Math 53 Homework 7 – Solutions

Problem 1. a) The variables are m and b, and we are trying to minimize $f(m,b) = \sum_{i=1}^{n} (y_i - (mx_i + b))^2$. Critical points are solutions of the two equations

$$f_m = \sum_{i=1}^n -2x_i(y_i - (mx_i + b)) = 0$$
, so $\sum_{i=1}^n (-x_iy_i + mx_i^2 + bx_i) = 0$, or equivalently,

$$m\sum_{i=1}^{n} x_i^2 + b\sum_{i=1}^{n} x_i = \sum_{i=1}^{n} x_i y_i;$$

and
$$f_b = \sum_{i=1}^{n} -2(y_i - (mx_i + b)) = 0$$
, so $\sum_{i=1}^{n} (-y_i + mx_i + b) = 0$, or equivalently,

$$m\sum_{i=1}^{n} x_i + bn = \sum_{i=1}^{n} y_i.$$

Thus the critical points are the solutions of the given equations. (Observe: given the data x_i and y_i , this is merely a 2×2 linear system!) We will not prove here that the critical point is a minimum.

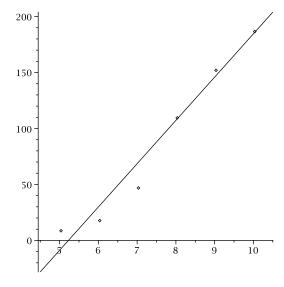

b) We calculate $\sum x_i = 45$, $\sum x_i^2 = 355$, $\sum y_i = 527.4$, and $\sum x_i y_i = 4632.4$. So the equations are

$$\begin{cases} 45m + 6b = 527.4\\ 355m + 45b = 4632.4 \end{cases}$$

This gives m = 38.68 and b = -202.2.

c) We calculate the predicted values (and plot the data as well):

x	5	7	9
Predicted $(mx + b)$	-8.8	68.6	145.9
Actual	9.8	48.1	152.7

For x = 5 the predicted value is clearly invalid. In fact the historical data from 2000 to 2008 is much better approximated by an *exponential* function $y = \exp(m'x + b')$, so over that range of years one should try to find the best fit line for $\ln(y_i)$ vs. x_i instead; whereas the more recent data is reasonably well approximated by a linear function.

d) According to y = mx + b, about 223.3 billion text messages will be sent in December 2011 (x = 11), and about 571.4 billion will be sent in December 2020.

Problem 2. a) $w = x^2 + y^2 + z^2$ where $y^2 + xz = 2$:

(i) $f(x, y, z) = x^2 + y^2 + z^2$, and $\partial f/\partial x = 2x$. In this case y and z are being held constant (but $y^2 + xz$ is not being held constant).

(ii) we use the relation
$$y^2 + xz = 2$$
 to solve for z : namely, $z = (2 - y^2)/x$. Therefore $w = g(x,y) = x^2 + y^2 + \frac{(2-y^2)^2}{x^2}$. This gives $\left(\frac{\partial w}{\partial x}\right)_y = \frac{\partial g}{\partial x} = 2x - \frac{2(2-y^2)^2}{x^3}$.

Here we differentiate with respect to x while y is being held constant, but z varies (so that the relation $y^2 + xz = 2$ remains valid).

(iii) we use the relation
$$y^2 + xz = 2$$
 to eliminate y : namely, $y^2 = 2 - xz$, so $w = h(x, z) = x^2 + (2 - xz) + z^2$. This gives $\left(\frac{\partial w}{\partial x}\right)_z = \frac{\partial h}{\partial x} = 2x - z$.

Here we differentiate with respect to x while z is being held constant, but y varies (so that the relation $y^2 + xz = 2$ remains valid).

(To see that these partial derivatives are really different, observe that for (x, y, z) = (1, 1, 1), we get $\partial f/\partial x = 2$, but $\partial g/\partial x = 0$ and $\partial h/\partial x = 1$! This is of course because these quantities correspond to scenarios where different quantities are being held constant.)

b) Differentiating $w = x^2 + y^2 + z^2$, we get: dw = 2x dx + 2y dy + 2z dz. Differentiating the constraint equation $y^2 + xz = 2$, we get: z dx + 2y dy + x dz = 0.

Treating x, y as independent variables: $z dx + 2y dy + x dz = 0 \Rightarrow dz = -\frac{z}{x} dx - \frac{2y}{x} dy$. Substituting into dw, we get:

$$dw = 2x dx + 2y dy + 2z \left(-\frac{z}{x} dx - \frac{2y}{x} dy\right) = \left(2x - \frac{2z^2}{x}\right) dx + \left(2y - \frac{4yz}{x}\right) dy.$$

So
$$\left(\frac{\partial w}{\partial x}\right)_y = 2x - \frac{2z^2}{x}$$
 (which is consistent with the formula in (a)).

Next, viewing x, z as independent: $z dx + 2y dy + x dz = 0 \Rightarrow dy = -\frac{z}{2y} dx - \frac{x}{2y} dz$.

Substituting into dw:

$$dw = 2x \, dx + 2y \left(-\frac{z}{2y} \, dx - \frac{x}{2y} \, dz \right) + 2z \, dz = (2x - z) \, dx + (2z - x) \, dz.$$

So
$$\left(\frac{\partial w}{\partial x}\right)_z = 2x - z$$
.

$$\int_0^1 xy\sqrt{x^2+y^2}\,dy = \left[\frac{1}{3}x(x^2+y^2)^{3/2}\right]_0^1 = \frac{1}{3}x(x^2+1)^{3/2} - \frac{1}{3}x^4.$$

So
$$\int_0^1 \int_0^1 xy \sqrt{x^2 + y^2} \, dy \, dx = \frac{1}{3} \int_0^1 x(x^2 + 1)^{3/2} - x^4 \, dx =$$
