

Topology Seminar

Adeel Khan

of IHES will be speaking on

Derived cycle classes

on September 28 at 4:30 in
MIT Room Zoom

Let X be a smooth complex algebraic variety. In contrast with the situation for the singular homology groups $H_*(X)$, the construction of intersection products on the Chow group of X is subtle due to the comparative difficulty in transverse intersections. I will explain one way to deal with this problem by considering cycle classes that come from der
