LUNCH SEMINAR FOR GRADUATE STUDENTS

MONDAY, NOVEMBER 21, 2011
11:00 - 12:00 PM

ROOM 4-149

Sug Woo Shin
(MIT)

“Families and equidistribution”

Abstract

Families are ubiquitous in mathematics. When an invariant can be attached to each member of a family, it is natural to ask how the invariant varies (or how it is distributed) as the member varies in the family. For example, given a family of equations $y^2 = x(x-1)(x-t)$ parametrized by $t$ in the finite field $F_p$, one can ask how the number of solutions in $F_p$ changes according to $t$. (The invariant of the equation, or the corresponding algebraic curve, is the number of $F_p$-points in this case.) After a general introduction to this type of questions, I will consider some exemplary problems in number theory, for instance asking whether the invariants are equally distributed in a suitable sense.
