(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

**Sentential logic**, also called *propositional logic*, studies how prime sentences (atomic) combine using logical connectives.

- A prime sentence is a basic statement that is either true or false.
  - Example:
- Let A = T, where A could be "Dogs normally have 4 legs", a True statement.

▶ Let *B* = F could be "Dogs are blue", a False statement.

## Logical Connectives

**Logical connectives** are symbols used to build compound sentences from the prime ones. The most common are the following:

Taking into mind that A = T and B = F

- $\neg A$  not A (negation) is False
- $A \land B A$  and B (conjunction) is False
- $A \lor B A$  or B (disjunction) is True
- $A \rightarrow B$  if A, then B (implication) is False
- $A \leftrightarrow B A$  if and only if B (bi-conditional) is False

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

## Truth Tables

Purpose: Evaluate logical expressions systematically.

**Example 1:**  $A \lor B$ 

**Example 2:**  $A \lor \neg A$  (a tautology)

**Key Term:** Tautology — A statement that is always true, e.g.,  $A \lor \neg A$ .

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

## Logical Laws – Identity

 $\top:$  A Verum, statement that is always true.

 $\perp$ : A Falsum, statement that is always false.

 ${\ensuremath{\scriptscriptstyle \Xi}}$  : Logical Equivalence, where two composites have the same truth table.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Identity Laws:

- $A \lor \bot \equiv A$
- $A \wedge \top \equiv A$

## **Example Table:** $A \lor \bot$

A	$\bot$	$A \lor \bot$
Т	F	Т
F	F	F

Logical Laws – Domination

#### **Domination Laws:**

- $A \lor \top \equiv \top$
- $A \land \bot \equiv \bot$

#### **Example Table:** $A \land \bot$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

A	$\bot$	$A \land \bot$
Т	F	F
F	F	F

# Summary

### Key Concepts Reviewed:

We touched base on the following:

- Sentential Logic
- Logical Connectives
- Truth Tables (Tautologies)

## Set Theory

**Sets** a well-defined collection of distinct objects, which are called *elements* of a set.

**Subset** A set A is a subset of another set B when all elements of A are within B, all  $a \in B$ 

**Inclusion** A set A is a subset of a set B and every element of A is also in B, meaning A can be equal to B. Denoted as  $A \subseteq B$  and read as "A is included in B."

**Proper Inclusion** Every element of a set *A* is included within a set *B* but they are not equal, *B* has additional other elements,

denoted as  $A \subset B$  and read as "A is properly included in B."

## Set Theory

**Intersection** the set containing all elements that in both sets A and B, denoted as  $A \cap B$ **Union** in two sets A and B, a union is the set containing all elements that are in either A or B or both, denoted as  $A \cup B$ 

# **Proof Techniques**

#### Definition

**Proof by contradiction** assumes the negation of the desired conclusion and derives a logical inconsistency from this assumption.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Proof by Contradiction

#### Example

**Prove that, if**  $A \cap B = A$ , then  $A \subseteq B$ . *Proof:* Suppose for the sake of contradiction that  $A \notin B$ . Then there exists some  $a \in A$  such that  $a \notin B$ . This implies that  $a \notin A \cap B$ . But then, since  $a \in A$ ,  $A \cap B \neq A$ , which is a contradiction, indicating that in fact  $A \subseteq B$ .

# Why Logic? Why Sudoku?

- More than just a puzzle. It challenges players to use logic, deduction, and structure.
- Because we can use set theory and predicate logic to formally describe the rules and valid solutions.
- Translate human reasoning into mathematical language
- It shows how mathematics can model real world problem solving.
- Using logic to understand Sudoku is an example of how logic helps us structure and automate reasoning in various fields.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Key Mathematical Tools

- Set: A group or collection of distinct items. In Sudoku, a row, column, or box can be seen as a set of numbers from 1 to 9.
- Predicate: A logical sentence that becomes true or false depending on the input. Example: "x is greater than 5"
- Quantifiers: Symbols that help us talk about "how many" things something applies to.

- Y means "for all"
- ▶ ∃ means "there exists"
- Satisfiability: Are all constraints consistent?

# Formalizing the Grid

- A Sudoku grid has cells. We label each one by row and column: G = {(i, j) | 1 ≤ i, j ≤ 9}
- The digits we can place: D = {1,2,...,9}
- The relation R ⊆ G × D: This matches each grid cell with a digit like ((3,4),7) for placing 7 at (3,4).
- The predicate P(i,j,d): True if digit d is placed in row i, column j. P(i,j,d) ⇐ ((i,j),d) ∈ R

						9		
3	4				2		1	5
		9		5	7			
1			3		5			7
		4					9	
7			6		1			8
		3		9	9			
4	6	9			9		5	1
						2

Sudoku Rules as Set Theory and Logic

Row constraint (no repeated digit in a row):

$$\forall i, d, j_1 \neq j_2: \neg (P(i, j_1, d) \land P(i, j_2, d))$$

**Column constraint:** 

$$\forall j, d, i_1 \neq i_2: \neg (P(i_1, j, d) \land P(i_2, j, d))$$

#### Subgrid constraint:

Let

$$S_{k,l} = \{(i,j) \mid 3k-2 \le i \le 3k, \ 3l-2 \le j \le 3l\}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Each subgrid must contain all digits once.

## How Logic Solves Sudoku (Part 1)

- Starting Point: We begin with a few numbers already filled in. Call this set R<sub>0</sub>, part of the full solution set R, R<sub>0</sub> ⊆ R.
- Translate to Logic: Each given number becomes a statement like P(i,j,d): "Cell (i, j) has digit d."
- Use Logic Rules:
  - If we know a cell has digit d, then it can't have any other digit  $d' \neq d$ .
  - That digit d also can't appear again in the same row, column, or box.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

# How Logic Solves Sudoku (Part 2)

#### Make Deductions:

- If only one digit can go in a cell, we can safely place it.
- If a digit can only go in one spot in a row, column, or box, we place it there.
- Repeat: Keep applying these logical steps and updating possibilities.
- Continue until every cell is filled (a solution), or no choices are left (no solution).

						9		
3	4				2		1	5
		9		5	7			
1			3		5			7
		4					9	
7			6		1			8
		3		9	9			
4	6	9			9		5	1
						2		

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

## Summary: Sudoku and Logic

- The way we solve Sudoku using logic is like following an algorithm, a set of rules to solve a problem.
- Every move is a deduction, where we use the rules to figure out what must be true.
- Sudoku turns into a puzzle made of logical constraints
- Shows how math can model the way we think and solve problems.
- The logic and methods we used apply to important concepts and tools in computer science, science, and even everyday reasoning.
