= e, \\ ((12) \circ (23))^3 &= (123)^3 = e.\end{aligned}$$

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

The **symmetric group**  $\mathfrak{S}_n$  is the group of all permutations of  $n$  elements. For  $\mathfrak{S}_4$ , using cycle notation, we see that

$$\begin{aligned}(12)^2 &= (23)^2 = (34)^2 = e, \\ ((12) \circ (34))^2 &= e, \\ ((12) \circ (23))^3 &= (123)^3 = e.\end{aligned}$$

Let  $s_i = (i \ i + 1)$  be these **adjacent transpositions** (swaps).

## Symmetric Group

Can we have this nice structure in the presentation of other groups? Yes!

The **symmetric group**  $\mathfrak{S}_n$  is the group of all permutations of  $n$  elements. For  $\mathfrak{S}_4$ , using cycle notation, we see that

$$\begin{aligned}(12)^2 &= (23)^2 = (34)^2 = e, \\ ((12) \circ (34))^2 &= e, \\ ((12) \circ (23))^3 &= (123)^3 = e.\end{aligned}$$

Let  $s_i = (i \ i + 1)$  be these **adjacent transpositions** (swaps). Then

$$\mathfrak{S}_4 = \langle s_1, s_2, s_3 \mid s_1^2 = s_2^2 = s_3^2 = (s_1 s_2)^3 = (s_2 s_3)^3 = (s_1 s_3)^2 = e \rangle.$$

# Coxeter Groups

We have

$$D_8 = \langle s_1, s_2 \mid s_1^2 = s_2^2 = (s_1 s_2)^4 = e \rangle,$$

$$\mathfrak{S}_4 = \langle s_1, s_2, s_3 \mid s_1^2 = s_2^2 = s_3^2 = (s_1 s_2)^3 = (s_2 s_3)^3 = (s_1 s_3)^2 = e \rangle.$$

# Coxeter Groups

We have

$$D_8 = \langle s_1, s_2 \mid s_1^2 = s_2^2 = (s_1 s_2)^4 = e \rangle,$$

$$\mathfrak{S}_4 = \langle s_1, s_2, s_3 \mid s_1^2 = s_2^2 = s_3^2 = (s_1 s_2)^3 = (s_2 s_3)^3 = (s_1 s_3)^2 = e \rangle.$$

Accordingly, a **Coxeter group** is a group with presentation,

$$\langle s_1, s_2, \dots, s_n \mid s_i^2 = e \text{ for } 1 \leq i \leq n, \\ (s_i s_j)^{m_{i,j}} = e \text{ for } 1 \leq i < j \leq n \rangle,$$

where  $m_{i,j} \geq 2$ .

# Coxeter Diagrams and Examples

We can represent Coxeter groups with **Coxeter diagrams**.

## Coxeter Diagrams and Examples

We can represent Coxeter groups with **Coxeter diagrams**. For example,

$$D_8 = \langle s_1, s_2 \mid s_1^2 = s_2^2 = (s_1 s_2)^4 = e \rangle:$$

## Coxeter Diagrams and Examples

We can represent Coxeter groups with **Coxeter diagrams**. For example,

$$D_8 = \langle s_1, s_2 \mid s_1^2 = s_2^2 = (s_1 s_2)^4 = e \rangle:$$

$$\mathfrak{S}_4 = \langle s_1, s_2, s_3 \mid s_1^2 = s_2^2 = s_3^2 = (s_1 s_2)^3 = (s_2 s_3)^3 = (s_1 s_3)^2 = e \rangle:$$

## Finite Irreducible Coxeter Groups

A Coxeter group with finite order is called **finite**, and a Coxeter group with connected Coxeter diagram is called **irreducible**.

## Finite Irreducible Coxeter Groups

A Coxeter group with finite order is called **finite**, and a Coxeter group with connected Coxeter diagram is called **irreducible**.

### Theorem (Coxeter 1935, [2])

*All finite irreducible Coxeter groups are described by the following Coxeter diagrams:*

# Table of Contents

1 Coxeter Groups

2 Consecutive Pattern Containment

3 cc-Wilf-Equivalence

# Permutations

A permutation  $\sigma$  **consecutively contains** another permutation  $\pi$  if there is a contiguous subsequence of  $\sigma$  with the same **relative order** as  $\pi$ .

# Permutations

A permutation  $\sigma$  **consecutively contains** another permutation  $\pi$  if there is a contiguous subsequence of  $\sigma$  with the same **relative order** as  $\pi$ .

The permutation **132546** consecutively contains the permutation **2143**,

# Permutations

A permutation  $\sigma$  **consecutively contains** another permutation  $\pi$  if there is a contiguous subsequence of  $\sigma$  with the same **relative order** as  $\pi$ .

The permutation **132546** consecutively contains the permutation **2143**, and the permutation **4132** consecutively contains the permutation **312**.

# Permutations

A permutation  $\sigma$  **consecutively contains** another permutation  $\pi$  if there is a contiguous subsequence of  $\sigma$  with the same **relative order** as  $\pi$ .

The permutation **132546** consecutively contains the permutation **2143**, and the permutation **4132** consecutively contains the permutation **312**.

Goal: Generalize consecutive pattern containment to Coxeter groups.

## Reduced Words

Given an element  $w$  of a Coxeter group  $W$ , we can write it as a product of generators, called a **word**. A word of minimal length is called **reduced**.

## Reduced Words

Given an element  $w$  of a Coxeter group  $W$ , we can write it as a product of generators, called a **word**. A word of minimal length is called **reduced**.

### Example

In  $\mathfrak{S}_4$ , with generators  $s_i = (i \ i + 1)$  for  $i = 1, 2, 3$ , we have the following possible words for  $w = 4132$ :

$$4132 = s_2 s_3 s_2 s_3 s_1 s_3 = s_3 s_2 s_1 s_3 = s_2 s_3 s_2 s_1.$$

## Parabolic Decomposition

Given a connected subset (on the Coxeter diagram)  $J$  of the set of generators  $S$ , we let  $w_J$  be the **longest suffix** of any reduced word for  $w$  that contains only generators from  $J$

## Parabolic Decomposition

Given a connected subset (on the Coxeter diagram)  $J$  of the set of generators  $S$ , we let  $w_J$  be the **longest suffix** of any reduced word for  $w$  that contains only generators from  $J$

### Example

In  $\mathfrak{S}_4$ , with generators  $s_i = (i \ i + 1)$  for  $i = 1, 2, 3$ , we have the following possible words for  $w = 4132$ :

$$4132 = s_2 s_3 s_2 s_3 s_1 s_3 = s_3 s_2 s_1 s_3 = s_2 s_3 s_2 s_1.$$

## Parabolic Decomposition

Given a connected subset (on the Coxeter diagram)  $J$  of the set of generators  $S$ , we let  $w_J$  be the **longest suffix** of any reduced word for  $w$  that contains only generators from  $J$

### Example

In  $\mathfrak{S}_4$ , with generators  $s_i = (i \ i + 1)$  for  $i = 1, 2, 3$ , we have the following possible words for  $w = 4132$ :

$$4132 = s_2 s_3 s_2 s_3 s_1 s_3 = s_3 s_2 s_1 s_3 = s_2 s_3 s_2 s_1.$$

The longest suffix of a reduced word containing only generators from  $J = \{s_1, s_2\}$  is from the reduced word  $s_2 s_3 \cdot \mathbf{s_2 s_1}$ . Note that  $\mathbf{s_2 s_1} = 312$ .

## Consecutive pattern containment

### Definition (W. 2022+)

Suppose  $\pi$  and  $\sigma$  are group elements of Coxeter groups  $W, W'$  with set of generators  $S, S'$ , respectively. Then we say that  $\sigma$  **consecutively contains**  $\pi$  if there exists a connected subset  $J \subseteq S'$  such that  $\pi$  “equals”  $\sigma_J$ . Formally, this involves an isomorphism.

Figure: Consecutive containment in Coxeter groups

# Table of Contents

- 2 Consecutive Pattern Containment
- 3 cc-Wilf-Equivalence**

# cc-Wilf-Equivalence

## Definition

Given two permutations  $\pi, \tau$ , we say that they are **c-Wilf-equivalence** if for every  $n$ , the number of permutations on  $n$  elements consecutively containing  $\pi$  is the same as the number consecutively containing  $\tau$ .

# cc-Wilf-Equivalence

## Definition

Given two permutations  $\pi, \tau$ , we say that they are **cc-Wilf-equivalence** if for every  $n$ , the number of permutations on  $n$  elements consecutively containing  $\pi$  is the same as the number consecutively containing  $\tau$ .

Accordingly, we define

## Definition (W. 2022+)

We say that two **Coxeter group elements**  $\pi$  and  $\tau$  of an irreducible Coxeter group are **cc-Wilf-equivalence** if for every finite irreducible Coxeter group  $W$ , the number of  $\sigma \in W$  consecutively containing  $\pi$  is the same as the number consecutively containing  $\tau$ .

## Automorphisms Induce cc-Wilf-Equivalences

Recall that  $4132 = s_2 s_3 \cdot \mathbf{s_2 s_1}$  consecutively contains  $312 = \mathbf{s_2 s_1}$ .  
But it also consecutively contains  $231 = \mathbf{s_1 s_2}$ .

## Automorphisms Induce cc-Wilf-Equivalences

Recall that  $4132 = s_2 s_3 \cdot \mathbf{s_2 s_1}$  consecutively contains  $312 = \mathbf{s_2 s_1}$ .  
But it also consecutively contains  $231 = \mathbf{s_1 s_2}$ .

**Figure:** Isomorphisms for consecutive containment for the Symmetric group

## Automorphisms Induce cc-Wilf-Equivalences

Recall that  $4132 = s_2 s_3 \cdot \mathbf{s_2 s_1}$  consecutively contains  $312 = \mathbf{s_2 s_1}$ .  
But it also consecutively contains  $231 = \mathbf{s_1 s_2}$ .

**Figure:** Isomorphisms for consecutive containment for the Symmetric group

### Proposition (W. 2022)

If  $\pi$  is an element of a Coxeter group  $W$ , and  $\phi$  is a **diagram automorphism** of  $W$ , then  $\pi$  is cc-Wilf-equivalent to  $\phi(\pi)$ .

## Maximal Element Induces cc-Wilf-Equivalences

If  $\pi = \pi_1\pi_2 \cdots \pi_n$  is a permutation on  $n$  elements, then the **complement** of  $\pi$ ,  $\pi^C := (n+1-\pi_1)(n+1-\pi_2) \cdots (n+1-\pi_n)$  is c-Wilf-equivalent to  $\pi$  since  $\sigma$  consecutively contains  $\pi$  if and only if  $\sigma^C$  consecutively contains  $\pi^C$ .

## Maximal Element Induces cc-Wilf-Equivalences

If  $\pi = \pi_1\pi_2 \cdots \pi_n$  is a permutation on  $n$  elements, then the **complement** of  $\pi$ ,  $\pi^C := (n+1-\pi_1)(n+1-\pi_2) \cdots (n+1-\pi_n)$  is c-Wilf-equivalent to  $\pi$  since  $\sigma$  consecutively contains  $\pi$  if and only if  $\sigma^C$  consecutively contains  $\pi^C$ .

We can generalize this by writing  $\pi^C = n(n-1) \cdots 21 \circ \pi$ .

## Maximal Element Induces cc-Wilf-Equivalences

If  $\pi = \pi_1\pi_2 \cdots \pi_n$  is a permutation on  $n$  elements, then the **complement** of  $\pi$ ,  $\pi^C := (n+1-\pi_1)(n+1-\pi_2) \cdots (n+1-\pi_n)$  is c-Wilf-equivalent to  $\pi$  since  $\sigma$  consecutively contains  $\pi$  if and only if  $\sigma^C$  consecutively contains  $\pi^C$ .

We can generalize this by writing  $\pi^C = n(n-1) \cdots 21 \circ \pi$ . Now,

### Proposition (Well Known, [1])

*Every finite Coxeter group  $W$  has a unique element of maximal length. We will denote this element  $w_0(W)$ .*

The permutation  $n(n-1) \cdots 21$  is precisely this element in  $\mathfrak{S}_n$ .

# Maximal element induces cc-Wilf-Equivalences (cont.)

Proposition (Well Known, see [1])

*Every finite Coxeter group  $W$  has a unique element of maximal length. We will denote this element  $w_0(W)$ .*

# Maximal element induces cc-Wilf-Equivalences (cont.)

## Proposition (Well Known, see [1])

*Every finite Coxeter group  $W$  has a unique element of maximal length. We will denote this element  $w_0(W)$ .*

Using this,

## Proposition (W. 2022)

*Let  $\pi$  be an element of a Coxeter group  $W$ . Then  $\pi$  is cc-Wilf-equivalent to  $w_0(W)\pi$ .*

## Nontrivial Families of cc-Wilf-Equivalence classes

Theorem (Duane—Remmel 2011 [4], Dotsenko—Khoroshkin 2013 [3])

*We say that a permutation  $\pi$  is **non-overlapping** if two of its occurrences share in any other permutation  $\sigma$  can share at most one position. Then the first and last entries of a non-overlapping permutation determines its c-Wilf-equivalence class.*

The idea is that  $\pi$  and  $\tau$  are essentially interchangeable wherever they occur.

## Nontrivial Families of cc-Wilf-Equivalence classes

Theorem (Duane—Remmel 2011 [4], Dotsenko—Khoroshkin 2013 [3])

*We say that a permutation  $\pi$  is **non-overlapping** if two of its occurrences share in any other permutation  $\sigma$  can share at most one position. Then the first and last entries of a non-overlapping permutation determines its c-Wilf-equivalence class.*

The idea is that  $\pi$  and  $\tau$  are essentially interchangeable wherever they occur. Skipping over a lot of details, we prove the following:

Theorem (W. 2022)

*If  $\pi$  and  $\tau$  are both strongly difference-disjoint and automorphic-equivalent, then they are cc-Wilf-equivalent.*
