$$|\alpha - \frac{a}{b}| \leq \frac{1}{b(n+1)}.$$

⌟

Proof: Consider the $n+1$ numbers

$$0, \alpha, 2\alpha, \ldots, n\alpha \in \mathbb{R}/\mathbb{Z},$$

then there are two of them with distance$\leq \frac{1}{n+1}$. Thus their difference gives such a b. □

Thm. (15.2.4.3) [Dirichlet-Hurewitz]. For any $\alpha \in \mathbb{R} \setminus \mathbb{Q}$, there are infinitely many $\frac{p}{q} \in \mathbb{Q}$ s.t. $|\frac{p}{q} - \alpha| \leq \frac{1}{\sqrt{5}q^2}$. ⌟

Proof: Cf. [G. H. Hardy and E. M. Wright. An introduction to the theory of numbers]Thm194**?**. We prove here for a weaker result:

For $N > 0$, consider the sets $\{\{q\alpha\} | q = 0, \ldots, N\}$, where $\{\beta\}$ are the fractional part of β. Then by pigeonhole principle gives two $0 \leq q_1 < q_2 \leq N$ s.t. $|(q_1 - q_2)\alpha - p| \leq 1/N \leq (q_2 - q_1)$. Let $q = q_2 - q_1$, then $|p/q - \alpha| \leq 1/q^2$. □

Def. (15.2.4.4) [Continued Fractions]. ⌟

Def. (15.2.4.5) [Diophantine Numbers]. For $\mu \in \mathbb{R}_{\geq 2}$, a (C, μ)-**Diophantine number** is a number $\theta \in \mathbb{R}$ s.t. there exists $C \in \mathbb{R}_+$ s.t. for any $p, q \in \mathbb{Z}_+, q \neq 0$,

$$|\theta - \frac{p}{q}| \geq \frac{C}{q^\mu}.$$

And a **badly approximable number** is a $(C, 2)$-Diophantine number for some $C \in \mathbb{R}_+$. ⌟

Prop. (15.2.4.6). $\xi \in \mathbb{R}$ is badly approximable iff the fractional expansion $\xi = [a_0; a_1, a_2, \ldots]$ satisfies $(a_n)_{n\in\mathbb{N}}$ is bounded. ⌟

Proof: Cf.[Distributions Modulo 1]P245. □

Prop. (15.2.4.7) [Approximation and Fractional Expansions]. Let $M \in \mathbb{Z}_+, \kappa, \mu \in [0, 1]$, $A \in \mathbb{R}_+, B \in \mathbb{R}_{>1}$, and $\frac{p}{q}$ is a fractional approximation of κ s.t. $q > 6M$. Let $\varepsilon = ||q\mu|| - M||q\kappa||$, then

- If $\varepsilon > 0$, then there is no solution of the inequality
$$|m\kappa - n + \mu| < AB^{-m}$$
for $m, n \in \mathbb{Z}$ with $\frac{\log(Aq/\varepsilon)}{\log B} \leq m \leq M$.
- (This may apply when $\kappa + \mu$ is close to 1)If $\varepsilon < 1/3$ but $\lfloor q\mu + 0.5 \rfloor = q - p$, then there is no solution of the inequality
$$|m\kappa - n + \mu| < AB^{-m}$$
for $m, n \in \mathbb{Z}$ with $\max(\frac{\log(3Aq)}{\log B}, 1) < m \leq M$.

⌟

Proof: 1: Assume $0 \leq m \leq M$, then
$$|m(q\kappa - p) + (mp - nq) + q\mu| < qAB^{-m},$$
so
$$qAB^{-m} > |mp - nq + q\mu| - m||q\kappa|| \geq ||q\mu|| - M||q\kappa|| = \varepsilon.$$
2: Assume $0 \leq m \leq M$, then
$$|m(q\kappa - p) + (mp - nq + r) + (q\mu - r)| < qAB^{-m},$$
so
$$|mp - nq + r| < qAB^{-m} + ||q\mu|| + M||q\kappa|| < qAB^{-m} + 2/3.$$
If $qAB^{-m} \leq 1/3$, then $mp - nq + r = 0$. But then the hypothesis implies that $m \equiv 1 (\mathrm{mod}\ q)$. As $q > 6M$, this means $m = 1$. □

Higher Degree case

Prop. (15.2.4.8) [Dirichlet-Hurewitz/Davenport-Schmidt]. For $d \in \mathbb{Z}_+$, let $k_d \in [-1, \infty]$ be the supremum of numbers $w \in \mathbb{R}_+$ s.t. for any $\alpha \in \mathbb{R}$ not an algebraic number of degree$\leq d$ and any $\varepsilon \in \mathbb{R}_+$, there exists a constant $C = C(\alpha, \varepsilon)$ s.t. there are inf.m. real algebraic number ξ of degree d satisfying
$$|\alpha - \xi| \leq CH^+(\xi)^{-dk_d+\varepsilon}.$$
Then
- $k_1 = 2$ by(15.2.4.3).
- $k_2 = 3$.
- $k_d \leq d + 1$.

⌟

Proof: 2: One direction is by(15.2.3.4), the other by [Davenport-Schmidt, Approximation to real number by quadratic irrationals]?.
3 follows from(15.2.3.4). □

Prop. (15.2.4.9) [Dirichlet-Hurewitz/Davenport-Schmidt/Roy]. For $d \in \mathbb{Z}_+$, let $k_d \in [-1, \infty]$ be the supremum of numbers $w \in \mathbb{R}_+$ s.t. for any $\alpha \in \mathbb{R}$ not an algebraic integer of degree$\leq d$ and any $\varepsilon \in \mathbb{R}_+$, there exists a constant $C = C(\alpha, \varepsilon)$ s.t. there are inf.m. real algebraic number ξ of degree d satisfying
$$|\alpha - \xi| \leq CH^+(\xi)^{-dk_d+\varepsilon}.$$
Then

- $k_1 = -1$ trivially.
- $k_2 = 3$.
- $k_3 = \frac{3+\sqrt{5}}{2}$.
- $\lfloor \frac{d+1}{2} \rfloor \leq k_d \leq d+1$.

⌟

Proof: 2: One direction is Roth's theorem, the other is [Davenport-Schmidt, Approximation to real number by algebraic integers].

3: [Davenport-Schmidt, Approximation to real number by algebraic integers] and [Approximation by cubic algebraic integers, Roy].

4: (15.2.3.4) and [Davenport-Schmidt, Approximation to real number by algebraic integers] and [Approximation by cubic algebraic integers, Roy]. □

5 Dynamics on $\mathbb{T}^1$

References are [Bug12].

Equidistributions

Thm. (15.2.5.1) [Weyl's Criterion]. Given $n \in \mathbb{Z}_+$ and a sequence $(\underline{x}_n) \in (\mathbb{R}^n)^{\mathbb{Z}_+}$, the following are equivalent:

- $(\underline{x}_n)$ is equidistributed modulo $\mathbb{Z}^n$.
- For any $\mathbb{Z}^n$-periodic function $f \in C(\mathbb{R};\mathbb{C})$,
$$\lim_{N\to\infty} \frac{1}{N} \sum_{n=1}^N f(\underline{x}_n) = \int_{[0,1]^n} f(x)\mathrm{d}x.$$
- For any $h \in \mathbb{Z}^n \setminus 0$,
$$\lim_{N\to\infty} \frac{1}{N} \sum_{n=1}^N e^{2\pi \mathrm{i} \sum_{i=1}^N h_i x_i} = 0.$$

⌟

Proof: 1 and 2 follows easily from the definition of Riemann integration.

2 and 3 follows from the Stone-Weierstrass theorem that the set of trigonometric functions is dense in $\mathrm{C}_{\mathbb{C}}([0,1])$(11.3.8.3). □

Cor. (15.2.5.2). For any $m \in \mathbb{Z}_+$, if $\alpha_1, \ldots, \alpha_m \in \mathbb{R}$ and $\{1, \alpha_1, \ldots, \alpha_n\}$ is linearly independent over $\mathbb{Q}$, then $(n\alpha_1, \ldots, n\alpha_m)_{n\in\mathbb{Z}_+}$ is equidistributed modulo $\mathbb{Z}^m$. ⌟

Proof: The hypothesis implies that for any $h \in \mathbb{Z}^n \setminus 0$, $\sum h_i \alpha_i \notin \mathbb{Q}$. Thus it is easy to see that
$$\lim_{N\to\infty} \frac{1}{N} \sum_{n=1}^N e^{2\pi \mathrm{i} \sum_{i=1}^N h_i x_i} = 0.$$
□

Cor. (15.2.5.3). If $(x_n) \in \mathbb{R}^{\mathbb{Z}_+}$ is a sequence that is equidistributed modulo 1, and $(y_n) \in \mathbb{R}^{\mathbb{Z}_+}$ is a convergent sequence, then $(x_n + y_n)_{n\in\mathbb{Z}_+}$ is also equidistributed modulo 1. ⌟

Thm. (15.2.5.4) [Weyl]. Let $d \in \mathbb{Z}_+$ and $P(X) = a_d X^d + \ldots + a_1 X + a_0 \in \mathbb{R}[X]$ s.t. at least one of $a_1, \ldots, a_d$ is irrational, then the sequence $(P(n))_{n \in \mathbb{Z}_+}$ is equidistributed modulo 1. ⌟

Proof: Cf.[Bug12]P2.**?** □

Prop. (15.2.5.5). Given any sequence $(x_n)_{n \in \mathbb{Z}_+} \in \mathbb{R}^{\mathbb{Z}_+}$ s.t.

$$\liminf_{n \to \infty} (x_{n+1} - x_n) > 0,$$

then for Lebesgue-a.e. $\xi \in \mathbb{R}$, the sequence $(\xi x_n)_{n \in \mathbb{Z}_+}$ is equidistributed modulo 1.

In particular, this is true for $x_n = \alpha^n$ where $\alpha \in \mathbb{R}, |\alpha| > 1$. ⌟

Proof: Cf.[Distribution modulo 1]P6.**?** □

Prop. (15.2.5.6). Given any $\xi \in \mathbb{R}^\times$, then for Lebesgue-a.e. $\alpha \in \mathbb{R}$ with $|\alpha| > 1$, the sequence $(\xi \alpha^n)_{n \in \mathbb{Z}_+}$ is equidistributed modulo 1. ⌟

Proof: Cf.[Distribution modulo 1]P8.**?** □

Discrepency of Distributions

Def. (15.2.5.7)[Discrepancy]. For $N \in \mathbb{Z}_+$ and $x_1, \ldots, x_N \in \mathbb{R}$, the **discrepency** between $x_1, \ldots, x_N$ is defined to be

$$D_N(x_1, \ldots, x_N) \triangleq \sup_{0 \leq u < v \leq 1} \left|\frac{\#\{k \in [N]_+ | \{x_k\} \in [u, v)\}}{N} - (v - u)\right|.$$

⌟

Prop. (15.2.5.8). A sequence $(x_N) \in \mathbb{R}^{\mathbb{Z}_+}$ is equidistributed modulo 1 iff $\lim_{N \to \infty} D_N(x_1, \ldots, x_N) = 0$. ⌟

Proof: This follows from the uniform convergence theorem. □

Prop. (15.2.5.9). For any sequence $(x_N) \in \mathbb{R}^{\mathbb{Z}_+}$, there are infinitely many $N \in \mathbb{Z}_+$ s.t.

$$D_N(x_1, \ldots, x_N) \geq \frac{\log N}{25N}.$$

⌟

Proof: Cf.[Sequences, Discrepancies and Applications] or [Uniform distribution of sequences]. □

Multiplication by Rational Numbers

Prop. (15.2.5.10). If $b \in \mathbb{Z}_{\geq 2}$ and $\xi \in \mathbb{R} \setminus \mathbb{Q}$, the numbers $\{\xi b^n\}_{n \in \mathbb{Z}_+}$ cannot be contained in an interval of length strictly shorter than $1/b$.

And this bound is strict, by considering the Sturmian words(25.7.1.4). ⌟

Proof: Let $\{\xi\} = [0.a_1 a_2 \ldots]_b$, then we may assume that there exists some $l \in [b-2]$ s.t. $a_i \in \{l, l+1\}$ for any $i \in \mathbb{Z}_+$, otherwise it is easy to see that the assertion is true. In this case, by(25.7.1.3), for any $m \in \mathbb{Z}_+$, there exists a sequence W_m of m-blocks s.t. $0 \amalg W_m$ and $1 \amalg W_m$ both appear in the sequence $a_1, a_2, \ldots$. Then this will imply that there exists two $u_m, v_m \in \mathbb{Z}_+$ s.t. $\{\xi b^{u_m}\} - \{\xi b^{v_m}\} > b^{-1} - b^{-m}$. As m can be arbitrarily large, the assertion follows. □

Prop. (15.2.5.11) [Mahler]. For any $\varepsilon \in \mathbb{R}_+$, $p, q \in \mathbb{Z}, p > q \geq 2$, and $\gcd(p,q) = 1$, there exists $N \in \mathbb{Z}_+$ s.t. $||(\frac{p}{q})^n|| \geq 2^{-\varepsilon n}$ for any $n \in \mathbb{Z}_{\geq N}$. ⌟

Proof: ?Cf.[Mah57].

Apply Roth's theorem(15.2.3.7) with $K = \mathbb{Q}, S = \{\infty, 2, 3\}$ with $\alpha_\infty = 1, \alpha_2 = \infty, \alpha_3 = 0$, and $\beta_k = 3^k/n2^k$ with $n = \lceil (\frac{3}{2})^k \rceil$. Then $|\beta - \alpha_2|_2 \leq 2^{-k}, |\beta - \alpha_3|_3 \leq 3^{-k}|n|_3^{-1}$, and $H(\beta_k) = 3^k|n|_3$. Thus Roth's theorem says for any $\varepsilon > 0$,

$$|1 - 3^k/n2^k|_\infty \leq 2^k 3^k |n|_3 (3^k|n|_3)^{-2-\varepsilon}$$

holds for only f.m. k. This implies that $\lceil (\frac{3}{2})^k \rceil - (\frac{3}{2})^k \geq 3^{-\varepsilon k}$ holds for a.e. k. Thus we can apply(15.3.4.13). □

Def. (15.2.5.12) [Mahler's Z-Numbers]. $\xi \in \mathbb{R}_+$ is called a **Mahler's Z-number** if $0 < \{\xi(\frac{3}{2})^n\} < 1/2$ holds for any $n \in \mathbb{Z}_+$. ⌟

Multiplication by Algebraic Numbers

Def. (15.2.5.13)[Pisot and Salem Numbers]. A **Pisot number** is an algebraic number $\alpha \in \overline{\mathbb{Z}} \cap \mathbb{R}_{>1}$ s.t. all the Galois conjugates α_i of α except α itself satisfy $|\alpha_i| < 1$.

A **Salem number** is algebraic number $\alpha \in \overline{\mathbb{Z}} \cap \mathbb{R}_{>1}$ s.t. all the Galois conjugates α_i of α except α itself satisfy $|\alpha_i| \leq 1$, and $|\alpha_i| = 1$ for some i. ⌟

Prop. (15.2.5.14) [Pisot]. Let $\alpha \in \mathbb{R}_{>1}, \xi \in \mathbb{R}^\times$ s.t.

$$\sum_{n \in \mathbb{Z}_+} ||\xi \alpha^n||^2$$

converges, then α is a Pisot number(15.2.5.13), and $\xi \in \mathbb{Q}(\alpha)$. ⌟

Proof: Cf.[Distribution Modulo 1]P16.? □

Thm. (15.2.5.15) [Vijayaraghavan]. Let $\alpha \in \mathbb{R}_{>1}, \xi \in \mathbb{R}^\times$ s.t. $(\{\xi\alpha^n\})_{n \in \mathbb{Z}_+}$ has only f.m. limit points, then α is a Pisot number(15.2.5.13), and $\xi \in \mathbb{Q}(\alpha)$. ⌟

Proof: □

Cor. (15.2.5.16). If $\xi \in \mathbb{R}^\times$ and $p, q \in \mathbb{Z}, p > q \geq 2$, then the sequence $(\{\xi(\frac{p}{q})^n\})$ has infinitely many limit points. ⌟

Prop. (15.2.5.17). If $\alpha \in \mathbb{R}_{\geq 1} \cap \overline{\mathbb{Q}}$ with minimal polynomial $q_d X^d + \ldots + q_1 X + q_0 \in \mathbb{Z}[X]$, and

$$\limsup_{n \to \infty} ||\xi \alpha^n|| < \frac{1}{|q_0| + \ldots + |q_n|},$$

then α is a Pisot or Salem number, and $\xi \in \mathbb{Q}(\alpha)$. ⌟

Proof: □

Prop. (15.2.5.18). For any Salem number $\alpha \in \mathbb{R}$, the sequence $(\alpha^n)_{n \in \mathbb{Z}_+}$ is dense modulo 1, but not equidistributed modulo 1. ⌟

Proof: Cf.[Distributions Modulo 1]P57. □

Prop. (15.2.5.19). If $\alpha \in \mathbb{R}$ is a Pisot or Salem number, then there are infinitely many composite numbers in the sequence $(\lfloor \alpha^n \rfloor)_{n \in \mathbb{Z}_+}$. ⌟

Proof: Cf.[Integer parts of powers of Pisot and Salem numbers]?. □

Littlewood Conjecture

Conj. (15.2.5.20) [Littlewood]. For any $(\xi, \eta) \in \mathbb{R}^2$, $\inf_{q \in \mathbb{Z}_+} q.||q\xi||.||q\eta|| = 0$. ⌟

Proof: □

Conj. (15.2.5.21) [Mixed Littlewood Conjecture, Mathan-Teulié]. For any $p \in \mathbf{P}$ and $\xi \in \mathbb{R}$, $\inf_{q \in \mathbb{Z}_+} q.|q|_p.||q\xi|| = 0$. ⌟

15.3 Diophantine Geometry

References are [Galois Cohomology, Serre]Chap2.4.5, [B-G06], [Fundamentals of Diophantine Geometry, Lang], [Weil50].

Arithmetic of varieties(i.e. varieties over absolutely f.g. fields) that are not necessarily Abelian varieties are studied in this section. The Abelian variety case is studied in Arithmetic of Abelian Varieties.

1 Hilbert's 10-th Problem

Diophantine Sets

Def. (15.3.1.1) [Diophantine Sets]. For $m \in \mathbb{Z}_+$, a subset $E \subset (\mathbb{Z}_+)^m$ is called a **Diophantine set** if there exists $n \in \mathbb{N}$ and a polynomial

$$P(T_1, \ldots, T_m, X_1, \ldots, X_n) \in \mathbb{Z}[T_1, \ldots, T_m, X_1, \ldots, X_n]$$

s.t.

$$(t_1, \ldots, t_m) \in E \iff \exists (x_1, \ldots, x_n) \in \mathbb{Z}^n, P(t_1, \ldots, t_m, x_1, \ldots, x_n) = 0.$$

⌟

Prop. (15.3.1.2). Any Diophantine set is recursively denumerable(2.7.2.7). ⌟

Prop. (15.3.1.3). The class of Diophantine sets contains the level sets of integral polynomials, and is closed under finite direct sums, finite intersections and projections. ⌟

Prop. (15.3.1.4) [Diophantine Sets in $\mathbb{Z}_+$]. $S \subset \mathbb{Z}_+$ is a Diophantine subset iff there exists $n \in \mathbb{Z}_+$ and $P \in \mathbb{Z}[X_1, \ldots, X_n]$ s.t.

$$S = \{m \in \mathbb{Z}_+ | \exists (X_1, X_2, \ldots, X_n) \in \mathbb{Z}^n | P(X_1, \ldots, X_n) = m\}$$

⌟

Proof: One direction is clear. For the other, notice if there exists $n \in \mathbb{N}$ and $Q \in \mathbb{Z}[X_1, \ldots, X_n]$ s.t.

$$S = \{m \in \mathbb{Z}_+ | \exists (X_1, X_2, \ldots, X_n) \in \mathbb{Z}^n | P(m, X_1, \ldots, X_n) = 0\},$$

then take $P(X_0, X_1, \ldots, X_n) = X_0(1 - P^2(X_0, X_1, \ldots, X_n))$. □

Prop. (15.3.1.5) [Examples of Diophantine Sets].

- For $a, n \in \mathbb{Z}_+$, suppose

$$(a + \sqrt{a^2 - 1})^n = x_n(a) + y_n(a)\sqrt{a^2 - 1},$$

  where $x_n(a), y_n(a) \in \mathbb{Z}_+$, then the set $E = \{(y, n, a) \in (\mathbb{Z}_+)^3 | y = y_n(a)\}$ is a Diophantine set.
- The set $E_0 = \{(y, n, a) \in (\mathbb{Z}_+)^3 | y = a^n\}$ is a Diophantine set.
- The set $E = \{(r, k, n) \in (\mathbb{Z}_+)^3 | r = \binom{n}{k}, n \geq k\}$ is a Diophantine set.
- The set $E = \{(m, k) | m = k!\}$ is a Diophantine set.
- The set $E = \{(x, y, p, q, k) | \frac{x}{y} = \binom{p/q}{k}, p > qk\}$ is a Diophantine set.

⌟

Proof: Cf.[Manin, P99].
1: □

Cor. (15.3.1.6) [`Prime` is Diophantine]. `Prime` $\subset \mathbb{Z}_+$ is a Diophantine set. ⌟

Proof: This is because by Wilson's theorem(2.6.3.30), for $p \in \mathbb{Z}_+$, p is a prime iff it is the first coordinate of the following Diophantine equation

$$\{(p, f, a) \in \mathbb{Z}_+ | p = f + 1, \quad q = f!, \quad q - ap = 1\}.$$

□

Thm. (15.3.1.7) [Matiyasevich]. Any recursively denumerable subset of $(\mathbb{Z}_+)^n$ is a Diophantine subset. ⌟

Proof: Cf.[M. Davis, J. Matijasevic, and J. Robinson, Hilbert's 10th Problem. Diophantine equations: Positive aspects of a negative solution, in Mathematical Developments from Hilbert's Problems, F. Browder, ed., American Mathematical Societ, Providence, RI, 1976.] □

Cor. (15.3.1.8) [Hilbert's 10-th Problem, Matiyasevich]. Hilbert's 10-th problems is undecidable/computable/recursive(2.7.2.6). ⌟

Proof: □

Def. (15.3.1.9) [Simple Diophantine Sets]. A **simple Diophantine set** is a Diophantine set $G \subset \mathbb{Z}_+$ s.t. $\mathbb{Z}_+ \setminus G$ is not Diophantine, and for any infinite Diophantine subset $D \subset \mathbb{Z}_+$, $D \cap G \neq \varnothing$. ⌟

Prop. (15.3.1.10). There exists a simple Diophantine set(15.3.1.9). ⌟

Diophantine Coding

Prop. (15.3.1.11) [Cantor Numbering of Tuples]. We can encode the pair of natural numbers in the following way:

$$(0,0), (0,1), (1,0), (0,2), (1,1), (2,0), (0,3), \ldots.$$

Equivalently, the **Cantor numbering** is defined to be

$$\mathrm{Cant}(a, b) = \frac{(a+b)^2 + 3a + b}{2}.$$

And

$$\mathrm{Cant}(a, b) = c \iff \exists y[(a+y)^2 + 3a + y = 2c], \quad \mathrm{Cant}(a, b) = c \iff \exists x[(x+b)^2 + 3x + b = 2c].$$

Similar, for $n \in \mathbb{Z}_+$, we can define numbering for n-tuples inductively as

$$\mathrm{Cant}_1(a_1) = a_1, \quad \mathrm{Cant}_2(a_1, a_2) = \mathrm{Cant}(a_1, a_2), \quad \mathrm{Cant}_{k+1}(a_1, \ldots, a_{k+1}) = \mathrm{Cant}_k(a_1, \ldots, a_{k-1}, \mathrm{Cant}_2(a_k, a_{k+1})).$$

⌟

Unsolvability

Diophantine Forms of Problems

Prop. (15.3.1.12) [Riemann Hypothesis]. For a Diophantine form of the negation of Riemann hypothesis, Cf.[The Riemann Hypothesis and Diophantine Equations]. ⌟

2 Conjectures

Def. (15.3.2.1)[Arithmetic Varieties]. An **arithmetic variety** is a regular scheme that is projective and flat over $\mathbb{Z}$. ⌟

Weak Approximation

Prop. (15.3.2.2). If X is a smooth complete intersection of two quadrics in $\mathbb{P}_F^N$ for $N \geq 5$, and $X(F) \neq \varnothing$, then X satisfies weak approximation. ⌟

Proof: Cf.[Colliot-Thelene-Skorobogatov1987, R-equivalence on cubic bundles of degree 4]. □

Mazur's Conjecture

Conj. (15.3.2.3) [Mazur]. Let $X/\mathbb{Q}$ be a smooth algebraic scheme over a field, then the topological closure of $X(\mathbb{Q})$ in $X(\mathbb{R})$ consist of a finite union of connected components. ⌟

Proof: □

Remark (15.3.2.4). As the kernel of the Brauer-pairing(10.2.6.1) vanishes on all the infinite places, when the Brauer-Manin obstruction is sufficient, Mazur's conjecture holds. ⌟

Artin's Conjecture

Def. (15.3.2.5) [C_d-Fields]. A field K is called C_k or for any homogenous polynomial $F(X_1,\ldots,X_n)$ of degree d with coefficient in K that $d^k < n$ has a non-zero solution in K^n.

C_0 fields are just alg.closed fields, C_1 fields are also called **quasi-algebraically closed**. ⌟

Prop. (15.3.2.6). Algebraic extensions of a quasi-alg.closed field is quasi-alg.closed. ⌟

Proof: For a homogenous polynomial $F(X_1,\ldots,X_n)$, its coefficient lies in a finite extension of K contained in L, so we may assume L/K is finite. Then choose a basis $\{e_1,\ldots,e_m\}$ of L over K, then consider the function

$$f(x_{11},\ldots,x_{1m},\ldots,x_{n1},\ldots,x_{nm}) = \mathrm{Nm}_{L/K}(F(x_{11}e_1+\ldots+x_{1m}e_m,\ldots,x_{n1}e_1+\ldots+x_{nm}e_m)),$$

which is a homogenous polynomial of degree nm with coefficient in K, because it has values all in K. So it has a nonzero solution in K^{nm} by(6.11.2.3), Krull's height theorem and k is alg.closed. □

Prop. (15.3.2.7) [Chevalley-Waring]. Any finite field $\mathbb{F}_q$ is quasi-algebraically closed. In fact, for any system of homogenous polynomials f_i of n variables, if $\sum_{i=1}^r \deg f_i < d$, then the number of solutions to this equation on $\mathbb{F}_q$ is divisible by p, where q is a p-power. ⌟

Proof: The number of solutions to this system is equivalent to

$$\sum_{x\in\mathbb{F}_q^n}\prod(1-f_i^{q-1}(x))$$

modulo p.

But notice that if $i<q-1$, then $\sum_{x\in\mathbb{F}_q}x^i=0$ in $\mathbb{F}_q$ by(2.6.3.25), but as the degree of the highest term of $\sum_{x\in\mathbb{F}_q^n}\prod(1-f_i^{q-1}(x))$ modulo p is smaller than $n(q-1)$, some x_i has power smaller than $q-1$, thus when summed over $\mathbb{F}_q$, it vanishes. □

Remark (15.3.2.8). This may follow from the fact any smooth projective Fano variety over $\mathbb{F}_q$ has a rational point(15.14.6.3). ⌟

Prop. (15.3.2.9) [Tsen]. Algebraic function fields of dimension 1 over an alg.closed field K is quasi-alg.closed. ⌟

Proof: By(15.3.2.6), it suffice to consider the case $K=k(t)$ purely transcendental. for a polynomial F with coefficient in $k(t)$, we can assume it has coefficient in $k[t]$, then let δ be their maximal degree. If substituted with $X_i=\sum_{i=0}^N a_ijt^j$, the function becomes a system of $\delta+dN+1$ homogenous equation with $n(N+1)$ unknowns a_{ij}, since $d<n$, $\delta+dN+1<n(N+1)$ for N large. In this case, □

Prop. (15.3.2.10). If K is quasi-alg.closed, then $H^2(G(K_s/K),K_s^*)=0$. ⌟

Proof: Cf.[Etale Cohomology Fulei 5.7.15]. □

Cor. (15.3.2.11). By this and(15.3.2.6), the condition of(8.7.2.17) are satisfied. So if K is quasi-alg.closed, then $cd(G(K_s/K))\le 1$ and $H^i(G(K_s/K),K_s^*)=0$ for $i\ge 1$. ⌟

Prop. (15.3.2.12) [Ax-Kochen]. For any d, there is a N_d that if $p>N_d$, then any homogenous polynomial $f(X_1,\dots,X_n)$ of degree d with coefficient in $\mathbb{Q}_p$ that $d^k<n$ has a non-zero solution in $\mathbb{Q}_p^n$. ⌟

Proof: The proof uses Model theory.**?** □

3 Rational Points

Congruent Number Problem

Def. (15.3.3.1)[Congruent Numbers]. For $n\in\mathbb{Z}_+$, n is called a **congruent number** if there exists $(x,y,z)\in\mathbb{Q}^2$ s.t. $x^2+y^2=z^2$ and $\frac{xy}{2}=n$.

By(15.3.5.2), this is equivalent to the existence of $(r,s,t)\in\mathbb{Z}_+$ s.t.

$$rs(r^2-s^2)=nt^2.$$

⌟

Prop. (15.3.3.2). For any $n\in\mathbb{Q}_+$, there is a bijection of sets:

$$\{x<y<z\in\mathbb{Q}_+|x^2+y^2=z^2,\frac{xy}{2}=n\}\longleftrightarrow\{a\in\mathbb{Q}|a\in\mathbb{Q}^2,a+n\in\mathbb{Q}^2,a-n\in\mathbb{Q}^2\}$$

given by

$$(x,y,z)\mapsto a=(\frac{z}{2})^2,\quad a\mapsto(\sqrt{a+n}-\sqrt{a-n},\sqrt{a+n}+\sqrt{a-n},2\sqrt{a}).$$

In particular, $n\in\mathbb{Z}_+$ is a congruent number iff there exists $x\in\mathbb{Q}_+$ s.t. $x,x+n,x-n$ are all rational squares. ⌟

Prop. (15.3.3.3) [Congruent Numbers and Elliptic Curves]. For any $n \in \mathbb{Q}_+$, there is a bijection of sets:

$$\{a,b,c \in \mathbb{Q} | a^2+b^2=c^2, \frac{ab}{2}=n\} \longleftrightarrow \{x,y \in \mathbb{Q} | ny^2 = x^3 - x, y \neq 0\}$$

given by

$$(a,b,c) \mapsto a = (-\frac{b}{a+c}, \frac{2}{a+c}), \quad (x,y) \mapsto (\frac{1-x^2}{y}, \frac{-2x}{y}, \frac{1+x^2}{y}).$$

And it can be shown that the elliptic curve $E^{(n)}: ny^2 = x^3 - x$ satisfies

$$E^{(n)}(\mathbb{Q})_{\text{tor}} = \{O, (0,0), (1,0), (-1,0)\}\text{?}.$$

So n is a congruence number iff $\text{rank}(E^{(n)}/\mathbb{Q}) \geq 1$. ⌟

Thm. (15.3.3.4) [Tunnell]. Let $n \in \mathbb{Z}_+$ be square-free, and $a = \begin{cases} 1 & ,2 \nmid n \\ 2 & ,2|n \end{cases}$. Then if n is a congruent number, then

$$\#\{x,y,z \in \mathbb{Z} | \frac{n}{a} = 2ax^2 + y^2 + 8z^2, 2|z\} = \#\{x,y,z \in \mathbb{Z} | \frac{n}{a} = 2ax^2 + y^2 + 8z^2, 2 \nmid z\}$$

And the converse is also true if we assume the rank part of B-S.D. conjecture for the elliptic curve $E^{(n)}/\mathbb{Q}: y^n = x^3 - n^2 x$. ⌟

Proof: □

Cor. (15.3.3.5) [Fibonacci1220/Fermat1640].

- 1, 2, 3 are not a congruent number.
- 5, 6, 7 are congruent numbers.

⌟

Proof: 1: We give a direct proof: If 1 is a congruent number, then by(15.3.3.1), there exists $r, s \in \mathbb{Z}_+$ s.t. $\gcd(r,s) = 1$, $r \not\equiv s (\text{mod } 2)$, and $rs(r-s)(r+s)$ is a square.

Then $r, s, r+s, r-s$ are pairwise coprime, so there exists $x, y, u, v \in \mathbb{Z}_+$ s.t.

$$r = x^2, \quad s = y^2, \quad r+s = u^2, \quad r-s = v^2,$$

and □

Conj. (15.3.3.6) [Congruence Number Problem]. Any $n \in \mathbb{Z}_+$ s.t. $n \equiv 5,6,7 (\text{mod } 8)$ is a congruence number. ⌟

Proof: □

Remark (15.3.3.7). For $n \in \mathbb{Z}_+$ square-free, the L-function of $E^{(n)}$ has root number

$$\varepsilon(n) = \begin{cases} 1 & ,n \equiv 1,2,3 (\text{mod } 8) \\ -1 & ,n \equiv 5,6,7 (\text{mod } 8) \end{cases}, \quad N(n) = \begin{cases} 32n^2 & ,2 \nmid n \\ 16n^2 & ,2|n \end{cases}.$$

In particular, the parity conjecture of B-S.D implies the congruence number problem(15.3.3.6). ⌟

Proof: □

Conj. (15.3.3.8).

$$\lim_{X \to \infty} \frac{\#\{n \in \mathbb{Z}_+ | n \equiv 1,2,3 (\text{mod } 8) \ \& \ n \text{ is congruent}\} \cap [1,X]}{\#\{n \in \mathbb{Z}_+ | n \equiv 1,2,3 (\text{mod } 8)\} \cap [1,X]} = 0.$$

⌟

4 Integral Points

Simple Cases

Thm. (15.3.4.1) [Pell's Equations]. A **Pell's equation** is a Diophantine equation of the form

$$\{x, y \in \mathbb{Z}_+ | x^2 - dy^2 = N\}$$

where $d \in \mathbb{Z}_+ \setminus (\mathbb{Z}_+)^2$ and $N \in \mathbb{Z}^\times$.

- For $N = 1$, there exists a solution (x_0, y_0) s.t. every solution (x, y) satisfies $(x + \sqrt{d}y) = (x_0 + \sqrt{d}y_0)^k$ for some $k \in \mathbb{Z}_+$. Such a (x_0, y_0) is called a **fundamental solution**.
- In general, if (x_0, y_0) is any solution to the equation for $x^2 - dy^2 = 1$, then every solution (x, y) for $x^2 - dy^2 = N$ satisfies $(x + \sqrt{d}y) = (x' + \sqrt{d}y')(x_0 + \sqrt{d}y_0)^k$ for some $k \in \mathbb{N}$, where $x', y' \in \mathbb{Z}$, and

$$(x')^2 - d(y')^2 = N, \quad |x'| \le \frac{\sqrt{|N|}(\sqrt{u_0} + \sqrt{u_0}^{-1})}{2}, \quad |y'| \le \frac{\sqrt{|N|}(\sqrt{u_0} + \sqrt{u_0}^{-1})}{2\sqrt{|d|}}, \quad u_0 = x_0 + \sqrt{d}y_0.$$

Moreover, if $N > 0$, we even can restrict to $|y'| \le \frac{\sqrt{|N|}(\sqrt{u_0} - \sqrt{u_0}^{-1})}{2\sqrt{|d|}}$ And if $N < 0$, then $y' > 0$. ⌟

Proof: 1: If $N = 1$, then the solutions of this equations are a subgroup of group of units in $\mathcal{O}_{\mathbb{Q}(\sqrt{d})}$. It follows from unit theorem that the group of units in $\mathcal{O}_{\mathbb{Q}(\sqrt{d})}$ is isomorphic to $\{\pm 1\} \times \mathbb{Z}$. So because we are restricted to the case that $x, y \in \mathbb{Z}_+$, it follows that the group of solutions is isomorphic to $\mathbb{Z}_+$, and it in fact generated by a single minimal solution (x_0, y_0).

2: We use the regulator map

$$\mathrm{Reg} : \mathbb{Q}(\sqrt{d})^\times \to \mathbb{R}^2 : u \mapsto (\log u, \log \sigma(u)),$$

where σ is the non-trivial element of $\mathrm{Gal}(\mathbb{Q}(\sqrt{d})/\mathbb{Q})$. Then $\mathrm{Reg}(u_0) = \log(u_0)(1, -1)$, which is linearly independent to $(1, 1)$. Thus for any solution (x, y), there exists $c_1, c_2 \in \mathbb{R}$ s.t.

$$L(x + \sqrt{d}y) = c_1(1, 1) + c_2 L(u_0).$$

In particular, $c_1 = \frac{\log |x + \sqrt{d}y| + \log |x - \sqrt{d}y|}{2} = \frac{\log |N|}{2}$. And we can find $k \in \mathbb{Z}$ s.t. $c_2 = k + \delta$ with $|\delta| \le 1/2$. Therefore if $x' + \sqrt{d}y' = (x + \sqrt{d}y)(x_0 - \sqrt{d}y_0)^{-k}$, then

$$\max(\log |x' + \sqrt{d}y'|, \log |x' - \sqrt{d}y'|) \le \log \sqrt{|N| u_0}.$$

From which we can get the desired bound on x', y'. Finally, notice the hypothesis $x, y \in \mathbb{Z}_+$ implies that we can assume $k \ge 0$. □

Diophantine Sequences

Def. (15.3.4.2) [Diophantine Sequences]. For $m \in \mathbb{Z}_+$, a sequence of positive integers $a_1 \le a_2 \le \ldots \le a_m \in \mathbb{Z}_+$ is called a **Diophantine sequence** of length m if for any $1 \le i < j \le m$,

$$a_i a_j + 1 \in (\mathbb{Z}_+)^2.$$

⌟

Conj. (15.3.4.3). Every Diophantine sequence of length 3 can be extended to a Diophantine quadruple: If (a,b,c) is a Diophantine triple,

$$ab+1=r^2, \quad ac+1=s^2, \quad bc+1=t^2, \quad a,b,c,r,s,t\in\mathbb{Z}_+,$$

then (a,b,c,d) is a Diophantine quadruple where $d=a+b+c+2abc\pm 2rst$.

Then it is conjectured that these are the only two ways of extension. ⌟

Proof: For example,

$$(at\pm rs)^2-1=a^2(bc+1)+(ac+1)(ab+1)\pm 2arst-1=a(a+b+c+2abc\pm 2rst).$$

For the conjecture,? □

Thm. (15.3.4.4) [Baker-Davenport/Kedlaya/Dujella-Pethö].

- If $\{1,3,c\}$ is a Diophantine triple, then there exists $k\in\mathbb{Z}_+$ s.t.

$$c=c_k=\frac{1}{6}[(2+\sqrt{3})(7+4\sqrt{3})^k+(2-\sqrt{3})(7-4\sqrt{3})^k-4].$$

  Notice $c_0=0, c_1=8, c_2=120$.
- $(1,3,c,d)$ is a Diophantine quadruple iff $\{c,d\}=\{c_k,c_{k+1}\}$ for some $k\in\mathbb{Z}_+$.

⌟

Proof: 1:

2: Given item1, it suffices to show that if $k\in\mathbb{Z}_+$, the set of equations

$$\{d,x,y,z\in\mathbb{Z}_+|d+1=x^2, \quad 3d+1=y^2, \quad c_kd+1=z^2\}$$

has only solutions $d\in\{c_{k-1},c_{k+1}\}$.

It's equivalent to solve the Pell'e equation set:

$$\{z^2-c_kx^2=1-c_k, \quad 3z^2-c_ky^2=3-c_k\}.$$

We first prove for $k=1$:

Lemma (15.3.4.5) [The $k=1$ case, Baker-Davenport]. $(1,3,8,d)$ is a Diophantine sequence iff $d=120$. ⌟

Proof: If $(1,3,8,n)$ is a Diophantine sequence, then $n=x^2-1$ for some $x\in\mathbb{Z}_+$. Then there exists $y,z\in\mathbb{Z}_+$ s.t.

$$\{3x^2-2=y^2, \quad 8x^2-7=z^2\}.$$

Thus it suffices to show that such a set of equations has solutions in $\mathbb{Z}_+$ iff $x\in\{1,11\}$.

First, by(15.3.4.1), we can show that positive integral solutions to $y^2-3x^2=-2$ are all of the form

$$y+\sqrt{3}x=(1+\sqrt{3})(2+\sqrt{3})^m, \quad m\in\mathbb{N},$$

thus

$$x=\frac{1+\sqrt{3}}{2\sqrt{3}}(2+\sqrt{3})^m-\frac{1-\sqrt{3}}{2\sqrt{3}}(2-\sqrt{3})^m.$$

If $m=0, x=1$, and if $m=2$, $x=11$.

Similarly, positive integral solutions to $z^2 - 8x^2 = -7$ are all of the form

$$z + \sqrt{8}x = (1+\sqrt{8})(3+\sqrt{8})^n, \quad n \in \mathbb{N}$$

or

$$z + \sqrt{8}x = (5+2\sqrt{8})(3+\sqrt{8})^n = (-1+\sqrt{8})(3+\sqrt{8})^{n+1}, \quad n \in \mathbb{N},$$

thus

$$x = \frac{1+\sqrt{8}}{2\sqrt{8}}(3+\sqrt{8})^n - \frac{1-\sqrt{8}}{2\sqrt{8}}(3-\sqrt{8})^n$$

or

$$x = \frac{-1+\sqrt{8}}{2\sqrt{8}}(3+\sqrt{8})^n - \frac{-1-\sqrt{8}}{2\sqrt{8}}(3-\sqrt{8})^n.$$

Let $P = \frac{1+\sqrt{3}}{2\sqrt{3}}(2+\sqrt{3})^m, m \geq 3$ and $Q = \frac{1+\sqrt{8}}{2\sqrt{8}}(3+\sqrt{8})^n$ or $Q = \frac{-1+\sqrt{8}}{2\sqrt{8}}(3+\sqrt{8})^n$, then we want a solution to

$$P + \frac{2}{3P} = Q + \frac{7}{8Q}.$$

For any such solution, $P > 80$, and

$$P - Q > \frac{2}{3P} - \frac{2}{3Q} = \frac{2(P-Q)}{PQ},$$

so $P > Q$. And also $Q > P - \frac{7}{8Q} > P - \frac{7}{8}$, so

$$P - Q = \frac{7}{8Q} - \frac{2}{3P} < \frac{7}{8(P-\frac{7}{8})} - \frac{2}{3P} < \frac{1}{4P}.$$

Thus

$$0 < \log\frac{P}{Q} < -\log(1 - \frac{1}{4P^2}) < \frac{1}{4P^2} + \frac{1}{16P^4} < 0.26P^{-2},$$

which means that

$$0 < m\log(2+\sqrt{3}) - n\log(3+\sqrt{8}) + \log\frac{(1+\sqrt{3})\sqrt{8}}{(\pm 1+\sqrt{8})\sqrt{3}} < 0.26P^{-2} < \frac{0.11}{(2+\sqrt{3})^{2m}}.$$

Then it follows from Baker's theory(14.7.1.11) that $m < 10^{40}$.
Finally, using(15.2.4.7) twice, it can be shown that no such $m \geq 3$ exists(Cf. [B-D69]). □

After this, assume k is the smallest natural number s.t. the assertion is wrong. Then $k \geq 2$ because $k = 1$ is true by the above lemma(15.3.4.5). Fix $c = c_k \geq 120$. The hypothesis implies that there exists $s, t \in \mathbb{Z}_+$ s.t. $c + 1 = s^2, 3c + 1 = t^2$. So Neither c nor $3c$ is a square. Then it follows from(15.3.4.1) that there exists $z', x' \in \mathbb{Z}, m \in \mathbb{N}, z'', y'' \in \mathbb{Z}, n \in \mathbb{N}$ s.t.

$$z + x\sqrt{c} = (z' + x'\sqrt{c})(s+\sqrt{c})^m, \quad z\sqrt{3} + y\sqrt{c} = (z''\sqrt{3} + y''\sqrt{c})(t + \sqrt{3c})^n,$$

and

$$|z'| \leq \sqrt{c-1}\frac{\sqrt{s+\sqrt{c}} + \sqrt{s+\sqrt{c}}}{2}^{-1} < \sqrt{c}\frac{\sqrt{2s+3}}{2} < \frac{c}{4},$$

$$|z''| \le \sqrt{3(c-3)} \frac{\sqrt{t+\sqrt{3c}} + \sqrt{t+\sqrt{3c}}}{6}^{-1} < \sqrt{t^2-10} \frac{\sqrt{2t+3}}{6} < \frac{c}{6}.$$

If we define sequences

$$\{v_p| : v_0 = z', v_1 = sz' + cx', v_{p+2} = 2sv_{p+1} - v_p\},$$

$$\{w_q| : w_0 = z'', w_1 = tz'' + cx'', w_{q+2} = 2tw_{q+1} - w_q\},$$

then $z = v_m = w_n$. Moreover, we can use induction to show that

$$v_{2p} \equiv z' + 2c(p^2 z' + psx')(\text{mod } c^2), \quad v_{2p+1} \equiv sz' + c[2p(p+1)sz' + (2p+1)x'](\text{mod } c^2), \quad p \in \mathbb{N}.$$

$$w_{2q} \equiv z'' + 2c(3q^2 z'' + qty'')(\text{mod } c^2), \quad w_{2q+1} \equiv tz'' + c[6q(q+1)tz'' + (2q+1)y''](\text{mod } c^2), \quad q \in \mathbb{N}.$$

Then we claim:

Lemma (15.3.4.6). Let $k \in \mathbb{Z}_{\ge 2}$ be the minimal number s.t. there exists $t \in \mathbb{Z}_+$ s.t. $(1, 3, c_k, c_t)$ is a Diophantine sequence, then with $c = c_k$,

- If $v_{2m} = w_{2n}$ has a solution, then $z' = z'' = \pm 1$.
- If $v_{2m+1} = w_{2n}$ has a solution, then $z'' = sz' = \pm s$.
- If $v_{2m} = w_{2n+1}$ has a solution, then $z' = tz'' = \pm t$.
- If $v_{2m+1} = w_{2n+1}$ has a solution, then $z'/t = z''/s = \pm 1$.

⌟

Proof: Cf.[D-P98]P294.? Use minimality of k. □

After this, it is easy to show that $v_{2m} = w_{2n+1}$ or $v_{2m+1} = w_{2n}$ has no solutions by parity reason(notice c is even). For the next two cases:

Lemma (15.3.4.7).

- If $v_{2m} = w_{2n}$, then

$$0 < 2m \log(s + \sqrt{c}) - 2n \log(t + \sqrt{3c}) + \log \frac{\sqrt{3}(\sqrt{c} \pm 1)}{\sqrt{c} \pm \sqrt{3}} < \frac{3}{2}(s + \sqrt{c})^{-4m}.$$

- If $v_{2m+1} = w_{2n+1}$, then

$$0 < (2m+1) \log(s + \sqrt{c}) - (2n+1) \log(t + \sqrt{3c}) + \log \frac{\sqrt{3}(2\sqrt{c} \pm t)}{2\sqrt{c} \pm s\sqrt{3}} < 22(s + \sqrt{c})^{-4m-2}.$$

In particular, in both cases, $m \ge n$. ⌟

Proof: Cf.[D-P98]P298.? The derivation is similar to the $k = 1$ case. □

Cor. (15.3.4.8).

- If $v_{2m} = w_{2n}$, and $m, n \neq 0$, then $n > 0.105\sqrt{c}$.
- If $v_{2m+1} = w_{2n+1}$, and $m, n \neq 0$, then $n > 0.156\sqrt[4]{c}$.

⌟

Proof: Cf.[D-P98]P300.? □

Then it follows from(15.3.4.7) and Baker's theory(14.7.1.11) that if $v_{2m} = w_{2n}$, then

$$\frac{3}{2}m \log c < 3.822 \cdot 10^{15} \cdot 0.33 \log c \cdot 0.38 \log c \cdot 0.64 \log c \cdot \log(2m),$$

thus

$$\frac{m}{\log(2m)} < 2.045 \cdot 10^{14} (\log c)^2.$$

Combining(15.3.4.8), we get

$$m < 2.045 \cdot 10^{14} \log(2m)[\log(91m^2)]^2,$$

which implies $m < 9 \cdot 10^{19}$ and so $c < 8 \cdot 10^{41}$ and $k \leq 36$.

Similarly, if $v_{2m+1} = w_{2n+1}$, then

$$2m \log c < 3.822 \cdot 10^{15} \cdot 0.33 \log c \cdot 0.38 \log c \cdot 0.73 \log c \cdot \log(2m+1),$$

thus

$$\frac{m}{\log(2m+1)} < 1.75 \cdot 10^{14} (\log c)^2.$$

Combining(15.3.4.8), we get

$$m < 1.75 \cdot 10^{14} \log(2m+1)[\log(1689m^4)]^2,$$

which implies $m < 4 \cdot 10^{20}$ and so $c < 5 \cdot 10^{85}$ and $k \leq 75$.

So to complete the proof, it suffices to show that:

Lemma (15.3.4.9).

- For $k \leq 36$, the equation $v_{2m} = w_{2n}$ with $0 \leq n \leq m < 9 \cdot 10^{19}$ has only one solution $m = n = 0$.
- For $k \leq 75$, the equation $v_{2m+1} = w_{2n+1}$ with $0 \leq n \leq m < 4 \cdot 10^{20}$ has only one solution $m = n = 0$(in which case $z = 2c \pm st$, corresponding to $d = c_{k\pm 1}$, in view of(15.3.4.3)). ⌟

Proof: Use(15.2.4.7) twice, wich $M = 9 \cdot 10^{19}$ and $M = 9$. Cf.[D-P98]P303. □
□

Thm. (15.3.4.10) [Bo-Alain-Volker]. There are no Diophantine sequences of length 5. ⌟

Proof: Cf.[There is no Diophantine quintuple. (English summary) Trans. Amer. Math. Soc. 371 (2019), no. 9, 6665–6709.] □

Waring's Problem

Def. (15.3.4.11) [Waring's Problem]. For $k \geq 1$, let $g(k) \in \mathbb{Z}_+$ be the smallest number s.t. every positive integer is a sum of at most $g(k)$ positive k-th powers. ⌟

Prop. (15.3.4.12). Situation as in(15.3.4.11), $g(k) \geq \lfloor 2^k \rfloor + \lfloor (\frac{3}{2})^k \rfloor - 2$. ⌟

Proof: This is because the number $\lfloor (\frac{3}{2})^k \rfloor 2^k - 1$ requires $\lfloor (\frac{3}{2})^k \rfloor - 1$ powers 2^k and $2^k - 1$ powers 1^k. □

Prop. (15.3.4.13) [Dickson-Niven-Pillai-Rubugunday]. Situation as in(15.3.4.11),

$$g(k) = \begin{cases} 2^k + \lfloor (\frac{3}{2})^k \rfloor - 2, & \lceil (\frac{3}{2})^k \rceil - (\frac{3}{2})^k \geq (\frac{3}{4})^k \\ ?, & \text{otherwise} \end{cases}.$$

In particular, $g(1) = 1, g(2) = 4, g(3) = 9, g(4) = 19$. ⌟

Proof: ? □

Conj. (15.3.4.14) [Mahler]. Situation as in(15.3.4.11), $g(k) = 2^k + \lfloor (\frac{3}{2})^k \rfloor - 2$ any k. ⌟

Proof: □

Thm& Conj.Cor. (15.3.4.15). By(15.2.5.11), this is true for k sufficiently large. But it is not known for how large k this is true, eventually due to the ineffectiveness of the proof of Roth's theorem(15.2.3.7). ⌟

Siegel's Theorem

References are [C-Z02] and [Sie35].

Thm. (15.3.4.16) [Siegel]. If $F \in$ `NField` and $C/F \subset \mathbb{A}^n_F$ is an affine curve with normalization C_{sm}, and let $\overline{C}$ be the completion of C_{sm}. Suppose $g(\overline{C}) > 0$ or $\#\widetilde{C} \backslash C_{\mathrm{sm}} \geq 3$, then for any $\Sigma^\infty_F \subset_{\mathrm{fin}} S \subset \Sigma_F$, $\#C(\mathcal{O}_{F,S}) < \infty$. ⌟

Proof: Firstly, it suffices to prove for C smooth: As the normalization is finite and birational(6.4.2.7), by omitting f.m. points, we may assume that all rational points of C lift to rational points of C. Moreover, if $\Gamma(C_{\mathrm{sm}}) = \Gamma(C)[f_1, \ldots, f_r]$, where f_i are integral over C_{sm}. We can enlarge S s.t. C has an integral model over $\mathcal{O}_{F,S}$, and each f_i is integral over $\Gamma(C/\mathcal{O}_{F,S})$. Then each $\mathcal{O}_{F,S}$-points of C lifts to C_{sm}, and the assertion reduces to C_{sm}.

For $g(\overline{C}) \geq 2$, this is a special case of Faltings' Theorem(15.14.8.2).

For $g = 1$, the assertion follows from(15.11.7.2).

For $g = 0$, then $\#\widetilde{C} \setminus C_{\mathrm{sm}} \geq 3$(in fact, any other cases can be reduced to the case $\#\widetilde{C} \setminus C_{\mathrm{sm}} \geq 3$, Cf.[B-G06]P184.) Then ?

5 Ternary Diophantine Equations

Def. (15.3.5.1) [Ternary Diophantine Equations]. A **ternary diophantine equation** is a Diophantine equation of the form

$$\{x, y, z \in \mathbb{Z} | Ax^p + By^q = Cz^r\}$$

where $A, B, C \in \mathbb{Z}^\times$. A **non-trivial solution** is a solution that $xyz \neq 0$. A **primitive solution** is a solution s.t. $\gcd(x, y, z) = 1$. ⌟

Prop. (15.3.5.2) [Pythagorean Triples]. A triple $(x, y, z) \in \mathbb{Z}^3$ s.t. $\gcd(x, y, z) = 1$ and $x^2 + y^2 = z^2$ is called a **Pythagorean triple**. Then for any $a > b \in \mathbb{Z}_+$ s.t. $\gcd(a, b) = 1$ and $a \not\equiv b \pmod 2$,

$$(x, y, z) = (a^2 - b^2, 2ab, a^2 + b^2)$$

is a Pythagorean triple. Conversely, any Pythagorean triple is of this form(after possibly switching x and y). ⌟

Proof: It is easy to verify that $(a^2 - b^2, 2ab, a^2 + b^2)$ is a Pythagorean triple. Conversely, for a Pythagorean triple (x, y, z), we may assume $y \neq 2$, and $y^2 = (z-x)(z+x)$. Notice $\gcd(z-x, z+x)|2$, but $2 \nmid y$, so $\gcd(z - x, z + x) = 1$. Thus there exists $r, s \in \mathbb{Z}_+$ s.t.

$$z + x = r^2, z - x = s^2.$$

Then $r \equiv s \pmod 2$. Denote $a = \frac{r+s}{2}, b = \frac{r-s}{2} \in \mathbb{Z}$, then $z = \frac{r^2+s^2}{2} = a^2 + b^2, x = \frac{r^2-s^2}{2} = 2ab$, and $y = rs = a^2 - b^2$. □

Def. (15.3.5.3) [Frey's Curve]. Let $a, b, c \in \mathbb{Z}$ satisfy $a^p + b^p = c^p, p \geq 3 \in \mathbf{P}, abc \neq 0$, the **Frey curve** for a, b, c is the elliptic curve $E_{a^p,b^p,c^p} \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ define by the Weierstrass equation

$$W_{a^p,b^p,c^p} : y^2 = x(x + a^p)(x - b^p).$$

Then it satisfies:

- $\mathfrak{D}_{W_{a^p,b^p,c^p}} = 16a^{2p}b^{2p}(a^p + b^p)^2 = 16(abc)^{2p}$.
- $\Delta^{\min}_{E_{a^p,b^p,c^p}/\mathbb{Q}}$ satisfies $\Delta^{\min}_{a^p,b^p,c^p} \geq \frac{|abc|^{2p}}{2^8}$ by(15.11.4.25).

⌟

Prop. (15.3.5.4) [Galois Representation of Frey's Curve]. Let $\rho_{a^p,b^p,c^p} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{GL}(2, \mathbb{F}_p)$ be the mod p Galois representation of $\mathrm{Gal}_\mathbb{Q}$ corresponding to the Frey's curve E_{a^p,b^p,c^p}(15.3.5.3), and let $\overline{\rho}_{a^p,b^p,c^p}$ be its reduction modulo p. Suppose that $a \equiv -1 \pmod 4$ and $2|b$, then

- $\overline{\rho}_{a^p,b^p,c^p}$ is absolutely irreducible.
- $\overline{\rho}_{a^p,b^p,c^p}$ is odd.
- $\overline{\rho}_{a^p,b^p,c^p}$ is unramified outside $2p$, flat at p, and semistable at 2**?**.

⌟

Proof: **?** Cf.[Serre, Galois representations arising from Modular Forms]Section4.1.. □

Remark (15.3.5.5). One suspects that such a Galois representation doesn't even exist. ⌟

Thm. (15.3.5.6) [Fermat's Last Theorem, Ribet/Wiles-Taylor]. If $p \geq 5 \in \mathbf{P}$, then there are no integral solution to the equation $a^p + b^p = c^p$. ⌟

Proof: If there exists an integral solution s.t. $abc \neq 0$, consider the Frey's curve E_{a^p,b^p,c^p}(15.3.5.3), then by(15.3.5.4), $\overline{\rho}_{a^p,b^p,c^p}$ is absolutely irreducible, odd and unramified outside $2p$, and flat at p.

Then it follows from modularity conjecture(19.4.2.6) that ρ_{a^p,b^p,c^p} is attached to some newform $f \in S_2(\Gamma_0(2p))$. Then it follows from Ribet's theorem(20.9.1.7) that $\overline{\rho}_{a^p,b^p,c^p} = \overline{\rho}_{g,p}$ for some newform $g \in S_2(\Gamma_0(2))$. But there is no cuspidal form of level $\Gamma_0(2)$ and weight 2 because $X_0(2) = \mathbb{P}^1$, and $H^0(\mathbb{P}^1, \Omega^1_{\mathbb{P}^1}) = 0$, contradiction. □

Remark (15.3.5.7) [Szpiro's Conjecture and Fermat's Last Theorem]. The Szpiro's conjecture(15.7.12.17) implies Fermat's last theorem for sufficiently large n(depending on the effectiveness of Szpiro's conjecture). ⌟

Proof: Let $a, b, c \in \mathbb{Z}$ satisfy $a^n + b^n = c^n, n \geq 2, abc \neq 0$, the conductor $N_{a,b,c}$ of the Frey's curve(15.3.5.3) $E_{a,b,c}$ satisfies $N_{a,b,c} \leq 2^8(abc)$ by(15.11.4.25). Szpiro's conjecture implies

$$\frac{|abc|^{2n}}{2^8} \leq |\Delta^{\min}_{a,b,c}| \leq \kappa_1 N_E^7 \leq 2^{56}\kappa_1|abc|^7,$$

so $|abc|^{2n-7} \leq 2^{64}\kappa$. As $|abc| \geq 2$, this gives an upper bound for n. □

Prop. (15.3.5.8) [Fermat's Equation in Function Case]. If $n \geq 2$, then any non-trivial solutions to the equation in $\mathbb{C}[T]$ of

$$X^n + Y^n = Z^n$$

are of the form $n = 2, X = (a^2 - b^2)/2, Y = ab, Z = (a^2 + b^2)/2$, where $a, b, c \in \mathbb{C}[T]$. ⌟

Proof: The $n = 2$ case is easy. If $n > 2$, we show there are no non-trivial solutions: Differentiate it to get:

$$X^{n-1}X' + Y^{n-1}Y' = Z^{n-1}Z',$$

And cancelling X^{n-1}, we get

$$Y^{n-1}(X'Y - Y'X) = Z^{n-1}(X'Z - Z'X).$$

Now $X'Z - Z'X \neq 0$ because X, Z are not linearly equivalent, and Y, Z is coprime, so $Y^{n-1} | X'Z - Z'X$. But then if we assume $\dim Y \geq \dim X$, then $(n-1)\dim Y \leq 2\dim Y - 1$, which implies $n \leq 2$, contradiction. □

Prop. (15.3.5.9) [Darmon].

- For $n \in \mathbb{Z}_{\geq 3}$, the equation $\{x, y, z \in \mathbb{Z} | x^n + y^n = 2z^n\}$ has no non-trivial primitive solution.
- For $n \in \mathbb{Z}_{\geq 4}$, the equation $\{x, y, z \in \mathbb{Z} | x^n + y^n = z^2\}$ has no non-trivial primitive solution.
- For $n \in \mathbb{Z}_{\geq 3}$, the equation $\{x, y, z \in \mathbb{Z} | x^n + y^n = z^3\}$ has no non-trivial primitive solution.

⌟

Proof:

2: The case $n = 4$ is proved by Fermat. The case $n = 5, 6, 9$ is proved by [Poonen, Some diophantine equations of the form]. Thus it suffices to prove the case $n = p \in \mathbf{P}_{\geq 7}$. If $2|ab$, assume $2|a$, and $c \equiv 1 (\mathrm{mod}\ 4)$. And if $2 \nmid ab$, by replacing c with $-c$ if necessary, we can assume $a \equiv -1 (\mathrm{mod}\ 4)$. Then consider the Frey curve $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ given by the Weierstrass equation

The case $n = 4$ is proved by Lucas [Theory of Numbers, Dickson]P630. The case $n = 5$ is proved by [Poonen, Some diophantine equation of the form]. □

Prop. (15.3.5.10) [Darmon]. For $p \in \mathbf{P}_{\geq 11}$, the ternary Diophantine equation

$$\{x, y, z \in \mathbb{Z} | x^4 - y^4 = z^p\}$$

has no non-trivial primitive solution s.t. $z \in 2\mathbb{Z}$. And it has no non-trivial primitive solution if $p \equiv 1 (\mathrm{mod}\ 4)$. ⌟

Proof: Let (a, b, c) be a solution of this equation. If c is odd, we can assume a is odd and b is even(otherwise change c to $-c$). Then $a - b, a + b, a^2 + b^2$ are all p-th powers up to powers of 2. Consider the Frey curve $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ given by the Weierstrass equation

$$W : y^2 = x(x + (a + b)^2)(x - (a - b)^2) = x^3 + 4abx^2 - (a^2 - b^2)^2 x.$$

Then

$$j(E) = 2^6 \frac{(a^2 + 3b^2)^3 (3a^2 + b^2)^3}{c^{2p}(a^2 - b^2)^3}, \mathfrak{D} = 2^6 c^{2p} (a^2 - b^2)^2.$$

Then the conductor N_E of E can be calculated by Tate's algorithm**?**.

$$\mathrm{ord}_p(N_E) = \begin{cases} 1 & , p | c \\ 0 & , p \neq 2, p \nmid c \\ 5 & , p = 2, 2 \nmid c \end{cases}.$$

By a result of Mazur**?**, $\overline{\rho}_{E,2}$ is irreducible, and by [Serre, Sur les repr´esentations modulaires de degre 2 de Gal$(\overline{\mathbb{Q}}/\mathbb{Q})$], ρ is unramified outside $2p$, and is finite at p. □

6 Unlikely Intersections

Def. (15.3.6.1) [Unlikely Intersections]. Let $S \in \mathcal{V}\mathrm{ar}^{\mathrm{sm}}/k$, and X, Y be irreducible subvarieties of S. Then an **atypical component** of $X \cap Y$ is a connected component $T \subset X \cap Y$ s.t. $\dim T > \dim X + \dim Y - \dim S$. ⌟

Conj. (15.3.6.2) [Zilber Conjecture on Intersecting with Tori]. Let $g \in \mathbb{Z}_+, S = \mathbb{G}_{m,\mathbb{C}}^g$. For any irreducible subvariety $X \subset S$, denote $X^{\mathrm{atyp}} \subset X$ to be the union of atypical components of $X \cap T$ where $T \subset S$ is an algebraic group. Then X^{atyp} is Zariski-closed. Equivalently, if X is not contained in a proper subvariety of S, then $X^{\mathrm{atyp}} \subset X$ is not Zariski dense in X. ⌟

Proof: □

Remark (15.3.6.3). Zilber's conjecture over $\overline{\mathbb{Q}}$ is equivalent to Zilber's conjecture over $\mathbb{C}$.**?**

⌟

Pila's Work

References are [P-W06].

Def. (15.3.6.4) [Algebraic and Transcendental Parts]. For $n \in \mathbb{Z}_+, X \subset \mathbb{R}^n$, the **algebraic part of** X is defined to be the union of all semi-algebraic subset of $\mathbb{R}^n$ contained in X, denoted by X^{alg}. And the **transcendental part** of X is defined to be $X^{\mathrm{trans}} = X \setminus X^{\mathrm{alg}}$. ⌟

Prop. (15.3.6.5)[Bombieri-Pila]. Let $f \in C([0,1])$ be a non-algebraic real-analytic function, then for any $\varepsilon \in \mathbb{R}_+$, there exists $C(f,\varepsilon) \in \mathbb{R}_+$ s.t.

$$\#\{x \in \Gamma(f) \cap \mathbb{Q}^2 | H(x) \leq H\} \leq C(f,\varepsilon)H^\varepsilon.$$

⌟

Proof: Cf.[P-W06]**?** □

Thm. (15.3.6.6)[Pila-Wilkie]. Let $X \subset \mathbb{R}^n$ be o-minimal definable, then for any $\varepsilon \in \mathbb{R}_+$, there exists $C(X,\varepsilon) \in \mathbb{R}_+$ s.t.

$$\#\{x \in X \cap \mathbb{Q}^2 | H(x) \leq H\} \leq C(X,\varepsilon)H^\varepsilon.$$

- Use notations from p-adic Analysis.

⌟

1 over p-adic Number Fields

Notation (15.4.1.1).
- Let $(K, \mathcal{O}_K, k) \in p$-`NField`.

⌟

Prop. (15.4.1.2). If $G \in \mathcal{S}\mathrm{ch}^{\mathrm{ft}} / \mathcal{O}_F$, then $G(\mathcal{O}_F)$ is compact. ⌟

Prop. (15.4.1.3). If G is a reductive group over K, then $\mathcal{G}(\mathcal{O}_K)$ is a maximal compact subgroup of $G(K)$. ⌟

Proof:

Prop. (15.4.1.4) [Reductive Groups are Unimodular]. If G/K is a reductive group, then $G(K)$ is unimodular. ⌟

Proof: □

□

Cor. (15.4.1.5). $GL(n, \mathcal{O}_F)$ is a maximal compact subgroup of $GL(n, F)$, and any compact subgroup of $GL(n, F)$ is conjugate to $GL(n, \mathcal{O}_F)$. ⌟

Proof: $GL(n, \mathcal{O}_F)$ is compact by(15.4.1.2).

For maximality, for any compact subgroup Γ, consider the standard representation of $\mathrm{GL}(n)$, it suffices to find an $\mathcal{O}_L$-lattice that is stable under Γ-action. Notice $\rho(\Gamma) \cap GL(n, \mathcal{O}_{L'})$ is open in $\rho(\Gamma)$, thus is of finite index, so $\Gamma(\mathcal{O}_L^n)$ is a lattice that is stable under Γ(14.2.3.34). □

Prop. (15.4.1.6). $SL(n, \mathbb{Q}_p)$ has two maximal subgroups

$$SL(n, \mathbb{Z}_p), \quad \begin{bmatrix} p & \\ & 1 \end{bmatrix}^{-1} SL(n, \mathbb{Z}_p) \begin{bmatrix} p & \\ & 1 \end{bmatrix}$$

up to conjugacy. ⌟

Proof: □

2 over Global Fields

Def. (15.4.2.1) [Groups of Non-Compact Types]. Let $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp} / \mathbb{Q}$ be semisimple, then G is said to be a **group of compact type** if $G(\mathbb{R})$ is compact, and said to be a group of non-compact type if it doesn't contain a non-trivial normal subgroup of compact type. ⌟

Prop. (15.4.2.2) [Real Approximation]. If $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp} / \mathbb{Q}$ satisfies each connected components of G contains a rational point, then $G(\mathbb{Q})$ is dense in $G(\mathbb{R})$. ⌟

Proof: Cf.[Mil17]P54. □

Congruence Subgroups

Def. (15.4.2.3) [Congruence Subgroups]. Let $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/\mathbb{Q}$ with an embedding $G \to \mathrm{GL}(n)_{\mathbb{Q}}$, for $N \in \mathbb{Z}_+$, define $\Gamma(N) = G(\mathbb{Q}) \cap \{g \in \mathrm{GL}(n;\mathbb{Z}) | g \equiv \mathbb{1} (\mathrm{mod}\ \ GL(n;N))\}$, and a **congruence subgroup** of $G(\mathbb{Q})$ is any subgroup of $G(\mathbb{Q})$ that contains some $\Gamma(N)$ as a finite index subgroup.

The notion is compatible with that defined in(15.4.3.13). In particular, the set of congruence subgroups of G doesn't depend on the embedding**?**. ⌟

Prop. (15.4.2.4) [Congruence Subgroup Problem]. Let G be a reductive group over $\mathbb{Q}$,

- If G is split simply connected other than SL(2), then every arithmetic subgroup of G is a congruence subgroup.
- If $G = \mathrm{SL}(2)$ or non-simply connected, there are many arithmetic subgroups of G that is not congruence subgroups.

⌟

Proof: Cf.[MATSUMOTO 1969. Sur les sous-groupes arithmétiques des groupes semi-simples de ´ploye´s. Ann. Sci. Ecole Norm. Sup. (4) 2:1 – 62.].[SURY, B. 2003. The congruence subgroup problem, volume 24 of Texts and Readings in Mathematics. Hindustan Book Agency, New Delhi.] □

Proof:

□

Prop. (15.4.2.6) [Minkowski]. The congruence subgroup $1 + pGL(n;\mathbb{Z})$ is torsion-free for $p \in \mathbf{P} \setminus \{2\}$. ⌟

Proof: Cf.[P-R94]P232. □

3 over Adeles

Notation (15.4.3.1).

- In this subsection, let $F \in$ `GField` and $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/F$.

⌟

Def. (15.4.3.2) [Adele Groups]. Let $G \subset \mathrm{GL}(V) \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/F$, where $V \in \mathcal{V}\mathrm{ect}_F$, $G(\mathbf{A}_F)$ is called the **group of Adele points of** G. Let Λ be a $\mathcal{O}_F$-lattice of V, for any place $v \in \Sigma_F^{\mathrm{fin}}$, let K_v be the stabilizer of $\Lambda_v = \Lambda \otimes_{\mathcal{O}_F} \mathcal{O}_v$ in $G(F_v)$, then $\mathcal{K}_v$ are compact open subgroups of $G(F_v)$. Define the **adelic group of** G

$$G(A_F) = \prod_v{}' (G(F_v), \mathcal{K}_v),$$

which is a locally compact topological group. These K_v are called **hyperspecial compact subgroups**, and they are maximal subgroups of $G(\mathcal{K}_v)$ for a.e. v if G is reductive(15.4.1.3). We can modify the remaining v s.t. $\mathcal{K}_v$ are special maximal compact subgroups**?**, and denote

$$\mathcal{K} = \mathcal{K}^f \mathcal{K}_\infty, \quad \mathcal{K}^f = \prod_{v \in \Sigma_F^{\mathrm{fin}}} \mathcal{K}_v, \quad \mathcal{K}_\infty = \prod_{v \in \Sigma_F^{\infty}} \mathcal{K}_v.$$

⌟

Proof: To show $G(\mathbf{A}_F)$ is independent of Λ, notice $|G(\mathbf{A}_F)|$ is clearly invariant, and if Λ' is another lattice, then $d^{-1}\Lambda \subset \lambda' \subset d\Lambda$ for some $d \in \mathbb{Z}_+$, so $\mathcal{K}_v$ are the same for $v \nmid d$.

$\mathcal{K}_v$ are compact open subgroups of $G(F_v)$ because they are the intersection of $GL(\Lambda_v) \cong GL(n, \mathcal{O}_v)$ with $G(F_v)$. To show they are maximal, for any other compact subgroup $\mathcal{K}'$ of $G(F_v)$, as $\mathcal{K}_v \cap \mathcal{K}$ is open, $\mathcal{K}'/K' \cap \mathcal{K}_v$ is a finite set, thus **?** □

Cor. (15.4.3.3). $G(\mathbf{A}_F) = G(\mathbf{A}_{F,S}) \times G(\mathbf{A}_F^S)$. ⌟

Prop. (15.4.3.4). For a closed embedding of algebraic groups $G \subset G' \in \mathcal{A}lg\mathcal{G}rp/F$, the inclusion $G(\mathbf{A}_F) \subset G'(\mathbf{A}_F)$ is a closed embedding. But for open immersions, the induced inclusion may not be immersions. For example, the embedding $\mathbb{G}_m \subset \mathbb{A}^1$ doesn't induce immersion $\mathbf{I}_F \subset \mathbf{A}_F$. ⌟

Proof: **?** □

Example (15.4.3.5) [GL(n)]. Fix the following compact subgroup of $GL(n, A)$:

$$\mathcal{K} = \prod \mathcal{K}_v, \quad \mathcal{K}_v = \begin{cases} O(n) & v \text{ real} \\ U(n) & v \text{ complex} \\ GL(n, \mathcal{O}_v) & v \text{ non-Archimedean} \end{cases}.$$

then $\mathcal{K}$ is the maximal compact subgroup of $GL(n, \mathbf{A}_F)$ in the sense that any compact subgroup can conjugate into K.

$\mathfrak{gl}_{n,\infty} = \prod_{v \in S_\infty} \mathfrak{gl}(n, F_v)$, then we can define $(\mathfrak{gl}_{n,\infty}, \mathcal{K}_\infty)$-modules. ⌟

Prop. (15.4.3.6). $GL(F)$ is discrete in $GL(A_F)$. ⌟

Proof: □

Prop. (15.4.3.7) [Fundamental Domain]. $GL(F)\backslash GL(\mathbf{A}_F)$ has a fundamental domain which can be covered by a sufficiently large **Siegel sets** $\mathfrak{S}_{c,d}$. ⌟

Proof: □

Prop. (15.4.3.8). $GL(F)\backslash GL(A_F)$ has finite volume if G is semisimple, and it is compact if G is anisotropic. ⌟

Proof: □

Def. (15.4.3.9) [Strong Approximation Property]. Let S be a finite set of places containing Σ_F^∞, a group G is said to satisfy the **strong approximation** for S if it satisfies the following equivalent conditions:

- The image of $G(F)$ is dense in $G(\mathbf{A}^S)$,
- $G(F)G(\mathbf{A}_S)$ is dense in $G(\mathbf{A})$.
- For any compact open subgroup $U^S \subset G(\mathbf{A}^S)$, $G(A) = G(F)G(A_S)U^S$.

In particular,

$$\Gamma\backslash G(\mathbf{A}_S) \cong G(F)\backslash G(\mathbf{A})/U^S.$$

where Γ is the image of $G(F) \cap (G(\mathbf{A}_S) \times U^S)$ in $G(\mathbf{A}_S)$. ⌟

Thm. (15.4.3.10) [Strong Approximation]. Assume G is a simply-connected semisimple group(9.3.2.1) and $G(A_S)$ is non-compact for some finite subset $\Sigma_F^\infty \subset S \subset \Sigma_F$, then G satisfies strong approximation for S. ⌟

Proof: Cf.[Algebraic Groups and Number Theory, P427]. □

Remark (15.4.3.11). This is not true for non-semisimple or non-simply connected: for $\mathbb{G}_m$, $\mathbb{Q}^\times$ is not dense in $\mathbb{A}_{\mathbb{Q},f}^\times$.

For PGL(2), the determinant of $PGL(2,\mathbb{Q})$ is $\mathbb{Q}^\times/(\mathbb{Q}^\times)^2$ and the determinant of $PGL(2,\mathbb{A}_{\mathbb{Q},f})$ is $\mathbb{A}_{\mathbb{Q},f}^\times/(\mathbb{A}_{\mathbb{Q},f}^\times)^2$, which is not dense. ⌟

Cor. (15.4.3.12) [Strong Approximation for SL(n)]. Let $F\in$ `NField`, then

- $\mathrm{SL}(n)_F$ satisfies strong approximation for Σ_F^∞.
- Let K_0 be an open compact subgroup of $GL(n,\mathbf{A}^f)$, then
$$GL(n,F)GL(n,A_\infty)K_0T_1(A)=GL(n,A).$$
- Let K_0 be an open compact subgroup of $GL(n,\mathbf{A}^f)$ that the image of K_0 under the determinant map is $\prod_{v\in\Sigma_F^{\mathrm{fin}}}\mathcal{O}_v^*$, then
$$\det: GL(n,F)GL(n,\mathbf{A}_\infty)\backslash GL(n,\mathbf{A}_F)/K_0\to F^\times\,\mathbf{I}_{F,\infty}\backslash I_F/\prod_{v\in\Sigma_F^{\mathrm{fin}}}\mathcal{O}_v^*=\mathrm{Cl}_1(F)$$
is an isomorphism.

⌟

Proof: 1 is a direct consequence of(15.4.3.10).

2 is a direct consequence of 1.

3: det is clearly surjective. To show it is injective, if $\det(a)=\det(b)\in\mathrm{Cl}_1(F)$, then $\det(a)=\det(g_1g_\infty bk_0)$ where $g_1\in GL(n,F),g_\infty\in GL(n,A_{F,\infty}),k_0\in GL(n,A_F^f)$ by hypothesis. Then $g_1g_\infty bk_0a^{-1}\in SL(n,\mathbf{A}_F)$, and by item1 it is of the form $h_1h_\infty k_0$ where $h_1\in SL(n,F),h_\infty\in SL(n,A_{F,\infty}),k_1\in a(K_0\cap SL(n,\mathbf{A}_F^f))a^{-1}$. Then the assertion follows. □

Prop. (15.4.3.13) [Passage From Archimedean to Adele via Congruence Subgroups]. If $F\in$ `GField`, $U_\Gamma\subset G(\mathbf{A}_F^f)$ a compact open subgroup and Γ the image of $G(F)\cap(G(A_\infty)\times U_\Gamma)$ in $G(A_\infty)$, called a **congruence subgroup** of G. If G satisfies strong approximation for $S=\Sigma_F^\infty$(15.4.3.9), then
$$\Gamma\backslash G(A_\infty)\cong G(F)\backslash G(A)/U_\Gamma.$$

In general, for any open compact subgroup $U\subset G(A_f)$,
$$\#G(F)\backslash G(A)/G(A_\infty)U<\infty.$$

Thus if $\{g_i\}\subset G(A_f)$ is a set of double coset representatives,
$$G(F)\backslash G(A)/U=\coprod_i\Gamma_i\backslash G(A_\infty)$$
where Γ_i is the image of $(g_iUg_i^{-1}\times G(A_\infty))\cap G(F)$ in $G(A_\infty)$. Thus the passage from Archimedean to adele is not seriously affected by the lack of strong approximation. ⌟

Proof: The double coset is finite because for any $(g_v)\in G(A_F^f)$, by strong approximation for $\mathbb{G}_a$, we can choose a $g\in G(F)$ s.t. $g^{-1}g_v\in K_v$ for any $v\in\Sigma_F^{\mathrm{fin}}$, then the image is finite as U is compact open and $\prod_v K_v$ is compact. □

15.5 Arithmetic Subgroups

Main references are [Mor15] and [V. Platonov and A. Rapinchuk: Algebraic Groups and Number Theory.]

1 Arithmetic Subgroups

Def. (15.5.1.1) [Arithmetic Subgroups]. For $G \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$, an **arithmetic subgroup** $\Gamma \leq G(\mathbb{Q})$ is a subgroup that is commensurable with $G(\mathbb{Q}) \cap GL(n, \mathbb{Z})$ for some embedding $G \hookrightarrow \mathrm{GL}(n)_{\mathbb{Q}}$. This notion is independent of the embedding chosen.

If $G \subset \mathrm{GL}(V)$ and $L \subset V$ be a lattice, then the arithmetic subgroup $G(\mathbb{Q}) \cap GL(n, \mathbb{Z})$ is also denoted by $G(\mathbb{Z}; L)$, called the **group of units of** G. If no confusion is make, it is also denoted by $G(\mathbb{Z})$. ⌟

Proof: Cf.[?]P171. □

Lemma (15.5.1.2) [Invariance of Arithmetic Subgroups]. For $\varphi : G \to G' \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$, the kernel of an arithmetic subgroup is an arithmetic subgroup. ⌟

Proof: □

Cor. (15.5.1.3). If $G = H \ltimes N \subset \mathrm{GL}(V) \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$, then $H(\mathbb{Z}) \ltimes N(\mathbb{Z}) \subset G(\mathbb{Z})$ has finite index. ⌟

Proof: Let $\mathrm{pr} : G \to H$ be the projection, then $H(\mathbb{Z}) \ltimes N(\mathbb{Z}) = \mathrm{pr}^{-1}(H(\mathbb{Z}))$. □

Prop. (15.5.1.4). If $\varphi : G \to G' \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$ is surjective, then φ maps an arithmetic subgroup to an arithmetic subgroup. ⌟

Proof: ? □

Prop. (15.5.1.5). There exists arithmetic subgroups not of the form $G(\mathbb{Z}; L)$. ⌟

Proof: ? By the proof of(15.5.1.2), any $G^L_{\mathbb{Z}}$ must contain some congruence subgroup $G_{\mathbb{Z}}(d)$, but there are examples of subgroups of finite index of $SL(2, \mathbb{Z})$ not of this form, Cf.[?]Chap9.5. □

Prop. (15.5.1.6). Let $G \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$ and Γ be an arithmetic subgroup, then for any f.d. representation $\rho \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}}(G)$, there exists a Γ-invariant lattice. ⌟

Proof: Cf.[?]P173. □

Reduction Theory

Prop. (15.5.1.7). Let $G \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$ and Γ be an arithmetic subgroup, then Γ is finitely presented. ⌟

Proof: ? □

Prop. (15.5.1.8). Let $G \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$, then there exists only f.m. conjugacy classes of finite subgroups of $G_{\mathbb{Z}}$. ⌟

Proof: ? □

Thm. (15.5.1.9) [Borel Density Theorem]. Let $G \in \mathcal{L}\mathrm{in}\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}$ be semisimple of non-compact type, then any arithmetic subgroup Γ is Zariski-dense in G. ⌟

Proof: Cf.[?]P205.? □

Compactness of $G(\mathbb{R})/G(\mathbb{Z})$

Prop. (15.5.1.10). Let $S \in \mathcal{L}in\mathcal{A}lg\mathcal{G}rp/\mathbb{Q}$ be a torus, then the following are equivalent:

- S is $\mathbb{Q}$-anisotropic.
- $S(\mathbb{R})/S(\mathbb{Z})$ is compact.

⌟

Proof: Cf.[?]P205.? □

Prop. (15.5.1.11). Let $G \in \mathcal{L}in\mathcal{A}lg\mathcal{G}rp/\mathbb{Q}$, then the following conditions are equivalent:

- $G(\mathbb{R})/G(\mathbb{Z})$ is compact.
- The reductive part of G^0 is anisotropic over $\mathbb{Q}$.

⌟

Proof: Cf.[?]P210.? □

Prop. (15.5.1.12) [Mahler's Criterion]. A subset $\Omega \subset GL(n;\mathbb{R})$ is compact modulo $GL(n;\mathbb{Z})$ iff it satisfies:

- $\{\det(g)|g \in \Omega\}$ is bounded.
- $[\Omega.(\mathbb{Z}^n \setminus \{0\})] \cap U = \varnothing$ for some nbhd U of $0 \in \mathbb{R}^n$.

⌟

Proof: Cf.[?]P211.? □

Finiteness of the Volume of $G(\mathbb{R})/G(\mathbb{Z})$

Prop. (15.5.1.13). For $G \in \mathcal{L}in\mathcal{A}lg\mathcal{G}rp/\mathbb{Q}$, $G(\mathbb{R})/G(\mathbb{Z})$ has finite volume iff G^0 doesn't have non-trivial characters defined over $\mathbb{Q}$. ⌟

Proof: Cf.[?]P213. □

Prop. (15.5.1.14). If $G \in \mathcal{L}in\mathcal{A}lg\mathcal{G}rp/\mathbb{Q}$ is semisimple, and Γ is an arithmetic subgroup, then $G(\mathbb{R})/\Gamma$ has finite volume. ⌟

Proof: Cf.[?]P220. □

Finite Arithmetic Groups

Conj. (15.5.1.15). If $G \subset \mathrm{GL}(n)_{\mathbb{Q}} \in \mathcal{A}lg\mathcal{G}rp/\mathbb{Q}$ is of compact-type, then for any totally real extension $F/\mathbb{Q}$, $G(\mathcal{O}_F) = G(\mathbb{Z})$. ⌟

Proof: □

Remark (15.5.1.16). By(15.5.1.17), it suffices to prove this conjecture for $\mathrm{O}(V)$ for any inner space $V/\mathbb{Q}$. ⌟

Prop. (15.5.1.17). If $G \subset \mathrm{GL}(n) \in \mathcal{A}lg\mathcal{G}rp/\mathbb{Q}$ satisfies $G(\mathbb{R})$ is compact and Zariski dense in G, then G preserves a quadratic definite quadratic form f. ⌟

Proof: Cf.[?]P230. □

Prop. (15.5.1.18) [Bartels-Kitaoka]. Let $F/\mathbb{Q}$ be a totally real nilpotent Galois extension, and $\Gamma \leq \mathrm{GL}(n;\mathcal{O})$ is a finite $\mathrm{Gal}(F/\mathbb{Q})$-invariant subgroup, then $\Gamma \subset \mathrm{GL}(n;\mathbb{Z})$. ⌟

Proof: Cf.[**?**]P234. □

Prop. (15.5.1.19). Let $V/\mathbb{Q}$ be an inner space and $A = (a_{ij}) \in GL(n;\mathbb{Z})$ be an integral Gram matrix for V. If $a_{ii} \leq 4\lambda$ for any i, where λ is the smallest eigenvalue of A, then for any totally real extension $F/\mathbb{Q}$, $\mathrm{O}(V;\mathcal{O}_F) = \mathrm{O}(V;\mathbb{Z})$. ⌟

Proof: Cf.[**?**]P236. □

2 Arithmetic Subgroup of Lie Groups

Def. (15.5.2.1) [Arithmetic Subgroups]. Let H be a connected real Lie group, then an **arithmetic subgroup** $\Gamma \subset H$ is a subgroup s.t. there exists an algebraic group $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/\mathbb{Q}$, a surjective homomorphism $G(\mathbb{R})^0 \to H$ with compact kernel, and $\Gamma_0 \subset G(\mathbb{Q})$ an arithmetic subgroup(15.5.1.1) s.t. $\Gamma_0 \cap G(\mathbb{R})^0$ is mapped to Γ. ⌟

Prop. (15.5.2.2). Let H be a semisimple real Lie group that admits a faithful f.d. representation, then every arithmetic subgroup of H is discrete of finite covolume, and contains a torsion-free subgroup of finite index. ⌟

Proof: Cf.[Mil17b]P34. □

Prop. (15.5.2.3). In any connected real Lie group there are only countably many arithmetic subgroups up to conjugacy. ⌟

Proof: Cf.[Mor15]5.1.20. □

Thm. (15.5.2.4) [Margulis]. Every discrete subgroup of finite volume in a non-compact simple real Lie group H is arithmetic unless H is isogenous to $SO(1,n)$ or $SU(1,n)$.

Note that $SL(2,\mathbb{R})$ is isogenous to $SO(1,2)$, so the theorem doesn't apply to it. ⌟

Proof: Cf.[Mor15]5.2.**?** □

15.6 Geometry of Numbers

References are [Cassels, Geometry of Numbers] and [Venkatesh's notes].

1 Minkowski Theory

Cf.[B-G06].

Thm. (15.6.1.1) [Minkowski's Lattice Point Theorem]. Let $V \in \mathcal{V}\mathrm{ect}_{\mathbb{R}}^n$ equipped with a Haar measure $\mathrm{d}x$ and $\Gamma \subset V$ be a complete lattice. Suppose $X \subset V$ is a centrally symmetric and convex measurable subset of V s.t.

$$\mu(X) > 2^n \operatorname{Vol}(\Gamma),$$

then $\# X \cap \Gamma > 1$. ⌟

Proof: Cf.[Neukirch]P27. □

Def. (15.6.1.2) [Minkowski Spaces]. For $F \in \mathtt{NField}$, $\mathbb{F}_{\mathbb{C}} \cong \prod_{\sigma: F \to \mathbb{C}} \mathbb{C}$, and $\mathrm{Gal}_{\mathbb{R}}$ acts on $\mathbb{F}_{\mathbb{C}}$ via permuting the coordinates. Then define

$$\mathbb{F}_{\mathbb{R}} = (\mathbb{F}_{\mathbb{C}})^{\mathrm{Gal}_{\mathbb{R}}}.$$

And it is equipped with a symmetric inner space structure via restriction from $\mathbb{F}_{\mathbb{C}} \cap \prod_{\sigma: F \to \mathbb{C}} \mathbb{C}$. Such a space $F_{\mathbb{R}}$ is called the **Minkowski space attached to** F. ⌟

Prop. (15.6.1.3) [Embedding in Minkowski Spaces]. For $F \in \mathtt{NField}$, there is a natural map $j : \mathbb{F} \subset \mathbb{F}_{\mathbb{R}}$, and if $\mathfrak{a} \neq 0 \in \mathrm{Ideal}(\mathcal{O}_F)$, then $j(\mathfrak{a})$ is a complete lattice in $F_{\mathbb{R}}$ with

$$\operatorname{Vol}(j(\mathfrak{a})) = \sqrt{|d_F|}||\mathfrak{a}||.$$

⌟

Proof: Cf.[Neukirch]P31. □

Prop. (15.6.1.4). Let $F \in \mathtt{NField}$ and $\mathfrak{a} \neq 0 \in \mathrm{Ideal}(\mathcal{O}_F)$. Let $c_\tau \in \mathbb{R}_+$ for each $\tau \in \operatorname{Hom}(F, \mathbb{C})$, s.t. $c_\tau = c_{\overline{\tau}}$, and

$$\prod_\tau c_\tau > (\frac{2}{\pi})^s \sqrt{|d_F|}||\mathfrak{a}||,$$

then there exists $a \in \mathfrak{a}^\times$ s.t.

$$|\tau(a)| < c_\tau, \quad \forall \tau \in \operatorname{Hom}(F, \mathbb{C}).$$

⌟

Proof: Cf.[Neukirch]P32. □

Prop. (15.6.1.5) [Minkowski's Second Theorem]. Let $F \in \mathtt{NField}$, $\deg(F) = d$, V a f.d. F-vector space of dimension n, and Λ a lattice in V. For any $v|\infty$, let S_v be a non-empty open convex symmetric bounded subset S_v of V_v. For $\lambda > 0 \in \mathbb{R}$, denote $\lambda S = \prod_{v|\infty} \lambda S_v \times \prod_{v\nmid\infty} \lambda \Lambda_v$. For $n \geq 1$, denote the ***n*-th succesive minimum** of S to be

$$\lambda_n = \inf\{t > 0 | tS \text{ contains } n \text{ linearly independent vectors of } \Lambda \text{ over } K\}.$$

Then
$$(\prod_{i=1}^{n}\lambda_i)\,\mathrm{Vol}(S)^{1/d}\leq 2^N,$$
where the volume is calculated w.r.t. the Adele measure given by(14.4.5.5).

Moreover, if S_v are totally symmetric, then
$$\frac{2^{dn}\pi^{sn}}{(n!)^r((2n)!)^s}N(d_{K/\mathbb{Q}})^{n/2}\leq(\prod_i\lambda_i)^d\mathrm{Vol}(S).$$

⌟

Proof: Cf.[B-G06]P611. □

15.7 Arithmetic of Abelian Varieties

Main references are [Sta], [Abelian Varieties notes Conrad], [Mil08], [B-G06], [Abelian Variety van der Geer], [BLR90]. See [Bhatt's notes] for everything done in the relative setting. A history of Abelian varieties can be found in [Mil08]P125.

1 Basics

Def. (15.7.1.1) [Abelian Schemes]. For $S \in \mathcal{S}\mathrm{ch}$, an **Abelian scheme** over S is a proper smooth group variety $A \in \mathcal{V}\mathrm{ar}/S$(6.11.5.1). Denote $\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/S$ the subcategory of $\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/S$ consisting of Abelian schemes over S.

Being an Abelian scheme is stable under base change of fields, by(6.11.1.3). ⌟

Prop. (15.7.1.2). For $S \in \mathcal{S}\mathrm{ch}$ and $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/S$, any global tangent vector on a group variety is left invariant. ⌟

Proof: Because $\Gamma(X, \mathcal{O}_X) = k$(6.11.1.12), so by(9.1.4.35), $\Gamma(X, \mathcal{O}_X \otimes T_{X,e}) = T_{X,e}$ are all generated by left invariant vectors(left and right translation commutes). □

Thm. (15.7.1.3) [Abelian Varieties are Projective, Weil]. Abelian varieties are projective, by(9.1.4.8) and(6.4.5.3). ⌟

Thm. (15.7.1.4)[Rigidity]. Let $S \in \mathcal{S}\mathrm{ch}$ and $f : X \to Y \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/S$ be a morphism from an Abelian varieties to a group variety, then it is a group homomorphism followed by a translation $t_{f(e_X)}$. ⌟

Proof: Set $y = i_Y(f(e_X))$ and consider $h = t_y \circ f$, then $h(e_X) = e_Y$, and consider the morphism:

$$g : X \times X \to Y : (x, x') \mapsto h(xx')(h(x)h(x'))^{-1}.$$

then $g(e_X, X) = g(X, e_X) = e_Y$, so the rigidity lemma(6.11.1.20) shows g is constant with value e_Y. Thus $h \circ m_X = m_Y \circ (h \times h)$, thus h is a group homomorphism. □

Cor. (15.7.1.5) [Abelian Varieties are Commutative]. For $S \in \mathcal{S}\mathrm{ch}$,

- If $X \in \mathcal{V}\mathrm{ar}/S$, then the Abelian variety structure on X is determined by e_X.
- If $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/S$, the group law on X is commutative, justifying the name.

⌟

Remark (15.7.1.6). The completeness of X is essential for the proof. In fact, there are many non-commutative group varieties, like $\mathrm{GL}(n)$.

From now, use the additive notation for Abelian varieties. ⌟

Proof: 1: If there are two Abelian variety structures $(m, i), (n, j)$, then consider $X \times X \to X \to X : (x, y) \mapsto m(x, y)(n(x, y)^{-1})$, then it is constant on $e_X \times X$ and $X \times e_X$, thus it is constant, so $m = n$. And $i = j$ is also clear by the associativity.

2: The inverse i is a group homomorphism by(15.7.1.4), thus it is commutative. □

Prop. (15.7.1.7) [Rigidity of Morphism from Smooth Varieties]. If $k \in$ `Field` and $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, then any rational map from a smooth k-variety Y extends to a morphism $Y \to X$. ⌟

Proof: By(6.4.5.15), a rational map is defined on a set whose complement has codimension ≥ 2, but then(9.1.1.20) shows it must be defined on all of X. □

Prop. (15.7.1.8). For $S \in \mathcal{S}\mathrm{ch}$ and $X, Y \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/S$. If $f : X \to Y$ is a homomorphism over S s.t. for any arithmetic point $s \in S$, $f_s : X_s \to Y_s$ has finite kernel, then f is surjective, thus is an isogeny. ⌟

Proof: ? □

Cor. (15.7.1.9) [Quotient by Finite Subgroups]. Quotients of an Abelian variety A are also an Abelian varieties. ⌟

Proof: It is a group variety of dimension 1 with a rational point by(9.1.5.29). And it is complete by(6.4.5.3). □

Remark (15.7.1.10). WARNING: it is not true that the quotient of an Abelian variety by any finite group of automorphisms is an Abelian variety, as the quotient of an elliptic curve by the hyperelliptic involution(i.e. -1) is just $\mathbb{P}^1$. ⌟

Cor. (15.7.1.11)[Even Functions]. For $k \in \mathtt{Field}$ and $E \in \mathcal{E}\mathrm{ll}/k$, then $f \in R(E)$ is even iff $f \in K(x)$. ⌟

Proof: Write $f(x, y) = g(x) + h(x)y$, then the condition says $(2y + a_1x + a_3)h(x) = 0$ for any $(x, y) \in E(\overline{K})$. Thus $h(x) = 0$, otherwise E is degenerate, which is not possible. □

Pseudo-Abelian Varieties

Def. (15.7.1.12) [Pseudo-Abelian varieties]. A **pseudo-Abelian variety** over a field k is a group variety with no non-trivial affine normal group subvarieties. ⌟

Prop. (15.7.1.13). Abelian varieties are pseudo-Abelian varieties. ⌟

Proof: Every normal group subvariety is closed thus complete, hence if it is affine, it equals e. □

Prop. (15.7.1.14). Being a pseudo-Abelian variety is stable under separable base change of fields. ⌟

Proof: Cf.[Mil17]P149. □

Prop. (15.7.1.15). Let G be a group variety over k, then there exists a unique affine normal group subvariety N s.t. G/N is a pseudo-Abelian variety. And this N is stable under base change. ⌟

Proof: This follows from(9.1.4.34) and(9.1.5.30)(9.1.5.29). □

Prop. (15.7.1.16) [Barsotti-Chevalley]. Let k be perfect, then any pseudo-Abelian variety over k is complete hence is an Abelian variety. ⌟

Proof: Cf.[Mil17]P154. □

Cor. (15.7.1.17). If G is a group variety over a perfect field k, then unique affine normal group subvariety N s.t. G/N is an Abelian variety, by(15.7.1.15). ⌟

Thm. (15.7.1.18)[Algebraic Groups are Extensions of Abelian Varieties]. Let G be a connected algebraic group over a field k, then there is a connected affine normal algebraic subgroup N(not necessarily smooth) s.t. G/N is is an Abelian variety. ⌟

Proof: Cf.[Mil17]P155. □

Cor. (15.7.1.19). Every pseudo-Abelian variety G is commutative. ⌟

Proof: As G is smooth and connected, so is $[G,G]$(9.1.4.27), so it is a group variety(9.1.4.34). Let N be given by(15.7.1.18), then because G/N is an Abelian variety, $[G,G]\subset N$. Thus $[G,G]$ is affine, which implies $[G,G]=e$. □

Prop. (15.7.1.20) [Totaro(2013)]. Any pseudo-Abelian variety is an extension of a connected unipotent group variety U by an Abelian variety A in a unique way. ⌟

Proof:

□

Line Bundles

Remark (15.7.1.21). As Abelian varieties are regular, $\mathrm{Cl}(X)\cong\mathrm{Pic}(X)$, by(6.5.3.15). ⌟

Prop. (15.7.1.22) [Theorem of the Cube]. If X is an Abelian variety, and L is a line bundle over X, then

$$\Theta(L)=\mathrm{pr}_{123}^*(L)\otimes\mathrm{pr}_{12}^*(L^{-1})\otimes\mathrm{pr}_{13}^*(L^{-1})\otimes\mathrm{pr}_{23}^*(L^{-1})\otimes\mathrm{pr}_1^*(L)\otimes\mathrm{pr}_2^*(L)\otimes\mathrm{pr}_3^*(L)$$

is trivial. ⌟

Proof: This is trivial on $0\times X\times X, X\times 0\times X, X\times X\times 0$, so it is trivial, by(6.11.1.23). □

Cor. (15.7.1.23). There is a form of morphisms from a scheme to X, just by considering $(f,g,h): Y\times Y\times Y\to X\times X\times X$, i.e.

$$(f+g+h)^*L\otimes(f+g)^*L^{-1}\otimes(f+h)^*L^{-1}\otimes(g+h)^*L^{-1}\otimes f^*L\otimes g^*L\otimes h^*L$$

is trivial. ⌟

Cor. (15.7.1.24) [Theorem of the Square]. Let A be an Abelian variety that $\mathcal{L}$ is a line bundle, then for any $x,y\in A$,

$$t_{x+y}^*L\otimes L\cong t_x^*L\otimes t_y^*L\in\mathrm{Pic}(A_{k(x)k(y)}).$$

Notice this isomorphism is defined under the field generated by the residue fields of x and y. ⌟

Proof: Apply the theorem of the cube(15.7.1.23) for $f=\mathrm{id}_X$ and g,h the function with constant value x,y. □

Cor. (15.7.1.25). For a line bundle L on an Abelian variety X, then the map $\varphi_L: X\to\mathrm{Pic}(X): x\mapsto[t_x^*L\otimes L^{-1}]$ is a homomorphism. ⌟

Cor. (15.7.1.26). For any $\mathcal{L}\in\mathrm{Pic}(A)$,

$$[n]^*L\cong L^{n(n+1)/2}\otimes[-1]^*L^{n(n-1)/2}.$$

⌟

Proof: Use(15.7.1.23) in case $f=[n],g=[1],h=[-1]$, then we have:

$$n^*L^2\otimes(n+1)^*L^{-1}\otimes(n-1)^*L^{-1}\cong(L\otimes[-1]^*L)^{-1}.$$

So we can use induction. □

Def. (15.7.1.27) [Even Line Bundle]. Consider the involution $[-1]$ of X and its action on the line bundles, then a **even/odd line bundle** is defined to be a line bundle L that $[-1]^*\mathcal{L} \cong \mathcal{L}$(resp. $\mathcal{L}^{-1}$). ⌟

Prop. (15.7.1.28). On an Abelian variety, there is an even very ample line bundle. ⌟

Proof: Abelian variety is projective by(15.7.1.3), thus there is a very ample line bundle L, and $[-1]^*L$ is also very ample, so $L \otimes [-1]^*L$ is even and very ample, by(6.5.4.23). □

Prop. (15.7.1.29). For $F \in \mathtt{NField}, A \in \mathcal{A}b\,\mathcal{V}ar\,/F$ and $c \in \mathrm{Pic}(A)$, there are an odd line bundle c^- and an even line bundle c^+ that $c = c_- + c_+$. ⌟

Proof: Consider $2c = (c+[-1]^*(c))+(c-[-1]^*(c))$. $c-[-1]^*(c)$ is odd thus is in $\mathrm{Pic}^0(X)$ by(15.7.4.9), thus by(15.7.6.14), there is a $c^* \in \mathrm{Pic}^0(X)$ that $2c^* = c - [-1]^*(c)$. Then $c = (c - c^*) + c^*$ satisfies the requirement. □

Lemma (15.7.1.30). Let $S \in \mathcal{S}\mathrm{ch}, A \in \mathcal{A}b\,\mathcal{V}ar\,/S$ and $\mathrm{pr}_i : A \times A \to A$ be the projections and m be the multiplication, then the following are equivalent:

- $m^*(c) \cong \mathrm{pr}_1^*(c) + \mathrm{pr}_2^*(c)$.
- $\tau_a^*(c) \cong c$ for $a \in A$.

And if these are satisfied, c is even. ⌟

Proof: The equivalence is a consequence of the formula $(m^*(c) - \mathrm{pr}_1^*(c) - \mathrm{pr}_2^*(c))|_{A\times\{a\}} = \tau_a^*(c) - c$ and the see-saw principle(6.11.1.22). the last assertion is a consequence of the first equation pulled back via the morphism

$$A \to A \times A : a \mapsto (a, -a).$$

□

Prop. (15.7.1.31) [Projective Embeddings]. No Abelian varieties of dimension g can be embedded into $\mathbb{P}^{2g-1}$. No Abelian variety except for elliptic curves and Abelian surfaces of degree 10 in $\mathbb{P}^4$ can be embedded into $\mathbb{P}^{2g}$. ⌟

Proof: Cf.[Van de Geer P26], where algebraic topologies are used. □

2 Formal Groups

Def. (15.7.2.1) [Formal Group Law of Abelian Varieties]. Given $k \in \mathtt{Field}, A \in \mathcal{A}b\,\mathcal{V}ar\,/k$, the group structure on A induces a homomorphism $\mathcal{O}_{A,e} \to (\mathcal{O}_{A,e} \times \mathcal{O}_{A,e})_{e\times e}$, whose completion is a formal group law of dimension n. ⌟

3 over Alg.Closed Fields

Notation (15.7.3.1).

- Let $k \in \mathtt{Field}, k = \overline{k}$.

⌟

Prop. (15.7.3.2). There is a closed pt 0 in X that corresponds to 0 in the group $X(k)$, if we denote Ω_0 the cotangent space at 0, it is the stalk of the differential $\Omega_{X/k}$ at 0(6.5.5.6). ⌟

Def. (15.7.3.3) [Fields of Moduli]. Let k be a field, the **field of moduli** of an Abelian variety A over $\overline{k}$ is the fixed field of $\{\sigma \in \mathrm{Gal}(\overline{k}/k) | A^\sigma \cong A\}$. ⌟

Def. (15.7.3.4) [Fields of Definition]. Let k be a field, the **field of moduli** of an Abelian variety A over $\overline{k}$ is the minimal field $\overline{k} \supset k' \supset k$ s.t. A is defined over k'. ⌟

Remark (15.7.3.5). Generally, the field of definition is bigger than the field of moduli. ⌟

Prop. (15.7.3.6). For any Abelian variety A over a field $k = \overline{k}$ of dimension g, $\dim_k H^1(A, \mathcal{O}_A) \leq g$. In fact, equality holds by(15.7.4.16). ⌟

Proof: This follows from Borel's classification of Hopf-algebras(3.11.3.14). Cf.[Van de Geer P94] or [Conrad Notes, P45].**?** □

Prop. (15.7.3.7). Let $k \in \mathtt{Field}, k = \overline{k}$, $A \in \mathcal{A}b\,\mathcal{V}ar\,/k$, and $X \subset A$ is an integral subvariety. Suppose $\{a \in A(k) | a + X = X\} = 0$, then for m large, the map

$$\alpha_m : X^m \to A^{m-1} : (x_1, \ldots, x_m) \mapsto (x_1 - x_2, x_2 - x_3, \ldots, x_{m-1} - x_m)$$

is quasi-finite with generic degree 1. ⌟

Proof: Cf.[Equidistribution of Small points, Shouwu]P163.**?** □

p**-Divisible Groups**

Prop. (15.7.3.8). For $k \in \mathtt{Field}, \operatorname{char} k = p, A \in \mathcal{A}b\,\mathcal{V}ar\,/k, \ell \in \mathbf{P} \setminus \{p\}$, $A(k^{\text{sep}})$ is an Abelian group and $A[\ell^n] \cong (\mathbb{Z}/(\ell^n))^{2g}$ and $A[p^n] \cong (\mathbb{Z}/(p^n))^r$ for some $r \geq 1$. ⌟

Prop. (15.7.3.9). There is an isomorphism

$$\mathrm{H}^m_{\text{ét}}(\Lambda_{k^{\text{sep}}}, \mathbb{Q}_\ell) \cong \bigwedge^m_{\mathbb{Q}_\ell} (V_\ell(A))^*.$$

⌟

Proof: Cf.[Grothendieck Monodromy theorem]. □

4 Dual Abelian Varieties

Def. (15.7.4.1) [Dual Abelian Varieties]. For $S \in \mathcal{S}\mathrm{ch}$ and $A \in \mathcal{A}b\,\mathcal{V}ar\,/S$, the **dual Abelian variety** $A^\vee$ is defined to be its Picard scheme $\underline{\mathrm{Pic}}^0_{A/S} \in \mathcal{S}\mathrm{ch}^{\text{sep,loc.pf}}\,/S$(9.7.2.22), which represents $\widetilde{\underline{\mathrm{Pic}}}^0_{A/S}$(i.e. line bundles with a rigidification(9.7.2.5)). We will see it is an Abelian variety(i.e. smooth) in(15.7.4.16).

By definition, there is a universal line bundle $p_A \in \mathrm{Pic}(A \times A^\vee)$ with a rigidification along e. ⌟

Def. (15.7.4.2) [Symmetric Homomorphisms]. For $S \in \mathcal{S}\mathrm{ch}$ and $X \in \mathcal{A}b\,\mathcal{V}ar\,/S$, a homomorphism $\alpha : X \to X^\vee$ over S is called a **symmetric homomorphism** if $\alpha^\vee = \alpha$. ⌟

Prop. (15.7.4.3) [$A \to A^\vee$ **Induced by Line Bundles**]. Let $S \in \mathcal{S}\mathrm{ch}$ and $A \in \mathcal{A}b\,\mathcal{V}ar\,/S$. For any $\mathcal{L} \in \underline{\mathrm{Pic}}_{A/S}(S)$(line bundles with a rigidification(9.7.2.1)), there is a **Mumford line bundle** on $A \times A$ given by

$$\Lambda(\mathcal{L}) = m^*\mathcal{L} - \mathrm{pr}_1^*\mathcal{L} - \mathrm{pr}_2^*\mathcal{L},$$

where $m : A \times A \to A$ is the product. It is in $\mathrm{Pic}^0(A)$ because $u : \Lambda(c)|_{e \times A} \cong \mathcal{O}_S$ and $\Lambda(\mathcal{L})|_{A \times a} = \tau_a^* c - c$. Then by definition, this line bundle corresponds to a morphism $\lambda_{\mathcal{L}} : A \to A^\vee$ over S, and by(9.7.2.34) $\lambda_c(a) = \tau_a^* c - c \in A^\vee(k(a))$. This is also a homomorphism of Abelian schemes, by(15.7.1.4), as $\varphi_c(e) = e$.

It is clear that $\mathcal{L} \mapsto \lambda_{\mathcal{L}}$ is a group homomorphism $\mathrm{Pic}_{A/S}(S) \mapsto \mathrm{Hom}_S(A, A^\vee)$. Also, denote $K(\mathcal{L}) = \ker(\lambda_{\mathcal{L}})$. ⌟

Cor. (15.7.4.4). $\lambda_{\mathcal{L}}$ is symmetric. ⌟

Proof: This is because $\Lambda(\mathcal{L})$ is symmetric. □

Cor. (15.7.4.5). For $x \in A(k)$, $\lambda_{\tau_x^*\mathcal{L}} = \lambda_{\mathcal{L}}$. ⌟

Proof: This follows from see-saw lemma, by observing that stalks of the line bundles in(15.7.4.3) are $\tau_{a+x}^*\mathcal{L} - \tau_x^*\mathcal{L}$ and $\tau_a^*\mathcal{L} - \mathcal{L}$ resp.. □

Cor. (15.7.4.6). $(\mathrm{id}_A, \varphi_{\mathcal{L}})^* p_A = \mathcal{L} \otimes [-1]^*\mathcal{L}$. ⌟

Proof:

$$(\mathrm{id}_A, \varphi_{\mathcal{L}})^* p_A = \Delta_A^*(\mathrm{id} \times \lambda_{\mathcal{L}})^* p_A = \Delta_A^*(m^*\mathcal{L} - \mathrm{pr}_1^*\mathcal{L} - \mathrm{pr}_2^*\mathcal{L}) = [2]^*\mathcal{L} \otimes \mathcal{L}^{-2} \cong \mathcal{L} \otimes [-1]^*\mathcal{L}(15.7.1.26).$$

□

Prop. (15.7.4.7) [Poincaré Class is Even]. The Poincaré class $p_A \in \mathrm{Pic}(A \times A^\vee)$ is even. ⌟

Proof: Let $b \in A^\vee$, then

$$([-1]^*(p))|_{A\times\{b\}} = [-1]^*(p|_{A\times\{-b\}}) = [-1]^*(-b) = b.$$

and

$$([-1]^*(p))|_{\{0\}\times A^\vee} = [-1]^*(p|_{\{0\}\times\widehat{A}}) = 0.$$

Thus $[-1]^*p \cong p$ by(9.7.2.34) and the see-saw principle(6.11.1.22). □

Lemma (15.7.4.8). If $b \in \mathrm{Pic}(A)$ and $\lambda_b = 0$, then for any ample $c \in \mathrm{Pic}(A)$, there is some $a \in A(K)$ that $b = \tau_a^*(c) - c$. ⌟

Proof: [Mumford, P77]. □

Thm. (15.7.4.9) [Characterizing $A^\vee$]. For $\mathcal{L} \in \mathrm{Pic}(A)$, $[-1]^*(\mathcal{L}) \otimes \mathcal{L}^{-1} \in \mathrm{Pic}^0(A)$, and the following are equivalent:

1. $\mathcal{L} \in \mathrm{Pic}^0(A)$.
2. $\lambda_{\mathcal{L}} = 0$.
3. For every ample line bundle $c \in \mathrm{Pic}(A)$, there is an $a \in A$ that $\mathcal{L} \cong \tau_a^*(c) - c$.
4. There is an ample line bundle $c \in \mathrm{Pic}(A)$ and an $a \in A$ s.t. $\mathcal{L} \cong \tau_a^*(c) - c$.
5. $\mathcal{L}$ is odd.
6. For any scheme X, the map $\mathrm{Mor}(X, A) \to \mathrm{Pic}(X) : \varphi \mapsto \varphi^*(c)$ is a group homomorphism.

⌟

Proof: $2\to 3$ is lemma(15.7.4.8). $4\to 1$ is by(15.7.4.3). $3\to 4$ is trivial.

$1\to 2$: $\mathcal{L}\in\mathrm{Pic}^0(A)$ corresponds to a section $[\mathcal{L}]:k\to\underline{\mathrm{Pic}}^0_A$. Let

$$\Lambda(p_A)=(m\times\mathrm{id}_{\underline{\mathrm{Pic}}^0(A)})^*(p_A)-(\mathrm{pr}_1\times\mathrm{id}_{\underline{\mathrm{Pic}}^0(A)})^*(p_A)-(\mathrm{pr}_2\times\mathrm{id}_{\underline{\mathrm{Pic}}^0(A)})^*(p_A),$$

then it corresponds to a map $\Lambda:A\times\underline{\mathrm{Pic}}^0_A\to\underline{\mathrm{Pic}}^0_A$ s.t.

$$\lambda_{\mathcal{L}}=\Lambda\circ(i_1\times[\mathcal{L}]):A\to\underline{\mathrm{Pic}}^0_A.$$

But $\Lambda(A\times\{0\})=0$, so by rigidity lemma(6.11.1.20) it factors through the projection pr_1. Thus $\lambda_{\mathcal{L}}=0$.

$6\to 5$ is trivial, and 6 is clearly equivalent to the assertion when $X=A$, and it is equivalent to 2 by(15.7.1.30).

We next prove $[-1]^*(c)-c\in\mathrm{Pic}^0(A)$: because $[-1]\tau_a=\tau_{-a}[-1]$, we have

$$\tau_a^*([-1]^*(c))-[-1]^*(c)=[-1](\tau_{-a}^*(c)-c).$$

since $\tau_{-a}^*(c)-c\in\mathrm{Pic}^0(X)$ by(15.7.4.3), the equation is equal to $c-\tau_{-a}^*(c)$ by implication$1\to 2\to 6$. and this further equals $\tau_a^*(c)-c$ by the theorem of square(15.7.1.24). Then

$$\tau_a^*([-1]^*(c)-c)-([-1]^*(c)-c)=0.$$

Hence $[-1]^*(c)-c\in\mathrm{Pic}^0(A)$ by the implication $2\to 3\to 4\to 1$.

$5\to 1$: Let c be an odd element, then $-2c=[-1]^*(c)-c\in\mathrm{Pic}^0(A)$ by what just proved, we have $c\in\mathrm{Pic}^0(A)$, then φ_c has image in the kernel of $[2]$ on $\widehat{A}$, by the implication $1\to 2$, thus it has trivial image, by(15.7.6.14). □

Cor. (15.7.4.10). $\mathcal{L}\mapsto\lambda_{\mathcal{L}}$ induces an injection

$$\mathrm{NS}(A_{\overline{k}})=\mathrm{Pic}(A_{\overline{k}})/\mathrm{Pic}^0(A_{\overline{k}})\hookrightarrow\mathrm{Hom}(A_{\overline{k}},A^\vee_{\overline{k}}).$$

⌟

Cor. (15.7.4.11) [Abelian Varieties are Finite Torsion-Free]. For $k\in\mathtt{Field}$ and $A\in\mathcal{A}b\mathcal{V}ar/k$, $\mathrm{NS}(A_{\overline{k}})$ is a finite free $\mathbb{Z}$-module. (Although this is true for any complete variety**?**). ⌟

Proof: This follows from(15.7.4.10) and(15.7.6.8). □

Cor. (15.7.4.12). Let $S\in\mathcal{S}\mathrm{ch}$ and $A\in\mathcal{A}b\mathcal{V}ar/S$. If b is a section of $\underline{\mathrm{Pic}}^0_{A/S}\to S$, and $\mathcal{L}=b^*(p_A)\in\mathrm{Pic}(A)$, then $\lambda_A=0$. ⌟

Proof: □

Cor. (15.7.4.13). For $\mathcal{L}\in\mathrm{Pic}(A)$ and $n\in\mathbb{Z}$, $\lambda_{[n]\mathcal{L}}=n^2\lambda_{\mathcal{L}}$. ⌟

Proof: By(15.7.1.26), it suffices to prove for $n=-1$. And this follows from(15.7.4.9) and the fact $[-1]^*\mathcal{L}\otimes\mathcal{L}^{-1}\in\mathrm{Pic}^0(A)$. □

Prop. (15.7.4.14). Let $k\in\mathtt{Field}$, $A\in\mathcal{A}b\mathcal{V}ar/k$. For $\lambda\in\mathrm{Hom}(A,A^\vee)$, consider $\mathcal{M}=(\mathrm{id},\lambda)^*p_A$, then $\lambda_{\mathcal{M}}=\lambda+\lambda^\vee$. In particular, if λ is symmetric, then $\varphi_{\mathcal{M}}=2\lambda$. ⌟

Proof: [Geer]P159. □

Prop. (15.7.4.15) [Ample Implies Non-Degenerate]. $\mathcal{L} \in \mathrm{Pic}(A)$ is ample iff it is non-degenerate and $H^0(A, \mathcal{L}) \neq 0$.

In particular, an effective line bundle on A is ample iff it is non-degenerate. ⌟

Proof: Cf.[Diophantine Geometry, P253] or [Conrad notes].**?** □

Cor. (15.7.4.16) [Dual Abelian Variety]. Let $k \in \mathtt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$, then

$$A^\vee = \underline{\mathrm{Pic}}^0_{X/S} = \underline{\mathrm{Pic}}^0_{X/S,\mathrm{red}} = \underline{\mathrm{Pic}}^\tau_{X/S}$$

is also an Abelian variety, and $\dim A = \dim A^\vee = \dim_k H^1(A, \mathcal{O}_A)$. ⌟

Proof: Take an ample line bundle $\mathcal{L}$ on A, then $\varphi_L : A \to A^\vee$ has finite kernel, thus $\dim \widehat{A} \geq \dim A$, but by(15.7.3.6) and(9.7.2.24), $\dim_k H^1(A, \mathcal{O}_A) = T_e(A^\vee) \leq \dim A$, thus it is regular by(5.3.5.17).

$\underline{\mathrm{Pic}}^\tau_{X/S} = \underline{\mathrm{Pic}}^0_{X/S}$ because we can pass to the $k = \overline{k}$, and use the fact Abelian varieties are torsion-free(15.7.4.11). □

Lemma (15.7.4.17). For $k \in \mathtt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$, $\mathcal{L} \in \mathrm{Pic}(A)$, consider the double Picard map(9.7.2.37) $\kappa_A : A \to A^{\vee\vee}$, then $\lambda_{\mathcal{L}} = \lambda_{\mathcal{L}}^\vee \circ \kappa_A : A \to A^\vee$. ⌟

Proof: Cf.[van Der Geer, P100]. □

Prop. (15.7.4.18) [Double Duality Theorem]. For $k \in \mathtt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$, the double Picard map(9.7.2.37) $A \to A^{\vee\vee}$ is an isomorphism. ⌟

Proof: Cf.[van Der Geer, P101].**?** □

Prop. (15.7.4.19) [Dual Abelian Schemes]. If $S \in \mathcal{S}ch$ and $A \in \mathcal{A}b\mathcal{V}ar/S$, then

- $\underline{\mathrm{Pic}}^0_{A/S} = \mathrm{Pic}^\tau_{A/S}$ is a projective Abelian scheme over S, called the **dual Abelian scheme** of A/S.
- the double Picard map(9.7.2.37) $A \to A^{\vee\vee}$ is an isomorphism.

⌟

Proof: By reducing to the fiber, these reduces to the case that S is a field, and this case follows from(15.7.4.16) and(15.7.4.18). □

Def. (15.7.4.20) [Non-Degenerate Line Bundles]. For $S \in \mathcal{S}ch$ and $A \in \mathcal{A}b\mathcal{V}ar/S$, a **non-degenerate line bundle** is a rigidified line bundle $\mathcal{L} \in \underline{\mathrm{Pic}}_{A/S}(S)$ s.t. $K(\mathcal{L}) = \ker \varphi_{\mathcal{L}}$ is a finite flat group scheme, i.e. $\varphi_{\mathcal{L}}$ is an isogeny. ⌟

5 Cohomology on Abelian Varieties

Thm. (15.7.5.1) [Cohomology of the Poincaré Class]. For $k \in \mathtt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar^g/k$, Let $\mathrm{pr}_2 : A \times A^\vee \to A^\vee$ be the projection, then

$$R^n \mathrm{pr}_{2*} p_A = e_*(k)^{\delta_{n,g}}, \quad H^n(A \times A^\vee, p_A) = k^{\delta_{n,g}}.$$

⌟

Proof: Cf.[Conrad, P62] or [Geer, P126]**?**. □

Thm. (15.7.5.2) [Cohomology of Line Bundles]. Let $k \in \mathtt{Field}$ and $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^g/k$, $\mathcal{F} \in \mathfrak{Coh}(A)$, then

1. $\chi(\mathcal{F}) = \deg(\mathrm{ch}_g(\mathcal{F}))$.
2. If $\mathcal{L} \in \mathrm{Pic}(A)$, then $\chi(\mathcal{L}) = \deg(c_1(\mathcal{L})^g)/g!$. In particular, $\chi(\mathcal{L}^m) = m^g\chi(\mathcal{L})$.
3. $\deg(\lambda_{\mathcal{L}}) = \chi(\mathcal{L})^2$. In particular, $\deg(\lambda_{\mathcal{L}})$ is a square. Notice if $\mathcal{L}$ is degenerate, then $\deg(\lambda_{\mathcal{L}}) = 0$.
4. If $\mathcal{L} \in \mathrm{Pic}(A)$ is a non-degenerate line bundle, then there is a unique integer $0 \leq i \leq g$ s.t. $H^i(X, \mathcal{L}) \neq 0$. Such an i is called the **index of** $\mathcal{L}$. And $\mathrm{ind}(\mathcal{L}^{-1}) + \mathrm{ind}(\mathcal{L}) = g$. Notice $\mathrm{ind}(\mathcal{L}) = 0$ is equivalent to it is effective or equivalent to it being ample(15.7.4.15).
5. Moreover, if $k = \mathbb{C}$, and $A = \mathrm{Lie}(A)/\Lambda$, $\mathcal{L} \in \mathrm{Pic}(A)$, then $c_1(\mathcal{L})$ corresponds to a Hermitian form H**?**, and $\mathrm{ind}(\mathcal{L})$ is just the number of negative eigenvalues of H.

⌟

Proof: 1, 2: Because $\mathcal{T}_{A/k}$ is trivial, the Todd class $\mathrm{Todd}(\mathcal{T}_{A/k}) = 1$, so the assertions follows from Hirzebruch-Riemann-Roch(8.1.10.3).

3. 4. For the last assertion, Cf.[Van de Geer, P131]**?**

$$\dim_k H^n(X \times X, \Lambda(\mathcal{L})) = \deg(\lambda_{\mathcal{L}})\delta_{n,g},$$

$$H^n(X\times X, \Lambda(\mathcal{L})) \cong H^n(X\times X, m^*\mathcal{L}\otimes \mathrm{pr}_1^*\mathcal{L}^{-1}) \cong H^n(X\times X, \mathrm{pr}_1^*\mathcal{L}\otimes \mathrm{pr}_2^*\mathcal{L}^{-1}) \cong \bigoplus_{p+q=n} H^p(X,\mathcal{L})\otimes H^q(X,\mathcal{L}^{-1}).$$

So item4 follows from the two equations above.

5:**?** □

Cor. (15.7.5.3). Let $k \in \mathtt{Field}$ and $f : X \to Y \in \mathrm{Isog}_k$, then $\chi(f^*\mathcal{L}) = \deg(f)\chi(\mathcal{L})$. ⌟

Proof: We may base change to $k = \overline{k}$. By the proposition and the fact $c_1(f^*(\mathcal{L})^g) = f^*(c_1(\mathcal{L})^g)$, it suffices to show that $\deg(f^*([P])) = \deg(f)$ for any point $P \in Y(k)$, which is trivial. □

Prop. (15.7.5.4) [Properties of Indices]. For $k \in \mathtt{Field}$ and $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, then

- The index is a locally constant function in algebraic families of non-degenerate line bundles. In particular, if $\mathcal{L} \in \mathrm{Pic}(A)$ is non-degenerate and $\mathcal{L}' \in \mathrm{Pic}^0(A)$, $\mathrm{ind}(\mathcal{L}) = \mathrm{ind}(\mathcal{L} \otimes \mathcal{L}')$.
- If $f : B \to A \in \mathrm{Isog}_k$, and $\mathcal{L} \in \mathrm{Pic}(A)$ a non-degenerate line bundle, then $\mathrm{ind}(\mathcal{L}) = \mathrm{ind}(f^*\mathcal{L})$.
- If $\mathcal{L}$ is non-degenerate, then for $m \in \mathbb{Z}_+$, $\mathcal{L}^{\otimes m}$ is non-degenerate too, and $\mathrm{ind}(\mathcal{L}^{\otimes m}) = \mathrm{ind}(\mathcal{L})$.
- If $\mathcal{L}_1, \mathcal{L}_2, \mathcal{L}_1 \otimes \mathcal{L}_2 \in \mathrm{Pic}(A)$ are all non-degenerate, then $\mathrm{ind}(\mathcal{L}_1 \otimes \mathcal{L}_2) \leq \mathrm{ind}(\mathcal{L}_1) + \mathrm{ind}(\mathcal{L}_2)$.
- If $\mathcal{L}, \mathcal{L}' \in \mathrm{Pic}(X)$ and $\mathcal{L}, \mathcal{L} \otimes \mathcal{L}'$ are both non-degenerate, then $\mathrm{ind}(\mathcal{L} \otimes \mathcal{L}') \leq \mathrm{ind}(\mathcal{L})$.

⌟

Proof: Cf.[Geer, P134].**?** □

Prop. (15.7.5.5). Let $k \in \mathtt{Field}$ and $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$. Suppose $\mathcal{L}, \mathcal{H} \in \mathrm{Pic}(A)$ and $\mathcal{L}, \mathcal{L} \otimes \mathcal{H}$ are both non-degenerate, and that $\mathrm{ind}(\mathcal{L}) \neq \mathrm{ind}(\mathcal{L} \otimes \mathcal{H})$, then the polynomial $P(t) = \deg((c_1(\mathcal{L}) + tc_1(\mathcal{H}))^g)$ has a root $t \in [0, 1]$. ⌟

Proof: Cf.[Geer, P136]**?** □

Cor. (15.7.5.6). Let $k \in \mathtt{Field}$ and $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$. Then for any $\mathcal{L} \in \mathrm{Pic}(A)$ non-degenerate and $m \in \mathbb{Z}_+$, $\mathrm{ind}(\mathcal{L}^m) = \mathrm{ind}(\mathcal{L})$. ⌟

Proof: ? □

Thm. (15.7.5.7) [Kempf-Mumford-Ramanujam]. Let $\mathcal{L}$ be a line bundle on an Abelian variety A, and fix an ample line bundle H on A, let Φ be the Hilbert polynomial of $\mathcal{L}$ w.r.t. H, then

- The multiplicity of 0 in Φ equals $\dim K(\mathcal{L})$.
- If $\mathcal{L}$ is non-degenerate, then all roots of Φ in $\mathbb{C}$ are real, and the number of positive roots equals $\operatorname{ind}(\mathcal{L})$.

⌟

Proof: Cf.[Van de Geer, P139,140]. □

Prop. (15.7.5.8). For any ample line bundle $\mathcal{L}$ on A, $\mathcal{L}^{\otimes m}$ is basepoint-free for $m \geq 2$ and very ample for $m \geq 3$. ⌟

Proof:

□

Prop. (15.7.5.9). Let $S \in \mathcal{S}\mathrm{ch}$ is connected and $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/S$. If $\mathcal{L} \in \operatorname{Pic}(X)$ is non-degenerate, and there exists an arithmetic point $s \in S$ s.t. L_s is ample on X_s, then $\mathcal{L}$ is relatively ample on X/S. ⌟

Proof: □

6 Isogenies and Tate Modules

Isogenies

Prop. (15.7.6.1) [Isogenies of Abelian Varieties]. Let $k \in \mathtt{Field}$ and $f : X \to Y \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, the following are equivalent:

- f is an isogeny.
- f is surjective and $\dim X = \dim Y$.
- $\ker f$ is a finite group scheme and $\dim X = \dim Y$.
- f is finite.

The set of isogenies from X to Y is denoted by $\operatorname{Isog}(X, Y)$. $\operatorname{Isog}(X, X) \cup \{0\}$ is denoted by $\operatorname{Isog}(X)$. ⌟

Proof: This follows from the theory of algebraic groups. □

Prop. (15.7.6.2) [Separable Isogenies]. Let $f : X \to Y$ be an isogeny of Abelian varieties over k, then

- For any $Q \in Y(\overline{k})$, $\#f^{-1}(Q)(\overline{k}) = \deg_s(f)$, and for any $P \in X$, $e_P(f) = \deg_i(f)$.
- The map: $X[f] \to \operatorname{Gal}(K(X_{\overline{k}})/\varphi^*(K(Y_{\overline{k}}))) : P \mapsto \tau_P^*$ is an isomorphism of groups.
- f is unramified iff it is étale iff it is separable, and in this case, $K(X_{\overline{k}})/K(Y_{\overline{k}})$ is an Abelian Galois extension of degree $\deg(f)$.

⌟

Proof: 1: By(6.11.3.4), this holds for Q in a dense open subset of Y, thus by homogeneity, it holds for all Q. The second assertion follows from the fact after shrining f is finite locally free of rank $\deg(f)$ by using homogeneity on X.

2: This is clearly a group homomorphism. By Galois theory, it suffices to show it is injective, which is clear.

3: This follows from(15.7.6.1) and generic unramifiedness(6.6.5.9). □

Prop. (15.7.6.3) [Isogenous is an Equivalence Relation]. If $k \in \texttt{Field}, X, Y \in \mathcal{A}b\mathcal{V}ar/k$ and $f \in \operatorname{Isog}(X,Y)$, $d = \deg(f)$, then there exists $g \in \operatorname{Isog}(Y,X)$ s.t. $g \circ f = [d]_X, f \circ g = [d]_Y$.

In particular, we can write $X \sim Y$ to denote that X, Y are isogenous. This is an equivalence relation. ⌟

Proof: As $\ker(f)$ is a finite group scheme of rank d, $[d]\ker(f) = 0$, so $[d]$ factors through f via $g : Y \to X$, so $g \circ f = [d]_X$. Then also $[d]_Y \circ f = f \circ [d]_X = f \circ (g \circ f) = (f \circ g) \circ f$, thus $[d]_Y = f \circ g$ as f is a quotient map. □

Prop. (15.7.6.4) [Dual Isogenies]. Let $A, A' \in \mathcal{A}b\mathcal{V}ar/k$ and $\varphi \in \operatorname{Hom}(A, A')$, then we get a dual homomorphism $\widehat{\varphi} \in \operatorname{Hom}((A')^\vee, A^\vee)$. Then:

- $\widehat{\widehat{\varphi}} = \varphi$.
- $\deg(\widehat{\varphi}) = \deg(\varphi)$.
- $\widehat{\varphi + \psi} = \varphi^\vee + \widehat{\psi}$.
- $([m]_E)^\vee = [m]_{E^\vee}$.

⌟

Proof: 1: This is formal.

2: [Conrad, P66].?

3: This is clear from the modular description of $\widehat{A}$.

4: This follows from 3. □

<u>$\operatorname{Hom}(X,Y)$</u>

Def. (15.7.6.5) [Simple Abelian Varieties]. A **simple Abelian variety** is an Abelian variety that has no non-trivial Abelian subvarieties. ⌟

Thm. (15.7.6.6) [Poincaré's Complete Reducibility Theorem]. Let B be an Abelian subvariety of A, then there exists an Abelian subvariety C of A that the addition gives an isogeny

$$B \times C \to A.$$

⌟

Proof: Choose an ample line bundle c on A, let $\iota : B \to A$ be the inclusion and $\widehat{\iota} : \widehat{A} \to \widehat{B}$ the dual map, then

$$(\widehat{\iota} \circ \lambda_c)|_B = \lambda_{\iota^*(c)}.$$

Since $\iota^*(c)$ is also ample, $\varphi_{\iota^*(c)}$ is an isogeny, thus has finite kernel. Let $C = \ker(\iota \circ \varphi_c)$, then we have $C \cap B$ is finite, whence $B \times C \to A$ has finite kernel. The dimension theorem(9.1.4.36) applied to $\iota \circ \varphi_c$ shows

$$\dim C + \dim B^\vee = \dim A^\vee.$$

and this together with(15.7.4.16) shows $B \times C \to A$ is a surjection, because A is irreducible. Thus it is an isogeny. □

Cor. (15.7.6.7). For $k \in \texttt{Field}, A \in \mathcal{A}b\mathcal{V}ar/k$, there are simple Abelian subvarieties $B_1, \ldots, B_n$ of A that the inclusions give an isogeny

$$B_1 \times \ldots \times B_n \to A.$$

⌟

Prop. (15.7.6.8) [Hom(A, A') is Torsion-Free and F.g.]. Let k be a field and $A, A' \in \mathcal{A}b\mathcal{V}ar/k$, then $\mathrm{Hom}(A_1, A_2)$ w.r.t. the addition is a f.g. torsion-free Abelian group of rank at most $4g^2$. ⌟

Proof: Assume $[m]\circ\varphi = 0$, then $\varphi\circ[m] = 0$, and use the fact $[m]$ is surjective(15.7.6.14). The last assertion follows from(15.13.2.3). □

Def. (15.7.6.9) [Quasi-Isogenies]. For $A, A' \in \mathcal{A}b\mathcal{V}ar/k$, $\mathrm{Hom}(A, A')_{\mathbb{Q}} = \mathrm{Hom}(A, A') \otimes \mathbb{Q}$ is called the set of **quasi-isogenies** from A to A'.

Define the category Isog/k to be the category consisting of Abelian varieties over k with morphisms $\mathrm{Mor}(A, A') = \mathrm{Hom}(A, A')_{\mathbb{Q}}$. Notice $f : A \to A' \in \mathcal{A}b\mathcal{V}ar/k$ is an isogeny iff f is an isomorphism in Isog/k, by(6.4.4.20).

Thus by(15.7.6.7), Isog/k is a semisimple $\mathbb{Q}$-linear Abelian category. ⌟

Prop. (15.7.6.10). For $A, A' \in \mathcal{A}b\mathcal{V}ar/k$, if $A \sim A'$, then $\mathrm{End}_{\mathbb{Q}}(A) = \mathrm{End}_{\mathbb{Q}}(A')$. Moreover, $\mathrm{End}_{\mathbb{Q}}(A)$ is a semisimple $\mathbb{Q}$-algebra, and it is simple iff A is simple. ⌟

Proof: These follow from(15.7.6.7). □

Def. (15.7.6.11) [Abelian Varieties of GL(2)-Type]. $A \in \mathcal{A}b\mathcal{V}ar/\mathbb{Q}$ is called an **Abelian variety of GL(2)-type** if A is simple and $\mathrm{End}(A)_{\mathbb{Q}}$ contains some $E \in \mathtt{NField}$ with $[E : \mathbb{Q}] = \dim A$. ⌟

Thm. (15.7.6.12). $A \in \mathcal{A}b\mathcal{V}ar/\mathbb{Q}$ is of GL(2)-type iff it is a simple quotient of $J_1(N)/\mathbb{Q}$. ⌟

Proof: Cf.[Ribet, Abelian Varieties over $\mathbb{Q}$ and Modular Forms]. And [Serre's Modularity Conjecture 1]P502.? □

Tate Modules

Prop. (15.7.6.13). For $S \in \mathrm{N}\mathcal{S}\mathrm{ch}$, $A \in \mathcal{A}b\mathcal{V}ar^g/S, n \in \mathbb{Z}_+$ and n is invertible on S, then $A[n]$ is a finite locally free S-group scheme of order n^{2g}. ⌟

Proof: ? □

Prop. (15.7.6.14) [Multiplication Map, Weil]. Let $k \in \mathtt{Field}$, $A \in \mathcal{A}b\mathcal{V}ar/k$, and $n \in \mathbb{Z}\cap k^\times$, then $[n] : A \to A$ is finite faithfully flat of degree $n^{2\dim A}$. In particular it is an isogeny(15.7.6.1), and

- If $n \in \mathbb{Z}\setminus(\mathrm{char}\, k)$, then $[n]$ is finite étale and $|A[n]| \cong (\mathbb{Z}/n\mathbb{Z})^{2\dim A}$.
- If $n = 0 \in k$, then $[n]$ is not separable.
- If $\mathrm{char}\, k = p \in \mathbf{P}$, then $|A(p)| \cong (\mathbb{Z}/p\mathbb{Z})^r \times \alpha_p^{2g-2r} \times \mu_p^r$ for some $0 \le r \le g$. In particular, $A[p^e] = (\mathbb{Z}/(p^e))^r$ for any $e \ge 0$. This r is called the **p-rank** of A. It is invariant under isogenies.

⌟

Proof: 1, 2: Let $Z = \ker([n])$, then it is proper. By(15.7.1.26), choose an ample line bundle $\mathcal{L} = \mathcal{L}(D) \in \mathrm{Pic}(A)$, then $\mathcal{O}_Z = \mathcal{L}_Z^{n(n+1)/2} \otimes [-1]^*\mathcal{L}_Z^{n(n-1)/2}$. As $\mathcal{L}_Z$ and $[-1]^*\mathcal{L}_Z$ are both ample, $\mathcal{O}_Z$ is ample. Now(6.4.4.20) shows Z is finite. Thus by dimension equation, $[n]$ is finite and faithfully flat.

The action of $[n]$ on the tangent space at the origin is given by multiplying by n by(9.2.2.1), thus it is unramified at the origin iff $n \in \mathbb{Z}\cap k^*$ by(6.6.5.12), and also on any other closed points by homogeneity. Thus if $n \in \mathbb{Z}\cap k^*$, $[n]$ is finite étale, and otherwise $[n]$ is not separable, by(6.6.5.12), as it is not generically unramified.

To calculate $A[n]$ in the étale case, notice $[n]^*D = n^2D$, and the intersection number formula

$$n^{2g}(D \cdot D \cdot \ldots \cdot D) = ([n]^*D \cdot [n]^*D \cdot \ldots \cdot [n]^*D) = \deg([n])(D \cdot D \cdot \ldots \cdot D)$$

where the intersection is g-fold, thus $(D \cdot D \cdot \ldots \cdot D)$ equals the degree of the projection embedding of X via $\mathcal{L}(D)$ thus positive, so we get $\deg([n]) = n^{2g} = \#A[n]$ as $[n]$ is finite étale. To see the structure of $A[n]$, notice this is true for any $m|n$.

3: **?** Cf.[Conrad]. The last assertion follows from the fact the fact $[p]$ is surjective and the structure theory of Abelian groups. □

Def. (15.7.6.15) [Tate Modules]. Let $k \in \texttt{Field}, A \in \mathcal{A}b\mathcal{V}ar/k$. For $\ell \in \mathbf{P}\backslash \operatorname{char} k$, define $T_\ell(A) = \varprojlim_{n\geq 0} A[\ell^n]$, called the **Tate module** of A. Then it is naturally a $\mathbb{Z}_\ell$-module and isomorphic to $\mathbb{Z}_\ell^{2g}$ by(15.7.6.14).

Also define $V_\ell(A) = T_\ell(A) \otimes_{\mathbb{Z}_\ell} \mathbb{Q}_\ell$. There are Gal_k actions on them, as $[\ell^n]$ is étale and Gal_k preserves $A[\ell^n]$ because O is Gal_k-invariant.

For $\ell = \operatorname{char} k = p > 0$, we can also define $T_p(A)$, which is isomorphic to $\mathbb{Z}_p^r$ for some $0 \leq r \leq g$ by(15.7.6.14), but there is not Galois action on it. ⌟

Def. (15.7.6.16) [Adelic Tate Modules]. Situation as in(15.7.6.15), if $\operatorname{char} k = 0$, define the **Adelic Tate module** to be

$$T_f(A) = \prod_{\ell\in\mathbf{P}} T_\ell(A), \quad V_f(A) = \prod_{\ell\in\mathbf{P}}{}' (V_\ell(A), T_\ell(A)).$$

⌟

Prop. (15.7.6.17) [Étale Cohomology and Tate Modules]. Let $k = k^s$ and $A \in \mathcal{A}b\mathcal{V}ar^g/k$, and $\ell \in \mathbf{P}\backslash \operatorname{char} k$, then

- There are canonical isomorphisms $\mathrm{H}^1_{\text{ét}}(A, \mathbb{Z}_\ell) \cong \mathrm{Hom}_{\mathbb{Z}_\ell}(T_\ell(A), \mathbb{Z}_\ell) \cong T_\ell(A)(1)$. Thus $\mathrm{H}^1_{\text{ét}}(A, \mathbb{Z}_\ell) \cong \mathbb{Z}_\ell^{2g}$ by(15.7.6.14).
- The cup product define isomorphisms $\wedge^r H^1_{\text{ét}}(A, \mathbb{Z}_\ell) \cong H^r(A, \mathbb{Z}_\ell)$ for any $r > 0$.

⌟

Proof: Cf.[Mil08]P55. **?** □

Cor. (15.7.6.18). There is a natural Gal_k-invariant pairing $\wedge^r T_\ell(A) \times \mathrm{H}^r_{\text{ét}}(A, \mathbb{Z}_\ell) \to \mathbb{Z}_\ell$. ⌟

Prop. (15.7.6.19). Let $k \in \texttt{Field}, A \in \mathcal{A}b\mathcal{V}ar/k$ and $\ell \in \mathbf{P} \setminus \{\operatorname{char} k\}$, then for the representation $\rho_\ell : \mathrm{End}(A)_\mathbb{Q} \to \mathrm{End}(V_\ell)$ and any $f \in \mathrm{End}(A)_\mathbb{Q}$,

$$\deg(f) = \det(\rho_\ell(f)).$$

In particular, $\deg([n] - f) = \det(n - \rho_\ell(f))$ for any $n \in \mathbb{Z}$. ⌟

Proof: **?** □

Prop. (15.7.6.20) [Semisimplicity]. Let $F \in \texttt{GField}, \ell \in \mathbf{P}\backslash \operatorname{char} F, A \in \mathcal{A}b\mathcal{V}ar/F$, then the action of Gal_F on $V_\ell(A)$ is semisimple. ⌟

Proof:

□

7 Polarizations and Weil Pairings

Polarizations and Rosati Involutions

Def. (15.7.7.1) [Polarizations]. For $S \in \mathcal{S}\mathrm{ch}$ and $X \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/S$, a **polarization** of X/S is a symmetric isogeny $\lambda : X \to X^\vee$ s.t. étale locally, λ is of the form $\lambda_{\mathcal{L}}$ for relatively ample rigidified line bundles $\mathcal{L}$.

A **principal polarization** of an Abelian variety is a polarization of degree 1.

The category of Abelian varieties over k of dimension g together with a polarization of degree d is denoted by $\mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^{g,\mathrm{polar}=d}\,/k$. ⌟

Prop. (15.7.7.2) [Zarhin's Trick]. For any $k \in \texttt{Field}$ and $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/k$, $(A \times A^\vee)^4$ is canonically principally polarized. ⌟

Proof: Cf.[Mil08]P60. □

Thm. (15.7.7.3) [Finitely Many Polarizations]. Let $k \in \texttt{Field}$ and $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/k$, then for any $d \in \mathbb{Z}_+$, there are only f.m. isomorphism classes of polarizations on A of degree d. ⌟

Proof: Cf.[Mil08]P63. □

Def. (15.7.7.4) [Rosati Involutions]. For $k \in \texttt{Field}, A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/k$ and $\lambda : A \to A^\vee$ a polarization, then the inverse $\lambda^{-1} \in \mathrm{Hom}(A^\vee, A)_{\mathbb{Q}}$ is definable by(15.7.6.3). Then the **Rosati involution** corresponding to λ is defined to be the map

$$\mathrm{End}(A)_{\mathbb{Q}} \to \mathrm{End}(A)_{\mathbb{Q}} : \alpha \mapsto \lambda^{-1} \circ \alpha^\vee \circ \lambda.$$

Then it is an involution. ⌟

Prop. (15.7.7.5) [Rosati Involutions are Positive]. For $k \in \texttt{Field}$ and $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/k$, the bilinear form

$$(\alpha, \beta) \mapsto \mathrm{tr}(\alpha \circ \beta^\dagger) : \mathrm{End}(A)_{\mathbb{Q}}^2 \to \mathbb{Q}$$

is positive definite. ⌟

Proof: □

Prop. (15.7.7.6). Let $k \in \texttt{Field}$ and $(A, \lambda) \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/k$, then

- $\#\,\mathrm{Aut}((A, \lambda)) < \infty$.
- for any $n \geq 3$, any automorphism of (A, λ) acting trivially on $A[n]$ is the identity.

⌟

Proof: Cf.[Milne, P62]**?** □

Weil Pairings

Thm. (15.7.7.7)[Weil Pairings]. Let $S \in \mathcal{S}\mathrm{ch}$ and $X, Y \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}\,/S$, then for any isogeny $\alpha : X \to Y$, there is a perfect pairing

$$e_\alpha : \ker(\alpha) \times \ker(\alpha^\vee) \to \mathbb{G}_m.$$

⌟

Proof: Cf.[Mumford, P143]**?**. □

Def. (15.7.7.8) [Induced Pairings]. For $k \in \texttt{Field}, A \in \mathcal{A}b\mathcal{V}ar$, if e_m is any Weil pairing, and $\lambda : A \to A^\vee \in \mathrm{Isog}/k$, denote

$$e_m^\lambda = e_m \circ (\mathrm{id} \times \lambda) : A[m] \times A[m] \to \mu_m(1).$$

⌟

Def. (15.7.7.9). Let $k \in \texttt{Field}, \ell \in \mathbf{P}$ and $\mathrm{char}\, k \neq 2, \ell$. Then for $A \in \mathcal{A}b\mathcal{V}ar/k$, $\lambda \in \mathrm{Hom}(A, A^\vee)$ is ⌟

Prop. (15.7.7.10) [Weil Pairing for Elliptic Curves]. Let $E \in \mathcal{E}\mathrm{ll}/k$, then for any $m \in \mathbb{Z} \cap k^*$, there is a non-degenerate pairing

$$e_m : E[m] \times E[m] \to \mu_m$$

that is alternating, non-degenerate and Gal_k-invariant.

Moreover, $e_{mm'}(S,T) = e_m([m']S,T)$ for $S \in E[mm']$ and $S \in T[m]$. In particular, for $\ell \in \mathbf{P} \backslash \mathrm{char}\, k$, we can define a Weil pairing on the Tate module

$$e : T_\ell(E) \times T_\ell(E) \to \mu_{\ell^\infty}.$$

⌟

Proof: Let $T \in E[m]$, then by(15.11.1.22), there exists some $f \in \overline{K}(E)^*$ s.t. $\mathrm{div}(f) = m[E] - m[O]$. Let $T' \in E[m^2]$ s.t. $mT' = T$, then there exists a function $g \in \overline{K}(E)^*$ s.t.

$$\mathrm{div}(g) = [m]^*(T) - [m]^*(O) = \sum_{R \in E[m]} ([T' + R] - [R]).$$

Notice $f \circ [m]$ and g^m have the same divisor, so we may assume $f \circ [m] = g^m$. Then for any $S \in E[m]$ and $X \in E$, $g(S+X)^m = f(mX) = g(X)^m$, so $E \to \mathbb{P}^1 : g(X+S)/g(X)$ is constant and has value in μ_m, denote it by $e(T,S)$.

For bilinearity, Cf.[Sil16]P94**?**.

For alternating, Cf.[Sil16]P94**?**.

For non-degeneracy, if $e_m(S,T) = 1$ for any $T \in E[m]$, then g is $E[m]$-invariant, which implies $g = h \circ [m]$ for some $h \in \overline{K}(E)^*$ by(15.7.6.2) and the fact $[m]$ is separable. Then $(h \circ [m])^m = f \circ [m]$, so $f = h^m$, and $\mathrm{div}(h) = [T] - [O]$, so $T = O$.

Galois invariance is clear.

The last assertion follows by taking $g' = g \circ [m']$ and $f' = f^{m'}$. □

Cor. (15.7.7.11) [Primitive Pairing]. Let $E \in \mathcal{E}\mathrm{ll}/k$, then for any $m \in \mathbb{Z} \cap k^*$, $\mu_m \subset K(E[m])$, and there exists some $S, T \in E[m]$ s.t. $e_m(S,T)$ is a primitive m-th roots of unity. ⌟

Proof: If the subgroup generated by all $e_m(S,T)$ is μ_d, then $e_m([d]S,T) = 1$ for any $S,T \in E[m]$, so $[d]S = 0$ by non-degeneracy, so $d = m$ because $\#E[m] = (\mathbb{Z}/(m))^2$. Then the Gal_k-invariance of e shows $\mu_m \subset K(E[m])$. □

Prop. (15.7.7.12) [Duality with Isogenies]. Let $k \in \texttt{Field}$ and $\varphi : E_1 \to E_2 \in \mathrm{Isog}_k^1$, $m \in \mathbb{Z} \in k^*$, then for $S \in E_1[m], T \in E_2[m]$,

$$e_m(S, \varphi^\vee(T)) = e_m(\varphi(S), T).$$

In particular, for $S \in T_\ell(E_1)$ and $T \in T_\ell(E_2)$, $e(S, \varphi^\vee(T)) = e(\varphi(S), T)$. ⌟

Proof: Cf.[Sil16]P97**?**. □

Prop. (15.7.7.13). Let $E \in \mathcal{E}\text{ll}/k$ and $\varphi \in \operatorname{End}(E), \varphi \in \operatorname{End}(E)$, $\ell \in \mathbf{P} \setminus \operatorname{char} k$, then $\det(\varphi_\ell) = \deg(\varphi), \operatorname{tr}(\varphi_\ell) = 1 + \deg(\varphi) - \deg(1-\varphi)$. ⌟

Proof: For any $v, v' \in T_\ell(E)$, use the Weil pairing:

$$e(v,v')^{\deg(\varphi)} = e([\deg(\varphi)]v, v') = e(\varphi_\ell v, \varphi_\ell v') = e(v,v')^{\det(\varphi_\ell)},$$

thus $\deg(\varphi) = \det(\varphi_\ell)$. The latter equality follows from the identity $\operatorname{tr}(A) = 1 + \det(A) - \det(1-A)$ for any $A \in M_2(R)$. □

8 Over Archimedean Local Fields

Prop. (15.7.8.1) [Complex Abelian Varieties and Complex Tori]. By(12.9.5.9) and GAGA(12.8.7.17), $\mathcal{A}\text{b}\mathcal{V}\text{ar}/\mathbb{C}$ is the same as the category of complex tori V/Λ with a Riemann form $\omega : \wedge^2\Lambda \to \mathbb{Z}$(12.9.5.9).

Such a complex tori V/Λ is called a **polarizable integral Hodge structure**. ⌟

Def. (15.7.8.2) [Types of Polarizations]. Given a complex tori $X = V/\Lambda$ of dimension d with a Riemann form ω, there exists a basis of Λ and $d_1|d_2|\dots|d_n \in \mathbb{Z}_+$ s.t. the matrix ω w.r.t. this basis is

$$\begin{bmatrix} & D \\ -D & \end{bmatrix}, \quad D = \operatorname{diag}(d_1,\dots,d_n),$$

then X is said to have type D. ⌟

Prop. (15.7.8.3) [Abelian Varieties with Polarizations]. For $n \in \mathbb{Z}_+$ and $d_1|d_2|\dots|d_n \in \mathbb{Z}_+$, the set of polarized Abelian varieties over $\mathbb{C}$ of type $D = \operatorname{diag}(d_1,\dots,d_n)$ with a symplectic basis is in bijection with the set of $\operatorname{GL}(n,\mathbb{C})$ orbits of isomorphisms of real vector spaces $\Pi_\mathbb{R} : U_D \otimes \mathbb{R} \to \mathbb{C}^g$ s.t. for any $x, y \in V$,

$$(\Pi_\mathbb{R}^{-1}\,\mathrm{i}\,x, \Pi_\mathbb{R}^{-1}\,\mathrm{i}\,y)_D = (\Pi_\mathbb{R}^{-1}x, \Pi_\mathbb{R}^{-1}y)_D,$$

and the symmetric form

$$(x,y) \mapsto (\Pi_\mathbb{R}^{-1}\,\mathrm{i}\,x, \Pi_\mathbb{R}^{-1}y)_D$$

is positive definite.

And it is moreover canonical in bijection to the Siegel upper half space $\mathcal{H}_n$(12.13.6.6). ⌟

Proof: For any $X = V/U \in \mathcal{A}\text{b}\mathcal{V}\text{ar}^n/\mathbb{C}$ with a Riemann form ω of type D and a basis $\{u_1,\dots,u_n,v_1,\dots,v_n\}$ of U s.t. the matrix of ω is $\begin{bmatrix} & D \\ -D & \end{bmatrix}$. Then by choosing any complex basis $e_1,\dots,e_n$ of V, we get an isomorphism $U \otimes \mathbb{R} \cong \mathbb{C}^g$, and we can represent $\{u_i\}$ in the basis $\{e_i\}$ s.t.

$$(e_1,\dots,e_n,\mathrm{i}\,e_1,\dots,\mathrm{i}\,e_n) = \Pi_\mathbb{R}(u_1,\dots,u_n,v_1,\dots,v_n), \quad \Pi_\mathbb{R} = \begin{bmatrix} \Pi_{11} & \Pi_{12} \\ \Pi_{21} & \Pi_{22} \end{bmatrix} \in \operatorname{Mat}(2n,\mathbb{R}).$$

Then

$$(e_1,\dots,e_n)(\Pi_{11} + \mathrm{i}\,\Pi_{21}, \Pi_{21} + \mathrm{i}\,\Pi_{22})(u_1,\dots,u_{2n}),$$

and $\Pi = (\Pi_{11} + \mathrm{i}\,\Pi_{21}, \Pi_{21} + \mathrm{i}\,\Pi_{22})$ as in(12.9.5.11). Then the first assertion follows from(12.9.5.9). Notice the $\mathrm{GL}(n,\mathbb{C})$-orbit relation comes from the arbitrariness of the choice of basis $e_1,\dots,e_n$.

For the second assertion, notice that in each $\mathrm{GL}(n,\mathbb{C})$-orbit, there is a canonical choice of basis $\{e_1,\dots,e_n\}$ s.t. $e_i = \frac{1}{d_i}v_i$. Then in this basis,

$$\Pi_{\mathbb{R}} = \begin{bmatrix} \Pi_{11} & D \\ \Pi_{21} & 0 \end{bmatrix}, \quad \Pi = (\Pi_{11} + \mathrm{i}\,\Pi_{12}, D).$$

So if $Z = \Pi_{11} + \mathrm{i}\,\Pi_{12}$, the Riemann relations(12.9.5.11) are just equivalent to

$$\{Z^t = Z, \quad \mathrm{Im}(Z) \in \mathrm{Pos}(n,\mathbb{C})\}.$$

□

Cor. (15.7.8.4). For $n \in \mathbb{Z}_+$ and $d_1|d_2|\dots|d_n \in \mathbb{Z}_+$, the set of polarized Abelian varieties over $\mathbb{C}$ of type $D = \mathrm{diag}(d_1,\dots,d_n)$ with a symplectic basis is in bijection with the set of homomorphisms of real algebraic groups $h_1 : S_1 \to \mathrm{Sp}_{\mathbb{R}}(U_D)$ satisfying

- The complexification $h_{1,\mathbb{C}} : \mathbb{C}^\times \to \mathrm{Sp}_{\mathbb{R}}(U_D \otimes \mathbb{C})$ has weights ± 1 with multiplicities n.
- the symmetric form $(x,y) \mapsto (h_1(\mathrm{i})x, y)_D$ is positive definite.

⌟

Cor. (15.7.8.5) [Classifying Abelian Varieties with Polarizations]. It follows from(15.7.8.3) that for $n \in \mathbb{Z}_+$ and $d_1|d_2|\dots|d_n \in \mathbb{Z}_+$, the set of isomorphisms of Abelian varieties over $\mathbb{C}$ of type $D = \mathrm{diag}(d_1,\dots,d_n)$ with a symplectic basis is bijection with the set

$$\mathrm{Sp}_D(\mathbb{Z})\backslash\mathscr{H}_n.$$

⌟

Prop. (15.7.8.6) [Dual Riemann Forms]. If $X = V/\Lambda$ is a complex torus with a Riemann form ω, then the dual complex torus(12.9.5.8) $X^\vee$ also has a Riemann form defined as follows: any $f \in V^*$ corresponds to an element v_f s.t. $f(u) = \omega(u, v_f)$. Thus we can define $\omega'(f,g) = \omega(v_f, v_g)$. And there is an isogeny(i.e. surjective isomorphism with finite kernel)

$$A \to A^\vee : \overline{a} \mapsto [x \mapsto \omega(x,a)]$$

which is compatible with the Riemann forms. ⌟

Prop. (15.7.8.7) [Rosati Involutions are Positive]. Let $X = V/\Lambda \in \mathcal{A}b\,\mathcal{V}ar/\mathbb{C}$, then for any $\alpha \in \mathrm{End}_{\mathbb{Q}}(X)$, there exists $\alpha' \in \mathrm{End}_{\mathbb{Q}}(X)$ s.t.

$$\omega(\alpha x, y) = \omega(x, \alpha' y).$$

And this determines an involution on $\mathrm{End}_{\mathbb{Q}}(X)$, called the **Rosati involution**. Notice this is compatible with that defined in(15.7.7.4), by using(15.7.8.6).

Then this is a positive involution on $\mathrm{End}_{\mathbb{Q}}(X)$. ⌟

Proof: Notice the form $\omega_J : (x,y) \mapsto \omega(x, Jy)$ is symmetric and positive, and

$$\omega_J(\alpha x, y) = \omega(\alpha x, Jy) = \omega(x, \alpha' Jy) = \omega(x, J\alpha' y) = \omega_J(x, \alpha' y).$$

So this involution is positive by(15.8.2.19). □

Thm. (15.7.8.8) [Frobenius-Lefschetz-Poincaré-Riemann-Weierstrass]. The functor $A \mapsto H_1(A,\mathbb{Z})$ defines an equivalence from $\mathcal{A}b\,\mathcal{V}ar/\mathbb{C}$ to the category of polarizable integral Hodge structures of type $\{(-1,0),(0,-1)\}$. ⌟

Proof: ? □

Elliptic Curve Case

Prop. (15.7.8.9) [Complex Tori as Elliptic Curves]. Let Λ be a complete real lattice of $\mathbb{C}$, then we can make $\mathbb{C}/\Lambda$ into a Riemannian surface as the quotient space of $\mathbb{C}$. Then it is positive by**??**t is a smooth curve of genus 1 with the origin as the rational point, which means it is an elliptic curve. ⌟

Prop. (15.7.8.10) [Elliptic Curve as Complex Tori]. For an elliptic curve $\mathbb{C}/\Lambda$ over $\mathbb{C}$, by(11.5.4.7), the Weierstrass functions(11.5.4.5) $\mathfrak{P}, \mathfrak{P}'$ are just the rational functions in(15.11.1.7), so the map

$$z \mapsto [\mathfrak{P}(z), \mathfrak{P}'(z), 1]$$

is biholomorphic from $\mathbb{C}/\Lambda$ to the elliptic curve defined by the equation $y^2 = 4x^3 - g_2(\Lambda)x - g_3(\Lambda)$ that $g_2^3 - 27g_3^2 \neq 0$. And it also preserves the group structure. ⌟

Proof: To show that the homomorphism preserves group structure, notice that if z_1, z_2, z_3 maps to three points that is colinear, then they satisfy a equation

$$f(z) = a\mathfrak{P}(z) + b\mathfrak{P}'(z) + c.$$

If $b \neq 0$, then this is a meromorphic function with three poles, thus three zeros, which is exactly z_1, z_2, z_3, so by(11.5.4.2), $z_1 + z_2 + z_3 \equiv 0 \mod \Lambda$. If $b = 0$, then $z_3 = 0$, which corresponds to the point $(1, 0, 0) \in \mathbb{P}^2$, then the same argument shows $z_1 + z_2 + 0 \equiv 0 \mod \Lambda$. □

Lemma (15.7.8.11) [Isogenies and Homogeneities]. If E_1, E_2 are elliptic curves in $\mathbb{P}^2$ corresponding to Λ_1, Λ_2 via(15.7.8.10) resp., then the natural map

$$\{\text{isogenies } E_1 \to E_2\} \to \{\text{non-constant holomorphic maps } \varphi : \mathbb{C}/\Lambda_1 \to \mathbb{C}/\Lambda_2, \varphi(0) = 0\}$$

is a bijection. ⌟

Proof: By(12.9.5.2), it suffices to show for any lattices Λ_1, Λ_2 and $\alpha \in \mathbb{C}^*$ that $\alpha\Lambda_1 \subset \Lambda_2$, the map

$$[\mathfrak{P}(z, \Lambda_1), \mathfrak{P}'(z, \Lambda_1), 1] \to [\mathfrak{P}(\alpha z, \Lambda_2), \mathfrak{P}'(\alpha z, \Lambda_2), 1]$$

is a morphism. For this, notice $\mathfrak{P}(\alpha z, \Lambda_2)$ is an elliptic function for Λ_1, thus by(11.5.4.7), it is a rational function of $\mathfrak{P}(z, \Lambda_1)$ and $\mathfrak{P}'(z, \Lambda_1)$. □

Lemma (15.7.8.12). Let $E/\mathbb{C}$ be an elliptic curve in $\mathbb{P}^2$ defined by a Weierstrass equation, then there exists a lattice $\Lambda \subset \mathbb{C}$, unique up to homothety, that the embedding given in(15.7.8.10) induces an isomorphism $\mathbb{C}/\Lambda \cong E(\mathbb{C})$. ⌟

Proof: This is a consequence of(11.5.4.8) and(15.11.1.14). □

Prop. (15.7.8.13) [Elliptic Curves and Complex Tori]. The following categories are equivalent:

- $\mathrm{Isog}^1/\mathbb{C}$.
- Category of complex tori with morphisms homomorphisms preserving 0.
- Category of lattices in $\mathbb{C}$ with homotheties as morphisms.

⌟

Proof: This is a consequence of(15.7.8.10)(15.7.8.11) and(12.9.5.2). □

Cor. (15.7.8.14) [j-Functions Correspond]. In this correspondence, If $E \cong E_\tau = \mathbb{C}/(\mathbb{Z}+\mathbb{Z}\tau)$, then E is given by the by Weierstrass equation

$$W : y^2 = x^4 - \frac{g_2(\Gamma)}{4}x - \frac{g_3(\Gamma)}{4}.$$

Then

$$\Delta(W) = \Delta(\tau), \quad j(E) = j(\tau).$$

⌟

Proof: Comparing the definitions and use the definitions of $E_4, E_6, G_4, G_4, g_2, g_3$(20.2.4.5)(11.5.4.7), we get

$$g_2 = 60G_4 = 120\zeta(4)E_4 = \frac{4}{3}\pi^4 E_4 (21.7.4.1),$$

$$g_3 = 140G_6 = 280\zeta(4)E_6 = \frac{8}{27}\pi^4 E_6 (21.7.4.1).$$

So by(15.11.1.6),

$$j(W) = j(\tau) = 1728\frac{E_4(\tau)^3}{E_4^3(\tau) - E_6^2(\tau)}.$$

And for Δ, because $\Delta(\tau) = (2\pi)^{12}E_4^3(\tau)/j(\tau)$ and $\Delta(W) = c_4^3/j(\tau)$(15.11.1.5), it suffices to show that $c_4 = (2\pi)^4 E_4$. But

$$c_4 = 48g_2 = (2\pi)^4 E_4.$$

□

Prop. (15.7.8.15). Let $E/\mathbb{C}$ be an elliptic curve and Λ a lattice in $\mathbb{C}$ that $E(\mathbb{C}) \cong \mathbb{C}/\Lambda$, then

- there is a natural isomorphism $H_1(E(\mathbb{C}), \mathbb{Z}) \cong \Lambda : \gamma \mapsto \int_\gamma dz$.
- There is a natural isomorphism $H_1(E(\mathbb{C}), \mathbb{Z}/(m)) \cong E[m]$.

⌟

Proof: Cf.[Sil16]P176. □

Over $\mathbb{R}$

Prop. (15.7.8.16). Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{R}$, then there exists a unique τ in the set

$$\mathcal{C} = \{\mathrm{i}\, t | t \geq 1\} \cup \{e^{\mathrm{i}\,\theta} | \pi/3 \leq \pi/2\} \cup \{1/2 + \mathrm{i}\, t | t \geq \sqrt{3}/2\}.$$

s.t. $j(\tau) = j(E)$. And by(15.11.6.3), each $\tau \in \mathcal{C}$ corresponds to exactly two isomorphism classes of elliptic curves over $\mathbb{R}$. ⌟

Proof: Firstly these τ satisfies $j(\tau) \in \mathbb{R}$ because by the power expansions of $j(\tau)$(20.2.4.22), for $\tau = it$ or $1/2 + it$, $q \in \mathbb{R}$, thus $j(\tau) \in \mathbb{R}$. For $\tau = e^{i\theta}$, $\overline{j(e^{i\theta})} = j(-e^{-i\theta}) = j(e^{i\theta})$ as $j \in M_0(\Gamma(1))$.

Next it can be proven $j(i\infty) = +\infty$ and $j(1/2 + i\infty) = -\infty$, and j is injective on $\mathcal{C}$ by(20.2.4.22). Thus the assertion follows by continuity. □

Remark (15.7.8.17). Notice by action of $\alpha = \begin{bmatrix} 0 & -1 \\ 1 & -1 \end{bmatrix} \in \mathrm{SL}(2, \mathbb{Z})$ on $\{e^{i\theta} | \pi/3 \leq \pi/2\}$, we can also replace $\mathcal{C}$ by

$$\mathcal{C}' = \{\mathrm{i}\, t | t \geq 1\} \cup \{1/2 + \mathrm{i}\, t | t > 1/2\}.$$

⌟

9 char $k > 0$ Case

Prop. (15.7.9.1) [Finiteness over Finite Fields]. If $k \in \texttt{Field}, \#k < \infty$, then for any $g \in \mathbb{Z}_+$, $\# \mathcal{A}b\,\mathcal{V}ar^g/k < \infty$. ⌟

Proof: Firstly we show for A principally polarized by an ample line bundle $\mathcal{L}$. Then $\chi(\mathcal{L}) = 1$ by(15.7.5.2), and $\mathcal{L}^{\otimes 3}$ is very ample by(15.7.5.8), so it embeds A as a variety of degree $3^g.g!$ in $\mathbb{P}3^g - 1$ by(15.7.5.2). Such a variety is determined by its Chow form, which is a homogenous polynomial of degree $3^g.g!.d$ in each of $g+1$ sets of 3^g variables**?**. And the number of such polynomials are finite.

The general case can be reduced to the principal polarized case by Zarhin's trick(15.7.7.2). □

Prop. (15.7.9.2). Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}}$, and $(A, \lambda) \in \mathcal{A}b\,\mathcal{V}ar^{\text{polar}}/\mathbb{F}_q$ with Rosati involution $\dagger$, then

$$\text{Frob}_{q,A}^{\dagger} \circ \text{Frob}_{q,A} = [q].$$

⌟

Proof: Cf.[Mil08]P76.**?** □

Honda-Tate Theory

References are [Tat66] and [Hon68].

Prop. (15.7.9.3)[Weil Conjecture for Abelian Varieties]. For $p \in \mathbf{P}, r \in \mathbb{Z}_+, q = p^r, \ell \in \mathbf{P} \backslash \ell$, and $A \in \mathcal{A}b\,\mathcal{V}ar^g/\mathbb{F}_q$, let $\varphi_A = \varphi^r$ be the Frobenius of A, and let $P_\varphi(X)$ be the characteristic polynomial of the action of φ_A on $T_\ell(A)$, then

- $P_{A,\ell}(X) \in \mathbb{Z}[X]$, and is invariant of ℓ chosen. Thus we omit ℓ from now on.
- $P_A(X) = \prod_{i=1}^{2g}(X - \alpha_i)$, where $\alpha_i \in \mathbb{C}$ and $|\alpha_i| = q^{1/2}$.
- $\#A(\mathbb{F}_{q^m}) = \prod_{i=1}^{2g}(1 - \alpha_i^m)$.

In particular,

$$|\#A(\mathbb{F}_{q^m}) - q^{mg}| \leq 2gq^{m-\frac{1}{2}} + (4^g - 2g - 1)q^{m(g-1)}.$$

⌟

Proof: These follow from(15.7.6.17) and Weil conjecture(17.2.2.6)(21.2.3.5). □

Thm. (15.7.9.4)[Tate]. For $k \in \texttt{Field}^{\text{fin}}, \ell \in \mathbf{P} \setminus \{\text{char}\, k\}$ and $A \in \mathcal{A}b\,\mathcal{V}ar/k$, the homomorphism

$$\text{End}_k(A) \to \text{End}_{\varphi_A}(V_\ell(A))$$

is an isomorphism. ⌟

Proof: **?** □

Thm. (15.7.9.5)[Honda-Tate]. For $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$ and $A \in \mathcal{A}b\,\mathcal{V}ar^g/\mathbb{F}_q$ simple, by(15.7.9.3), for any embedding $\mathbb{Q}(\varphi_A) \hookrightarrow \mathbb{C}$, $\iota(\alpha)$ is a Weil q-number(14.4.1.13), and we get a map of sets

$$A \mapsto [\varphi_A] : \{\text{simple Abelian varieties}/\mathbb{F}_q\}/(\sim \text{isogenies}) \to \text{Weil}(q^{1/2})/(\sim \text{conjugations}).$$

Then this is a bijection. ⌟

Proof: The injectivity follows from(15.13.2.5) and the irreducibility of the action of φ_A on $V_\ell(A)$**?**, and the surjectivity is proven by Honda**??**(or [Chai-Oort]). □

Cor. (15.7.9.6). For $k \in \texttt{Field}^{\text{fin}}, \ell \in \mathbf{P} \setminus \{\text{char}\, k\}$, two Abelian varieties $A, B \in \mathcal{A}b\mathcal{V}ar^g/k$ are isogenous iff $\det(\varphi_A|H^1(A_{\overline{k}}, \mathbb{Q}_\ell)) = \det(\varphi_B|H^1(B_{\overline{k}}, \mathbb{Q}_\ell))$. ⌟

Proof: **?** □

Thm. (15.7.9.7)[Description of $\mathrm{End}(A)_\mathbb{Q}$ in terms of φ_A]. For $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$ and $A \in \mathcal{A}b\mathcal{V}ar^g/\mathbb{F}_q$ be simple, let $D = \mathrm{End}(A)_\mathbb{Q}, \varpi = \varphi_A \in D$, then

- D is a central division ring over $\mathbb{Q}(\varpi)$.
- For any $v \in \Sigma_{\mathbb{Q}(\varpi)}$, $\mathrm{inv}_v(D) = \frac{\mathrm{ord}_v(\varpi)}{\mathrm{ord}_v(q)}[\mathbb{Q}(\varpi)_v : \mathbb{Q}_p] \in \mathbb{Q}/\mathbb{Z}$. In particular, for $v \notin \Sigma^{p\infty}_{\mathbb{Q}(\varpi)}$, $\in_v (D) = 0$.
- $[D : \mathbb{Q}]_{\mathrm{red}} = 2 \dim A$.

⌟

Proof: Cf.[Tat66] or [Waterhouse and Milne, 1971].**?** □

10 Jacobians of Curves

Prop. (15.7.10.1)[Picard Schemes of Curves]. Let C be a smooth complete precurve over a field k of genus g with a rational point, then

- $\underline{\mathrm{Pic}}_{C/k}$ is representable by a disjoint union of smooth complete varieties $\underline{\mathrm{Pic}}^d_{C/k}, d \in \mathbb{Z}$ where $\underline{\mathrm{Pic}}^d_{C/k}$ corresponds to relative line bundles of degree d.
- $\underline{\mathrm{Pic}}^0_{C/k}$ is an Abelian variety over k.
- for $d \geq 0$, the Abel map $\mathrm{Div}^d_{C/k} \to \underline{\mathrm{Pic}}^d_{C/k}$ is surjective for $d \geq g$ and smooth for $d \geq 2g - 1$.
- The morphism $\mathrm{Div}^g_{C/k} \to \underline{\mathrm{Pic}}^g_{C/k}$ is birational.

⌟

Proof: Cf.[Sta]0BA0 or [Neron Models] or(15.7.10.2)**?**. item1 follows from(8.1.12.5) □

Prop. (15.7.10.2)[Picard Scheme of Relative Curves]. If X/S is locally projective, flat with fibers all curves, $m \in \mathbb{Z}$, let $\underline{\mathrm{Pic}}^m_{X/S}$ denote the subfunctor of $\underline{\mathrm{Pic}}_{X/S}$ representing invertible sheaves $\mathcal{L}$ with $\deg(\mathcal{L}) = m$, then

- $\underline{\mathrm{Pic}}^m_{X/S}$ are clopen subschemes of $\underline{\mathrm{Pic}}_{X/S}$ of f.t. and form a disjoint cover of it, and forming it commutes with base change.
- $\underline{\mathrm{Pic}}^{(0)}_{X/S} = \underline{\mathrm{Pic}}^0_{X/S} = \underline{\mathrm{Pic}}^\tau_{X/S}$, and each $\underline{\mathrm{Pic}}^m_{X/S}$ is a fppf-torsor under $\underline{\mathrm{Pic}}^0_{X/S}$.
- If X/S is projective and S is Noetherian, then each $\underline{\mathrm{Pic}}^m_{X/S}$ is quasi-projective over S.

⌟

Proof: Cf.[Kle05]P60.**?** □

Def. (15.7.10.3)[Jacobians of Curves]. For a smooth complete precurve over a field k, its **Jacobian variety** $\mathrm{Jac}(C)$ is just its Picard variety $\underline{\mathrm{Pic}}^0_{C/k}$(15.7.10.1). ⌟

Cor. (15.7.10.4). For a smooth complete precurve C over a field with a rational point, $x \in \mathrm{Pic}_{C/k}$ is in $\mathrm{Jac}(C)$ iff the corresponding line bundle x on $C_{k(x)}$ has degree 0, by(15.7.10.1). ⌟

Prop. (15.7.10.5). If C is a smooth complete curve of dimension g, then $\mathrm{Jac}(C)$ has dimension g, by(9.7.2.24) and(9.7.2.22). ⌟

Def. (15.7.10.6)[Symmetric Product]. Let C be a smooth curve, then the symmetric product $C^{(r)} = C^r/S_r$ is a smooth variety of dimension r by considering the symmetric functions. ⌟

Prop. (15.7.10.7) [Generic Riemann-Roch]. ⌟

Prop. (15.7.10.8) [Polarization of Jacobians]. ⌟

Prop. (15.7.10.9) [Push and Pull]. For a non-constant morphism $\varphi : C_1 \to C_2$ of pointed smooth curves over k, the push and pull induce maps

$$\varphi_* : \mathrm{Jac}(C_1) \to \mathrm{Jac}(C_2), \quad \varphi^* : \mathrm{Jac}(C_2) \to \mathrm{Jac}(C_1).$$

s.t. $\varphi_* \circ \varphi^* = [\deg(\varphi)]$. ⌟

Proof:

□

Prop. (15.7.10.10) [Abel-Jacobi]. Let X be a smooth curve over $\mathbb{C}$ with a rational point x_0, then $\mathrm{Jac}(C)$ is isomorphic to $\Omega^1_{\mathrm{hol}}(X)^\vee/H_1(X,\mathbb{Z})$ as complex manifolds via

$$\mathcal{L}(\sum_x n_x x) \mapsto \sum_x n_x \int_{x_0}^x .$$

⌟

Proof: □

Prop. (15.7.10.11). Let $k \in \mathtt{Field}$, C be a smooth complete curve over k, $P \in C(k)$, then for any $\ell \in \mathbf{P}$, the map $f_P : C \to \mathrm{Jac}(C)$ induce isomorphisms

$$H^1(\mathrm{Jac}(C), \mathcal{O}_{\mathrm{Jac}(C)}) \cong H^1(C, \mathcal{O}_C), \quad H^1(\mathrm{Jac}(C), \mathbb{Z}_\ell) \cong H^1(C, \mathbb{Z}_\ell).$$

⌟

Proof: Cf.[Mil08]P114. □

Prop. (15.7.10.12) [Surjection by Jacobians]. Let $k \in \mathtt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$, there exists a smooth complete curve C over k and a surjection $\mathrm{Jac}(C) \to A$. ⌟

Proof: We only prove for $\#k = \infty$. For k finite, Cf.[Gabber, On space filling curves and Albanese varieties], [Poonen, Bjorn, Bertini theorems over finite fields. Ann. of Math].?

Since elliptic curves are their own Jacobians, we can assume that $\dim A > 1$. Choose a projective embedding $A \to \mathbb{P}^n_k$, then by Bertini and the fact $\#k = \infty$, there is a hyperplane cut $A \cap H$ that is also a smooth complete k-variety. By repeating $\dim A - 1$ dimes, we get a k-curve C on A. This curve gives a map $\mathrm{Jac}(C) \to A$ by(15.7.10.8) and double duality(15.7.4.18). The image is an Abelian subvariety of A. If it is not the whole of A, then by Poincaré 's reducibility theorem(15.7.6.6), there exists another Abelian subvariety $A_2 \subset A$ s.t. $\mathrm{Jac}(C) \times A_2 \to A$ is an isogeny. In particular, $\mathrm{Jac}(C) \cap A_2$ is finite.

Using the embedding $C \subset \mathrm{Jac}(C)$, C is regarded as a subscheme of $\mathrm{Jac}(C)$. Take $n \in \mathbb{Z} \cap k^*$ large, the composition $\mathrm{Jac}(C) \times A_2 \xrightarrow{(1,n)} \mathrm{Jac}(C) \times A_2 \to A$ is finite, and the inverse image of C projects to $[n]^{-1}(A_1 \cap A_2) \subset A_2$, which is finite and disconnected. So the inverse image of C is not connected, which contradicts the fact it is an ample divisor by(6.5.4.12) and(6.8.6.25). □

Conj. (15.7.10.13) [Resolution Conjecture]. Let $k \in \texttt{Field}, k = \overline{k}$, and $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, we can find a surjective homomorphism $J_1 \to A$ where J_1 is a Jacobian of a curve by(15.7.10.12). Then the identity component of the kernel is also an Abelian variety. Then we can do the same process again.
is it possible to choose the Jacobians s.t. the process terminate after finite steps? ⌟

Proof: □

Thm. (15.7.10.14) [Tonelli]. Let $k \in \texttt{Field}$ and $k = \overline{k}$, and $(C, P), (C', P')$ be pointed complete smooth curves over k. Let $f : C \to \mathrm{Jac}(C)$ and $f' : C' \to \mathrm{Jac}(C')$ be the maps corresponding to P, P'. Then if $\beta : (\mathrm{Jac}(C), \lambda) \cong (\mathrm{Jac}(C'), \lambda')$ is an isomorphism of polarized Jacobians, then

- There exists an isomorphism $\alpha : C \to C'$ s.t. $f' \circ \alpha = \pm\beta \circ f + c$ for some $c \in \mathrm{Jac}(C')(k)$.
- If $g(C) \geq 2$ and C is non-hyperelliptic, then $\alpha, \pm 1, c$ are determined by β, P, P'. And if $g(C) \geq 2$, then ± 1 can be arbitrary, and α, c is determined by $\beta, \pm 1, P, P'$.

⌟

Proof: Cf.[Mil08]P120. □

Cor. (15.7.10.15).

- If $k \in \texttt{Field}, C, C'$ are complete smooth curves over k with rational points s.t. their polarized Jacobians are isomorphic, then C, C' are isomorphic over k.
- If $k \in \texttt{Field}$ is perfect, C, C' are complete smooth curves of genus≥ 2 over k, then if their polarized Jacobians are isomorphic, then C, C' are also isomorphic over k.

⌟

Proof: Let $\beta : (\mathrm{Jac}(C), \lambda) \cong (\mathrm{Jac}(C'), \lambda')$ is an isomorphism, for any $P \in C(\overline{k}), P' \in C'(\overline{k})$, there is a unique isomorphism $\alpha : C_{\overline{k}} \cong C'_{\overline{k}}$ s.t. $f^{P'} \circ \alpha = \pm\beta \circ f^P + c$, and if C is hyperelliptic, take $\pm = +$. Then if Q, Q' are different points, $f^P = f^Q + d$, $f^{Q'} = f^{P'} + e$ for some $d \in \mathrm{Jac}(C)(\overline{k}), e \in \mathrm{Jac}(C')(\overline{k})$. So α is invariant of the points P, P' chosen. In particular,

$$f^{\sigma(P')} \circ \alpha = \sigma(f^{P'}) \circ \alpha = \pm\beta \circ \sigma(f^P) + \sigma(c) = \pm\beta f^{\sigma(P)} + \sigma(c).$$

for any $\sigma \in \mathrm{Gal}_k$. So α is invariant under Gal_k, which means C, C' are isomorphic over k. □

Arithmetics

Prop. (15.7.10.16). If $F \in \texttt{GField}$ and C is a complete smooth curve over F with good reduction at a place P of F, then $\mathrm{Jac}(C)$ has good reduction at P. ⌟

Proof: The hypothesis implies C extends to a smooth proper curve $\mathcal{C}$ over $\operatorname{Spec} R_P$. Then the Picard scheme $\mathcal{J}$ of $\mathcal{C}/\operatorname{Spec} R_P$(15.7.10.2) has generic fiber $\mathrm{Jac}(C)$, which implies $\mathrm{Jac}(C)$ has good reduction at P. □

11 Néron Models

Main references are [Serre/Tate, Good Reduction of Abelian Varieties], [BLR90] and http://virtualmath1.stanford.edu/~conrad/mordellsem/Notes/L11.pdf.

Def. (15.7.11.1) [Néron Models]. Let (S, K) be a Dedekind scheme and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm,sep,ft}}/K$, then a **Néron model** for X is a smooth scheme $\mathcal{X} \in \mathcal{S}\mathrm{ch}^{\mathrm{sm,sep,ft}}/S$ representing the functor

$$\mathcal{S}\mathrm{ch}^{\mathrm{sm}}/S \to \mathcal{S}\mathrm{et} : \mathcal{Y} \mapsto \mathrm{Hom}_K(\mathcal{Y} \otimes_S K, X).$$

In particular, the natural map $\mathcal{X}(R) \to X(K)$ is a bijection. ⌟

Cor. (15.7.11.2) [Group Structures]. Let (S, K) be a Dedekind scheme and $X \in \mathcal{G}\mathrm{rp}^{\mathrm{sm,sep,ft}}/K$, then any Néron model for X is naturally equipped with a group structure extending that of X. ⌟

Proof: This follows from the universal properties. □

Prop. (15.7.11.3) [Étale Valuation Criterion for Group Schemes]. Let (R, K) be a DVR and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm,sep,ft}}/K$, then if $\mathcal{X}/R$ is a Néron model for X, then $\mathcal{X}$ satisfies valuation criterion for any R' that is the integral closure of R in an unramified field extension K'/K.

Conversely, if X is a group scheme over K, then the converse is also true: If $\mathcal{G}$ is a smooth R-group scheme of f.t., then $\mathcal{G}$ is a Néron model of its generic fiber iff the natural map $\mathcal{G}(R^{\mathrm{sH}}) \to \mathcal{G}(K^{\mathrm{sH}})$ is an isomorphism. ⌟

Proof: Cf.[BLR90]Prop. 7.1.1. □

Prop. (15.7.11.4) [Étale Base Change]. Let (R, K) be a Dedekind domain and ⌟

Proof: □

Prop. (15.7.11.5) [Unramified Base Change]. Let (R, K) be a DVR and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm,sep,ft}}/K$, K'/K an unramified field extension, R' the integral closure of R in K', then if $\mathcal{X}$ is a Néron model for X, then $\mathcal{X}_{R'}$ is a Néron-model for $X_{K'}$. ⌟

Proof: Because R'/R is smooth(by(6.6.4.6) and the definition of unramifiedness(14.2.2.4)), for any $\mathcal{Y}'/R'$ smooth,

$$\mathrm{Mor}_{R'}(\mathcal{Y}', \mathcal{X}_{R'}) = \mathrm{Mor}_R(\mathcal{Y}', \mathcal{X}) = \mathrm{Mor}_K(\mathcal{Y}'_K, X) = \mathrm{Mor}_{K'}(\mathcal{Y}'_{K'}, X_{K'}).$$

□

Prop. (15.7.11.6) [Étale Descent]. Let $(R, K) \subset (R', K') \subset (R^{\mathrm{sH}}, K^{\mathrm{sH}})$ be DVRs. If G is a smooth group scheme of f.t. over K s.t. $G_{K'}$ has a Néron model $\mathcal{G}'/R'$, then $\mathcal{G}'$ descends to a Néron model $\mathcal{G}/R$ of G. ⌟

Proof: Cf.[BLR90]Prop. 6.5.4. □

Cor. (15.7.11.7). Let $(R, K) \subset (R', K')$ be an unramified extension of DVRs, and $G \in \mathcal{G}\mathrm{rp}^{\mathrm{sm,ft}}/K$, then G has a Néron model iff $G_{K'}$ has a Néron model. ⌟

Proof: Cf.[BLR90]Prop. 6.5.4. □

Prop. (15.7.11.8) [Localness of Néron Property]. Let (S, K) be a Dedekind scheme and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm,sep,ft}}/K$.

- If (S_i) is an open cover of S, then X has a Néron model over S iff it has a Néron model over each S_i.
- $\mathcal{X} \in \mathcal{S}\mathrm{ch}^{\mathrm{ft,sep}}/S$ is a Néron model for X iff for each closed point $s \in S$, $\mathcal{X} \times_S \operatorname{Spec} \mathcal{O}_{S,s}$ is a Néron model for X over $\mathcal{O}_{S,s}$.

⌟

Proof: 1: One direction follows from(15.7.11.4), for the other, notice they can be glued by universal properties.

2: Cf.[BLR, Prop1.2.4]. If $\mathcal{X}/S$ is a Néron model, then for any closed point $s \in S$ and any $\varphi : \mathcal{Y}_{(s)} \in \mathcal{S}\mathrm{ch}^{\mathrm{sm}}/\mathcal{O}_{S,s}$ with a morphism $Y_{(s),K} \to X$, we need to show that it can be extended uniquely to a morphism over $\mathcal{O}_{S,s}$. We may assume that $Y_{(s)}$ is f.p., and then it extends to a scheme Y/S' on a nbhd S' of s. Then because X/S_i is a Néron model by item1, we can extend the φ over S', which restricts to a morphism over $\mathcal{O}_{S,s}$. The uniqueness is clear.

The converse is similar. Just notice that smoothness is a stalkwise properties(6.6.4.5). □

Prop. (15.7.11.9) [Extending Néron Models]. Let (S,K) be a Dedekind scheme and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm,sep,ft}}/K$, then X has a Néron model over S iff there exists an open dense subscheme $S' \subset S$ s.t. X has a Néron model over S, and for any $s \in S \setminus S'$, X has a Néron model over $\mathcal{O}_{S,s}$. ⌟

Proof: One direction is obvious**?**, for the other, for each $s_i \in S \setminus S'$, $\mathcal{X}_i/\mathcal{O}_{S,s_i}$ extends to smooth scheme on a nbhd S_i of s_i, and since $\mathcal{X}_i$ and $\mathcal{X}/S'$ has isomorphic generic fibers, we can assume that they are isomorphic on $S_i \cap S'$ after shrinking S_i. Then the glue together to a Néron model over $\mathcal{O}_{S,s}$. Then the assertion follows from(15.7.11.8). □

Cor. (15.7.11.10) [Néron Differentials]. Let (S,K) be a Dedekind scheme and $E \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/S$ with Néron model $\mathcal{A}/S$, then $\mathcal{K}_{\mathcal{E}/S}$ is free of rank 1. A generator of it is called a **Néron differential** of E. It is defined up to units on S. ⌟

Néron Models for Abelian Varieties

Prop. (15.7.11.11) [Néron Model for Abelian Varieties]. Let $K \in$ `Field` and A be any ring of integers in the field K, and $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/K$. Then there exists an open subset $Y = \operatorname{Spec} A_S \subset \operatorname{Spec} A$, and a scheme $\widetilde{X}$ projective over Y, and morphisms $\widetilde{m}: \widetilde{X} \times \widetilde{X} \to \widetilde{X}$ over Y and $\widetilde{e}: Y \to X$ that:

- The fiber of $\widetilde{X}$ over a generic point of Y with the morphisms $\widetilde{m}, \widetilde{e}$ are Abelian varieties isomorphic to X.
- $\widetilde{X}$ is a group scheme over Y, and its fiber over any closed point of Y with the morphisms $\widetilde{m}, \widetilde{e}$ are Abelian varieties.
- The mapping in item1 induces an isomorphism of groups $\widetilde{X}(Y) \cong X(K)$.

⌟

Proof: 1: Consider for any qc scheme over a field K, it is glued together from f.m. affine schemes, and these glueing involves f.m. polynomials and rational transition functions, and the coefficients of them are contained in a subring $A_S \subset K$ of f.t. over A. Thus this variety can be seen as a variety over A_S with the same equations, satisfying item1. The situation is similar for morphisms between qc schemes, in particular $\widetilde{m}$ and $\widetilde{e}$, thus constructing $\widetilde{X}$.

2: Cf.[Mumford, P265].**?**

3: Cf.[Mumford, P265].**?** □

Cor. (15.7.11.12). Let $x \in \widetilde{X}(Y)$, consider x as a closed subscheme of $\widetilde{X}$ and denote $n^{-1}(x)$ the closed subscheme in $\widetilde{X}$ the inverse image of x under the morphism $[n]_Y$. Then the natural projection $n^{-1}(x) \to Y$ is étale over all points $y \in Y$ that $\operatorname{char} k(y) \nmid n$. ⌟

Proof: [Mumford, P265].**?** □

Thm. (15.7.11.13) [Good Reduction of Abelian Varieties]. Let (S,K) be a Dedekind scheme, $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/K$ and $\mathcal{A} \in \mathcal{S}\mathrm{ch}/S$ is proper smooth with generic fiber A, then the group structure extends to $\mathcal{A}$, making it a Néron model of A. ⌟

Proof: Cf.[BLR90]P19 or [L11, Neron Model]P8.**?**

By(15.7.11.8), we may assume that S is local. □

Thm. (15.7.11.14) [Néron Model of Abelian Varieties]. Let (S, K) be a Dedekind scheme and $A \in \mathcal{A}b\mathcal{V}ar/K$, then A has a Néron model $\mathcal{A}/S$. Moreover, let $S' \subset S$ be the set of good points for A, then $\mathcal{A}_{S'} \in \mathcal{A}b\mathcal{V}ar/S'$. ⌟

Proof: We show that A extends to an Abelian scheme over a nbhd of each good point of S for A. This will suffice combining with(15.7.11.13)(15.7.11.18)(15.7.11.8) and(15.7.11.9).

By hypothesis, A extends to a smooth proper scheme $A_{(s)}$ over $\mathcal{O}_{S,s}$, and then we can extend it to a scheme of f.t. over a nbhd of s. By shrinking if necessary, we can assume it is smooth and proper, by(6.8.4.6). □

Prop. (15.7.11.15) [Strong Néron Extension Property]. Let (S, K) be a Dedekind domain, and $A \in \mathcal{A}b\mathcal{V}ar/K$ with a Néron model $\mathcal{A}/S$, then for any $\mathcal{Y} \in \mathcal{S}ch^{\mathrm{sm}}/S$ and a rational map $\varphi : \mathcal{Y}_K \to A$, there exists uniquely an S-morphism $\mathcal{Y} \to \mathcal{A}$ extending φ. ⌟

Proof: This follows from(15.7.1.7). □

Def. (15.7.11.16) [Relative Identity Components]. Let (S, K) be a Dedekind scheme and $A \in \mathcal{A}b\mathcal{V}ar/K$ with Néron differential $\mathcal{A}/S$, the **relative identity component** $\mathcal{A}_0$ of $\mathcal{A}$ is defined to be the open subgroup of $\mathcal{A}$ deleting all non-identity components of $\mathcal{A}_{\kappa(P)}$ for any closed point $P \in S$.

Then $\mathcal{A}_0$ is a subgroup scheme of $\mathcal{A}$**?**. ⌟

Proof of the Existence of Néron Models for Abelian Varieties

Cf.[BLR]Chap3-6.

Remark (15.7.11.17). In this subsubsection, let $(\mathcal{O}_K, K, k)$ be a DVR. ⌟

Prop. (15.7.11.18) [Local Néron Models for Abelian Varieties]. (15.7.11.14) is true when S is a DVR. ⌟

Def. (15.7.11.19) [Weak Néron Models]. For $X \in \mathcal{S}ch^{\mathrm{sm,sep,ft}}/K$, a **weak Néron model** for X is a family $(X_i) \in \mathcal{S}ch^{\mathrm{sm,sep,ft}}/R$ s.t. each K^{sH}-point of X extends to a R^{sH}-point of some X_i. ⌟

Thm. (15.7.11.20). For $X \in \mathcal{S}ch^{\mathrm{sm,sep,ft}}/K$, if $X(K^{\mathrm{sH}})$ is bounded in X, then there exists a weak Néron model for X. ⌟

Proof: Cf.[BLR90]P74. □

Prop. (15.7.11.21) [Weak Néron Property]. Let $X \in \mathcal{S}ch^{\mathrm{sm,sep,ft}}/K$ and (X_i) is a weak Néron model for X. If $Z \in \mathcal{S}ch^{\mathrm{sm}}/\mathcal{O}_K$ s.t. Z_k is irreducible, then any rational map $Z_k \to X_k$ extends to a rational map $Z \to X_i$ over R for some i. ⌟

Proof: Cf.[BLR90]P74. □

Properties of Néron Models

Prop. (15.7.11.22). If $(\mathcal{O}_K, K)$ is a DVR, then for $\mathcal{G} \in \mathcal{G}\mathrm{rp}^{\mathrm{sm,ft}}/\mathcal{O}_K$, the following are equivalent:

- $\mathcal{G}$ is a Néron model of its generic fiber.
- $\mathcal{G}(\mathcal{O}_K^{\mathrm{sH}}) \to \mathcal{G}(K^{\mathrm{sH}})$ is an isomorphism.
- $\mathcal{G}$ is separated and $\mathcal{G}(\mathcal{O}_K^{\mathrm{sH}}) \to \mathcal{G}(K^{\mathrm{sH}})$ is surjective.

⌟

Proof: $1 \to 2$ is trivial. $2 \to 3$ is valuation criterion. $2 \to 1$ follows from Weil's Extension Theorem and Weak Néron Property.

For $3 \to 2$:Cf.[BLR]7.1.1.? □

Prop. (15.7.11.23). If R has mixed characteristic $(0,p)$ and absolute ramification $e < p-1$, $0 \to A' \to A \to A'' \to 0 \in \mathcal{A}b\mathcal{V}\mathrm{ar}/K$ is an exact sequence, and A has good reduction, then the sequence of Néron models

$$0 \to \mathcal{A}' \to \mathcal{A} \to \mathcal{A}'' \to 0$$

is exact. ⌟

Proof: Cf.[BLR]Prop7.5.4. □

12 Reductions

Cf.[L13, Semistable Reductions for Abelian Varieties].

over DVRs

Prop. (15.7.12.1) [Reduction Types of Abelian Varieties]. Let $(\mathcal{O}_K, K, k)$ be a DVR and $A \in \mathcal{A}b\mathcal{V}\mathrm{ar}/K$ with a Néron model $\mathcal{A}/\mathcal{O}_K$(15.7.11.14), let $\widetilde{A}$ be the special fiber, then by(15.7.1.18), there exists a filtration of subgroups

$$\mathcal{A}_k \supset \mathcal{A}_k^0 \supset \mathcal{A}_k^1$$

where $\mathcal{A}_k^0$ is the identity component of $\mathcal{A}_k$, and $\mathcal{A}_k^1$ is affine commutative s.t. $\widetilde{A}^0/\widetilde{A}^1 \in \mathcal{A}b\mathcal{V}\mathrm{ar}/k$. Then A is said to have

- **good reduction** if $\mathcal{A}_k \in \mathcal{A}b\mathcal{V}\mathrm{ar}/k$. This is compatible with the definition as in(15.10.1.2) by(6.6.4.6).
- **semistable reduction** if $\widetilde{A}^1$ is a torus.
- **bad reduction** if $\widetilde{A}^1$ contains a copies of $\mathbb{A}^1$.

There are not other possibilities(?, Cf.[Milne]Chap 15). ⌟

Def. (15.7.12.2) [Tamagawa Numbers]. Let $(\mathcal{O}_K, K, k)$ be a DVR and $A \in \mathcal{A}b\mathcal{V}\mathrm{ar}/K$ with Néron model $\mathcal{A}/\mathcal{O}_K$, define the **component group of** A to be $\pi_0(\mathcal{A}_k)$, denoted by $\Phi(A)$. And $\#\Phi(A) < \infty$ is called the **Tamagawa number** of A.

Then $c(A)$ equals the number of geo.connected components of $\mathcal{A}_k$. And if k is finite, it also equals the connected components of $\mathcal{A}_k$ with a rational point. ⌟

Proof: Cf.[Liu Qing, 10.2.21(a)]. □

Def. (15.7.12.3) [Local Conductor]. Let $E \in \mathcal{E}\mathrm{ll}/F$, then the **conductor of** E is defined in [Sil99]P380.**?**

If $F = \mathbb{Q}$, then the conductor $N_E = \prod_{p \in \mathbf{P}} p^{f_p}$, where

$$f_p = \begin{cases} 0, & E \text{ has good reduction at } p \\ 1, & E \text{ has multiplicative reduction at } p \\ 2, & E \text{ has additive reduction at } p \ \& \ p \neq 2,3 \\ 2+\delta_p, & E \text{ has additive reduction at } p \ \& \ p = 2,3 \end{cases}$$

where $0 \le \delta_2 \le 6, 0 \le \delta_2 \le 3$. ⌟

Proof: □

Thm. (15.7.12.4) [Semistable Reduction Theorem]. Let (R, K, k) be a DVR, K'/K a finite extension, and R' the alg.closure of R in K. Let $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/K$, then:

- If A has stable or semistable reduction, then the reduction type of $A_{K'}$ is the same as that of E.
- If K'/K is unramified, then the reduction type of $A_{K'}$ is the same as that of E.
- There exists such a finite extension K'/K s.t. $A_{K'}$ is of stable or split semistable reduction type.

⌟

Proof: We only prove for elliptic curves.**?**

1: For these two cases, c_4 and Δ cannot be reduced anymore to another minimal Weierstrass equation by(15.11.4.5).

2: It suffices to consider the additive reduction case: **?** The short Weierstrass equation case is clear, for the general case, use Tate's algorithm.

3: Use the Legendre or Deuring form(15.11.1.17)(15.11.1.18) to analyze Δ and c_4. □

Thm. (15.7.12.5) [Néron-Ogg-Shafarevich Criterion]. Let (R, K, k) be a DVR and $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/K$, $\ell \in \mathbf{P} \setminus \operatorname{char} k$, then the following are equivalent:

- A has good reduction.
- The module $A[m](K^s)$ is unramified as a Gal_K-module, for all $m \in \mathbb{Z} \setminus \operatorname{char} k$.
- The Tate module $T_\ell(A)$ is unramified for all(some) primes $\ell \in \mathbf{P} \setminus \operatorname{char} k$.
- The module $A[m]$ is unramified for infinitely many $m \in \mathbb{Z} \setminus \operatorname{char} k$.

⌟

Proof: $2 \to 3 \to 4$ are obvious.

For the rest, Cf.`http://virtualmath1.stanford.edu/~conrad/mordellsem/Notes/L11.pdf`P20 or [Mil08]P141.**?**

$1 \to 2$: Let K' be the finite extension of K generated by $E[m]$, then (15.7.12.4) implies $E_{K'}$ has the same reduction type as E. Then by(15.11.4.19), $E[m] \to \widetilde{E}_{K'}(k')$ is an injection. So clearly I_v acts trivially on $E[m]$.

$4 \to 1$: Let $m \in \mathbb{Z} \setminus \operatorname{char} k$ s.t. $E[m]$ is unramified and $m > \#E(K^{\mathrm{ur}})/E_0(K^{\mathrm{ur}})$, where $\#E(K^{\mathrm{ur}})/E_0(K^{\mathrm{ur}}) < \infty$ by(15.11.4.15). Then because $E[m] \cong (\mathbb{Z}/(m))^2 \subset E(K^{\mathrm{ur}})$, $E_0(K^{\mathrm{ur}})$ contains some subgroup isomorphic to $(\mathbb{Z}/(\ell))^2$ for some $\ell \in \mathbf{P} \setminus \operatorname{char} k$, thus by(15.11.4.19), $\widetilde{E}_{\mathrm{sm}}(\overline{k})$ contains some subgroup isomorphic to $(\mathbb{Z}/(\ell))^2$. But by(15.11.1.16), this is possible only when $\widetilde{E}_{\mathrm{sm}} = \widetilde{E}$. Thus $E_{K^{\mathrm{ur}}}$ has good reduction, so E also has good reduction by(15.7.12.4). □

Cor. (15.7.12.6). If $0 \to A' \to A \to A'' \to 0$ are exact sequences of Abelian varieties over K and A has good reduction, then A', A'' also have good reductions. ⌟

Cor. (15.7.12.7) [Isogeny and Good Reductions]. Let (R, K, k) be a DVR and $A \to A' \in \mathcal{A}b\mathcal{V}ar/K$ is an isogeny, then A has good reduction iff A' does. ⌟

Proof: Use(15.7.12.5) and the fact if $\ell \in \mathbf{P}$ is prime to $\operatorname{char} k$ and $\deg \varphi$, then $\varphi_\ell : T_\ell(A) \to T_\ell(A')$ is an isomorphism of Gal_K-modules. □

Prop. (15.7.12.8). If $K \in p$-`LField`, $\ell \in \mathbf{P}\backslash p$ and $A \in \mathcal{A}b\mathcal{V}ar/K$ satisfies $\rho_{\ell,A}(\mathrm{Gal}_K)$ has finite image, then A has potential good reduction. ⌟

Proof: It follows from class field theory that the image of I_K is a quotient of $\mathcal{O}_K^*$, which contains a pro-p-group of finite index, and $\mathrm{End}(T_\ell(A))$ contains a pro-ℓ-group of finite index, so the image is finite. Then A has potential good reduction by(15.7.12.5). □

Thm. (15.7.12.9) [Néron-Ogg-Shafarevich Criterion for Elliptic Curves]. Let K be a CDVR, $\ell \in \mathbf{P}\backslash\{\operatorname{char} k\}$ and $A \in \mathcal{A}b\mathcal{V}ar/K$, then

- A has good reduction iff $T_\ell(A)$ is an unramified Gal_K-module.
- A has good or semistable reduction iff I_K acts unipotently on $T_\ell(A)$.
- A has potential good reduction iff $T_\ell(E)$ is potentially unramified, i.e. $\rho_{\ell,A}(I_K)$ is finite.

⌟

Proof: 1 follows from(15.7.12.5).

2: We only prove for $\dim A = 1$ case**?**: As I_K acts trivially on $\det(T_\ell(E))$ by(18.3.4.3), it acts unipotently on $T_\ell(E)$ iff it has a fixed vector. If it has a fixed vector, then $\widetilde{E}_{\mathrm{sm}}(\overline{k})$ contains a subgroup isomorphic to $\mathbb{Z}/(\ell)$, which is possible only if E has semistable or good reduction, by(15.11.1.16) and(15.7.12.4). The converse is proved the same way as that of(15.7.12.5).

3 follows from(3.2.6.11). □

Cor. (15.7.12.10). If K is a CDVR with residue characteristic p and $\varphi : E \to E'$ is an isogeny of degree p of elliptic curves over K, then E has good reduction of ordinary type/supersingular type iff E' does. ⌟

Proof: By(15.7.12.7) we can assume both E, E' have good reductions, then their minimal Weierstrass equations are their Néron models, thus by definition φ extends to a map $\widetilde{\varphi} : \widetilde{E} \to \widetilde{E}'$. Let $\psi = \widehat{\varphi}$, then we also have $\widetilde{\psi} : \widetilde{E}' \to \widetilde{E}$ s.t. $\widetilde{\psi} \circ \widetilde{\varphi} = [p]_{\widetilde{E}}$, and $\widetilde{\varphi} \circ \widetilde{\psi} = [p]_{\widetilde{E}'}$. Thus $[p]_{\widetilde{E}'} \circ \widetilde{\varphi} = \widetilde{\varphi} \circ [p]_{\widetilde{E}}$, which implies $\deg_s([p]_{\widetilde{E}}) = \deg_s([p]_{\widetilde{E}'})$, thus we are done by(15.11.3.5). □

Prop. (15.7.12.11) [Isogeny and Semistability]. If $A, B \in \mathcal{A}b\mathcal{V}ar/k$ are isogenous, then A is semistable iff B is semistable. ⌟

Proof: **?** □

Good Reductions

Thm. (15.7.12.12) [Extending Abelian Variety Structures]. Let $S \in \mathcal{S}ch$ be Noetherian and connected, and $X \in \mathcal{S}m\mathcal{P}rpr/S$ with a section $e : S \to X$. If for some geometric point $s \in S$, $X_s \in \mathcal{A}b\mathcal{V}ar/\kappa(s)$ with unit point $e(s)$, then $X \in \mathcal{A}b\mathcal{V}ar/S$ with unit section e. ⌟

Proof: Cf.[Ngo, Shimura Varieties]P16. □

Prop. (15.7.12.13). Let $(\mathcal{O}_K, K, k)$ be a DVR, $A \in \mathcal{A}b\mathcal{V}ar/K$ with Néron model $\mathcal{A}/\mathcal{O}_K$, then the following are equivalent:

- $\mathcal{A}$ is an Abelian scheme.
- A has good reduction over $\mathcal{O}_K$.
- $\mathcal{A}_k^0$ is proper hence in $\mathcal{A}b\mathcal{V}ar/k$.

⌟

Proof: $1 \to 2, 2 \to 3$ is clear.

$3 \to 1$: By(6.11.5.3) $\mathcal{A}_0$(15.7.11.14) is an Abelian scheme, so $\mathcal{A}_0 = \mathcal{A}$ is the Néron model by(15.7.11.13). □

Prop. (15.7.12.14) [Exactness]. Let (R, K) be a DVR with mixed characteristic $(0, p)$ and ramification index $e < p - 1$. If $0 \to A' \to A \to A'' \to 0$ is an exact sequence in $\mathcal{A}b\mathcal{V}ar/K$, and A has good reduction, then so does A' and A'' by(15.7.12.5). Then the Néron models

$$0 \to \mathcal{A}' \to \mathcal{A} \to \mathcal{A}'' \to 0$$

for an exact sequence. ⌟

Proof: Cf.[BLR90]Prop7.5.4.. □

Prop. (15.7.12.15) [Extending Polarizations]. Let (R, K) be a DVR and $A \in \mathcal{A}b\mathcal{V}ar/K$ has good reduction over R, then any polarization $\lambda : \mathcal{A} \to \mathcal{A}^\vee$ extends to a polarization on $\mathcal{A}$. ⌟

Proof: See [Artin 1986, 4.4 in Arithmetic Geometry], and [Chai and Faltings 1990].**?** □

__over Dedekind Domains__

Def. (15.7.12.16) [Conductor]. For an elliptic curve E over a $F \in$ `GField`, the **conductor of** E is defined to be the integral ideal of F given by

$$N_{E/F} = \prod_{v \in \Sigma_F^0} \mathfrak{p}_v^{f_v}$$

where f_v is the local conductors(15.7.12.3). ⌟

Conj. (15.7.12.17) [Szpiro]. For any $\varepsilon > 0$, there exists $C_\varepsilon > 0$ s.t.

$$|N_{K/\mathbb{Q}}(\Delta_E)| \leq C_\varepsilon |N_{K/\mathbb{Q}}(N_E)|^{6+\varepsilon}$$

for any $E \in \mathcal{E}ll/\mathbb{Q}$, where N_E is the conductor of E. ⌟

Proof: □

Thm. (15.7.12.18) [No Everywhere Good Reduction over $\mathbb{Q}$]. There are no $A \in \mathcal{A}b\mathcal{V}ar/\mathbb{Q}$ with everywhere good reductions. There are 24 elliptic curves over $\mathbb{Q}$ with good reductions away form 2, and 784 elliptic curves over $\mathbb{Q}$ with good reduction away from 2, 3. ⌟

Proof: We only prove that there are no elliptic curves with everywhere good reductions.**?**

Let $E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$ be an elliptic curve over $\mathbb{Q}$ with $a_i \in \mathbb{Z}$ and $\Delta = \pm 1$, then a_1 must be odd, otherwise $\Delta \equiv 5b_6^2 \equiv \pm 1 \mod 8$ is impossible. Thus $c_4 = b_2^2 - 24b_4 \equiv 1 \mod 8$. And $c_4^3 - c_6^2 = (\pm 12)^3$ shows that $c_4 \pm 12$ is a square or 3 times a square, which are both impossible by modulo 8.

For good reduction away from $2, 3$**?** □

Prop. (15.7.12.19). Let $F \in \texttt{NField}$ and $A, B \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$, and $S \subset \Sigma_F$ is a finite set of places of F containing Σ_F^∞ and all places s.t. A or B has bad reduction, then for any $\ell \in \mathbf{P}$ s.t. $S(\ell) \cap S = \varnothing$, there exists a finite set $T = T(S, \ell, g) \in \Sigma_\infty^0$ s.t. $T \cap (S \cup S(\ell)) = \varnothing$, and

$$P_\ell(\widetilde{A}_v, t) = P_\ell(\widetilde{B}_v, t) \Rightarrow A \sim B$$

⌟

Proof: Cf.[Mil08]P142. □

Semistable Reductions

Def. (15.7.12.20) [Semi-Abelian Schemes]. For $S \in \mathcal{S}\mathrm{ch}$, a **semi-Abelian scheme** S is a commutative smooth group variety s.t. each fiber is an extension of an Abelian scheme by a torus. ⌟

Prop. (15.7.12.21) [Reduction Theorem]. For any $F \in \texttt{NField}$, $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$, there exists a finite extension L/F s.t. A_L is semistable. ⌟

Proof: ? □

15.8 Complex Multiplication Theory

Main references are [Mil20b], [Lang, Complex Multiplication], [Abelian varieties with complex multiplication and modular functions, Shimura(1998)] and [The Fundamental Theorem of Complex Multiplication, Milne, 2007].

Notation (15.8.0.1).
- Use notations defined in Arithmetic of Abelian Varieties.

⌟

1 Introduction

Abelian varieties with complex multiplication correspond to special points on the moduli variety of abelian varieties, and their arithmetic is intimately related to that of the values of modular functions and modular forms at those points.

2 CM-Algebras and CM-Types

Def. (15.8.2.1) [CM-Fields]. A **CM-field** is a number field that is a totally imaginary quadratic extension of a totally real field. ⌟

Prop. (15.8.2.2) [Characterizing CM-Fields]. For $E \in \mathtt{NField}$, then E is a CM-field or totally real iff there exists exactly one $\mathtt{c}_E \in \mathrm{Aut}(E)$ s.t. for any $\rho \in \mathrm{Hom}(E, \mathbb{C}), \rho \circ \mathtt{c}_E = \mathtt{c} \circ \rho$. And it is CM iff $\mathtt{c}_E \neq \mathrm{id}_E$. ⌟

Proof: If $\rho \circ \mathtt{c}_E = \mathtt{c} \circ \rho$ for any $\rho \in \mathrm{Hom}(E, \mathbb{C})$, then $\rho \circ \mathtt{c}_E^2 = \rho$, so $\mathtt{c}_E^2 = \mathrm{id}$. if F is the fixed field of $\mathtt{c}_E$, then $[E : F] = 2$, and clearly F is totally real. Conversely, if E is a CM-field or totally real, then clearly there exists a unique such $\mathtt{c}_E$, which is the identity if E is totally real and the unique involution fixing the totally real subfield F.

In this case, if $\mathtt{c}_E \neq \mathrm{id}_E$, then $\rho(E) \subsetneq \mathbb{R}$ for any $\rho \in \mathrm{Hom}(E, \mathbb{C})$, thus E is totally imaginary. And if $\mathtt{c}_E = \mathrm{id}_E$, then E is also totally real. □

Cor. (15.8.2.3). A finite composite of CM-fields is a CM-field. In particular, the Galois closure of a CM-field is a CM-field.

And the composite of all CM-fields in $\mathbb{C}$ are the field $\mathbb{Q}^{\mathrm{cm}} \subset \overline{\mathbb{Q}}$ corresponding to the subgroup of $\mathrm{Gal}_{\mathbb{Q}}$ generated by all the elements $\{[\sigma, \mathtt{c}] | \sigma \in \mathrm{Gal}_{\mathbb{Q}}\}$, which is a normal subgroup. ⌟

Proof: The complex involutions on these CM-fields is compatible on their intersections, thus defines a complex involution on their composite. □

Cor. (15.8.2.4). Any CM-field E is of the form $E = F(\alpha)$, where F is totally real, $\alpha^2 \in F$, and $\rho(\alpha^2) \in \mathbb{R}_-$ for any homomorphism $\rho : F \to \mathbb{C}$. ⌟

Proof: If F is the totally real field contained in E and $\alpha \in E$ generates E over F, then by completing the square, we can assume $\alpha^2 \in F$. Then $\rho(\alpha^2) \in \mathbb{R}_-$ for any $\rho : F \to \mathbb{C}$, otherwise E is not totally imaginary. □

Def. (15.8.2.5) [CM-Algebras]. A **CM-algbera** is a finite product of CM-fields. ⌟

Def. (15.8.2.6) [CM-Types]. A **CM-type** for a CM-algebra E is a subset $\Phi \subset \mathrm{Hom}(E, \mathbb{C})$ s.t. $\mathrm{Hom}(E, \mathbb{C}) = \Phi \coprod \Phi^{\mathsf{c}_E}$.

A pair (E, Φ) where E is a CM-algebra and Φ is a CM-type on E is called a **CM-pair**.

More generally, if E is an étale algebra over $\mathbb{Q}$, then a **CM-type** on E is a subset $\Phi \subset \mathrm{Hom}(E, \mathbb{C})$ s.t. $\mathrm{Hom}(E, \mathbb{C}) = \sigma\Phi \coprod \mathsf{c} \circ \sigma\Phi$ for any $\sigma \in \mathrm{Gal}_{\mathbb{Q}}$. ⌟

Prop. (15.8.2.7). Let E be an étale algebra over $\mathbb{Q}$ and F the product of the largest totally real subfields of the factors of E, then choosing a CM-type is equivalent to choosing an extension ρ' to E of any homomorphism $\rho : F \to \mathbb{R}$. Thus a CM-pair (E, Φ) defines an isomorphism

$$E \otimes_{\mathbb{Q}} \mathbb{R} \xrightarrow[\cong]{\Phi} \prod_{\rho: F \to \mathbb{R}} \mathbb{C} \cong \mathbb{C}^{\Phi} : a \otimes r \mapsto (\rho'(a) r)_{\rho}, \quad \Phi = \{\rho' | \rho : F \to \mathbb{R}\}$$

⌟

Def. (15.8.2.8) [Primitive CM-Fields]. If E_0 is a CM-field and E/E_0 is a finite extension, then a CM-type Φ_0 on E_0 extends to a CM-type on E(15.8.2.6) by defining

$$\Phi = \{\varphi \in \mathrm{Hom}(E, \mathbb{C}) | \varphi|_{E_0} \in \Phi_0\}.$$

A **primitive CM-field** is a CM-pair(15.8.2.6) (E, Φ) where $E \in \mathtt{Field}$ and there doesn't exist a proper subfield $E_0 \subset E$ s.t. Φ is the extension of a CM-type on E_0. ⌟

Prop. (15.8.2.9). Every CM-pair (E, Φ) where E is a field is an extension of a unique primitive CM-pair (E_0, Φ_0) s.t. $E_0 \subset E$. Moreover, for any Galois CM-field E_1 containing E, E is the fixed field of E defined by the subgroup

$$H = \{\sigma \in \mathrm{Gal}(E_1/\mathbb{Q}) : \Phi_1^{\sigma} = \Phi_1\},$$

where Φ_1 is the extension of Φ to E_1. ⌟

Proof: If E is Galois over $\mathbb{Q}$, and E_0 is defined as above, then $\Phi\,\mathsf{c}_E = \mathsf{c}\,\Phi \neq \Phi$, so $\mathsf{c}_E \notin H$, thus c_E acts non-trivially on E_0. And c_E preserves E_0: We need to show that $\sigma\,\mathsf{c}_E\, a = \mathsf{c}_E\, a$ for any $a \in E_0$. For which it suffices to show that $\mathsf{c}_E\,\sigma\,\mathsf{c}_E \in H$. For this, notice

$$\Phi\,\mathsf{c}_E\,\sigma\,\mathsf{c}_E = \mathsf{c}\,\Phi\sigma\,\mathsf{c}_E = \mathsf{c}\,\Phi\,\mathsf{c}_E = \Phi.$$

Thus E_0 is CM-subfield of E. And $\Phi_0 = \Phi|_{E_0}$ is a CM-type on E_0, because if $\varphi'|_{E_0} = \mathsf{c}\,\varphi|_{E_0}$ for different $\varphi, \varphi' \in \Phi$, then $\mathsf{c}\,\varphi \in \varphi' H \subset \Phi$, contradiction.

And if E_0 is extended from another CM-subfield E', then any $\sigma \in \mathrm{Gal}(E/\mathbb{Q})$ fixing E' will fix Φ and lies in H. This shows $E_0 \subset E'$. So (E_0, Φ_0) is primitive.

For the general case, it suffices to notice that this E_0 is contained in E because any $\sigma \in \mathrm{Gal}(E_1/\mathbb{Q})$ fixing E will fix Φ_1 thus fixes E_0 by definition. And Φ clearly extends Φ_0. □

Cor. (15.8.2.10). A CM-pair (E, Φ) where E is a field is primitive iff there exists a Galois CM-field E_1 containing E s.t. E is the fixed field of E defined by the subgroup

$$H = \{\sigma \in \mathrm{Gal}(E_1/\mathbb{Q}) : \Phi_1^{\sigma} = \Phi_1\},$$

where Φ_1 is the extension of Φ to E_1. ⌟

Prop. (15.8.2.11) [Shimura-Taniyama]. Let E be a CM-field, $F = E^{c_E}$(15.8.2.2) and $E = F(\alpha)$ where $\alpha^2 \in F$ is totally negative. Then

$$\Phi = \{\varphi \in \mathrm{Hom}(E, \mathbb{C}) : \mathrm{Im}(\varphi(\alpha)) > 0\}$$

is a CM-type on E. And (E, Φ) is a primitive CM-pair iff

- $E = \mathbb{Q}(\alpha)$.
- $\sigma(\alpha)/\alpha$ is not totally positive for any $\sigma \in \mathrm{Gal}(E/\mathbb{Q})$.

⌟

Proof: Φ is a CM-type on E because for any $\varphi \in \Phi$, $\varphi\, c_E \notin \Phi$ because $\mathrm{Im}(\varphi\, c_E(\alpha)) = -\mathrm{Im}(\varphi(\alpha)) < 0$.

Let F_1 be the Galois closure of F and $E_1 = F_1(\alpha)$, and Φ_1 is the extension of Φ to E_1, then

$$\Phi_1 = \{\varphi \in \mathrm{Hom}(E_1, \mathbb{C}) : \mathrm{Im}(\varphi(\alpha)) > 0\}.$$

and if

$$H = \{\sigma \in \mathrm{Gal}(E_1/\mathbb{Q}) : \Phi_1^\sigma = \Phi_1\},$$

then H is exactly the group of $\sigma \in \mathrm{Gal}(E_1/\mathbb{Q})$ s.t. $\sigma(\alpha)/\alpha \in \mathbb{R}_+$. Then the assertion follows from(15.8.2.10). □

Reflex Fields

Def. (15.8.2.12) [Reflex Fields of CM Pairs]. Let (E, Φ) be a CM-pair, then the **reflex field** E^* of (E, Φ) is the subfield of $\overline{\mathbb{Q}}$ generated by the elements $\{\sum_{\varphi\in\Phi} \varphi(a) | a \in E\}$. ⌟

Prop. (15.8.2.13). Let (E, Φ) be a CM-pair with reflex field E^*, then

- E^* is the fixed field of the group $\{\sigma \in \mathrm{Gal}_{\mathbb{Q}} | \sigma(\Phi) = \Phi\}$.
- E^* is a CM-field.
- If (E_1, Φ_1) is an extension of (E, Φ)(15.8.2.8), then the reflex field of (E_1, Φ_1) is just E^*.

⌟

Proof: 1: This group is clearly in the fixed group of E^*, and if σ is in the fixed group of E^*, then

$$\sum_{\varphi\in\Phi} \varphi(a) = \sum_{\varphi\in\Phi} \sigma\varphi(a),$$

so $\sigma(\Phi) = \Phi$ by the linear independence of characters.

2: For $\sigma \in \mathrm{Gal}_{\mathbb{Q}}$ and $a \in E$,

$$c\,\sigma(\sum_{\varphi\in\Phi} \varphi(a)) = c \sum_{\varphi\in\Phi} \sigma\varphi(a) = \sum_{\varphi\in\Phi} \sigma\varphi(c_E(a)) = \sigma \sum_{\varphi\in\Phi} \varphi(c_E(a)) = \sigma\, c(\sum_{\varphi\in\Phi} \varphi(a)).$$

Thus E is a CM-field or totally real by(15.8.2.2). The latter case is not possible because of the linear independence of characters and the fact $c(\Phi) \neq \Phi$.

3 is trivial. □

Def. (15.8.2.14) [Reflex CM-Pairs]. Let (E, Φ) be a CM-pair that E is contained in $\mathbb{Q}$, let E_1 be the Galois closure of E, and Φ_1 the extension of Φ to E_1. Then (E_1, Φ^{-1}) is also a CM-pair. Then the primitive subfield (E^*, Φ^*) satisfies E^* is the reflex field of (E, Φ).

(E^*, Φ^*) is called the **reflex CM-pair** of (E, Φ). ⌟

Classification of Primitive CM-Pairs

Prop. (15.8.2.15). Milne, Prop1.30.**?** ⌟

Cor. (15.8.2.16). Milne, Prop1.31.**?** ⌟

Positive Involutions

Def. (15.8.2.17) [Positive Involutions]. Let $k \subset \mathbb{R}$ be a field, and B be a f.d. k-algebra, $\mathrm{tr} : B \to k$ a k-linear functional, then a **positive involution** w.r.t. tr is an involution ι on B s.t.

$$\mathrm{tr}(x) = \mathrm{tr}(\iota(x)), \quad \mathrm{tr}(\iota(x)\cdot x) > 0$$

for any nonzero $x \in B$. ⌟

Prop. (15.8.2.18) [Positive Involutions are Semisimple]. Let $k \subset \mathbb{R}$ be a field, and B be a f.d. k-algebra with a positive involution ι, then B is semisimple. And if Z is the center of B, then $Z = \prod_i K_i$ where $K_i \in$ `NField`, and each K_i are stable under ι. ⌟

Proof: By(3.6.2.8), it suffices to show that B is Jacobson semisimple: If $\mathfrak{a}$ is a nonzero nilpotent two-sided ideal of B, $a \neq 0 \in \mathfrak{a}$ is nilpotent, then $b = a\iota(a) \neq 0$ because $\mathrm{tr}(a\iota(a)) > 0$. Thus $b \neq 0 \in \mathfrak{a}$, and $\iota(b) = b$. So by the same reason $b^2 \neq 0$, and so on, so b is not nilpotent, contradicting(3.6.2.6).

The center is clearly invariant under the isomorphism given, so it is also semisimple, which is then a product of fields. To show each factor is stable under ι, notice that if $1 = \sum_i e_i$ is a decomposition w.r.t. this product, then $1 = \sum_i \iota(e_i)$, so $\{\iota(e_i)\} = \{e_i\}$. Moreover, $\iota(e_i) = e_i$ for each i, because otherwise $e_i\iota(e_i) = 0$, and $\mathrm{tr}(e_i\iota(e_i)) = 0$. □

Prop. (15.8.2.19). Let $k \subset \mathbb{R}$ be a field and B a f.d. k-algebra with an involution ι, then the following are equivalent:

- There is a faithful f.d. B-module V with a positive definite symmetric k-bilinear form $(-,-) : V \times V \to k$ s.t.
$$(bu, v) = (u, \iota(b)v), \quad b \in B, u, v \in V.$$
- For any f.d. B-module V, there exists a positive definite symmetric k-bilinear form $(-,-) : V \times V \to k$ s.t.
$$(bu, v) = (u, \iota(b)v), \quad b \in B, u, v \in V.$$
- There exists a k-linear functional tr on B s.t. ι is positive w.r.t. tr.

⌟

Proof: $1 \to 2$: As B is semisimple(15.8.2.18), any f.d. B-module is a direct summand of a direct sum of the faithful module V.

$2 \to 3$: Apply item2 to the B-module B itself, then we find a positive definite symmetric k-bilinear form $(-,-)$ on B, and an orthonormal basis $(e_1, \ldots, e_n)$ of B. Then we define

$$\mathrm{tr} : B \to \mathbb{Q} : \mathrm{tr}(b) = \sum_i (bb_i, b_i)$$

then $\mathrm{tr}(b) = \mathrm{tr}(\iota(b))$, and

$$\mathrm{tr}(b\iota(b)) = \sum_i (b\iota(b)b_i, b_i) = \sum_i (\iota(b)b_i, \iota(b)b_i) > 0.$$

$3 \to 1$: B is semisimple by(15.8.2.18), and then we can take $V = B$, and the positive definite symmetric k-bilinear form

$$(x, y) \mapsto \mathrm{tr}_{B/k}(\iota(y)x).$$

then $(bx, y) = \mathrm{tr}(\iota(y)bx) = \mathrm{tr}(\iota(\iota(b)y)x) = (x, \iota(b)y)$. □

Prop. (15.8.2.20) [Commutative Positive Involutions]. Every f.d. commutative $\mathbb{Q}$-algebra with a positive involution ι is a product of the following two:

- F is a totally real field and $\iota = \mathrm{id}_F$.
- E is a CM-field and $\iota = \mathtt{c}_E$.

⌟

Proof: Firstly, any product of these two are positive involutions. Conversely, if (B, tr) is a f.d. $\mathbb{Q}$-algebra with a positive involution, then by(15.8.2.18), B is semisimple, thus a finite product of number fields. Then by(15.8.2.18), each factor is fixed by the involution, so it suffices to consider the case $B \in \mathtt{NField}$. Let F be the fixed field of ι. Because the trace form $\mathrm{tr}_{B/\mathbb{Q}}$ is non-degenerate, we can assume $\mathrm{tr}(x) = \mathrm{tr}(\alpha x)$ for some $\alpha \in B^\times$.

If $F = B$, then F is totally real: if there exists a non-real embedding $\sigma : F \to \mathbb{C}$, then we can use weak approximation to find $x \in F^\times$ s.t. $\sigma(\alpha x^2)$ is near -1 and $\varphi(\alpha x^2)$ is near 0 for any other embedding $\varphi : F \to \mathbb{C}$. Then clearly $\mathrm{tr}(\alpha x^2) < 0$, contradiction.

If $F \neq B$, then $[B : F] = 2$, and $\mathrm{tr}_{B/\mathbb{Q}}(\alpha x \iota(x)) > 0$ for any $x \in B^\times$. Take $x = 1$, we see $\mathrm{tr}_{B/\mathbb{Q}}(\alpha) > 0$. In particular, $\alpha + \iota(\alpha) \neq 0 \in F$. Then in particular, $\mathrm{tr}_{B/\mathbb{Q}}(\alpha x \iota(x)) = \mathrm{tr}_{F/\mathbb{Q}}((\alpha + \iota(\alpha))x\iota(x)) > 0$. So by the argument above, F is totally real. And B is totally imaginary: If there exists a real embedding $\sigma : B \to \mathbb{C}$, then σ and $\sigma \circ \iota$ corresponds to different places, and by weak approximation, we can find $x \in B$ s.t. $\sigma((\alpha + \iota(\alpha))x)$ is near -1 and $\sigma(\iota(x))$ is near 1, and $\varphi(x)$ is near 0 for any other $\varphi : B \to \mathbb{C}$. Then $\mathrm{tr}_{F/\mathbb{Q}}((\alpha + \iota(\alpha))x\iota(x)) < 0$, contradiction. So in this case B is a CM-field, and $\iota = \mathtt{c}_B$. □

Cor. (15.8.2.21). There exists uniquely a positive involution on any CM-algebra, which is $\mathtt{c}_E$. ⌟

Weil q-Integers

Prop. (15.8.2.22) [Weil q-Integers and CM Fields]. If $p \in \mathbf{P}, q \in p^{\mathbb{Z}}$ and $\varpi \in \mathrm{Weil}(q^{1/2})$, then $\mathbb{Q}(\varpi)$ is either isomorphic to $\mathbb{Q}$ or $\mathbb{Q}(\sqrt{q})$ or a CM-field. ⌟

Proof: For any embedding $\rho : \mathbb{Q}(\pi) \to \mathbb{C}$,

$$\rho(\pi)\overline{\rho(\pi)} = q = \rho(\pi)\rho(q/\pi),$$

so $\bar{(}\rho(\pi)) = \rho(q/\pi)$, and $E = \mathbb{Q}(\pi)$ is a CM-field with the endomorphism $\mathtt{c}_E : \pi \mapsto q/\pi$. □

Prop. (15.8.2.23). Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}}$, $F \in \mathtt{NField}$ and $\pi, \pi' \in F \cap \mathrm{Weil}(q^{1/2})$. If $\mathrm{ord}_v(\pi) = \mathrm{ord}_v(\pi')$ for any $v \in \Sigma_F^p$, then π/π' is a roots of unity in E. ⌟

Proof: This is because there is an endomorphism of F(the conjugation) taking π to q/π, so for any $v \notin \Sigma_F^p$, $\mathrm{ord}_v(\pi) = 0$. Since the same is true for π', and $\mathrm{ord}_v(\pi) = \mathrm{ord}_v(\pi')$ for $v \in \Sigma_F^\infty$ too, by the definition of Weil q-integers. Thus $|\pi/\pi'|_v = 1$ for any $v \in \Sigma_F$, and the assertion follows from(14.4.4.30). □

3 CM Abelian Varieties

Def. (15.8.3.1) [Complex Multiplications]. For $k \in \texttt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$,

$$[\mathrm{End}_{\mathbb{Q}}(A) : \mathbb{Q}]_{\mathrm{red}} \leq 2\dim A.$$

And A is called an Abelian variety with **complex multiplication** or a CM Abelian variety if the equality holds. ⌟

Proof: Take $\ell \in \mathbf{P} \setminus \{\mathrm{char}\, k\}$, then $\mathrm{End}_{\mathbb{Q}}(A)$ acts faithfully on $T_\ell(A, \mathbb{Q}_\ell)$ by(15.13.2.3), which has dimension $2\dim A$(15.7.6.15), so we finish by(15.7.6.10) and(3.6.3.24). □

Prop. (15.8.3.2). For $k \in \texttt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$, the following are equivalent:

- A is CM.
- $\mathrm{End}_{\mathbb{Q}}(A)$ contains an étale subalgebra of rank $2\dim A$ over $\mathbb{Q}$.
- For any Weil cohomology $\mathscr{H}^*$ with coefficients in $\Omega \in \texttt{Field}^0$, the centralizer of $\mathrm{End}_{\mathbb{Q}}(A)$ in $\mathrm{End}_\Omega(H^1(A))$ is commutative (and equals $Z(\mathrm{End}_{\mathbb{Q}}(A)) \otimes \Omega$).

⌟

Proof: 1 $\iff$ 2 follows from the fact the maximal étale subalgebra of $\mathrm{End}_{\mathbb{Q}}(A)$ has degree $[\mathrm{End}_{\mathbb{Q}}(A) : \mathbb{Q}]_{\mathrm{red}}$(3.6.3.23).

2 $\iff$ 3 follows by noticing $\dim_\Omega(\mathscr{H}^1(A)) = 2\dim A$, and $\mathrm{End}_\Omega(A)$ acts faithfully on it**?**. Then use(3.6.3.24). □

Lemma (15.8.3.3). Let $A \in \mathcal{A}b\mathcal{V}ar/\mathbb{C}$ and $F \subset \mathrm{End}_{\mathbb{Q}}(A)$. If F has a real place, then $[F : \mathbb{Q}] | \dim A$. ⌟

Proof: **?** □

Prop. (15.8.3.4). For $k \in \texttt{Field}$ and $A \in \mathcal{A}b\mathcal{V}ar/k$,

- if A is simple, then A is CM iff $\mathrm{End}_{\mathbb{Q}}(A)$ is a CM-field of degree $2\dim A$ over $\mathbb{Q}$.
- If A is isotopic, then A is CM if $\mathrm{End}_{\mathbb{Q}}(A)$ contains a CM-field of degree $2\dim A$ over $\mathbb{Q}$, which is invariant under some Rosati involution.
- A is CM iff $\mathrm{End}_{\mathbb{Q}}(A)$ contains an étale CM-algebra of degree $2\dim A$ over $\mathbb{Q}$, which is invariant under some Rosati involution. And in this case, for $\ell \in \mathbf{P} \setminus \{\mathrm{char}\, k\}$, $T_\ell(A)$ is free of rank 1 over this algebra.

⌟

Proof: We use(15.8.3.2).

1: It suffices to show that if $\mathrm{End}_{\mathbb{Q}}(A)$ is a field of degree $2\dim A$, then it is CM.**?**

2: **?**

3 follows from 2. □

Prop. (15.8.3.5) [Tate1966]. Every Abelian variety over a finite field has CM. ⌟

Proof: **?** □

Complex CM Abelian Varieties

Prop. (15.8.3.6) [CM-Types of Complex Abelian Varieties]. Let E be a CM-algebra of degree $2g$, $A \in \mathcal{A}b\,\mathcal{V}ar^g/\mathbb{C}$ and $E \subset \mathrm{End}_{\mathbb{Q}}(A)$, then the action of E on $\mathrm{Tgt}_0(A)$ is faithful, so

$$\mathrm{Tgt}_0(A) \cong \bigoplus_{\varphi\in\Phi} \mathbb{C}_\varphi$$

where Φ is a set of homomorphisms from E to $\mathbb{C}$. Then from the decomposition

$$H_1(A, \mathbb{R}) \cong \mathrm{Tgt}_0(A) \bigoplus \overline{\mathrm{Tgt}_0(A)}$$

and the fact $H_1(A, \mathbb{Q})$ is a free E-module of rank 1(15.8.3.4), we see $\Phi \coprod \mathsf{c}\,\Phi = \mathrm{Hom}(E, \mathbb{C})$. So Φ is a CM-type on E.

Thus A is said to have **CM-type** (E, Φ) if Φ is a CM-type on E and

$$\mathrm{Tgt}_0(A) \cong \mathbb{C}^\Phi$$

as E-algebras. ⌟

Def. (15.8.3.7) [Reflex Field of a CM Abelian Variety]. Let $A \in \mathcal{A}b\,\mathcal{V}ar/\mathbb{C}$ be CM, then if E_0 is the center of $\mathrm{End}_{\mathbb{Q}}(A)$, by(15.8.3.4) and(15.8.3.6), E_0 is a CM-algebra, and there exists a CM-type Φ_0 on E_0 s.t. for any CM-pair E s.t. A is of CM-type (E, Φ), there Φ is the extension of Φ_0 to E.

Then the reflex field of (E_0, Φ) equals that of (E, Φ) for any (E, Φ), called the **reflex field** of A. ? ⌟

Prop. (15.8.3.8) [Abelian Varieties attached to CM-Pairs]. Let (E, Φ) be a CM-pair and Λ is a $\mathbb{Z}$-lattice in E, then

$$\Lambda \otimes_{\mathbb{Z}} \mathbb{R} \cong E \otimes_{\mathbb{Q}} \mathbb{R} \xrightarrow[\cong]{\Phi} \mathbb{C}^\Phi (15.8.2.7).$$

So $\Lambda \otimes_{\mathbb{Z}} \mathbb{R}$ has a complex structure and we get a Riemann pair (Λ, J_Φ), which corresponds to a complex torus A_Φ.

Then $\mathcal{O} = \{x \in E | a\Lambda \subset \Lambda\} \subset \mathrm{End}(A_\Phi)$ is an order in E(14.4.1.37), and then $E \subset \mathrm{End}_{\mathbb{Q}}(A_\Phi)$.

Then there is a Riemann form on (Λ, J_Φ) whose associated positive Rosati involution(15.7.8.7) stabilizes E(and thus equals c_E on E by(15.8.2.21)). In particular, A_Φ is a complex Abelian variety(15.7.8.1). ⌟

Proof: To give such a Riemann form, by(12.9.5.9), it suffices to give a non-degenerate bilinear form $\psi : E \times E \to \mathbb{Q}$ that satisfies

1. $\psi(ax, y) = \psi(x, \overline{a}y)$ for $a, x, y \in E$.
2. $\psi(x, y) = -\psi(y, x)$ for $x, y \in E$.
3. $\psi(J_\Phi x, J_\Phi y) = \psi(x, y)$ for $x, y \in E \otimes_{\mathbb{Q}} \mathbb{R}$.
4. $\psi(x, J_\Phi x) > 0$ for any non-zero $x \in E \otimes_{\mathbb{Q}} \mathbb{R}$.

Now because the trace form $\mathrm{tr} : E \times E \to \mathbb{Q}$ is non-degenerate, non-degenerate $\mathbb{Q}$-bilinear forms of E are exactly of the form

$$\psi(x, y) = \mathrm{tr}_{E/\mathbb{Q}}(\overline{y}\alpha x), \alpha \in E^\times.$$

And the conditions (1) is automatic, and (3) is automatic because in the isomophism

$$E \otimes_{\mathbb{Q}} \mathbb{R} \xrightarrow[\cong]{\Phi} \prod_{\rho:F\to\mathbb{R}} \mathbb{C} \cong \mathbb{C}^\Phi : a \otimes r \mapsto (\rho'(a)r)_\rho, \quad \Phi = \{\rho' | \rho : F \to \mathbb{R}\}, (15.8.2.7)$$

$\psi_{\mathbb{R}}$ corresponds to

$$\psi'((x_\varphi),(y_\varphi)) = \sum_{\varphi\in\Phi} \mathrm{tr}_{\mathbb{C}/\mathbb{R}}(\varphi(a)\overline{y_\varphi}x_\varphi)$$

and J_Φ corresponds to the isomorphism

$$(x_\varphi)_{\varphi\in\Phi} \mapsto (\mathrm{i}\, x_\varphi)_{\varphi\in\Phi}.$$

Thus it suffices to choose α s.t. $\varphi(\alpha)\in \mathrm{i}\,\mathbb{R}_+$ for any $\varphi\in\Phi$.

By(15.8.2.4), there exists $\alpha\in E^\times$ s.t. $E = F(\alpha)$ s.t. $\varphi(\alpha)\in \mathrm{i}\,\mathbb{R}$ for any $\varphi\in\Phi$, and we can then use weak approximation on F to modify α s.t. $\varphi(\alpha)\in\mathrm{i}\,\mathbb{R}_+$ for any $\varphi\in\Phi$. So this α clearly exists. Moreover, any other element α' is α times some element $a\in F$ that is totally positive. □

Prop. (15.8.3.9)[Classifying Complex CM Abelian Varieties up to Isogeny]. The map $(A,i)\to(E,\Phi)$ defines a bijection between the set of isogeny classes of CM Abelian varieties $A/\mathbb{C}$ with an embedding $i: E\to \mathrm{End}_{\mathbb{Q}}(A)$ and the set of isomorphism classes of CM-pairs (E,Φ), with inverse $(E,\Phi)\mapsto(A_\Phi,i_\Phi)$ which is the Abelian variety corresponding to the lattice $\Lambda=\mathcal{O}_E$(15.8.3.8), called the **principally-CM Abelian variety** of type (E,Φ). ⌟

Proof: Notice in(15.8.3.8), any two choice of the lattice $\mathfrak{a}$ give isogenous Abelian varieties, and because $H_1(A,\mathbb{Q})$ is free of rank 1 over E, let $e\in H_1(A,\mathbb{Q})$ be a basis vector, then $\mathfrak{a}e = H_1(A,\mathbb{Z})$ for some lattice $\mathfrak{a}\subset E$. Then this e defines an isomorphism

$$Ee\cong H_1(A,\mathbb{Z})\otimes\mathbb{Q} = H_1(A,\mathbb{Q})$$

thus the isomorphism

$$A\cong H_1(A,\mathbb{C})/H_1(A,\mathbb{Z}) \xrightarrow[\cong]{e^{-1}} E\otimes_{\mathbb{Q}}\mathbb{C}/\mathfrak{a} \xrightarrow[\cong]{\Phi} \mathbb{C}^\Phi/\Phi(\mathfrak{a}) \sim \mathbb{C}^\Phi/\Phi(\mathcal{O}_E).$$

This is clearly a bijection. □

Prop. (15.8.3.10)[Classifying Simple Complex CM Abelian Varieties]. Let A be a simple complex Abelian variety over $\mathbb{C}$ with CM and $E=\mathrm{End}_{\mathbb{Q}}(A)$, then E is a CM-field, and the map $A\mapsto(E,\Phi_A)$ defines a bijection between the set of isomorphism classes of simple complex Abelian varieties with CM and the set of isomorphism classes of primitive CM-paris. ⌟

Proof: $E\in$ `Field` by(15.8.3.4), and if it is not primitive, then (E,Φ) is extended from a primitive CM-field (E_0,Φ_0), and a choice of E_0-basis of E defines an embedding $E\subset \mathrm{Mat}([E:E_0],E_0)\subset \mathrm{End}_0(A_{\Phi_0}^{[E:E_0]})$, and

$$E\otimes_{\mathbb{Q}}\mathbb{R} = E\otimes_{E_0}(E_0\otimes_{\mathbb{Q}}\mathbb{R})\cong E\otimes_{E_0}(\mathbb{C}^{\Phi_0})\cong\mathbb{C}^\Phi$$

shows $A_{\Phi_0}^{[E:E_0]}$ is also of type (E,Φ). Thus $A\sim A_{\Phi_0}^{[E:E_0]}$ by(15.8.3.9), contradicting the fact A is simple. □

Cor. (15.8.3.11). The simple Abelian varieties with complex multiplications are classified up to conjugacy by the $\mathrm{Gal}_{\mathbb{Q}}$-orbits of CM-types on $\mathbb{Q}^{\mathrm{cm}}$, by(15.8.2.16). ⌟

Good Reductions

Prop. (15.8.3.12)[Potential Good Reduction of CM-Abelian Varieties]. Let $E\in$ `NField`, $A\in \mathcal{A}b\,\mathcal{V}ar/\mathbb{C}$ has complex multiplication by E, then A is defined over some number field F. And F can be chosen s.t. A_F has good reduction. ⌟

Proof: Cf.[Milne, Abelian Varieties, P55].? □

4 Mumford-Tate Groups

5 Fundamental Theorem

Thm. (15.8.5.1) [Fundamental Theorem of Complex Multiplication, Shimura-Taniyama]. Let $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/\mathbb{F}_q$ be the reduction from an complex Abelian variety of CM-type (E, Φ), then the Weil-q-integers of A can be constructed as follows:

⌟

Proof: Cf.[Milne, Abelian Varieties, P83].**?** □

6 Elliptic Curves

References are [Deu58] and [Ser67].

Prop. (15.8.6.1) [Complex Elliptic Curves with CM]. If $E \cong E_\tau \in \mathcal{E}\mathrm{ll}/\mathbb{C}$ has CM, then $\mathcal{K} = \mathbb{Q}(\tau)$ is an imaginary quadratic extension of $\mathbb{Q}$ and $\mathrm{End}(E)$ is isomorphic to an order of $\mathcal{K}$.

By(15.11.1.28), if $E \in \mathcal{E}\mathrm{ll}/\mathbb{C}$ has CM(15.8.3.1), then $\mathrm{End}(E)$ is an $\mathbb{Z}$-order in $\mathcal{K}$, which by(14.4.1.47)must be of the form $\mathcal{O}_{\mathcal{K},f} = \mathbb{Z} + f\mathcal{O}_K$, where $f = [\mathcal{O}_\mathcal{K} : \mathrm{End}(E)]$. ⌟

Proof: Cf.[Sil16]P176.**?** □

Thm. (15.8.6.2) [Classifying CM Elliptic Curves]. Given any imaginary quadratic field $\mathcal{K}$ and an $\mathbb{Z}$-order $\mathcal{O}_{\mathcal{K},f} \subset \mathcal{K}$, the isomorphism classes of elliptic curves over $\mathbb{C}$ with maximal CM by $\mathcal{O}_{\mathcal{K},f}$ is in bijection with $\mathrm{Cl}(\mathcal{O}_{\mathcal{K},f})$, denoted by $\mathcal{E}\mathrm{ll}_\mathbb{C}(\mathcal{O}_{\mathcal{K},f})$.

In particular, $\#\,\mathcal{E}\mathrm{ll}_\mathbb{C}(\mathcal{O}_{\mathcal{K},f}) < \infty$. The j-values of elliptic curves with maximal CM by $\mathcal{O}_{\mathcal{K},f}$ are called singular moduli **associated to** $\mathcal{O}_{\mathcal{K},f}$. ⌟

Proof: If $E \cong \mathbb{C}/\Lambda \cong E_\tau$, then $\mathbb{Z} + \mathbb{Z}\tau$ is an $\mathcal{O}_{\mathcal{K},f}$-module of rank 1, and by definition it is a proper fractional ideal of $\mathcal{O}_{\mathcal{K},f}$ thus invertible(14.4.1.48). Conversely, any such an invertible fractional ideals $\mathfrak{a}$ is a lattice in $\mathcal{K}$ thus defines an elliptic curve $E_\mathfrak{a}$ with $\mathrm{End}(E_\mathfrak{a}) = \mathcal{O}$ by(14.4.1.48). Finally it follows from(12.9.5.2) that two such $E_\mathfrak{a}$ and $E_{\mathfrak{a}'}$ are isomorphic iff $\mathfrak{a}, \mathfrak{a}'$ differ by a principle ideal. □

Prop. (15.8.6.3). Let $\mathcal{K}$ be an imaginary quadratic field, $E \in \mathcal{E}\mathrm{ll}_\mathbb{C}(\mathcal{O}_\mathcal{K})$, and $\mathfrak{a} \in \mathrm{Ideal}(\mathcal{O}_\mathcal{K})$, then

- $E[\alpha]$ is the kernel of the isogeny $E \to \overline{\mathfrak{a}} * E$.
- $E[\alpha]$ is a free $\mathcal{O}_\mathcal{K}/\mathfrak{a}$-module of rank 1.
- The degree of isogeny $E \to \overline{\mathfrak{a}} * E$ is $\mathrm{Nm}_{\mathcal{K}/\mathbb{Q}}(\mathfrak{a})$.
- For $\alpha \in \mathcal{O}_K^\times$, $\deg([\alpha]_E) = \mathrm{Nm}_{\mathcal{K}/\mathbb{Q}}(\alpha)$.

⌟

Proof: Cf.[Sil99]P102. □

Thm. (15.8.6.4) [Singular Moduli, Weber-Fueter]. Let $E \in \mathcal{E}\mathrm{ll}_\mathbb{C}(\mathcal{O}_{\mathcal{K},f})$, then

- $j(E) \in \mathcal{O}_{\overline{\mathbb{Q}}}$, and $\mathcal{K}(j(E))$ is the ray class field $\mathcal{K}_f$ of $\mathcal{K}$.
- $\mathrm{Gal}(\mathcal{K}_f/\mathcal{K})$ acts transitively on the j-values associated to $\mathcal{O}_{\mathcal{K},f}$(15.8.6.2).

In particular, $\deg(j(E)) = \mathrm{cl}(\mathcal{O}_{\mathcal{K},f})$. ⌟

Proof: Cf.[Serre] or [Sutherland]L21. or [Silverman]P447 or [Cox, Chap11]. Notice this should be a special case of Shimura-Taniyama. □

Cor. (15.8.6.5). There are 13 elliptic curves $E \in \mathcal{E}\text{ll}/\mathbb{Q}$ with CM, namely they are associated to $\mathcal{O}_{\mathcal{K},f}$ with

- $f = 1, \mathcal{K} = \mathbb{Q}(\sqrt{-d})$ with $d \in \{1, 2, 3, 7, 11, 19, 43, 67, 163\}$, with corresponding j-invariances
$$j = 2^6{\cdot}3^3,\quad 2^6{\cdot}5^3,\quad 0,\quad -3^3{\cdot}5^3,\quad -2^{15},\quad -2^{15}{\cdot}3^3,\quad -2^{18}{\cdot}3^3{\cdot}5^3,\quad -2^{15}{\cdot}3^3{\cdot}5^3{\cdot}11^3,\quad -2^{18}{\cdot}3^3{\cdot}5^3{\cdot}23^3{\cdot}29^3.$$
- $f = 2, \mathcal{K} = \mathbb{Q}(\sqrt{-d})$ with $d \in \{1, 3, 7\}$, with corresponding j-invariances
$$j = 2^3 \cdot 3^3 \cdot 11^3,\quad 2^4 \cdot 3^3 \cdot 5^3,\quad 3^3 \cdot 5^3 \cdot 17^3.$$
- $f = 3, \mathcal{K} = \mathbb{Q}(\sqrt{-3})$ with corresponding j-invariances $j = 2^{15} \cdot 3 \cdot 5^3$.

⌟

Proof: □

Thm. (15.8.6.6) [Hasse]. For $[\Lambda] \in \mathrm{Pic}(\mathcal{O}_{\mathcal{K},f})$, denoted $j(\Lambda) = j(\mathbb{C}/\Lambda)$, then if $\mathfrak{p}$ is a prime ideal of $\mathcal{O}_{\mathcal{K}}$ prime to the conductor and $\mathfrak{p}_f = \mathfrak{p} \cap \mathcal{O}_{K,f}$, then
$$(\mathrm{Art}(\mathrm{Frob}_{\mathfrak{p}}))(j(\Lambda)) = j(\Lambda{\cdot}\mathfrak{p}_f^{-1}).$$
⌟

Proof: ? □

CM-Lifting

Thm. (15.8.6.10) [Honda/Chai-Conrad-Oort2014]. For any $A \in \mathcal{A}b\mathcal{V}ar/\mathbb{F}_q$, there exists an isogeny $A \sim B_0$ s.t. B_0 admits a CM lift to characteristic 0. ⌟

Proof: □

Thm. (15.8.6.11)[Deuring CM-Lifting Lemma]. Let $p \in \mathbf{P}$ and $E \in \mathcal{E}\text{ll}/\overline{\mathbb{F}}_p$, and $\alpha_0 \in \mathrm{End}(E_0)\backslash\mathbb{Z}$, then there exists $F \in \mathtt{NField}$, $\mathcal{E} \in \mathcal{E}\text{ll}/\mathcal{O}_F$ and $\alpha \in \mathrm{End}(\mathcal{E})$, $\mathfrak{p} \in \Sigma_F^p$ s.t.
$$\mathcal{E}_{\overline{\kappa(\mathfrak{p})}} \cong E_0$$
s.t. $\alpha_{\overline{\kappa(\mathfrak{p})}}$ corresponds to α_0. ⌟

Proof: Cf.[Suw19]P5? □

Hilbert Class Polynomials

Def. (15.8.6.12) [Hilbert Class Polynomials]. Let $\mathcal{O}$ be a order in an imaginary quadratic field $\mathcal{K}$, the **Hilbert class polynomial** associated to $\mathcal{O}$ is defined to be

$$H_{\mathcal{O}}(X) = \prod_{E\in\mathcal{E}\mathrm{ll}_{\mathbb{C}}(\mathcal{O})} (X - j(E)).$$

And for $D \in \mathbb{Z}, D \equiv 0, 1 (\mathrm{mod}\ 4)$, the **Hilbert class polynomial** of discriminant D is defined to be the class polynomial for the order $\mathcal{O}_D$. ⌟

Lemma (15.8.6.13). For $\ell \equiv -1 (\mathrm{mod}\ 4) \in \mathbf{P} \setminus \{3\}$ and $D = -\ell$ or -4ℓ, $H_D(1728) \equiv 0 (\mathrm{mod}\ \ell)$. ⌟

Proof: Consider the curve $E : y^2 = x^3 - x$, it is supersingular by(15.11.3.12) or(15.8.6.20), and has j-invariant 1728. Thus $\varphi_E^2 = -\ell$ by (15.11.3.9)(15.11.3.3). Notice $E[2] = \{\infty, (0, 0), (\pm 1, 0)\}$, which are all defined over $\mathbb{F}_p$, so $2|(1 + F)$, and $\mathbb{Z}[\frac{1+\varphi_E}{2}] \cong \mathcal{O}_\ell$. Thus by Deuring CM-lifting lemma(15.8.6.11), there is an elliptic curve over some $\mathcal{O}_F$ with maximal CM by $\mathcal{O}_{-\ell}$ whose j-invariant is mapped to $1728 (\mathrm{mod}\ \ell)$, so $H_{-\ell}(1728) \equiv 0 (\mathrm{mod}\ \ell)$.

Similarly, E has endomorphism $I : (x, y) \mapsto (-x, \mathrm{i}\, y)$, $I^2 = -1, IF = -FI$, so we can lift IF to get an elliptic curve over some $\mathcal{O}_F$ with CM by $\mathcal{O}_{-4\ell}$. And it is maximal CM, because $\frac{1+IF}{2} \notin \mathrm{End}(E)$, as $(1 + IF)(P = (1, 0)) = (1, 0) + (-1, 0) \neq O$. □

Lemma (15.8.6.14). For $\ell \equiv -1 (\mathrm{mod}\ 4) \in \mathbf{P} \setminus \{3\}$ and $D = -\ell$ or -4ℓ, let $\mathcal{K}_D$ be the ray class field of $\mathcal{O}_D$, then for any root x_0 of $H_D(X)$ s.t. $x_0 \equiv 1728 (\mathrm{mod}\ \ell)$, there exists a unique $\mathfrak{l} \in \Sigma^\ell_{\mathcal{K}_D}$ s.t. $x_0 - 1728 \in \mathfrak{l}$. The j-invariant of this elliptic curve is mapped to $1728 (\mathrm{mod}\ \ell)$, so $H_{-\ell}(1728) \equiv 0 (\mathrm{mod}\ \ell)$. ⌟

Proof: The existence follows from(15.8.6.13), and if there are two primes $\mathfrak{l}, \mathfrak{l}'$ that divides $x - 1728$, then there exists $\sigma \neq \mathrm{id}$ s.t. $x_1 = \sigma(x_1) \equiv 1728 (\mathrm{mod}\ \ell)$. Then there are two elliptic curves $E_1, E_2/\overline{\mathbb{Q}}$ with j-invariants x_0, x_1 that reduces to the elliptic $E/\mathbb{F}_\ell : y^2 = x^3 - x$. Then we get a degree-preserving injection $\mathrm{Hom}(E_1, E_2) \hookrightarrow \mathrm{End}(E_{\overline{\mathbb{F}}_\ell}) = A$.

For the rest, see[Suw19]P8**?** □

Prop. (15.8.6.15). For $\ell \equiv -1 (\mathrm{mod}\ 4) \in \mathbf{P} \setminus \{3\}$, there exists $R, S \in \mathbb{Z}[X]$ s.t.

$$H_{-\ell}(X) = (X - 1728)R(X)^2, \quad H_{-4\ell}(X) = (X - 1728)S(X)^2.$$

⌟

Proof: Notation as in(15.8.6.14), there exists an involution τ of $\mathcal{K}_D$ s.t. $\sigma(x_0) = x_0$. Thus by the lemma, $\tau(\mathfrak{l}) = \mathfrak{l}$, and $f(\mathfrak{l}/\ell)$ is odd because $\mathrm{Gal}(\mathcal{K}_D/\mathcal{K})$ does(14.4.3.8). So σ acts trivially on $\kappa(\mathfrak{l})$. But τ doesn't fix any roots x of $H_D(X)$ other than x_0(because x_i corresponds to ideal classes of $\mathcal{O}_D$ where x_0 corresponds to the trivial class, and τ acts by $[I] \mapsto [I]^{-1}$), so the other roots come in pairs, and the assertion follows. □

Prop. (15.8.6.16). For $\ell \equiv -1 (\mathrm{mod}\ 4) \in \mathbf{P} \setminus \{3\}$, the only real roots of $H_\ell(X)$ and $H_{4\ell}(X)$ are $j(\frac{1}{2}(1 + \sqrt{-\ell}))$ and $j(\sqrt{-\ell})$ resp.. ⌟

Proof: For $D = \ell$ or -4ℓ, since the complex conjugation is compatible with the correspondence in(15.8.6.2), and because $I\overline{I} = \mathrm{Nm}(I)\mathcal{O}_D$, so the fixed points of $\mathfrak{c}$ are just 2-torsions in $\mathrm{Pic}(\mathcal{O}_D)$. But $\mathrm{Pic}(\mathcal{O}_D)$ is odd by(14.4.3.8), thus the only real j-value corresponds to the trivial class. □

Cor. (15.8.6.17). For any $j \in \mathbb{R}$, for $\ell \equiv -1 \pmod 4 \in \mathbf{P} \setminus \{3\}$ sufficiently large, $H_{-\ell}(j) > 0$ and $H_{-4\ell}(j) < 0$. ⌟

Proof: This is because $j(\frac{1}{2}(1+\sqrt{-\ell})) \to -\infty$ and $j(\sqrt{-\ell}) \to \infty$ as $\ell \to \infty$, by the power expansion(20.2.4.22). □

Applications

Prop. (15.8.6.18). For $p \in \mathbf{P}$,

- $$\sum_{x\in\mathbb{F}_p} \left(\frac{x^3+x}{p}\right) = \begin{cases} 0 & , p \equiv 3 \pmod 4 \\ -2a & , p = a^2+4b^2, a \equiv 1 \pmod 4 \end{cases}.$$
- $$\sum_{x\in\mathbb{F}_p} \left(\frac{x^3+1}{p}\right) = \begin{cases} 0 & , p \equiv 2 \pmod 3 \\ -2a & , p = a^2+3b^2, a \equiv 1 \pmod 3 \end{cases}.$$
- $$\sum_{x\in\mathbb{F}_p} \left(\frac{x^3+x}{p}\right) = \begin{cases} 0 & , \left(\frac{p}{7}\right) = -1 \\ -2a & , p = a^2+7b^2, \left(\frac{a}{7}\right) = 1 \end{cases}.$$

⌟

Proof: Because these corresponds to elliptic curves with CM by an imaginary quadratic field with class number 1, thus there exists , so the trace of φ_p can be determined.(**?** How, can it be lifted into $\mathcal{O}_{\mathcal{K}}$?). □

Supersingular Primes

References are [Elk87] and [Suw19].

Lemma (15.8.6.19). Let $k \in \mathtt{Field}^p$ and $E \in \mathcal{E}\mathrm{ll}/k$, E is supersingular iff there exists an order $\mathcal{O}$ of an imaginary quadratic field $\mathcal{K}$ s.t. $\mathcal{O} \subset \mathrm{End}(E)$ and p doesn't split in $\mathcal{K}$. ⌟

Proof: By(15.11.3.6), if it is ordinary, then $\mathrm{End}(\mathcal{O})$ is a $\mathbb{Z}$-order in an imaginary quadratic field $\mathcal{K}$. Then consider the p-adic representation

$$\mathcal{K} \otimes \mathbb{Q}_p = \mathrm{End}(E) \otimes \mathbb{Q}_p \to \mathrm{End}_{\mathbb{Q}_p}(V_p(E)) \cong \mathbb{Q}_p.$$

Then this map has a kernel, so $\mathcal{K} \otimes \mathbb{Q}_p$ is not a field, and p splits in $\mathcal{K}$. □

Thm. (15.8.6.20) [Supersingular Criterion for CM Elliptic Curves, Deuring]. Let $F \in \mathtt{NField}$ and $E \in \mathcal{E}\mathrm{ll}/F$ with CM by an imaginary quadratic field $\mathcal{K}$. If $\mathfrak{p} \in \Sigma_F^p$ is a good reduction for E, then $\widetilde{E}/\kappa(\mathfrak{p})$ is ordinary/supersingular iff p is split/non-split in $\mathcal{K}$. ⌟

Proof: Cf.[Lang, Elliptic Functions, Thm13.12].**?** □

Cor. (15.8.6.21) [Supersingular Reductions for CM Elliptic Curves]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with CM by $\mathcal{K}$, then

$$\#\{p \in \mathbf{P}, p \le X | \widetilde{E}/\mathbb{F}_p \text{ is supersingular elliptic}\} = \frac{X}{2\log X} + O(\frac{X}{\log X}).$$

⌟

Proof: This follows from the effective Chebotarev density theorem(14.6.5.4). □

Prop. (15.8.6.22) [Elkies]. For any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, there are infinitely many $p \in \mathbf{P}$ s.t. $\widetilde{E}/\mathbb{F}_p$ is supersingular elliptic. (This is also true if $\mathbb{Q}$ is replaced by a real field, Cf.[Elkies, 1989]). ⌟

Proof: By Deuring's CM-lifting lemma(15.8.6.11), for $D = -\ell$ or -4ℓ, $\widetilde{E}/\mathbb{F}_p$ has CM by $\mathcal{O}_D$ iff $H_D(j(E)) = 0 \in \mathbb{F}_p$. So by(15.8.6.19), p is a supersingular prime for E if

- $H_{-\ell}(j(E)) \in p\mathbb{Z}_p$ or $H_{-4\ell}(j(E)) \in p\mathbb{Z}_p$, and
- $\mathrm{ord}_p(\ell)$ is odd or $-\ell$ is a quadratic non-residue modulo p.

Suppose that there is a finite set S containing all the supersingular primes of E, assume $2 \in S$. By Dirichlet's theorem, there exists $\ell \in \mathbf{P}$ sufficiently large s.t.

$$\ell \equiv 3 (\mathrm{mod}\ 4), \quad \left(\frac{p}{\ell}\right) = 1, \quad p \in S.$$

Then by quadratic reciprocity, if $p \in \mathbf{P}$ and $H_{-\ell}(j(E)) \in p\mathbb{Z}_p$ or $H_{-4\ell}(j(E)) \in p\mathbb{Z}_p$, then $p \neq \ell$ and $\left(\frac{p}{\ell}\right) = 1$, otherwise there would be a new supersingular prime for E that is not in S.

As $H_{-\ell}, H_{-4\ell} \in \mathbb{Z}[X]$, for any $p \in \mathbf{P}$,

$$H_{-\ell}(j(E))^{-1} \in p\mathbb{Z}_p \iff j(E)^{-1} \in p\mathbb{Z}_p \iff H_{-4\ell}(j(E))^{-1} \in p\mathbb{Z}_p,$$

and if $j(E)^{-1} \in p$, then

$$\mathrm{ord}_p(H_{-\ell}(j(E))^{-1}) + \mathrm{ord}_p(H_{-4\ell}(j(E))^{-1}) = \mathrm{ord}_p(j(E)^{-1}) \cdot (\deg(H_{-\ell}) + \deg(H_{-4\ell}))$$

which is even by(15.8.6.15). And $H_{-\ell}(j(E))H_{-4\ell}(j(E)) < 0$ by(15.8.6.17). So $H_{-\ell}(j(E))H_{-4\ell}(j(E))$ would be a quadratic non-residue modulo ℓ by our hypothesis. But this contradicts(15.8.6.15). □

Without CM case

Thm. (15.8.6.23) [Serre]. For $F \in$ `NField` and $E \in \mathcal{E}\mathrm{ll}/F$ without CM, $\rho_E(\mathrm{Gal}_F) \subset \mathrm{GL}(2; \mathbf{A}^f)$ has finite index. ⌟

Proof: Cf.[Abelian l-adic representations and elliptic curves, Serre]. or [Bounds for Serre's open image theorem for elliptic curves over number fields]. □

Conj. (15.8.6.24) [Lang-Trotter]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM,

$$\#\{p \in \mathbf{P}, p \leq X | \widetilde{E}/\mathbb{F}_p \text{ is supersingular elliptic}\} \sim \frac{\sqrt{X}}{\log X}.$$

⌟

Proof: □

Prop. (15.8.6.25) [Serre-Elkies]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM,

$$\#\{p \in \mathbf{P}, p \leq X | \widetilde{E}/\mathbb{F}_p \text{ is supersingular elliptic}\} \leq X^{3/4+\varepsilon}.$$

In particular, supersingular primes have density 0. ⌟

Proof: [N. D. Elkies. Distribution of supersingular primes. Asterisque, (198-200):127–132 (1992), 1991. Journe´es Arithme´tiques, 1989]. □

Conj. (15.8.6.26) [Sato-Tate]. Let $F \in \texttt{NField}$ and $E \in \mathcal{E}\mathrm{ll}/F$ without CM, then for any place v, define $a_v = q_v + 1 - \#\widetilde{E}_v(\kappa_v)$, then by Weil conjecture, $|a_v| \le 2\sqrt{q_v}$, Let $a_v/2\sqrt{q_v} = \cos\theta_v, 0 \le \theta \le \pi$, then $\{\theta_v\}$ for places v leveled by q_v has distribution density $\frac{2}{\pi}\sin^2\theta$. ⌟

Proof: □

Remark (15.8.6.27) [Clozel-Harris-Shepherd-Barron-Taylor]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with $j(E) \notin \mathbb{Z}$, then the Sate-Tate conjecture(15.8.6.26) is true. ⌟

Proof: [Clozel-Harris-Taylor, Automorphy for some ℓ-adic lifts of automorphic mod ℓ representations], [A family of Calabi-Yau varieties and potential automorphy]. □

Cor. (15.8.6.28) [Birch]. Given $p \in \mathbf{P}$, for any $E \in \mathcal{E}\mathrm{ll}/\mathbb{F}_p$, define $a_v(E) = p + 1 - \#\widetilde{E}_v(\mathbb{F}_p)$ and $a_v(E)/2\sqrt{p} = \cos\theta_p(E), 0 \le \theta \le \pi$, then the distribution density of $\{\theta_p(E)\}$ for $E \in \mathcal{E}\mathrm{ll}/\mathbb{F}_p$ tends to $\frac{2}{\pi}\sin^2\theta$ for $p \to \infty$ when $p \to \infty$. ⌟

Proof: ? □

7 Singular Moduli

References are [Traces of Moduli, Zagier], and [On Singular Moduli, Gross-Zagier].

Def. (15.8.7.1) [Singular Moduli]. A **singular modulus** is a number $j(\tau) \in \mathbb{C}$ where $\tau \in \mathcal{K} \setminus \mathbb{Q}$ and $\mathcal{K}$ is an imaginary quadratic field. ⌟

8 CM Modular Forms

Def. (15.8.8.1) [CM Modular Forms]. A **CM modular form** is a modular form constructed from a binary quadratic form $Q(a,b)$ and a spherical polynomial $P(a,b)$ of order d.

For example,

$$f(z) = \sum_{a \equiv 1 \pmod 4, 2|b} a q^{a^2+b^2}$$

is a modular form, which corresponds exactly to $L(E,s)$, where $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q} : y^2 = x^3 + x$. ⌟

Proof: Cf.[1-2-3 of Modular Forms, P93].? □

Prop. (15.8.8.2). For $n \in 2\mathbb{Z}_+$, $\eta(z)^n$ is a CM modular form iff $n \in \{2, 4, 6, 8, 10, 14, 26\}$. For example,

$$\eta(z) =$$

⌟

Regular Surfaces

2 Fibered presurfaces

Def. (15.9.2.1) [fibered presurfaces]. Let $S \in \mathcal{S}ch$ be Dedekind, a **fibered presurface** over S is proper? flat S-scheme integral of dimension 2. ⌟

Prop. (15.9.2.2). Let $S \in \mathcal{S}ch$ be Dedekind, X a fibered presurface over S, then X_s has dimension 1 for any $s \in S$, and X_η is a precurve. ⌟

Proof: Cf.[Qing Liu]P348. □

Example (15.9.2.3). Let $q \in \mathbb{Z}_+$ be a square-free integer, then $\mathcal{C} = \mathbf{Proj}(\mathbb{Z}[X, Y, Z]/(X^q + Y^q + Z^q))$ is a normal fibered presurface over Spec Z. ⌟

Proof: Cf.[Qing Liu]P455. □

Prop. (15.9.2.4) [Horizontal and Vertical Divisors]. Let $S \in \mathcal{S}ch$ be Dedekind, X a fibered presurface over S, then

- If x is a closed point of X_η, then $\overline{\{x\}}$ is an integral closed subscheme of X that is finite surjective over S, called a **horizontal divisor**.
- If $D \subset X$ is a prime Weil divisor, then D is either a horizontal divisor, or an integral component of a special fiber, called a **vertical divisor**.
- If $x_0 \in X$ is closed, then $\dim \mathcal{O}_{X,x_0} = 2$.

Moreover, call a Weil divisor D on X horizontal or vertical if it consists of horizontal or vertical prime divisors. ⌟

Proof: Cf.[Qing Liu]P349. □

Prop. (15.9.2.5) [Generically Smoothness]. Let $S \in \mathcal{S}\mathrm{ch}$ be Dedekind and $\pi : X \to S$ be a fibered presurface s.t. X_η is smooth, then there is a dense open subscheme $V \subset S$ s.t. $\pi^{-1}(V) \to V$ is smooth. ⌟

Proof: Cf.[Qing Liu]P352. □

Regular Fibered Presurfaces

Prop. (15.9.2.6) [Regular Fibered Presurfaces are Projective]. Let S be affine and X/S be a flat morphism with fibers of dimension 1, then X/S is projective. In particular, a regular fibered presurface is projective. ⌟

Proof: Cf.[Qing Liu]P353. □

Prop. (15.9.2.7) [Sections are Regular]. Let $\pi : \mathcal{C} \to S$ be a regular fibered presurface and $s \in S$, then

- If $s \in S$ is closed and $x \in \mathcal{C}_s$ is closed, then $\mathcal{C}_s$ is regular at x iff $\pi^\sharp(\mathfrak{p}_s) \not\subseteq \mathfrak{m}_x^2$.
- If $P : U \to \mathcal{C}$ is a rational section, then $\mathcal{C}_p$ is smooth at $P(s)$ for $s \in U$.

⌟

Proof: 1: This is because $\mathcal{O}_{\mathcal{C}_s,x} = \mathcal{O}_{\mathcal{C},x}/\pi^\sharp(\mathfrak{p}_s)$, $\mathfrak{m}_{\mathcal{C}_s,x} = \mathfrak{m}_{\mathcal{C},x}/\pi^\sharp(\mathfrak{p}_s)$ and use the definition of regularity.

2: We show that $\pi^\sharp(\mathfrak{p}_s) \not\subseteq \mathfrak{m}_x^2$: Suppose otherwise, then

$$\mathfrak{p}_s = (\pi \circ P)^\sharp(\mathfrak{p}_s) \subset \pi^\sharp(\mathfrak{m}_x^2) = \mathfrak{p}^2,$$

which is impossible. □

Cor. (15.9.2.8). Let $\mathcal{C}/S$ be a regular fibered presurface, then $\mathcal{C}(S) = \mathcal{C}_{\mathrm{sm}}(S)$. If moreover $\mathcal{C}/S$ is proper, then $\mathcal{C}(S) = \mathcal{C}_{\mathrm{sm}}(S) = \mathcal{C}_\eta(K)$. ⌟

Example (15.9.2.9).

- $\mathcal{C} \subset \mathbb{P}^2_{\mathbb{Z}}$ defined by the equation $y^2 = x^3 + 2x^2 + 6$ is a regular fibered presurface over $\mathbb{Z}$ with 3 singular points.
- $\mathcal{C} \subset \mathbb{P}^2_{\mathbb{Z}}$ defined by the equation $y^2 = x^3 + 2x^2 + 6$ is not regular at $(x, y, 2)$.

⌟

Proof: 1: The determinant $\Delta = -2^6 \cdot 3 \cdot 97$, so it is has three singular fibers $\mathcal{C}_2, \mathcal{C}_3, \mathcal{C}_{97}$:

$$\mathcal{C}_2 : y^2 = x^3, \quad \mathcal{C}_3 : y^2 = x^2(x+2), \quad \mathcal{C}_{97} : y^2 = (x+66)^2(x+64).$$

By(15.11.1.16), they are singular at a single point, and we check these points are regular in $\mathcal{C}$:

For $\mathcal{C}_2$, the singular point is defined by $(x, y, 2)$, and has residue field $\mathbb{F}_2$. To show it is regular, it suffices to show that $(x, y, 2)/(x, y, 2)^2$ is generated by 2 elements x, y: $2 = 3^{-1}(y^2 - x^3 - 3x^2)$. The $\mathcal{C}_3, \mathcal{C}_{97}$ cases are similar. □

3 Arithmetic Surfaces

Def. (15.9.3.1) [Arithmetic Surfaces]. An **arithmetic surface** is a flat of f.t. over S that is integral normal and excellent, such that its generic fiber is a non-singular projective curve, and its special fibers are unions of curves. ⌟

Prop. (15.9.3.2). Any arithmetic surface is regular in codimension 1. ⌟

Prop. (15.9.3.3) [Mordell-Weil for Function Fields]. Let $\mathcal{E} \to C$ be an elliptic surface defined over a field k. Let $E/K(C)$ be the generic fiber. If k is a number field or $\mathcal{E}/C$ is not split, then $E(K(C))$ is a f.g. Abelian group. ⌟

Proof: Cf.[Sil99]P230. □

4 Intersection Theory

Def. (15.9.4.1) [Canonical Divisors]. $K_{X/S}$, Cf.[Qing Liu]P389. ⌟

Def. (15.9.4.2) [Vertically Nef]. Let X/S be a regular fibered presurface, then $D \in \mathrm{Cl}(X)$ is called **vertically nef** if $D \cdot C \geq 0$ for any vertical divisor C. ⌟

Prop. (15.9.4.3) [Factorization Theorem]. Any birational morphism of regular fibered presurfaces over S is a finite composition of blowing-up along a single closed point. ⌟

Proof: Cf.[Qing Liu]P395. □

Arithmetic Surfaces

Prop. (15.9.4.4) [Intersection between Vertical Divisors]. Let X/S be an arithmetic surface and $s \in S$ a closed point, then for any $\Gamma \in \mathrm{Div}_s(X)$, $\Gamma \cdot X_s = 0$. In particular, if $\Gamma_1, \ldots, \Gamma_r$ are irreducible components of X_s of multiplicities $d_1, \ldots, d_r$, then

$$\Gamma_i^2 = -\frac{d_j}{d_i} \sum_{j \neq i} \Gamma_i \cdot \Gamma_j \leq 0.$$

⌟

5 Minimal Arithmetic Surfaces

Def. (15.9.5.1) [Exceptional Divisors]. Let X/S be a regular fibered presurface, then an **exceptional divisor** or (-1)**-curve** $E \subset X$ is a prime divisor s.t. there is a morphism of regular fibered presurfaces $f : X \to Y$ s.t. $f(E)$ is a closed point. Notice an exceptional divisor must be a vertical divisor. ⌟

Prop. (15.9.5.2) [Castelnuovo's criterion, Lichtenbaum/Shafarevich]. Let X/S be a regular fibered presurface, $E \subset X_s$ a vertical prime divisor. Let $k' = H^0(E, \mathcal{O}_E)$, then E is an exceptional divisor iff $E \cong \mathbb{P}^1_{k'}$. And this is the case if $E^2 = -[k' : k(s)]$. ⌟

Proof: Cf.[Qing Liu]P416. □

Prop. (15.9.5.3) [Characterizing Exceptional Divisors]. Let X/S be a regular fibered presurface, then for a vertical prime divisor E on X,

- E is exceptional iff $K_{X/S} \cdot E < 0$(15.9.4.1) and $E^2 < 0$. And in this case, $K_{X/S} \cdot E = E^2$.
- If $\dim S = 0$ and $H^0(X, [\omega_{X/S}]^q) \neq 0$ for some $q \geq 1$ or $\dim S = 1$ and $p_a(X_\eta) > 0$, then E is exceptional iff $K_{X/S} \cdot E < 0$.

⌟

Proof: Cf.[Qing Liu]P417. □

Def. (15.9.5.4) [Minimal Surfaces]. A **relatively minimal surface** over S is a regular fibered presurface $\mathcal{C}/S$ s.t. for any other such regular fibered presurface $\mathcal{C}'$ and any birational morphism $\mathcal{C} \to \mathcal{C}'$ is an isomorphism. Equivalently, $\mathcal{C}$ is a regular proper model that doesn't contain an exceptional curve of the first kind, i.e. cannot be blown down by(15.9.4.3). Cf.[Sta]0C21.

A **minimal surface** over S is a regular fibered presurface $\mathcal{C}/S$ s.t. for any other such regular fibered presurface $\mathcal{C}'$ and any birational map $\mathcal{C}' \to \mathcal{C}$ is a birational morphism. In particular, a minimal surface $\mathcal{C}/S$ is relatively minimal, and $\mathrm{Aut}_S(\mathcal{C}) \cong \mathrm{Aut}_K(\mathcal{C}_\eta)$ is an isomorphism. ⌟

Cor. (15.9.5.5). If a relatively minimal arithmetic surface over S is birational to a minimal surface over S, then they are isomorphic over S. ⌟

Prop. (15.9.5.6) [Étale Descent]. Let X/S be an arithmetic surface with $p_a(X_\eta) > 0$, and $S' \to S$ is an étale covering or $S = \mathrm{Spec}\, R$ where R is a DVR and $S' = \mathrm{Spec}\, \widehat{R}$, then X/S is minimal iff $X \times_S S'/S'$ is minimal. ⌟

Proof: Cf.[Qing Liu]P423. □

Cor. (15.9.5.7). Let X/S be an arithmetic surface with $p_a(X_\eta) > 0$ and $T \to S$ is a smooth morphism, then for any $\xi \in T$ of codimension 1, $X \times_S \mathcal{O}_{T,\xi}$ is a minimal regular surface over $\mathcal{O}_{T,\xi}$. ⌟

Proof: Cf.[Qing Liu]P424. □

Minimal Models

Prop. (15.9.5.8) [Minimal Models]. Let $\mathcal{C}/S$ be a normal fibered presurface, then a **regular model** for $\mathcal{C}/S$ is a regular fibered presurface $\mathcal{C}'/S$ with a birational map $\mathcal{C}' \to \mathcal{C}$ over S. Notice $\mathcal{C}'_\eta \to \mathcal{C}_\eta$ is a birational map of regular projective precurve, thus an isomorphism.

A (relatively)**minimal model** for $\mathcal{C}/S$ is a regular model for $\mathcal{C}/S$ that is (relatively) minimal. Notice if a minimal model exists, it is unique up to a unique isomorphism. ⌟

Lemma (15.9.5.9). If X/S is an arithmetic surface, then there exists only f.m. fibers X_s containing an exceptional divisor. ⌟

Proof: Cf.[Qing Liu]P420. □

Prop. (15.9.5.10) [Blowing Down to Relatively Minimal Surfaces]. If X/S is an arithmetic surface, then X is a finite blowing-up of relatively minimal arithmetic surface over S. ⌟

Proof: The number of exceptional divisors decreases along contractions? □

Prop. (15.9.5.11) [Lichtenbaum/Shafarevich]. Let X/S be an arithmetic surface with $p_a(X_\eta) \geq 1$, then X admits a unique minimal model over S. ⌟

Proof: Cf.[Qing Liu]P422. □

Remark (15.9.5.12). This is not true for $p_a(X_\eta) = 0$, Cf.[Qing Liu]P422. ⌟

Cor. (15.9.5.13) [Minimal and Relatively Minimal Surfaces]. If X/S is an arithmetic surface s.t. $p_a(X_\eta) > 1$, then X is minimal iff it is relatively minimal iff $K_{X/S}$ is vertically nef, by(15.9.5.5) and(15.9.5.4)(15.9.5.3). ? In the field case, why the hypothesis is satisfied? ⌟

Cor. (15.9.5.14). If X/S is a smooth arithmetic surface, then X/S is relatively minimal by(15.9.4.4) as in this case X_s is a disjoint union of irreducible curves. And if $p(X_\eta) > 0$, then X is minimal. ⌟

15.10 Reductions

1 Semistable Reductions

Def. (15.10.1.1) [Models]. Let S be a Dedekind domain with function field K and X an algebraic K-scheme, a **model over** S for X is a proper flat f.t. S-scheme $\mathcal{X}$ s.t $\mathcal{X} \times_S K \cong X$. ⌟

Def. (15.10.1.2) [Good Reduction]. Let (R, K, k) be a CDVR and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{ft}}/K$, X is said to have **good reduction** over R if there is a smooth model $\mathcal{X}$ for X. If this is the case, then $\widetilde{X} = \mathcal{X}_k$ is a smooth scheme over k, called the **reduction of** X.

In this case, the reduction map $X(\overline{K}) \cong \mathcal{X}(\mathcal{O}_{\overline{K}}) \to \widetilde{X}(\overline{k})$ is surjective, by valuation criterion and formal smoothness criterion. ⌟

2 Reduction of Curves

Main references are [Sta]Chap55 and [Qing Liu].

Def. (15.10.2.1) [Semistable and Stable Unions of Curves]. Let $k \in \mathtt{Field}, k$, C an algebraic union of curves over k, then C is called a **semistable union of curves** iff $C_{\overline{k}}$ is reduced and the singular points of $C_{\overline{k}}$ are all ordinary double points. C is called a **stable union of curves** if moreover it satisfies:

- $C_{\overline{k}}$ is connected and projective, with $p_a(C) \geq 2$.
- Let Γ be an integral component of C that is isomorphic to $\mathbb{P}^1_k$, then it meets other integral components at at least 3 points.

⌟

<u>**Minimal Models**</u>

Def. (15.10.2.2) [Minimal Models]. Let R be a DVR with fraction field K. Let C be a smooth projective curve over K, then a **minimal model for** C is a regular proper model $\mathcal{C}$ for C s.t. for any other such model $\mathcal{C}'$, any birational map of models $\mathcal{C} \to \mathcal{C}'$ is an isomorphism.

Equivalently, $\mathcal{C}$ is a regular proper model that doesn't contain an exceptional curve of the first kind, i.e. cannot be blown down**?** Cf.[Sta]0C21. ⌟

Prop. (15.10.2.3) [Resolution of Singularities for Arithmetic Surfaces]. Let (R, K) be a DVR, C a smooth projective curve over K of genus g. Then there exists a proper regular model for C. ⌟

Proof: Cf.[Sil99] □

Thm. (15.10.2.4) [Minimal Model for Curves]. Let (R, K) be a Dedekind domain and C a smooth projective precurve over K of genus≥ 1, then there exists a minimal model $\mathcal{C}$ for C(15.10.2.2).

Moreover, for any other regular proper model $\mathcal{C}'$, there exists a unique domination map $\mathcal{C}' \to C$. ⌟

Proof: Cf.[Sil99]. □

Prop. (15.10.2.5) [Semistable Reductions]. Let (R, K) be a DVR, for a smooth complete curve C over K, the following are equivalent:

- There exists a proper model of C that is at-most-nodel of relative dimension 1 over R.
- There exists a minimal model of C that is at-most-nodel of relative dimension 1 over R.

- Any minimal model of C that is at-most-nodel of relative dimension 1 over R.

If this is the case, then C is said to have **semistable reduction**. ⌟

Proof: Cf.[Sta]0CDG. □

Prop. (15.10.2.6)[Good Reductions]. Let R be a DVR with fraction field K, for a smooth projective curve C over K, the following are equivalent:

- C has good reduction over R.
- There exists a minimal model of C that is smooth over R.
- Any minimal model of C is smooth over R.

⌟

Proof: Cf.[Sta]0CDI. □

Good Reduction for Curves

Prop. (15.10.2.7) [Reduction of Morphisms]. For any morphism $\varphi : C \to C'$ of smooth projective curves over $\mathbb{Q}$ with good reduction at p and $g(C') > 0$, there exists a unique reduction morphism $\widetilde{\varphi} : \widetilde{C} \to \widetilde{C}'$ that commutes with the reduction map(15.10.1.2). This defines a functor from the category of smooth projective curves of positive genus with good reduction to the category of smooth curves over $\mathbb{F}_p$.

Moreover, $\deg(\varphi) = \deg(\widetilde{\varphi})$, and by(15.10.1.2), if φ is surjective, $\widetilde{\varphi}$ is also surjective. And φ is an isomorphism iff $\widetilde{\varphi}$ is an isomorphism. ⌟

Proof: Cf.[BLR90]Prop 9.5.1**?** □

Cor. (15.10.2.8). If $\varphi : E \to E'$ is an isogeny of elliptic curves over $\mathbb{Q}$ with good reduction at p, then the reduction morphism $\widetilde{\varphi} : \widetilde{E} \to \widetilde{E}'$ is also an isogeny. ⌟

Proof: Because it maps $\widetilde{O}_E$ to $\widetilde{O}_{E'}$ and is surjective, this follows from(15.7.1.4). □

Prop. (15.10.2.9)[Pushforward of Divisors]. Let C be a smooth projective curve over $\mathbb{Q}$ with good reduction at p, then the reduction map $X(\overline{K}) \to \widetilde{X}(\overline{F}_p)$ induces a map

$$\mathrm{Div}^0(X) \to \mathrm{Div}^0(\widetilde{X})$$

that maps principal divisors to principal divisors, so inducing a map $\varphi_* : \mathrm{Pic}^0(C) \to \mathrm{Pic}^0(C')$, which is compatible with pushforward of divisors along morphisms of curves: if $h : C \to C'$ is a morphism of smooth projective curves over $\mathbb{Q}$ with good reductions at p, then the following digram is commutative:

$$\begin{array}{ccc} \mathrm{Pic}^0(C) & \xrightarrow{h_*} & \mathrm{Pic}^0(C') \\ \downarrow & & \downarrow \\ \mathrm{Pic}^0(\widetilde{C}) & \xrightarrow{\widetilde{h}_*} & \mathrm{Pic}^0(\widetilde{C}') \end{array}$$

⌟

Proof: Cf.[BLR90]Prop 9.5.1**?** □

Classification of Special Fibers of the Minimal Regular Models of Curves of Genus 2

Cf.[Y. Namikawa, K. Ueno, The complete classification of fibers in pencils of curves of genus two, Manuscripta Math. 9 (1973), 143–186.] and [A. P. Ogg, On pencils of curves of genus two, Topology 5 (1966), 355–362.].

15.11 Arithmetic of Elliptic Curves

Main References are [Sil16] and [Sil99], [Sil11]. Should add Sutherland's noteshttps://math.mit.edu/classes/18.783/2017/lectures.htmlL2-11, 13-14, 17-24. and Snowden's noteshttp://www-personal.umich.edu/~asnowden/teaching/2013/679/index.htmlL5,6,7,9,11, 14, 15, 17-23.

Notation (15.11.0.1).

- Use notations defined in Arithmetic of Abelian Varieties.
- Use notations defined in Global Fields.

⌟

1 Basics

Def. (15.11.1.1) [Elliptic Schemes]. For $k \in \texttt{Field}$, an **elliptic curve** E over k is a complete non-singular curve of genus 1 over a field k, together with a specified rational pt O. In(15.11.1.10), we will see an elliptic curve is smooth.

More generally, for $S \in \mathcal{S}\mathrm{ch}$, an **Elliptic scheme** $f : E \to S$ is an Abelian scheme over S of relative dimension 1(15.7.1.1). The category of elliptic schemes over S is denoted by $\mathcal{E}\mathrm{ll}\,/S$. ⌟

Remark (15.11.1.2). Elliptic curves are Abelian varieties by(15.11.1.10). Thus the theory of Abelian varieties apply to elliptic curves. ⌟

Prop. (15.11.1.3) [Invertible Sheaf]. Let $S \in \mathcal{S}\mathrm{ch}, E \in \mathcal{E}\mathrm{ll}\,/S$, and $e \in E(S)$ be the unit, then we can define

$$\omega_{E/S} = e^*\Omega_{E/S} = f_*\Omega_{E/S} \cong R^1 f_*\mathcal{O}_E \in \mathcal{M}\mathrm{od}(\mathcal{O}_S),$$

⌟

Proof: □

Weierstrass Theory

Def. (15.11.1.4) [Weierstrass Equations]. A **Weierstrass equations** is an equation of the form

$$y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6.$$

⌟

Def. (15.11.1.5) [Important Invariants]. Let $k \in \texttt{Field}, E \in \mathcal{E}\mathrm{ll}\,/k$, given any Weierstrass equation as in(15.11.1.4), we can define

- $b_2 = a_1^2 + 4a_2, \quad b_4 = a_1a_3 + 2a_4, \quad b_6 = a_3^2 + 4a_6, \quad b_8 = a_1^2a_6 - a_1a_3a_4 + a_2a_3^2 + 4a_2a_6 - a_4^2.$
- $\Delta = -b_2^2b_8 - 8b_4^3 - 27b_6^2 + 9b_2b_4b_6$ the **discriminant of** E, to determine whether E is singular.
- the quantity $c_4 = b_2^2 - 24b_4$, used in the singular case to determine iff it has a node or cusp.
- the quantity $c_6 = -b_2^3 + 36b_2b_4 - 216b_6$, used to determine twisted elliptic curves(15.11.6.3).
- the j**-invariant** $j = c_4^3/\Delta$, which is used to in the non-singular case to characterize E.

They satisfy the equations:

$$4b_8 = b_2b_6 - b_4^2, \quad 1728\Delta = c_4^3 - c_6^2.$$

⌟

Prop. (15.11.1.6) [Reduced Weierstrass Equations]. Let $k \in \texttt{Field}, E \in \mathcal{E}\mathrm{ll}/k$, given any Weierstrass equation as in(15.11.1.4),

- If $\mathrm{char}\, k \neq 2$, we can replace (x, y) by $(x, y - (a_1 x + a_3)/2)$ to eliminate a_1, a_3 to transform the original Weierstrass equation to
$$y^2 = x^3 + \frac{b_2 x^2 + 2b_4 x + b_6}{4}.$$
- If $\mathrm{char}\, k \neq 2, 3$, then we can further replace (x, y) to $((x - 3b_2)/36, y/216)$ to eliminate b_2 to transform the Weierstrass equation to
$$y^2 = x^3 - 27c_4 x - 54c_6.$$
In particular, E has a Weierstrass equation of the form
$$y^2 = x^3 + a_4 x + a_6, \quad \Delta = -16(4a_4^3 + 27a_6^2), \quad j = 1728\frac{4a_4^3}{4a_4^3 + 27a_6^2}$$
- If char $k = 3$, then E has a Weierstrass equation of the form
$$y^2 = x^3 + a_2 x^2 + a_6, \quad \Delta = -a_2^3 a_6, \quad j = -a_2^3/a_6, \text{or} \quad y^2 = x^3 + a_4 x + a_6, \quad \Delta = -a_4^3, \quad j = 0$$
- If char $k = 2$, then E has a Weierstrass equation of the form
$$y^2 + xy = x^3 + a_2 x^2 + a_6, \quad \Delta = a_6, \quad j = 1/a_6, \text{or} \quad y^2 + a_3 y = x^3 + a_4 x + a_6, \quad \Delta = a_3^4, \quad j = 0.$$

⌟

Prop. (15.11.1.7) [Explicit Embedding of Elliptic Curves]. Any $E \in \mathcal{E}\mathrm{ll}/k$ is isomorphic to a plane curve in $\mathbb{P}_k^2$ defined by an affine Weierstrass equation in $k[x, y]$.

And any isomorphism between elliptic curves defined by affine Weierstrass equations over k and fixes $[0, 1, 0]$ are linear maps of the form
$$(X, Y) \mapsto (u^2 X + r, u^3 Y + s u^2 X + t), \quad u \in k^*, s, r \in k.$$

⌟

Proof: If E is an elliptic curve over k, consider a rational point $O \in E(k)$, Riemann-Roch(6.12.2.9) tells $l(nP) = \deg(nP) = n$ for $n \geq 1$. Now $L(kP) = k$ by Riemann-Roch(6.12.2.9). So we choose a basis $1, x$ for $\mathcal{O}_X(2O)$, and extend it to a basis $1, x, y$ of $L(3P)$. Since $L(6O) = 6$, there is a linear relation between the seven elements $1, x, x^2, xy, y^2, x^3$. And y^2, x^3 must occur by observing the pole order at P. Thus by rescaling, we can write the relation as
$$y^2 + a_1 xy + a_3 y = x^3 + a_2 x^2 + a_4 x + a_6.$$

So x, y defines a rational map of E to $\mathbb{P}^2 : a \mapsto (x(a), y(a), 1)$. This map extends to an embedding of E into $\mathbb{P}^2$, by(6.12.1.15). Moreover, by the above proof, if E' is another Weierstrass form, then $1, x'$ are basis for $\mathcal{O}_X(2O)$ and $1, x', y'$ are basis for $\mathcal{O}_X(3O)$. Thus we have the linear relation between (X, Y) and (X', Y').

To define an Abelian structure on E, first notice that
$$E(k) \to \mathrm{Cl}^0(E) : Q \mapsto [Q] - [P]$$

is an isomorphism. Using Riemann-Roch, it is injective because $l(Q) = 1$ for $Q \in E(k)$, and for any divisor A of degree 0, $L(A+P) > 0$, so there exists an effective divisor that is equivalent to $A+P$, but this must be a rational point $Q \in E(k)$. Thus we can endow $E(k)$ with a group structure inherited from $\mathrm{Cl}^0(E)$. By(15.11.1.9), there is a group variety structure prolonging this construction, so E is a group scheme. □

Remark (15.11.1.8). There is a more advanced way to prove that this is a group action, in [Qing Liu]P492.? ⌟

Lemma (15.11.1.9) [Explicit Group Structure]. Let E be an elliptic curve given by a Weierstrass equation

$$y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6,$$

then the group addition on $E\backslash O$ is given by

- $-(x_0, y_0) = (x_0, -y_0 - a_1x - a_3)$.
- $(x_1, y_1) + (x_2, y_2) = O$ iff $x_1 = x_2$ and $y_1 + y_2 + a_1x_2 + a_3 = 0$. Otherwise

$$(x_1, y_1) + (x_2, y_2) = (\lambda^2 + a_1\lambda - a_2 - x_1 - x_2, -(\lambda + a_1)x_3 - \nu - a_3)$$

where

$$\lambda = \begin{cases} \frac{y_1-y_2}{x_1-x_2} & x_1 \neq x_2 \\ \frac{3x^2+2a_2x_1+a_4-a_1y_1}{2y_1+a_1x_1+a_3} & x_1 = x_2 \end{cases}, \quad \nu = \begin{cases} \frac{y_2x_1-y_1x_2}{x_1-x_2} & x_1 \neq x_2 \\ \frac{-x_1^3+a_4x_1+2a_6-a_3y_1}{2y_1+a_1x_1+a_3} & x_1 = x_2 \end{cases}$$

- (Doubling Formula) $x([2]P) = \frac{x^4-b_4x^2-2b_6x-b_8}{4x^3+b_2x^2+2b_4x+b_6}$.

Thus the group actions defined in(15.11.1.7) are all morphisms. In particular, E is a group variety. ⌟

Proof: Cf.[Sil16]P53. □

Cor. (15.11.1.10) [Elliptic Curves and Abelian Varieties]. If X is an Abelian variety of dimension 1, then X is an elliptic curve. The converse is also true, by(15.11.1.7). In particular, the theory of Abelian varieties15.7 applies to elliptic curves. And we will use notations for Abelian varieties. ⌟

Proof: By(9.1.4.35)(9.1.4.34), the tangent space $\mathcal{T}_{X/k}$ is trivial of rank 1, thus it is a curve of genus 1 by(6.12.1.24). it is also regular, by(6.6.4.16). □

Prop. (15.11.1.11) [Normalized Invariant Differential Form]. Let $k \in \texttt{Field}$ and E a plane cubic over k defined by the equation $W : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$. Then the differential form given by

$$\omega = \frac{\mathrm{d}x}{2y + a_1x + a_3} = \frac{\mathrm{d}y}{3x^2 + 2a_2x + a_4 - a_1y}$$

is a non-zero section of $\mathcal{K}_{E_{\mathrm{sm}}}$. It is normalized s.t. at the origin, with the uniformizer $z = -x/y$, it has value 1.

Moreover, it is invariant under translation. It is called the **normalized invariant differential form** on E w.r.t W. ⌟

Proof: Firstly we show $\mathrm{div}(\omega) = 0$: consider a finite smooth point $P_0 = (x_0, y_0)$, then it cannot have pole, otherwise P_0 is singular. Because $x - x_0 \in L(2O)$, $\mathrm{ord}_{P_0}(x - x_0) \leq 2$, and if $\mathrm{ord}_{P_0}(x - x_0) = 2$, $\mathrm{ord}_{P_0}(y - y_0) \geq 2$ also by inspecting the Weierstrass equation. Thus $\mathrm{ord}_P(\omega) = 0$. Then consider the situation at O: $\mathrm{ord}_O(x) = -2, \mathrm{ord}_O(y) = -3$, thus $\mathrm{ord}_O(\frac{\mathrm{d}x}{2y+a_1x+a_3}) = 0$ except possibly $\mathrm{char}\, k = 2$.

But the same calculation shows $\mathrm{ord}_O(\frac{dy}{3x^2+2a_2x+a_4-a_1y}) = 0$ except possibly when $\mathrm{char}\, k = 3$. Thus we are done.

Now any translation action induces a map $\tau_x^*\omega = a(x)\omega$, where $a \in K(C)^\times$. But $a(x)$ has no pole and zeros, thus $a(x) \in k^\times$. But then $a(x)$ is rational function with no zero and poles, thus $a(x) = a(O) = 1$. □

Cor. (15.11.1.12). $[m]_E^*\omega = \mathrm{pr}_1^*\omega + \mathrm{pr}_2^*\omega$. ⌟

Proof: It follows from this and the see-saw principal that $m_E^*\mathcal{K}_E \cong \mathrm{pr}_1^*\mathcal{K}_E \otimes \mathrm{pr}_2^*\mathcal{K}_E$. □

Prop. (15.11.1.13) [Change of Variables]. A change of variables of the form (x, y) replaced by $(u^2x + a, u^3y + bx + c)$ changes c_4 to $u^{-4}c_4$, c_6 to $u^{-6}c_6$, Δ to $u^{-12}\Delta$, and preserves j. ⌟

Proof: This is just a equation of identities, so it suffices to prove for k of characteristic 0, then in this case, by(15.11.1.6), c_4, c_6 is just the coefficients of the Weierstrass equation transformed into the reduced form(times a constant). So it suffices to prove for transformation between reduced Weierstrass equations. In this case, $a = b = c = 0$, and the assertion is clear. □

Prop. (15.11.1.14) [Characterizing Singularities]. Let $k \in$ `Field`, then

- The plane cubic E over k defined by a Weierstrass formula f is never singular at $O = [0, 1, 0]$, and it is a curve.
-
  - E is smooth iff its determinant $\Delta \neq 0$. And in this case it is an elliptic curve by genus formula.
  - E has a node iff $\Delta = 0$ and $c_4 \neq 0$.
  - E has a cusp iff $\Delta = c_4 = 0$.
- For $E, E' \in \mathcal{E}\mathrm{ll}/k$, $E_{\overline{k}} \cong E'_{\overline{k}}$ iff $j(E) = j(E')$. In fact, they are isomorphic over a separable field extension k'/k of degree 24, and if $j \neq 0, 1728$, then they are isomorphic over a separable field extension k'/k of degree 2.

⌟

Proof: 1: Firstly, E is never singular at $[0, 1, 0]$: On $U(z)$, the curve is given by $z + a_1xz + a_3z^2 = x^3 + a_2x^2z + a_4xz^2 + a_6z^3$, which is not singular at $(0, 0)$. Secondly, E has genus 1. Finally it is a curve by(3.2.3.14) and checking f doesn't has a root $y \in \overline{k}(x)$: This is true by degree reasons using reduced Weierstrass equations(15.11.1.6).

2: (1): By(15.11.1.10), non-singular is equivalent to smoothness. So we may base change to $\overline{k}$. If P is non-singular, linearly transform it to $(0, 0)$, then by Jacobian criterion, $\frac{\partial}{\partial x}f = \frac{\partial}{\partial y}f = 0$, so $a_3 = a_4 = a_6 = 0$, and it can be verified that $\Delta = 0$. Conversely, if $\Delta = 0$, then use the reduced Weierstrass equations and argue case by case, we can find a singular point.

(2), (3): In this case, assume $a_3 = a_4 = a_6 = 0$, then $c_4 = (a_1^2 + 4a_2)^2$, and $E : y^2 + a_1xy - a_2x^2 - x^3 = 0$, so the assertion is clear.

2: We use the reduced Weierstrass equations, derive an equation between their coefficients, and take a suitable change of variables. Details are omitted. □

Prop. (15.11.1.15)[Fields of Moduli]. For any element $j_0 \in \overline{k}$, there exists an elliptic curve over $k(j_0)$ with j-invariant j_0. In particular, any elliptic curve over k is defined over $k(j(E))$, by(15.11.1.14). ⌟

Proof: If $j_0 \neq 0, 1728$, then we can take the curve

$$E : y^2 + xy = x^3 - \frac{36}{j_0 - 1728}x - \frac{1}{j_0 - 1728}$$

with $\Delta(E) = \frac{j_0^3}{(j_0-1728)^3}, j(E) = j_0$.

If $j = 0$ or 1728, we can take one of the curves

$$E : y^2 + y = x^3, \quad \Delta = -27, \quad j = 0$$

$$E : y^2 = x^3 + x, \quad \Delta = -64, \quad j = 1728.$$

Notice for $\mathrm{char}\, k = 2$ or 3, $0 = 1728$, and at least one of these are elliptic curves. □

Prop. (15.11.1.16) [Singular Weierstrass]. If $k \in \texttt{Field}$ is perfect or $\mathrm{char}\, k \neq 2, 3$, $E \in \mathbb{P}^2_k$ is a plane cubic given by a Weierstrass equation W is singular, then

- E has a unique singular point, and it is a rational point.
- E is birational to $\mathbb{P}^1_k$, i.e. its non-singular projective model is $\mathbb{P}^1$(6.12.1.18).
- E_{sm} is a commutative k-group under the group action given in(15.11.1.9) with origin $O = [0, 1, 0]$, and $E_{\mathrm{sm}} \cong \mathbb{G}_m$ if E has a split node, and $E_{\mathrm{sm}} \cong \mathbb{G}_a$ if E has a cusp.

⌟

Proof: 1: By(15.11.1.14), the singular points must be a finite point, and $\Delta = 0$. Over $\overline{k}$, the singular points of E is characterized by the equations $W = \frac{\partial}{\partial x} W = \frac{\partial}{\partial y} W = 0$. Then we can use the reduced Weierstrass equations(15.11.1.6): If $\mathrm{char}\, k \neq 2, 3$, then clearly $(x_0, y_0) \in k^2$. The perfect case is similar.

2: Because the curve is never singular at O by(15.11.1.14), by a linear change, we can assume that one of the singular point is $(0, 0)$. Then by Jacobian criterion, it must be of the form

$$y^2 + a_1 xy = x^3 + a_2 x^2.$$

Then the projection along $(0, 0)$ is an isomorphism**?** this is wrong!

$$E \backslash \{0, \infty\} \to \mathbb{P}^1_k \backslash \{[0 : 1]\} : (x, y) \mapsto [x : y]$$

with inverse

$$[1, t] \mapsto (t^2 + a_1 t - a_2, t^3 + a_1 t^2 - a_2 t).$$

E_{sm} is a group scheme because we can verify on closed points, and the fact any line through $(0, 0)$ has multiplicity more than 1. To determine the group structure, Cf.[Sil16]P56**?**. □

Prop. (15.11.1.17) [Legendre Forms]. Let $\mathrm{char}\, K \neq 2$, then

- every elliptic curve over $\overline{K}$ is isomorphic to an elliptic curve in **Legendre form**

$$E_\lambda : y^2 = x(x - 1)(x - \lambda), \quad \lambda \neq 0, 1 \in \overline{K}.$$

- $\Delta(E_\lambda) = 16\lambda^2(\lambda - 1)^2, j(E_\lambda) = 2^8 \frac{(\lambda^2-\lambda+1)^3}{\lambda^2(\lambda-1)^2}, c_4 = 16(1 - \lambda(1 - \lambda))$.
- If K is a valued field, we may take $v(\lambda) \geq 0$ as $j(E_\lambda) = j(E_{\lambda^{-1}})$.
- The map $\overline{K} \to \overline{K} : \lambda \mapsto j(E_\lambda)$ is 6 to 1 except above the points 0 and 1728, where for $\mathrm{char} K \neq 2, 3$, $\# j^{-1}(0) = 2$, $\# j^{-1}(1728) = 3$, and for $\mathrm{char} K = 3$, $j^{-1}(0 = 1728) = 1$.

⌟

Proof: 1: put the Weierstrass equation of E in the reduced form(15.11.1.6), then it is of the form

$$y^2 = (x - e_1)(x - e_2)(x - e_3)$$

in $\overline{K}[x, y]$, and because $\Delta = 16(e_1 - e_2)^2(e_2 - e_3)^2(e_3 - e_1)^2 \neq 0$, so e_1, e_2, e_3 are pairwise distinct. Thus the linear transform

$$x \mapsto (e_2 - e_1)x' + e_1$$

makes the Weierstrass equation in the Legendre form with $\lambda = \frac{e_3 - e_1}{e_2 - e_1}$.

2: Direct calculation.

3: Directly calculating the differential of j.**?** □

Prop. (15.11.1.18)[Duering Normal Form]. Every elliptic curve over $\overline{K}$, except possibly char $K = 3$ and $j(E) = 0$, is isomorphic to an elliptic curve in **Deuring normal form**

$$E_\alpha : y^2 + \alpha xy + y = x^3, \quad \alpha \in \overline{K}, \quad \Delta(E_\alpha) = \alpha^3 - 27 \neq 0, \quad j(E_\alpha) = \frac{\alpha^3(\alpha^3 - 24)^3}{\alpha^3 - 27}, \quad c_4 = \alpha(\alpha^3 - 24).$$

And if K is a valued field, we can take $v(\alpha) > 0$. ⌟

Proof: Use(15.11.1.14), it suffices to show that $j(\alpha)$ can take any value $j \in \overline{K}$.

The last assertion is because if $v(\alpha) < 0$, then the product of roots of $\frac{x(x-24)^3}{x-27} = \frac{\alpha^3(\alpha^3-24)^3}{\alpha^3-27}$ other than α is $-72^3/(\alpha - 27)$ has positive valuations. □

Prop. (15.11.1.19) [Automorphism Group]. Let $k \in \texttt{Field}, E \in \mathcal{E}\mathrm{ll}/k$, then the the automorphic group of E is

$$\mathrm{Aut}(E) \cong \begin{cases} \mu_2(k) & j(E) \neq 0, 1728 \\ \mu_4(k) & j(E) = 1728, \mathrm{char}\, k \neq 2, 3 \\ \mu_6(k) & j(E) = 0, \mathrm{char}\, k \neq 2, 3 \\ D_{12} & j(E) = 0 = 1728, \mathrm{char}\, k = 3, k = \overline{k} \\ C_3 \ltimes Q_8 & j(E) = 0 = 1728, \mathrm{char}\, k = 2, k = \overline{k} \end{cases}$$

⌟

Proof: Any automorphism of E is defined by a linear maps of the form

$$(X, Y) \mapsto (u^2 X + r, u^3 Y + su^2 X + t), \quad u \in k^\times, s, r \in K.$$

If char $k \neq 2, 3$, use the reduced Weierstrass form $E : y^2 = x^3 + Ax + B$, so it is of the form $(X, Y) \mapsto (u^2 X, u^3 Y)$, which is possible iff $u^{-4}A = A, u^{-6}B = B$. Thus by arguing case by case, we are done.

The char $k = 2, 3$ cases are similar, use reduced Weierstrass forms(15.11.1.6) and argue case by case. □

Prop. (15.11.1.20) [Dual Elliptic Curves]. An elliptic curve E is canonically isomorphic to its dual $\widehat{E}$, by the mapping $P \mapsto \mathcal{L}(P - O)$. ⌟

Proof: This morphism is induced by the ample line bundle $\mathcal{L}(O)$(15.7.4.3), and it is an isomorphism because it has degree 1, by Riemann-Roch(15.7.5.2). □

Cor. (15.11.1.21). For any $\mathcal{L} \in \mathrm{Pic}(E)$ of degree d, $\varphi_{\mathcal{L}} = [d] : E \to E$ via the canonical duality, because $\mathrm{Pic}^0(E)$ induces trivial maps by(15.7.4.9) and(8.1.12.5). ⌟

Cor. (15.11.1.22)[Characterizing Principal Divisors]. Let $E \in \mathcal{E}\mathrm{ll}/k$ and $D = \sum n_i[P_i] \in \mathrm{Div}(E)$, where P_i are rational points, then D is a principal divisor iff $\sum n_i = 0$ and $\sum[n_i]P_i = O$. ⌟

Proof: Of course $\sum n_i = 0$. In this case, $\sum[n_i]P_i$ is mapped to the line bundle corresponding to $[D] \in \widehat{E}$ via $E \to \widehat{E}$, so $[D] = 0$ iff $\sum[n_i]P_i = O$. □

Isogenies

Prop. (15.11.1.23). Let $\varphi, \varphi' : E' \to E$ be isogenies of elliptic curves over k, and let ω be an invariant differential on E, then by(15.11.1.12),

$$(\varphi + \varphi')^*\omega = \varphi^*\omega + (\varphi')^*\omega.$$

⌟

Cor. (15.11.1.24). $[m]^*\omega = m\omega$. ⌟

Cor. (15.11.1.25) [$\mathrm{End}(E)$ **is Commutative in Characteristic 0].** Let $E \in \mathcal{E}\mathrm{ll}/k$ with the normalized invariant differential form ω, then there is a ring homomorphism

$$\mathrm{End}(E_{\overline{k}}) \to \overline{k} : \varphi \mapsto a_\varphi, \text{where } \varphi^*\omega = a_\varphi\omega.$$

And the kernel is the set of inseparable endomorphisms of $E_{\overline{k}}$. In particular, if $\mathrm{char}\, k = 0$, then $\mathrm{End}(E_{\overline{k}})$ is commutative. ⌟

Proof: Cf.[Sil16]P79.? □

Prop. (15.11.1.26) [Dual Isogenies]. Let $k \in \mathtt{Field}, E, E' \in \mathcal{E}\mathrm{ll}/k$ and $\varphi \in \mathrm{Hom}(E, E')$, then under the canonical isomorphism(15.11.1.20), the dual map $\widehat{\varphi}$ can be regarded as a map $\widehat{\varphi} : E' \to E$. Then

$$\widehat{\varphi} \circ \varphi = [\deg(\varphi)]_E, \varphi \circ \widehat{\varphi} = [\deg(\varphi)]_{E'}.$$

$\mathrm{End}(E) \to \mathrm{End}(E) : \varphi \mapsto \widehat{\varphi}$ is additive, and defines an involution on $\mathrm{End}(E)$. ⌟

Proof: Let $d = \deg(\varphi)$. By unwinding definition, $\widehat{\varphi} \circ \varphi : E \to E' \to \widehat{E}' \to \widehat{E}$ is just $\varphi_{\varphi^*\mathcal{L}(O)}$. But for elliptic curves, $\varphi_{\mathcal{L}}$ only depends on $\deg(\mathcal{L})$, thus $\varphi_{\varphi^*\mathcal{L}(O)} = \varphi_{\mathcal{L}(dO)} = [d]\varphi_{\mathcal{L}(O)}$. The second assertion follows by noticing $\varphi = \widehat{\widehat{\varphi}}$ and $\deg(\varphi) = \deg(\widehat{\varphi})$(15.7.6.4). □

Cor. (15.11.1.27) [$\mathrm{End}(E)$]**.** Let k be a field and $E \in \mathcal{E}\mathrm{ll}/k$, then $\mathrm{End}(E) \otimes \mathbb{Q}$ is a division ring. ⌟

Prop. (15.11.1.28) [Classification of $\mathrm{End}(E)$]**.** Let $k \in \mathtt{Field}, E \in \mathcal{E}\mathrm{ll}/k$, then $\mathrm{End}(E)$ has the following three possibilities:

- $\mathbb{Z}$.
- an $\mathbb{Z}$-order in an imaginary quadratic extension over $\mathbb{Q}$.
- an $\mathbb{Z}$-order in a definite quaternion algebra over $\mathbb{Q}$.

And the third case won't happen in characteristic0, by(15.11.1.25). ⌟

Proof: This follows from(3.6.5.1) and(15.13.2.3). □

2 Formal Groups of Elliptic Curves

In this subsection, the formal group structure of an elliptic is studied.

In this subsection, E is an elliptic curve over a field K given by Weierstrass equation $y^2+a_1xy+a_3y=x^3+a_2x^2+a_4x+a_6$.

Prop. (15.11.2.1) [Calculation of Formal Group Law]. Make a change of variable $z=-x/y, w=-1/y$ to the Weierstrass equation of E, the equation becomes

$$w=z^3+(a_1z+a_2z^2)w+(a_3+a_4z)w^2+a_6w^3=f(z,w).$$

Then

- $\widehat{\mathcal{O}}_{E,O}\cong K[[z]]$.
- There is a unique power series $w(z)\in\mathbb{Z}[a_1,\ldots,a_6][[z]]$ satisfying $w(0)=0$ and $w(z)=f(z,w(z))$.
- $w(z)=z^3(1+A_1z+A_2z^2+\ldots)$, where A_n is a homogenous polynomial in $a_1,\ldots,a_6$, where a_i has weight i.
- $$x(z)=z/w(z)=z^{-2}-a_1z^{-1}-a_2-a_3z-(a_4+a_1a_3)z^2+\ldots\in\mathbb{Z}[a_1,\ldots,a_6][[z]]$$
$$y(z)=-1/w(z)=-z^{-3}+a_1z^{-2}+a_2z^{-1}+a_3+(a_4+a_1a_3)z+\ldots\in\mathbb{Z}[a_1,\ldots,a_6][[z]]$$
- The formal group law of E(15.7.2.1) is given by
$$F(z_1,z_2)=z_1+z_2-a_1z_1z_2-a_2(z_1^2z_2+z_1z_2^2)+(-2a_3z_1^3z_2+(a_1a_2-3a_3)z_1^2z_2^2-2a_3z_1z_2^3)+\ldots\in\mathbb{Z}[a_1,\ldots,a_6][[z_1,z_2]].$$
- The normalized invariant differential form(15.11.1.11)
$$\omega(z)=\frac{dx(z)}{2y(z)+a_1x(z)+a_3}=[1+a_1z+(a_1^2+a_2)z^2+(a_1^3+2a_1a_2+2a_3)z^3+(a_1^4+3a_1^2a_2+6a_1a_3+a_2^2+2a_4)z^4+\ldots]dz\in\mathbb{Z}[a_1,\ldots,a_6][[z]]dz$$
- $$i(z)=\frac{x(z)}{y(z)+a_1x(z)+a_3}=\frac{z^{-2}-a_1z^{-1}+\ldots}{-z^{-3}+2a_1z^{-2}+\ldots}\in\mathbb{Z}[a_1,\ldots,a_6][[z]].$$

In particular, this formal group law is defined over $\mathbb{Z}[a_1,\ldots,a_6]$. ⌟

Proof: $\omega(z)\in\mathbb{Z}[a_1,\ldots,a_6][[z]]dz$ by(9.5.3.16).

For $F(z_1,z_2)$: ? □

Prop. (15.11.2.2) [Inseparable Degree and Heights]. Let K be a field of characteristic $p>0$ and $E_1/K, E_2/K$ be two elliptic curves, and $\varphi:E_1\to E_2$ a non-zero isogeny of elliptic curves over K, and let $\widehat{\varphi}:\widehat{E}_1\to\widehat{E}_2$ be the homomorphism of formal group schemes, then

$$\deg_i(\varphi)=p^{\mathrm{ht}(\widehat{\varphi})}.$$

⌟

Proof: Cf.[Sil16]P134.? □

Cor. (15.11.2.3). Let K be a field of characteristic $p>0$, then $\mathrm{ht}(\widehat{E})=1$ or 2, because $\deg([p]_E)=p^2$(15.7.6.14). ⌟

3 char $k > 0$ case

Notation (15.11.3.1).

- Let $k \in \texttt{Field}^p$,
- Let $E \in \mathcal{E}\mathrm{ll}/k$ be given by a Weierstrass equation $y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$.

⌟

Prop. (15.11.3.2). Let $k = \mathbb{F}_q$, $\#E(k) \equiv 0 \mod 4$. ⌟

Proof: There are two involutions on E: $(x, y, z) \mapsto (x, -y, z)$, $(x, y, z) \mapsto (z, y/x, x)$. The fixed points of these elements contain

$$(0, 1, 0), \quad (0, 0, 1), \quad (\varepsilon_1, \varepsilon_2\sqrt{2\varepsilon_1}, 0), \quad (\varepsilon_3\sqrt{-1}, 0, 1).$$

Considering either cases s.t. $-1 \in \mathbb{F}_q^2$ or $2 \in \mathbb{F}_q^2$, the number of these points are divisible by 4, thus we are done. □

Prop. (15.11.3.3) [Hasse-Weil]. Let $p \in \mathbf{P}, q = p^r$, $k = \mathbb{F}_q$ and $E \in \mathcal{E}\mathrm{ll}/k$, then

- If $a = 1+q-\#E(\mathbb{F}_q)$, α, β be the two roots of $T^2-aT+q = 0$, then $\#E(\mathbb{F}_{q^n}) = 1+q^n-\alpha^n-\beta^n$.
- $|\#E(\mathbb{F}_q) - 1 - q| \leq 2\sqrt{q}$.
- The Frobenius map $\varphi_E : E \to E$ satisfies $\varphi^2 - a\varphi + [q] = 0$.
- $a = 1 + q - \deg(1 - \varphi)$, and $[a] = \varphi + \widehat{\varphi}$.

⌟

Proof: $1, 2$ are special cases of(15.7.9.3). $3, 4$ follow from(15.7.7.13) and(15.7.6.17). □

Cor. (15.11.3.4). Let $k = \mathbb{F}_q$, $p \neq 2$ and E is given by $y^2 = x^3 + a_2x^2 + a_4x + a_6$, then

$$|\sum_{x\in\mathbb{F}_q}(\frac{x^3 + a_2x^2 + a_4x + a_6}{\mathbb{F}_q})| \leq 2\sqrt{q}.$$

⌟

Proof: This is because $\#E(\mathbb{F}_q) = \sum_{x\in\mathbb{F}_q}(1 + (\frac{x^3+a_2x^2+a_4x+a_6}{\mathbb{F}_q}))$. □

Supersingular Elliptic Curves

Main references are [Igu58].

Def. (15.11.3.5) [Supersingular Elliptic Curve]. Let $p \in \texttt{Prime}, k \in \texttt{Field}^p$, $F_{E/k,r} : E \to E^{(p^r)}$ the relative Frobenius(6.2.10.1), and $\widehat{F}_{E/k}$ be its dual. Then the following are equivalent:

- $E[p^r] = 1$ for all $r \geq 1$.
- $E[p^r] \not\cong \mathbb{Z}/p^r\mathbb{Z}$ for some $r \geq 1$.
- $\widehat{F}_{E/k,r}$ is purely inseparable for one(thus all) r.
- $[p] : E \to E$ is purely inseparable, and $j(E) \in \mathbb{F}_{p^2}$.
- $\mathrm{End}(E)$ is an order in a quaternion algebra.
- The formal group $\widehat{E}/K$ associated to E has height $2(\neq 1)$.

Such curves are called **supersingular elliptic curves**, otherwise E is called an **ordinary elliptic curve**.

Being supersingular is stable and reflective under base change. ⌟

Proof: Cf.[Silverman P144].**?** □

Prop. (15.11.3.6) [Ordinary Elliptic Curves]. Let $k \in \texttt{Field}$, $\operatorname{char} k = p > 0$, $E \in \mathcal{E}\mathrm{ll}/k$ be an ordinary elliptic curve, then

- If $j(E) \in \overline{\mathbb{F}}_p$, then $\mathrm{End}(E)$ is an order in an imaginary quadratic field. In particular, this is the case when k is a finite field.
- If $j(E) \notin \overline{\mathbb{F}}_p$, then $\mathrm{End}(E) \cong \mathbb{Z}$.

⌟

Proof: 1: If $j(E) \in \overline{\mathbb{F}_p}$, then E is defined over some $\mathbb{F}_q$. Let $\varphi = \varphi_q$, then if $\varphi^r \in \mathbb{Z}$, $\varphi^r = [\pm q^r]$, so $\#E[\varphi^r] = \deg_s(\varphi^r) = 1$ by(15.7.6.2), contradicting the fact E is ordinary. Thus the assertion follows from(15.11.1.28).

2: **?** □

Cor. (15.11.3.7). For $E \in \mathcal{E}\mathrm{ll}/\overline{\mathbb{F}_p}$, E is ordinary iff $\mathrm{End}(E)$ is an order in an imaginary quadratic field, and E is supersingular iff $\mathrm{End}(E)$ is an order in a quaternion algebra. ⌟

Def. (15.11.3.8) [Hasse Invariant]. The **Hasse invariant** for E is a number which is 0 if E is supersingular and 1 if E is ordinary. The definition of it is in [Katz, p-adic Modular Forms].**?** ⌟

Prop. (15.11.3.9) [Supersingular and Trace]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{F}_q$ and φ_E be the Frobenius of $E/\mathbb{F}_q$, then

- E is supersingular iff $\#E(\mathbb{F}_q) \equiv 1 \mod p$, iff $a_p = \alpha + \beta \equiv 0 \mod p$ in(15.11.3.3).
- If $q = p \geq 5$ is a prime, then E is supersingular iff $\#E(\mathbb{F}_p) = p + 1$. This is false for $p = 2$ or $p = 3$.

⌟

Proof: 1: By(15.11.3.3), let $a = 1 + q - \#E(\mathbb{F}_q)$, then $\widehat{\varphi}_E = [a] - \varphi$ is separable iff $a = 0 \in \mathbb{F}_q$ by**??**. Thus the assertion follows from(15.11.3.5).

2: Because $|\alpha + \beta| \leq 2\sqrt{p} < p$ in this case. □

Cor. (15.11.3.10). Let $p \geq 5$ and $E \in \mathcal{E}\mathrm{ll}/\mathbb{F}_p$ be supersingular, then

$$\#E(\mathbb{F}_{p^n}) = \begin{cases} p^n + 1 & n = 2k+1 \\ (p^{n/2} - (-1)^{n/2})^2 & n = 2k \end{cases}$$

⌟

Proof: This is because $\alpha = -\beta = \sqrt{p}\,\mathrm{i}$. □

Prop. (15.11.3.11)[Supersingular in Characteristic2]. Let k be a field of characteristic2, then E/k is supersingular iff $j(E) = 0$. In particular, $y^2 + y = x^3$ is the only supersingular elliptic curve over $\overline{k}$. ⌟

Proof: We use the condition $\#E(\mathbb{F}_2) = 2$. We use the reduced Weierstrass equations in(15.11.1.5). By doubling formula(15.11.1.9), this is equivalent to the non-existence of a point $(x, y) \in E(\overline{k})\backslash O$ s.t. $a_1 x + a_3 = 0$. And it can be checked this is true iff $j(E) = 0$. □

Prop. (15.11.3.12) [Supersingular Elliptic Curves over Finite Fields, Igusa]. Let $p \in \mathbf{P}$ and $E \in \mathcal{E}\mathrm{ll}/\overline{\mathbb{F}}_p$.

1. If $p = 2$, the only supersingular elliptic curve over $\overline{\mathbb{F}}_2$ is isomorphic to $y^2 + y = x^3$.
2. If $p \geq 3$ and E is given by a Weierstrass form $y^2 = f(x)$, then E is supersingular iff $\mathrm{Coef}(\frac{f(x)^{(p-1)/2}}{x^{p-1}}) = 0 \in \overline{\mathbb{F}}_p$.
3. If $p \geq 3$ and E is given by a Legendre form $y^2 = x(x-1)(x-\lambda)$, then E is supersingular iff
$$H_p(\lambda) = \sum_{i=1}^{(p-1)/2} \binom{\frac{(p-1)}{2}}{i}^2 \lambda^i = 0.$$
4. If $p \geq 3$, the polynomial H_p has distinct roots in $\overline{\mathbb{F}}_p$, and the number of isomorphism classes of supersingular elliptic curves over $\overline{\mathbb{F}}_p$ is
$$\begin{cases} 1 & , p = 3 \\ [\frac{p}{12}] & , p \equiv 1 \mod 12 \\ [\frac{p}{12}] + 1 & , p \equiv 5, 7 \mod 12 \\ [\frac{p}{12}] + 2 & , p \equiv 11 \mod 12 \end{cases}$$
5. (Mass Formula)
$$\sum_{E/\overline{\mathbb{F}}_p \text{ supersingular}} \frac{1}{\mathrm{Aut}(E)} = \frac{p-1}{24}.$$

⌟

Remark (15.11.3.13). This has relations to the class number of normal quaternion algebras over $\mathbb{Q}$ ramified at p, Cf.[Igu58]. ⌟

Proof: 1: This follows from(15.11.3.11).

2: Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{F}_q$, denote $A_q = \mathrm{Coef}(\frac{f(x)^{(q-1)/2}}{x^{q-1}})$, then
$$\#E(\mathbb{F}_q) \equiv \sum_{x \in \mathbb{F}_q} (1 + (\frac{x^3 + a_2x^2 + a_4x + a_6}{\mathbb{F}_q})) \equiv 1 - A_q \mod p.$$
Then $A_q \equiv a_E \mod p$, and the assertion follows from(15.11.3.9).

Finally, it can be seen from the equation $f(x)^{(p^{r+1}-1)/2} = f(x)^{(p^r-1)/2}[f(x)^{(p-1)/2}]^{p^r}$ that $A_{p^{r+1}} = A_{p^r} A_p^{p^r}$. So by an induction argument, $A_q = 0$ iff $A_p = 0$.

3:
$$\mathrm{Coef}(\frac{(x(x-1)(x-\lambda))^{(p-1)/2}}{x^{p-1}}) = \mathrm{Coef}(\frac{(x-1)^{(p-1)/2}(x-\lambda)^{(p-1)/2}}{x^{(p-1)/2}}) = \sum_{i=1}^{(p-1)/2} \binom{\frac{(p-1)}{2}}{i}^2 \lambda^i = H_p(\lambda)$$

4: Consider the **Picard-Fuchs differential operator**
$$D = 4t(t-1)\frac{\partial^2}{\partial t^2} + 4(1-2t)\frac{\partial}{\partial t} - 1,$$
then direct calculation shows
$$DH_p(t) = p \sum_{i=1}^{(p-1)/2} (p-2-4i) \binom{\frac{(p-1)}{2}}{i}^2 t^i = 0.$$

Thus possible multiple roots of H can only be 1 or 0. But $H_p(0)=1$, and $H_p(1)=\binom{p-1}{\frac{p-1}{2}}=(-1)^{\frac{p-1}{2}}$, thus $H_p(t)$ has no multiple roots.

Let $\varepsilon_p(j)=1$ if the elliptic curve E with the indicated j-invariant is supersingular, and $\varepsilon_p(j)=0$ otherwise. Notice for $p\geq 5$, $j:\lambda\to j(E_\lambda)$ is 6 to 1 except $\#j^{-1}(0)=2$ and $\#j^{-1}(1728)=3$, thus by counting the number of zeros of $H_p(\lambda)$, the number of supersingular elliptic curves is

$$\frac{1}{6}(\frac{p-1}{2}-2\varepsilon_p(0)-3\varepsilon_p(1728))+\varepsilon_p(0)+\varepsilon_p(1728)=\frac{p-1}{12}+\frac{2}{3}\varepsilon_p(0)+\frac{1}{2}\varepsilon_p(1728).$$

Thus the assertion follows from determining elliptic curves of j-invariants 0 and 1728 are supersingular or not, which is done by(15.11.3.14).

5: It follows from the proof of item4 that this number is 1/2 of number of roots of $H_p(\lambda)=\frac{p-1}{24}$. □

Lemma (15.11.3.14) [Examples of Supersingular Elliptic Curves].

- For $p\geq 5$, the elliptic curve $E:y^2=x^3+1$ with j-invariant 0 is supersingular iff $p\equiv 2\mod 3$.
- For $p\geq 3$, the elliptic curve $E:y^2=x^3+x$ with j-invariant 1728 is supersingular iff $p\equiv 3\mod 4$.

⌟

Proof: These follows form calculating the x^{p-1}-term of $(x^3+1)^{(p-1)/2}$ or $(x^3+x)^{(p-1)/2}$ and(15.11.3.12) item2. □

4 Reduction of Elliptic Curves

Main references are [Liu02].

In this subsection, let S be a Dedekind scheme with generic point η and function field K.

Prop. (15.11.4.1) [Minimal Models of Elliptic Curves]. Let $E\in\mathcal{E}\mathrm{ll}/K$ and $\mathcal{E}/S$ be a minimal model for E, then

- $\mathcal{E}_{\mathrm{sm}}(S)=\mathcal{E}(S)=E(K)$.
- The automorphism $(m,\mathrm{pr}_2):E\times_K E\to E\times_K E$ extends to an automorphism $t:\mathcal{E}\times_S\mathcal{E}_{\mathrm{sm}}\to\mathcal{E}\times_S\mathcal{E}_{\mathrm{sm}}$.
- t induces an automorphism $\mathcal{E}_{\mathrm{sm}}\times_S\mathcal{E}_{\mathrm{sm}}\to\mathcal{E}_{\mathrm{sm}}\times_S\mathcal{E}_{\mathrm{sm}}$, and $\mathrm{pr}_1\circ E$ makes $\mathcal{E}_{\mathrm{sm}}$ a smooth group scheme over S extending that of E.

⌟

Proof: Cf.[Liu02]P492. □

Thm. (15.11.4.2)[$\mathcal{N}=\mathcal{E}_{\mathrm{sm}}$]. Let (R,K) be a DVR, $E\in\mathcal{E}\mathrm{ll}/K$ with minimal model $\mathcal{E}$(15.10.2.4), then $\mathcal{E}_{\mathrm{sm}}$ is a Néron model of E. ⌟

Proof: Cf. [Liu, Prop10.2.12] or [BLR, 1.5/1].

To show universal property, let X/S be smooth, and $f:X_\eta\to E$ be a morphism considered as a rational morphism $X\to\mathcal{E}_{\mathrm{sm}}$. Let $\xi\in X$ be a point of codimension 1, and $T=\operatorname{Spec}\mathcal{O}_{X,\xi}$, then by(15.9.5.7) and the proof of(15.11.4.1), $\mathcal{E}\times_S T\to T$ is an arithmetic surface with smooth locus $\mathcal{N}\times_S T$**?**, so by(15.9.2.8), $\mathcal{N}(T)=\mathcal{N}_T(T)=E(K)$, which means f can be extended to ξ. Then in fact f is a morphism by(9.1.1.20). □

over DVRs

In this subsubsection, let $(R, K, \mathfrak{m}, k)$ be a DVR, $S = \operatorname{Spec} R$.

Prop. (15.11.4.3) [Weierstrass Models are Normal]. Let $E \in \mathcal{E}\mathrm{ll}/K$, then any Weierstrass equation for E over R is normal. ⌟

Proof: Cf.[Conrad, Minimal model for Elliptic Curves]. □

Def. (15.11.4.4) [Minimal Weierstrass Equation]. Let $E \in \mathcal{E}\mathrm{ll}/K$, then a **minimal Weierstrass equation** for E is an Weierstrass equation for E in $R[X, Y]$ with determinant Δ with minimal valuation. ⌟

Prop. (15.11.4.5) [Uniqueness of Minimal Weierstrass Equations]. Let $E \in \mathcal{E}\mathrm{ll}/K$, then E has a minimal Weierstrass equation, and it is unique up to change of variables of the form

$$(X, Y) \mapsto (u^2 X + r, u^3 Y + su^2 X + t), \quad u \in R^*, r, s, t \in R.$$

Moreover, given any Weierstrass equation, then any change of coordinates that is used to produce a minimal Weierstrass equation is of the form

$$(X, Y) \mapsto (u^2 X + r, u^3 Y + su^2 X + t), \quad u, r, s, t \in R.$$

⌟

Proof: Cf.[Sil16]P186.? □

Cor. (15.11.4.6) [Weierstrass Models]. Let $E \in \mathcal{E}\mathrm{ll}/K$, a minimal Weierstrass of E defines a model $\mathcal{W}/R$ of E, and it is invariant of the Weierstrass equation chosen, called the **Weierstrass model** of E. Denote $\widetilde{E} = \mathcal{W}_k$. ⌟

Prop. (15.11.4.7) [Weierstrass Model of Elliptic Curves]. Let (R, K) be a DVR, if $E \in \mathcal{E}\mathrm{ll}/K$, then a Weierstrass equation with $a_i \in R$ defines a scheme $\mathcal{W} \in \mathbb{P}^2_R$. Then

- Both $\mathcal{W}_{\mathrm{sm}}$ and $\mathcal{W}$ has generic fiber E. If E has good reduction and W is a minimal Weierstrass equation, then $\mathcal{W} = \mathcal{W}_{\mathrm{sm}}$ is smooth.
- The natural map $\mathcal{W}(R) \to E(K)$ is a bijection. If $\mathcal{W}$ is regular, then $\mathcal{W}_{\mathrm{sm}}(R) \to \mathcal{W}(R)$ is also a bijection.
- The group structure on E/K extends to a group structure on $\mathcal{W}_{\mathrm{sm}}/R$, and the addition further extends to a group action of $\mathcal{W}_{\mathrm{sm}}/R$ on $\mathcal{W}/R$.

⌟

Proof: Cf.[**?**]P321. □

Prop. (15.11.4.8) [Weierstrass Model and Minimal Models]. Let (R, K) be a DVR, if $E \in \mathcal{E}\mathrm{ll}/K$ with minimal model $\mathcal{E}$, then any minimal Weierstrass model $\mathcal{W}$ can be obtained by blowing down the finitely many components of $\mathcal{E}_k$ which are disjoint from the closure in $\mathcal{E}$ of O_E. In particular, by(15.11.4.2), $\mathcal{W}_{\mathrm{sm}}$ is isomorphic to the relative identity component(15.7.11.16) $\mathcal{N}_0$ of the Néron model of E. ⌟

Proof: Cf.[Liu Qing, Thm. 9.4.35] □

Def. (15.11.4.9) [Reduction Types]. Let (R, K, k) be a DVR, and $E \in \mathcal{E}\mathrm{ll}/K$, then

- E has good reduction iff $(\mathcal{N}_0)_k \in \mathcal{E}\mathrm{ll}/k$.
- E has semistable reduction(15.7.12.1) iff $(\mathcal{N}_0)_{k^{\mathrm{sep}}} \cong \mathbb{G}_m$. And it is called a **split multiplicative reduction** if $(\mathcal{N}_0)_k \cong \mathbb{G}_m$, otherwise it is called a **non-split multiplicative reduction**.
- E has bad reduction iff $(\mathcal{N}_0)_{k^{\mathrm{sep}}} \cong \mathbb{G}_a$.

⌟

Proof: These follow from(15.7.12.1)(15.11.1.16) and the fact $\mathcal{N}_0 \cong \mathcal{W}_{\mathrm{sm}}$ for any minimal Weierstrass model for E. □

Def. (15.11.4.10) [Reduction of Elliptic Curves]. Let (R, K, k) be a CDVR and $E \in \mathcal{E}\mathrm{ll}/K$ with Néron model $\mathcal{N}/\mathcal{O}_K$. Then $\mathcal{N}(\mathcal{O}_K) = E(K)$, and by infinitesimal lifting property of smoothness**?**, the reduction map $r : \mathcal{N}(\mathcal{O}_K) \to \mathcal{N}_k(k)$ is surjective. Define

$$E_0(K) = r^{-1}(\mathcal{N}_0(k))(15.11.4.8), \quad E_1(K) = \ker(r).$$

$E_1(K)$ is called the **kernel of the reduction**. In particular,

$$\mathcal{N}_0(k) \cong E_0(K)/E_1(K).$$

⌟

Prop. (15.11.4.11) [Formal Group is the Kernel]. Let (R, K, k) be a CDVR and $E \in \mathcal{E}\mathrm{ll}/K$, then with notations as in(15.11.2.1),

$$\widehat{E}(\mathfrak{m}) \to E_1(K) : z \mapsto [z, -1, w(z)]$$

is an isomorphism of groups. ⌟

Proof: By(15.11.2.1), $\omega(z) \in z^3R[[z]]$, and by the definition of $w(z)$, $[z, -1, w(z)] \in E_1(K)$, and it is a group homomorphism by the definition of formal group law associated to E. It remains to prove that this map is surjective:

Clearly O is in the image, suppose $(x_0, y_0) \in E_1(K)$, then $v(x_0) < 0, v(y_0) < 0$, thus by inspecting the Weierstrass equation, $v(x_0) = -2r, v(y_0) = -3r$ for some $r > 0 \in \mathbb{Z}$. Then $z_0 = x_0/y_0 \in \mathfrak{m}$, and (x_0, y_0) is the image of z_0. □

Prop. (15.11.4.12) [Characterizing Reductions]. Let (R, K, k) be a CDVR and $E/K \in \mathcal{E}\mathrm{ll}/K$ be given by a minimal Weierstrass equation $E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$ over $\mathcal{O}_K$, then by(15.11.1.14),

- $\widetilde{E}$ is a good reduction iff $\Delta \in \mathcal{O}_K^*$.
- $\widetilde{E}$ is a semistable reduction iff $\Delta \in \mathfrak{m}$ and $c_4 \in \mathcal{O}_K^*$.
- $\widetilde{E}$ is an additive reduction iff $\Delta, c_4 \in \mathfrak{m}$.

⌟

Prop. (15.11.4.13) [Characterizing Potentially Good Reduction]. E has potentially good reduction iff $j(E) \in \mathcal{O}_K$.

In particular, an elliptic curve with complex multiplication over K has potentially good reduction.

⌟

Proof: If $E_{\overline{k}}$ has good reduction, then $j(E) = (c_4')^3/\Delta' \in R'$. Conversely, if $j(E) \in R$, use Legendre form or Deuring form(15.11.1.17)(15.11.1.18), the equation

$$j = 2^8 \frac{(\lambda^2 - \lambda + 1)^3}{\lambda^2(\lambda-1)^2} \text{ or } j = \frac{\alpha^3(\alpha^3 - 24)^3}{\alpha^3 - 27}$$

implies $\lambda \in \mathcal{O}_K^*, \lambda(\lambda-1) \in \mathcal{O}_K^*$(or $\alpha \in \mathcal{O}_K^*, \alpha^3 - 27 \in \mathcal{O}_K^*$), so $E_{\overline{k}}$ has good reduction. □

Prop. (15.11.4.14) [Tamagawa Numbers]. Let $E \in \mathcal{E}\mathrm{ll}/K$ with a minimal model $\mathcal{E}/\mathcal{O}_K$, then $c(E)$ equals the number of geo.integral components occuring with multiplicity 1 in $\mathcal{E}_k$. ⌟

Proof: Cf.[Liu Qing, 10.2.24]. □

Prop. (15.11.4.15) [Tamagawa Numbers]. Let $E \in \mathcal{E}\mathrm{ll}/K$. If E has split multiplicative reduction over K, then $E(K)/E_0(K)$ is a cyclic group of order $v(\Delta) = -v(j)$. And in other cases, the group is finite and has order at most 4. ⌟

Proof:

□

Cor. (15.11.4.16). If $K \in$ `p-Field` and $E \in \mathcal{E}\mathrm{ll}/K$, then $E(K)$ contains a subgroup of finite index that is isomorphic to $\mathcal{O}_K$. ⌟

Proof: Because $E(K)/E_0(K)$ and $E_0(K)/E_1(K) \cong \widetilde{E}_{ns}(k)$ are all finite by(15.11.4.15), it suffices to prove that $E_1(K) \cong \widehat{E}(\mathfrak{m})$ has a subgroup of finite index that is isomorphic to $\mathcal{O}_K$. But this follows from the fact $\widehat{E}(\mathfrak{m}^r) \cong \mathfrak{m}^r$ for r large(9.5.4.7). □

Tate Algorithm

Prop. (15.11.4.17) [Kodaira-Néron]. Let $(R, \mathfrak{m})$ be a DVR with fraction field K and alg.closed residue field k. Let E/K be an elliptic curve, and $\mathcal{C}/R$ a minimal proper regular model for E over R, then the special fiber of $\mathcal{C}$ has one of the following Forms:

- (Type I_0) An elliptic curve.
- (Type I_1) A rational curve with a node.
- (Type $\mathrm{I}_n, n \geq 2$) n smooth rational curves intersecting transversally at a single point one-by-one in the shape of a n-gon.
- (Type II) A rational curve with a cusp.
- (Type III) Two non-singular rational curves which intersects tangentially at a single point.
- (Type I_0^*) A non-singular rational curve of multiplicity 2 with 4 non-singular rational curves of multiplicity1 attached.
- (Type I_n^*) A chain of $n+1$ non-singular rational curves of multiplicity2, with two non-singular curves of multiplicity1 attached at each end.
- (Type IV^*) ?
- (Type III^*) ?
- (Type II^*) ?

⌟

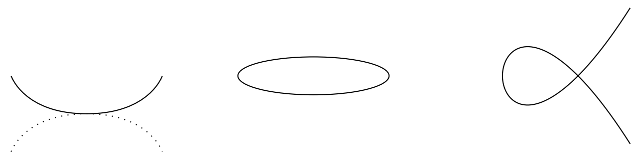

Figure (15.11.4.1): Kodaira Types

Proof: Cf.[Sil99]P354. □

Prop. (15.11.4.18)[Tate Algorithm]. There is an algorithm that determines if a Weierstrass equation for E is minimal.?

Torsion Points

Prop. (15.11.4.19) [Controlling Torsion Points]. Let $m \in \mathbb{Z} \cap k^\times$, then

- $E_1(K)[m] = O$
- The reduction map $E_0(K)[m] \to \widetilde{E}_{\mathrm{sm}}(k)[m]$ is injective.
- If E has good reduction and $K = K^{\mathrm{sep}}$, then it is also an isomorphism.

Proof: 1: By(15.11.4.11), $E_1(K)[m] \cong \widehat{E}(\mathfrak{m})[m]$, which has only one element because $[m]_{\widehat{E}}$ is an isomorphism(9.5.3.5).

2 follows from 1 and the exact sequence in(15.11.4.10).

3 follows as they have the same cardinality. □

Prop. (15.11.4.20) [Controlling Torsion Points]. Let $\operatorname{char} K = 0$ and $\operatorname{char} k = p > 0$, let E be given by a Weierstrass equation

$$E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6 \in R[X, Y].$$

Let $P = (x_0, y_0) \in E(K)$ be a torsion point of exact order m, then

- If m is not a p-power, then $x_0, y_0 \in R$.
- If $m = p^n$, then $v(x) \geq -2\lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor$, $v(y) \geq -3\lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor$.

Proof: Change the Weierstrass equation to a minimal Weierstrass equation, then by(15.11.4.4), the coordinates in the new equation satisfies $v(x') \leq v(x_0), v(y') \leq v(y_0)$, thus it suffices to prove for minimal Weierstrass equations.

If $v(x_0) \geq 0$, then $v(y_0) \geq 0$. Suppose $v(x_0) < 0$, then $v(y_0) < 0$, and $v(x_0) = -2r, v(y_0) = -3r$ for some $r > 0$. thus $P \in E_1(K)$ and thus corresponds to $z \in \widehat{E}(\mathfrak{m})$(15.11.4.11). Then the theorem follows from(9.5.4.6). □

Over Dedekind Domains

Def. (15.11.4.21)[Canonical Heights]. For $F \in \mathtt{NField}$ and $E \in \mathcal{E}\mathrm{ll}/F$, by(15.7.10.4) and(15.7.4.9), $\widehat{h}_{\mathcal{L}}$ only depends on $\deg(\mathcal{L})$. And by(6.12.2.20), any degree 1 line bundle is ample, and the Néron-Tate bilinear form $\langle \cdot, \cdot \rangle_{\text{N-T}}$ given by this line bundle is called the **canonical height pairing** of E.

It is a positive-definite quadratic form on $E(\overline{K})\otimes\mathbb{R}$ by(15.13.1.4). And for $P\in E(\overline{K})$, $\langle P,P\rangle_{\text{N-T}}$ is called the **canonical height** of P.

In particular we can take the line bundle $\mathcal{O}(O)$, then $\langle O,O\rangle_{\text{N-T}}=0$, and for any $P\neq 0$ in $\mathcal{L}(O)$,

$$\langle P,P\rangle_{\text{N-T}}=\lim_{n\to\infty}h(x([2^n]P))/4^N.$$

⌟

Proof: For the final assertion, apply(15.2.1.23) to the morphism $\varphi:E\to\mathbb{P}^1$ associated to the rational function x:

$$\langle P,P\rangle_{\text{N-T}}=\lim_{n\to\infty}\widehat{h}_{\mathcal{O}(2O)}([2^n]P)/4^N=\lim_{n\to\infty}h_{\mathcal{O}_{\mathbb{P}^1}(1)}(\varphi([2^n]P))/4^N=\lim_{n\to\infty}h(x([2^n]P))/4^N.$$

□

Prop. (15.11.4.22) [Elliptic Regulators]. Let F be a number field and $E\in\mathcal{E}\mathrm{ll}/F$, then the **elliptic regulator** is the volume of a fundamental domain of $E(K)/E(K)_{\text{tor}}$ computed using the canonical height. In particular, it is the discriminant of $(\langle X_i,X_j\rangle_{E,F})_{i,j}$ where $\{X_i\}$ is a basis for $E(K)/E(K)_{\text{tor}}$. ⌟

Def. (15.11.4.23) [Minimal Discriminants]. For $F\in\texttt{GField}$ and $E\in\mathcal{E}\mathrm{ll}/F$, define the **minimal discriminant** $\Delta^{\min}_{E/F}$ to be $\Delta^{\min}_{E/F}=\prod_{v\in\Sigma_F^{\text{fin}}}\mathfrak{p}_v^{\operatorname{ord}(\Delta_v^{\min})}$, where $\Delta_v^{\min}$ is the discriminant of a minimal Weierstrass equation for E_v.

Then for any Weierstrass equation W for E, by(15.11.1.13), $\mathfrak{D}_{E/F}=\Delta^{\min}_{E/F}(\mathfrak{a}_W)^{12}$ for some ideal $\mathfrak{a}$ of F, and the ideal class of $\mathfrak{a}_\Delta$ is stable under change of Weierstrass equations, called the **Weierstrass class** of E, denoted by $\overline{\mathfrak{a}}_{E/F}$. ⌟

Def. (15.11.4.24) [Unstable Minimal Discriminants]. For $F\in\texttt{GField}$ and $E\in\mathcal{E}\mathrm{ll}/F$, suppose $(j_E)=\mathfrak{a}\mathfrak{b}^{-1}$ where $\mathfrak{a},\mathfrak{b}\in\mathrm{Ideal}^*(\mathcal{O}_F)$ are relatively prime, then the **unstable minimal discriminant** of E is defined to be

$$\Upsilon_{E/F}=\Delta^{\min}_{E/F}\cdot\mathfrak{b}^{-1}.$$

Then

- $\Upsilon_{E/F}\in\mathrm{Ideal}^*(\mathcal{O}_F)$.
- For $v\in\Sigma_F^{\text{fin}}$, $v(\Upsilon_{E/F})=0$ iff E has good or semistable reduction at v.
- $v\in\Sigma_F^{\text{fin}}$, $v(\Upsilon_{E/F})<12+12v(2)+6v(3)$.

⌟

Proof: 1, 2: These follow from the fact $j(E)=c_4^3/\Delta$(15.11.1.5) and(15.11.4.12).

3: For any minimal Weierstrass equation, maybe it follows from the change of variable formula(15.11.1.13)**?**. □

Prop. (15.11.4.25) [A Curve Related to Fermat's Last Theorem]. Let $a,b,c\in\mathbb{Z}^\times$ satisfy $(a,b,c)=1$, let E be the elliptic curve defined by the Weierstrass equation

$$E:y^2=x(x+a)(x-b),$$

then

- the minimal discriminant(15.11.4.23) $\Delta^{\min}_{E/K}$ of E is either $2^4|abc|^2$ or $2^{-8}|abc|^2$.

- E has semistable reduction for any odd prime.

⌟

Proof: By calculation

$$\mathfrak{D}_W = 2^4(abc)^2, \quad c_4 = 2^4(a^2+ab+b^2), \quad c_6 = -2^5(2a^3+3a^2b+3ab^2+2b^3),$$

$$(22a^2-8ab-8b^2)c_4+(a+2b)c_6 = 288a^2, \quad -(8a^2+8ab-22b^2)c_4-(2a+b)c_6 = 288b^2.$$

1: Any change of variable of E to the minimal Weierstrass equation satisfies $u^4|c_4, u^6|c_6$, so

$$u^4|(288a^2, 288b^2)$$

so $u=1$ or 2, and $\Delta_E^{\min} = u^{-12}\mathfrak{D}_W = 2^4|abc|^2$ or $2^{-8}|abc|^2$.

2: If $p\in\mathbf{P}\backslash\{2\}$ and $p|\Delta_E^{\min}$, then p divides a or b or c. In each case, $p\nmid c$, so E has multiplicative reduction at these p(15.11.4.12). □

Prop. (15.11.4.26) [Global Minimal Weierstrass Equation]. For $F\in\texttt{NField}$ and $E\in\mathcal{E}\mathrm{ll}/F$, E has a global minimal Weierstrass equation if its Weierstrass class is trivial.

In particular, if $\mathrm{cl}(F)=1$, e.g. $F=\mathbb{Q}$, then any $E\in\mathcal{E}\mathrm{ll}/F$ has a global minimal Weierstrass equation. ⌟

Proof: Choose any Weierstrass equation for E over K, let

$$x = u_v^2x+r_v, \quad y = u_v^3y+s_vu_v^2x+t_v, \quad u_v,r_v,s_v,t_v\in\mathcal{O}_{K,v}$$

be the local change of variable to get the minimal Weierstrass equation at place v, then by hypothesis, $(u_v)_v$ is principal, which means there is some $u\in K$ s.t. $v(u)=v(u_v)$ for any v. Then choose by Chinese remainder theorem $r,s,t\in\mathcal{O}_K$ that is closed to r_v,s_v,t_v for each relevant v, then the change of variables

$$x = u^2x+r, \quad y = u^3y+su^2x+t$$

changes the coordinates to a minimal Weierstrass equation. □

Cor. (15.11.4.27). Let $F\in\texttt{GField}$ with $6\nmid\mathrm{cl}(F)$ and $E\in\mathcal{E}\mathrm{ll}/F$ with everywhere good reduction, then E has a minimal model. ⌟

Proof: Because in this case the Weierstrass class $\mathfrak{a}_\Delta$ is a 12-torsion in $\mathrm{Cl}(F)$, which implies it is trivial. □

Cor. (15.11.4.28). If $F\in\texttt{NField}$ and S is a finite set of places of K s.t. $\mathrm{Cl}(\mathcal{O}_{F,S})=1$, then any elliptic curve over F has a minimal Weierstrass equation of the form $W: y^2=x^3+Ax+B$ with $A,B\in\mathcal{O}_{K,S}$ satisfying $\mathfrak{D}_W\mathcal{O}_{F,S}=\Delta_{E/F}^{\min}\mathcal{O}_{F,S}$. ⌟

Proof: The proof is easier than that(15.11.4.26). □

Prop. (15.11.4.29). If $F\in\texttt{NField}$ with $\mathrm{Cl}(F)\neq 1$, then there exists $E\in\mathcal{E}\mathrm{ll}/F$ with no global minimal Weierstrass equations. ⌟

Proof: Cf.[Weierstrass equations and the minimal discriminant of an elliptic curve", Mathematika 31 (1984), no. 2, 245–251]. □

Prop. (15.11.4.30) [Density of Global Minimal Models]. ⌟

Proof: Cf.[The density of elliptic curves having a global minimal Weierstrass equation", J. Number Theory 109 (2004), no. 1, 41–58.]. □

5 Tate Curve

Def. (15.11.5.1). Define formal power series

$$s_k(q)=\sum_{n\geq 1}\sigma_k(n)q^n=\sum_{n\geq 1}\frac{n^kq^n}{1-q^n}\in\mathbb{Z}[[q]],$$

$$a_4(q)=-5s_3(q),\quad a_6(q)=-\frac{5s_3(q)+7s_5(q)}{12}\in\mathbb{Z}[[q]],$$

$$X(u,q)=\sum_{n\in\mathbb{Z}}\frac{q^nu}{(1-q^nu)^2}-2s_1(q),\quad Y(u,q)=\sum_{n\in\mathbb{Z}}\frac{(q^nu)^2}{(1-q^nu)^3}+s_1(q)\in\mathbb{Z}[u][[q]].$$

⌟

Prop. (15.11.5.2).

$$s_1(q)=\sum_{n\geq 1}\frac{q^n}{(1-q^n)^2}\in\mathbb{Z}[[q]],$$

$$X(u,q)=\frac{u}{(1-u)^2}+\sum_{n\geq 1}[\frac{q^nu}{(1-q^nu)^2}+\frac{q^nu^{-1}}{(1-q^nu^{-1})^2}-\frac{2q^n}{(1-q^n)^2}]\in\mathbb{Z}[u][[q]],$$

$$Y(u,q)=\frac{u^2}{(1-u)^3}+\sum_{n\geq 1}[\frac{(q^nu)^2}{(1-q^nu)^3}+\frac{q^nu^{-1}}{(1-q^nu^{-1})^3}+\frac{q^n}{(1-q^n)^2}]\in\mathbb{Z}[u][[q]],$$

Thus

$$X(qu,q)=X(u,q)=X(u^{-1},q),\quad Y(qu,q)=Y(u,q)\in\mathbb{Z}[u,u^{-1}][[q]].$$

⌟

Proof: The first one follows from(9.5.2.2). □

Prop. (15.11.5.3) [Relation to Weierstrass $\mathfrak{P}$-Functions]. Let $\wp(z;\tau)$ be the Weierstrass $\wp$-function associated to the lattice $\Lambda_z=\mathrm{span}\{1,\tau\}$(11.5.4.5), then $X(e^{2\pi iz},q(\tau)),Y(e^{2\pi iz},q(\tau))$ converges and uniformly and absolutely on $\mathbb{C}\backslash\Lambda_z$ in $\mathbb{C}$ to holomorphic functions, and

$$\frac{1}{(2\pi\,\mathrm{i})^2}\wp(z;\tau)=X(e^{2\pi\,\mathrm{i}\,z},q(\tau))+\frac{1}{12},\quad \frac{1}{(2\pi i)^3}\wp(z;\tau)'=X(e^{2\pi iz},q(\tau))+2Y(e^{2\pi iz},q(\tau)).$$

⌟

Proof: The convergence of X,Y is clear. By(15.11.5.1), $X(e^{2\pi iz},q(\tau))$ is $\{1,\tau\}$-doubly periodic, and clearly it has a double pole at the origin. Also the Laurent part of $X(e^{2\pi iz},q(\tau))$ at $z=0$ is the Laurent part of $\frac{e^{2\pi iz}}{(1-e^{2\pi iz})^2}$, which is $\frac{1}{(2\pi i)^2z^2}-\frac{1}{12}$. Then by comparison with that of $\mathfrak{P}(z;\tau)$(11.5.4.6) and use Liouville's theorem.

The second identity follows from applying $\frac{\partial}{\partial z}$. □

Prop. (15.11.5.4) [Formal Identities]. There are identities

1. $$-a_6(q)+a_4^2(q)+72a_4a_6-64a_4^3-432a_6^3=\Delta(q)\in\mathbb{Z}[[q]].$$

2. $$Y(u^{-1},q)=-Y(u,q)-X(u,q)\in\mathbb{Z}[u,u^{-1}][[q]].$$

3.
$$Y(u,q)^2 + X(u,q)Y(u,q) = X(u,q)^3 + a_4(q)X(u,q) + a_6(q) \in \mathbb{Z}[u][[q]].$$

4.
$$(X(u_2,q) - X(u_1,q))^2 X(u_1u_2,q) = (Y(u_2,q) - Y(u_1,q))^2 + (Y(u_2,q) - Y(u_1,q))(X(u_2,q) - X(u_1,q)) - (X(u_2,q) - X(u_1,q))^2 (X(u_2,q) + X(u_1,q))$$

$$(X(u_2,q) - X(u_1,q))Y(u_1u_2,q) = -[(Y(u_2,q) - Y(u_1,q)) + (X(u_2,q) - X(u_1,q))]X(u_1u_2,q) - (Y(u_1,q)X(u_2,q) - Y(u_2,q)X(u_1,q))$$

⌟

Proof: Verify these in the complex analytic case.?
3: By(11.5.4.7) and(15.11.5.3)(20.2.4.5),

$$\wp'(z)^2 = 4\wp(z)^3 - g_2\wp(z)^2 - g_3\wp(z)$$

implies the desired equation.

□

Cor. (15.11.5.5) [Tate Curve]. Notation as in(15.11.5.1), $\mathrm{Tate}(q) : y^2 + xy = x^3 + a_4(q)x + a_6(q)$ is an elliptic scheme over $\mathbb{Z}[[q]]$, called the **Tate curve**. The discriminant and j-invariant of $\mathrm{Tate}(q)$ is given by

$$\Delta(\mathrm{Tate}(q)) = \Delta(q) : q\prod_{n\geq 1}(1-q^n)^{24}(20.2.4.20), \quad j(\mathrm{Tate}(q)) = j(q)(20.2.4.22).$$

And it has the normalized differential form $\omega = \mathrm{d}x/(2y+x)$. Also denote $\omega_{\mathrm{can}} = 2\pi\,\mathrm{i}\,\omega$. ⌟

Prop. (15.11.5.6) [N-Torsion Points]. It can be shown formally from(15.11.5.10) that

$$\mathrm{Tate}(q^N)[N] = \{(X(\zeta_N^i q^j, q^N), Y(\zeta_N^i q^j, q^N))\}?,$$

which are all defined over $\mathbb{Z}[[q]][\frac{1}{N}, \zeta_N]$. In particular, all the level N structures of $\mathrm{Tate}(q^N)$ are defined over $\mathbb{Z}[[q]][\frac{1}{N}, \zeta_N]$. ⌟

Proof:

□

Prop. (15.11.5.7) [Tate Curve over $\mathbb{C}$]. Notation as in(15.11.5.1), then for $q \in \mathbb{C}, 0 < |q| < 1$,

- $E_q : y^2 + xy = x^3 + a_4(q)x + a_6(q)$ is an elliptic curve over $\mathbb{C}$, and

$$\varphi : \mathbb{C}^*/q^{\mathbb{Z}} \to E_q^{\mathrm{an}} : u \mapsto [X(u,q), Y(u,q), 1]$$

is a complex analytic isomorphism.

- The discriminant of E_q is given by

$$\Delta(E_q) = \Delta(q) : q\prod_{n\geq 1}(1-q^n)^{24}(20.2.4.20), \quad j(E_q) = j(q)(20.2.4.22)$$

- For any elliptic curve $E/\mathbb{C}$, there exists a $q \in \mathbb{C}^*, |q| < 1$ s.t. E is isomorphic to E_q.

⌟

Proof: Cf.[Sil99]P410.**?** □

Prop. (15.11.5.8) [Tate Curve over $\mathbb{R}$]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{R}$, there exists a unique $q \in \mathbb{R}, 0 < |q| < 1$ s.t.

- E is isomorphic to $E_q : y^2 + xy = x^3 + a_4(q)x + a_6(q)$ over $\mathbb{R}$.
- the isomorphism composed with

$$\varphi : \mathbb{C}^*/q^{\mathbb{Z}} \cong E_q^{\mathrm{an}} : u \mapsto (X(u, q), Y(u, q))$$

as in(15.11.5.10) induces an isomorphism of complex Lie groups $\psi : \mathbb{C}^*/q^{\mathbb{Z}} \to E_{\mathbb{C}}^{an}$ that commutes with complex conjugation. In particular, ψ induces an isomorphism of real Lie groups

$$\psi : \mathbb{R}^*/q^{\mathbb{Z}} \cong E_{\mathbb{R}}^{\mathrm{an}}.$$

⌟

Proof: 1: By(15.7.8.16) and(15.7.8.17), there are exactly on $\tau \in \mathcal{C}' = \{\mathrm{i}\,t|t \geq 1\} \cup \{1/2 + \mathrm{i}\,t|t > 1/2\}$ s.t. $j(\tau) = j(E) \in \mathbb{R}$, and

$$\mathcal{J} = \{\mathrm{i}\,t|t > 0\} \cup \{1/2 + \mathrm{i}\,t|t > 0\}.$$

corresponds to $q \in \mathbb{R}, 0 < |q| < 1$ via $\tau \mapsto q = e^{2\pi\,\mathrm{i}\,\tau}$. Also there are identifications

$$\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \{\mathrm{i}\,t|t > 1\} = \{\mathrm{i}\,t|t < 1\}, \quad \begin{bmatrix} 1 & -1 \\ 2 & -1 \end{bmatrix} \{1/2 + \mathrm{i}\,t|t > 1/2\} = \{1/2 + \mathrm{i}\,t|t < 1/2\}, \quad \begin{bmatrix} & -1 \\ 1 & -1 \end{bmatrix} (\mathrm{i}) = \frac{1}{2} + \frac{i}{2},$$

thus it suffices to show that for any two $q, q' \in \mathcal{J}$ with $q \neq q'$, $E_q \ncong E_{q'}$. It suffices to show for the twists, where we can use(15.11.6.3) to show that their c_4, c_6 changed sign, so they are not isomorphic over $\mathbb{R}$.

2: This follows from(15.11.5.10). □

Cor. (15.11.5.9) [Connected Components]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{R}$, then

$$E(\mathbb{R}) \cong \begin{cases} \mathbb{R}/\mathbb{Z} & \Delta(E) < 0 \\ \mathbb{R}/\mathbb{Z} \times \mathbb{Z}/(2) & \Delta(E) > 0 \end{cases}$$

as real Lie groups. ⌟

Proof: Notice $\mathrm{sgn}(\Delta) = \mathrm{sgn}(q)$ by(15.11.5.10). The $q > 0$ case is clear. For $q < 0$, notice there is an isogeny $E_{q^2} \to E_q$ with kernel q, so $E_{\mathbb{R}}^{\mathrm{an}} \cong [\mathbb{R}/\mathbb{Z} \times \mathbb{Z}/(2)]/(1/2, -1) \cong \mathbb{R}/\mathbb{Z}$. □

Prop. (15.11.5.10) [over Complete Valued Fields]. Notation as in(15.11.5.1), let K be a complete non-Archimedean valued field, then for $q \in K, 0 < |q| < 1$,

- $E_q : y^2 + xy = x^3 + a_4(q)x + a_6(q) \in \mathcal{E}\mathrm{ll}/K$. The discriminant of E_q is given by

$$\Delta(E_q) = \Delta(q) : q \prod_{n \geq 1} (1 - q^n)^{24} (20.2.4.20), \quad j(E_q) = j(q) (20.2.4.22)$$

- $$\varphi : \overline{K}^\times \to E_q(\overline{K}) : u \mapsto [X(u,q), Y(u,q), 1]$$

  is a continuous surjective homomorphism with kernel $q^{\mathbb{Z}}$, and it is Gal_K-invariant, thus for any $K \subset L \subset \overline{K}$ inducing a continuous surjective homomorphism

  $$\varphi : L^\times \to E_q(L)$$

  with kernel $q^{\mathbb{Z}}$.

⌟

Proof: 1: This follows from(15.11.5.5) by base change.

2: Clearly $X(u,q), Y(u,q)$ converges for any $u \in K^\times/q^{\mathbb{Z}}$, and by(15.11.5.1) it suffices to consider the case $|q| < |u| < |q|^{-1}$. In this case, the formal power series for $X(u,q), Y(u,q)$ are convergent in the complete field $K(u)$, and it follows from(15.11.5.4) that $\varphi(\overline{K}^*) \in E$. It is clearly continuous for $u \neq 1$, and if u converges to 1, $X(u,q)/Y(u,q) \to 0$ by the expansion in(15.11.5.4), so $\varphi(1) = O$.

To show φ is a homomorphism, it suffices to verify for $1 < |u_1| < |q|^{-1}, |q| < |u_2| < 1$ that $\varphi(u_1) + \varphi(u_2) = \varphi(u_1 u_2)$. Notice by the argument above, $\varphi(u) = O$ iff $u = 1$. If $u_1 = 1$ or $u_2 = 1$, then $\varphi(u_1) + \varphi(u_2) = \varphi(u_1 u_2)$ is clear, and if $u_1 u_2 = 1$, then $\varphi(u_1) + \varphi(u_2) = O$ by the identities in(15.11.5.4) and(15.11.1.9). When $u_1 \neq 1, u_2 \neq 1,_1 u_2 \neq 1$, $\varphi(u_1) \neq \varphi(u_2)$, $\varphi(u_1) + \varphi(u_2)$ are determined by polynomial equations with coordinates of $\varphi(u_1), \varphi(u_2)$, and we can show this equation holds for $\varphi(u_1 u_2)$ because it holds in the complex case(15.11.5.10). For the case $\varphi(u_1) = \varphi(u_2)$, notice that $\mathrm{Im}(\varphi)$ is infinite, as for $|t| < 1$, $|X(1+t)| = |t|^{-2}$ by the formula in(15.11.5.4). Now this case follows from(3.1.2.14).

Next, we show $\varphi : L^\times \to E_q(L)$ is surjective. As K is arbitrary, we may assume $L = K$. For this, Cf.[Tate, a review of non-Archimedean Elliptic Functions]**?**. □

Cor. (15.11.5.11). $\mathrm{Tate}(q)(\mathbb{Q}((q))) \cong \mathbb{Q}((q))^\times/q^{\mathbb{Z}}$. ⌟

Lemma (15.11.5.12). Let $\alpha \in K$ with $|\alpha| > 1$, then there exists a unique $q \in K$ s.t. $|q| < 1$ s.t. $j(q) = \alpha$. Moreover, $q \in \mathbb{Z}[[\frac{1}{\alpha}]]$. ⌟

Proof: Let $f(q) = j(q)^{-1} \in q + q^2\mathbb{Z}[[q]]$, thus by(9.5.1.3) there exists a $g \in q\mathbb{Z}[[q]]$ s.t. $f(g(q)) = q = g(f(q))$. So if $f(q) = \frac{1}{\alpha}$, then $q = f(\frac{1}{\alpha})$. And this q do satisfies $j(q) = \alpha$. □

Thm. (15.11.5.13) [p-Adic Uniformization, Tate]. Let K be a complete valued field, $E \in \mathcal{E}\mathrm{ll}/K$ with $|j(E)| > 1$, then

- There exists a unique $q \in K$ s.t. $E_{\overline{K}} \cong (E_q)_{\overline{K}}$.
- For this q, the following are equivalent:
  - $E \cong E_q$.
  - $\gamma(E) = 1$(15.11.6.3).
  - E has split multiplicative reduction.

⌟

Proof: 1 follows from(15.11.5.12) and(15.11.1.14).

2: Firstly $\gamma(E_q) = 1$, because

$$c_4(E_q) = 1 - 48a_4(q) = 1 + 240s_3(q), \quad -c_6(E_q) = 1 - 72a_4(q) - 864a_6(q) = 1 - 504s_5(q)$$

are all of the form $1+4\alpha, |\alpha|<1$, thus they are both squares in $K^\times$, as $1+4\alpha = [(1+4\alpha)^{1/2}]^2$**??**

Next, $|a_4(q)|, |a_6(q)| \le 1$, so $\widetilde{E}_q : y^2+xy = x^3$ has split multiplicative reduction. Then $1 \iff 2$ by(15.11.6.3), and to show $1 \iff 3$, it suffices to show that if E has split multiplicative reduction, then $\gamma(E) = 1$: Let the valuation ring of K be R with maximal ideal $\mathfrak{m}$ and residue field k. Let $y^2 + a_1xy + a_3 = x^3 + a_2x^2 + a_4x + a_6$ be a minimal polynomial. We may assume the singular point is $(0,0) \in \widetilde{E}(k)$, then $a_3 \equiv a_4 \equiv a_6 \equiv 0 \mod \mathfrak{m}$, thus $b_4 = a_1a_3 + 2a_4 \equiv 0 \mod \mathfrak{m}$, and $c_4 = b_2^2 - 2b_4 \equiv b_2^2 \mod m$. Thus $b_2 \in R^*$, and

$$\gamma(E) = -\frac{c_4}{c_6} = \frac{1}{b_2}\frac{1-24b_4/b_2^{-2}}{1-36b_4/b_2^2+216b_6/b_2^3} \mod (K^\times)^2.$$

So by**??**gain, $\gamma(E) \cong b_2 \mod (K^\times)^2$.

Because E has multiplicative split reduction, $y^2 + \overline{a}_1xy - \overline{a}_2x^2 = (y-\overline{\alpha}x)(y-\overline{\beta}x) \in k$, $\overline{\alpha} \neq \overline{\beta}$. Thus by Henselian lifting, $y^2+a_1xy-a_2x^2 = (y-\alpha x)(y-\beta x) \in K$ for some α,β, and $b_2 = a_1^2+4a_2 = (\alpha-\beta)^2 \in (K^\times)^2$. □

Cor. (15.11.5.14). If $\gamma(E) \neq 1$, let $L = K(\sqrt{\gamma(E)})$, then $E_L \cong (E_q)_L$, and

$$E(K) \cong \{u \in L^*/q^{\mathbb{Z}} | N_{L/K}(u) \in {}^{\mathbb{Z}}\}.$$

⌟

Proof: Cf.[Sil99]P444. □

6 Twists of Elliptic Curves

Cf.[Sil16]Chap10.6.

Prop. (15.11.6.1)[Twists of Elliptic Curves]. Because the category of smooth curves is an algebraic stack, for $k \in$ `Field` and $C \in \mathfrak{Cur}^{\mathrm{sm}}/k$, the set $\mathrm{Twist}(C/k)$ of twisted smooth curves of C is in bijection with $H^1(k, \mathrm{Isom}(C_{k^s}))$ by(6.1.5.2).

Also the category of elliptic curves(with the origin fixed) is an algebraic stack, thus the set $\mathrm{Twist}((E,O)/k)$ of twisted elliptic curves of an elliptic curve over k is in bijection with $H^1(k, \underline{\mathrm{Aut}}(E))$. ⌟

Remark (15.11.6.2). [Sil16]P318,342 has a direct proof, and can find the twist corresponding to a cocycle explicitly.**?** ⌟

Prop. (15.11.6.3) [$\mathrm{Twist}((E,O)/k)$]**.** Let $k \in$ `Field`, $\mathrm{char}\, k \neq 2,3$ and $E \in \mathcal{E}\mathrm{ll}/k$. Denote $n = \#\mathrm{Aut}(E_{\overline{k}})$, then

- $\mathrm{Twist}((E,O)/k)$ is canonically isomorphic to $k^\times/(k^\times)^n$.
- For E/k given by Weierstrass equation $y^2 = x^3 + Ax + B$, the twisted elliptic curve of E corresponding to $D(\mathrm{mod}\ (K^\times)^n)$ has the Weierstrass equation

$$E^{(D)} : \begin{cases} y^2 = x^3 + D^2Ax + D^3B, & j(E) \neq 0, 1728 \\ y^2 = x^3 + DAx, & j(E) = 1728 \\ y^2 = x^3 + DB, & j(E) = 0 \end{cases}.$$

- In case $j(E) \neq 0, 1728$, $n = 2$, define $\gamma(E) = -c_4/c_6 \in \mathbb{K}^\times/(K^\times)^2$(which equals A/B in the short form), then for $E, E' \in \mathcal{E}\mathrm{ll}/k$ with $j(E), j(E') \neq 0, 1728$,

$$E \cong E' \iff j(E) = j(E') \ \&\ \gamma(E) = \gamma(E').$$

⌟

Proof: This is because the Kummer sequence and(15.11.1.19) implies $H^1(k, \underline{\mathrm{Aut}}(E)) \cong H^1(k, \mu_n) = k^\times/(k^\times)^n$. For the corresponding elliptic curve, Cf.[Sil16]P343.**?** □

Def. (15.11.6.4) [Weil-Châtelet Groups]. For $k \in \mathtt{Field}, E \in \mathcal{E}\mathrm{ll}/k$, define the **Weil-Châtelet Group** $\mathrm{WC}(E/k)$ to be the isomorphism classes of X-torsors on $\mathcal{S}\mathrm{ch}_{\text{ét}}/k$. Then there is a bijection of pointed sets $\mathrm{WC}(E/k) \cong H^1(k, E)$, by(6.3.2.18). So $\mathrm{WC}(E/k) \subset \mathrm{Twist}(E/k)$(15.11.6.1). ⌟

Prop. (15.11.6.5). If $k \in \mathtt{Field}, E \in \mathcal{E}\mathrm{ll}/k$ and $C \in \mathrm{WC}(E/k)$, then $\mathrm{Jac}(C) \cong E$. ⌟

Proof: Because C is a smooth curve, let $p \in C$ be a geometric point, and take the line bundle $\mu^*\mathcal{L}(p) - \mathrm{pr}_2^*\mathcal{L}(p) - \mathrm{pr}_1^*\mathcal{L}(O)$, where $\mu : E \times C \to C$ is the action. Then after a base change to $k(p)$, this map corresponds to the canonical isomorphism $E \cong E^\vee$(15.11.1.20), thus it is also an isomorphism because $\mathcal{S}\mathrm{ch}_X$ is a prestack over $\mathcal{S}\mathrm{ch}_{\mathrm{fpqc}}$. □

Prop. (15.11.6.6). Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{R}$, then

$$\mathrm{WC}(E/\mathbb{R}) \cong \begin{cases} 0 & \Delta(E) > 0 \\ \mathbb{Z}/(2) & \Delta(E) < 0 \end{cases}.$$

⌟

Proof: By(15.11.6.4) and(15.11.5.8), the Galois cohomology of the exact sequence $1 \to q^{\mathbb{Z}} \to \mathbb{C}^\times \to E(\mathbb{C}) \to 1$ says

$$0 \to \mathrm{WC}(E/\mathbb{R}) \to H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), q^{\mathbb{Z}}) \to H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), \mathbb{C}^\times),$$

and $\mathbb{H}^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), q^{\mathbb{Z}}) \cong q^{\mathbb{Z}}/q^{2\mathbb{Z}}, H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), \mathbb{C}^\times) \cong \mathbb{R}^\times/(\mathbb{R}^\times)^2$ by(8.7.3.5)(8.7.1.20). So we are done by observing $\mathrm{sgn}(\Delta) = \mathrm{sgn}(q)$ by(15.11.5.10). □

Goldfeld Conjecture

Cf.[Gol79].

Conj. (15.11.6.7) [Goldfeld]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, consider its twists $E^{(D)}$ as in(15.11.6.3), then

$$\lim_{X\to\infty} \frac{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free }, r_{\mathrm{an}}(E^{(d)}) = r, |d| < X\}}{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free }, |d| < X\}} = \begin{cases} \frac{1}{2} & r = 0 \\ \frac{1}{2} & r = 1 \\ 0 & r \geq 2 \end{cases}.$$

⌟

Proof: □

Conj.Cor. (15.11.6.8) [Weak Goldfeld Conjecture]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$,

$$\liminf_{X\to\infty} \frac{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free }, r_{\mathrm{an}}(E^{(d)}) = r, |d| < X\}}{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free }, |d| < X\}} > 0.$$

⌟

Thm& Conj.Cor. (15.11.6.9) [Kriz-Li]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has a rational 3-isogeny, then the weak Goldfeld conjecture is true.

And for the sextic family $\{y^2 = x^3 + d\}$, the proportion is$\geq 1/6$ for $r = 0$ and $\geq 1/6$ for $r = 1$. ⌟

Proof: [Daniel Kriz and Chao Li. Goldfeld's conjecture and congruences between Heegner points]. □

Thm& Conj.Cor. (15.11.6.10) [Tian–Yuan–Zhang, Smith]. For the sextic family $\{y^2 = x^3 + d\}$, the proportion is$\geq 1/6$ for $r = 0$ and $\geq 1/6$ for $r = 1$. ⌟

Proof: [Ye Tian, Xinyi Yuan, and Shou-Wu Zhang. Genus periods, genus points and congruent number problem], [Smith. The congruent numbers have positive natural density]. □

7 Integral Points

Thm. (15.11.7.1) [Siegel]. Let E/K be an elliptic curve with $\#E(K) = \infty$. Let v be an absolute valuation of $\overline{K}$, $Q \in E(\overline{K})$ and $f \in R(E)^\times$ which corresponds to a morphism $\varphi : E \to \mathbb{P}^1 : P \mapsto [1, f(P)]$, then

$$\varinjlim_{P \in E(K), h(\varphi(P)) \to \infty} \frac{\log d_v(P; Q)}{h(\varphi(P))} = 0.\text{(15.2.1.31)}$$

⌟

Proof: Cf.[Sil16]P276. □

Cor. (15.11.7.2) [Finiteness of Integral Points]. If C/K is a complete smooth curve of genus 1 and $f \in R(C)^\times$, $S \subset \Sigma_K$ a finite set, then $\{P \in C(K) | f(P) \in \mathcal{O}_{K,S}\}$ is a finite set. ⌟

Proof: By a finite base change of fields, we may assume $\varphi^{-1}(\infty)$ contains a rational point O, and this point makes C into an elliptic curve. Let $\varphi : E \to \mathbb{P}^1 : P \mapsto [1, f(P)]$. It follows from the definition that there is some $v \in S$ s.t.

$$h(\varphi(P)) \leq \#S \cdot \log |f(P)|_v$$

for any $P \in C(K)$ s.t. $f(P) \in \mathcal{O}_{K,S}$. Then if $\#\{P \in C(K) | f(P) \in \mathcal{O}_{K,S}\} = \{P_1, \ldots, P_n, \ldots\}$ is infinite, it follows from Northcott's theorem(15.2.1.7) that $h(\varphi(P_i)) \to \infty$, and $|f(P_i)|_v \to \infty$ for a specific $v \in S$. Suppose $e_O(\varphi) = e$, then **?** □

1 Néron-Tate Heights

Prop. (15.13.1.1) [Néron-Tate Heights]. Let $F \in \texttt{GField}, X \in \mathcal{A}b\mathcal{V}ar/F, \mathcal{L} \in \mathrm{Pic}(X)$, then there are uniquely defined bilinear form $b_{\mathcal{L}}$, additive homomorphism $l_{\mathcal{L}}$ on $X(\overline{F})$ s.t.

$$\widehat{h}_{\mathcal{L}}(x) = \frac{1}{2}b_{\mathcal{L}}(x,x) + l_{\mathcal{L}}(x) \sim h_{\mathcal{L}}(x),$$

called the **Néron-Tate height** of $\mathcal{L}$. ⌟

Proof: We want to use(3.1.3.13) for the Weil height(15.2.1.23) $h_{\mathcal{L}}$ on $X(\overline{K})$: apply the theorem of the cube(15.7.1.22) to the projections $\pi_i : X \times X \times X \to X$ and pullback to X via the diagonal map, then taking the Weil heights, we will get the desired relation

$$h_{\mathcal{L}}(\sum_{i=1}^{3} x_i) - \sum_{1\leq i<j\leq 3} h_{\mathcal{L}}(x_i + x_j) + \sum_{i=1}^{3} h_{\mathcal{L}}(x_i) \sim 0.$$

□

Remark (15.13.1.2). Another way to get this is through Tate's limiting argument(15.17.3.2). ⌟

Cor. (15.13.1.3). The Néron-Tate height is a refinement of Weil heights(15.2.1.23) made for Abelian varieties:

- The map $\widehat{h} : \mathrm{Pic}(X) \mapsto \mathbb{R}^{X(\overline{K})} : \mathcal{L} \mapsto \widehat{h}_{\mathcal{L}}$ is an additive homomorphism.
- (Symmetry)If $\varphi : A \to B$ is a homomorphisms of Abelian varieties, then $\widehat{h}_{\varphi^*(\mathcal{L})} = \widehat{h}_{\mathcal{L}} \circ \varphi$.
- (Positivity)Let $\mathcal{L} \in \mathrm{Pic}(X)$ be even. If $\mathcal{L}$ is base-free or ample, then $\widehat{h}_{\mathcal{L}} \geq 0$.
- (Boundedness)Let $\mathcal{L} \in \mathrm{Pic}(X)$ be even and ample(such an $\mathcal{L}$ exists by(15.7.1.28)), then $\widehat{h}_{\mathcal{L}}$ induces a symmetric bilinear form on $X(K)$ satisfying $\{x \in X(\overline{K}) | \deg(x) \leq d, (x,x) < C\}$ is finite for all $C > 0$

⌟

Proof: $1, 2$ follow from the corresponding property of Weil heights(15.2.1.23) and the uniqueness in(3.1.3.13).

3: Notice that the fact $\mathcal{L}$ is even implies $\widehat{h}_{\mathcal{L}} = \frac{1}{2}b(x,x)$. The ample case reduces to the base-free case, because there is a multiple $m\mathcal{L}$ that is very ample, and then $\widehat{h}_{m\mathcal{L}} = m\widehat{h}_{\mathcal{L}}$. For the base-free case, c is the pullback of $\mathcal{O}(1)$ for some morphism $X \to \mathbb{P}^n$, thus $h_{\mathcal{L}}$ is non-negative by(15.2.1.3), and $h_{\mathcal{L}} \sim \widehat{h}_{\mathcal{L}}$, thus $\widehat{h}_{\mathcal{L}}$ must also be non-negative.

4 follows from Northcott's theorem(15.2.1.24). □

Cor. (15.13.1.4)[Positive Definiteness]. For any ample line bundle $\mathcal{L} \in \mathrm{Pic}(A)$, $b_{\mathcal{L}}$ induces a positive definite symmetric bilinear form on $A(\overline{F}) \otimes_{\mathbb{Z}} \mathbb{R}$ ⌟

Proof: We want to use(3.1.3.14). Notice $b_{\mathcal{L}}$ is just $2\widehat{h}_{\mathcal{L}\otimes[-1]^*\mathcal{L}}$, thus satisfies the conditions by(15.13.1.3). □

Prop. (15.13.1.5) [Zero of Heights and Torsion]. If $F \in \texttt{GField}$, $A \in \mathcal{A}b\mathcal{V}ar/F$ and $\mathcal{L}$ is ample, then $\widehat{h}_{\varphi,\mathcal{L}}(x) = 0$ iff x is preperiodic, i.e. the sequence $\{x, \varphi(x), \varphi^2(x), \ldots\}$ is finite.

In particular, $\widehat{h}_{\mathcal{L}}(x) = 0$ iff x is torsion. ⌟

Proof: Assume $l \neq 0$. If x is preperiodic, then clearly $\widehat{h}_{\varphi,\mathcal{L}}(x) = \lim_{r\to\infty} \lambda^{-r} h_{\mathcal{L}}(\varphi^r(x)) = 0$. Conversely, if $\widehat{h}_{\varphi,\mathcal{L}}(x) = 0$, then $\widehat{h}_{\varphi,\mathcal{L}}(\varphi^r(x)) = 0$ for any r, then $|h_{\mathcal{L}}(\varphi^r(x))| \leq |\widehat{h}_{\varphi,\mathcal{L}}(\varphi(x))| + C(\varphi,\mathcal{L}) = C(\varphi,\mathcal{L})$ is bounded and also $\varphi^r(x) \in X(k(x))$, thus has bounded degree. So by Northcott's theorem(15.2.1.24), there are only f.m. such points. □

Cor. (15.13.1.6) [Kronecker]. For $\zeta \in \overline{\mathbb{Q}}$, $h^+(\zeta) = 0$(15.2.1.5). ⌟

Proof: This is a special case of(15.13.1.5), where $\varphi : \mathbb{P}^1 \to \mathbb{P}^1 : [x,y] \mapsto [x^n, y^n]$ and $\mathcal{L} = \mathcal{O}(1)$, thus the preperiodic points are just $0, \infty$ and all the roots of unity. □

Prop. (15.13.1.7) [Néron-Tate Pairings]. Let $F \in \texttt{NField}$ and $A \in \mathcal{A}b\mathcal{V}ar/F$, then $A \times \widehat{A}$ is also an Abelian variety with the even Poincaré class p(15.7.4.7), thus generating a function:

$$\widehat{h}_{A\times A^\vee,p} : A(\overline{F}) \times \widehat{A}(\overline{F}) \to \mathbb{R}.$$

Then in fact this pairing is bilinear, called the **Néron-Tate pairing** $\langle\cdot,\cdot\rangle_{A,\text{N-T}}$.

The Weil-Tate pairing satisfies the functoriality property: If $f : A \to B$ is a homomorphism of Abelian varieties, then $\langle f(a), b\rangle_{B,\text{N-T}} = \langle a, \widehat{f}(b)\rangle_{A,\text{N-T}}$. ⌟

Proof: Use functoriality of heights for $A \to A \times \widehat{A}$, then $\widehat{h}_{A\times\widehat{A},p}((a,0)) = \widehat{h}_{A,0}(a) = 0$. Similarly, $\langle 0, a\rangle_{A,K} = 0$. Thus $\widehat{h}_{A\times\widehat{A},p}$ is bilinear by(3.1.3.8).

The last assertion follows from(9.7.2.36). □

Prop. (15.13.1.8). Let $\mathcal{L} \in \text{Pic}(A)$ and $\varphi_{\mathcal{L}} : A \to \widehat{A}$ the associated homomorphism(15.7.4.3), then for any $a, a' \in A(\overline{K})$,

- $\widehat{h}_{\tau_{a'}^*\mathcal{L}}(a) = \widehat{h}_{\mathcal{L}}(a) + b(a,a')$.
- $\widehat{h}_{\mathcal{L}}(a) = \langle a, \mathcal{L}\rangle_{A,\text{N-T}}$.
- $b_{\mathcal{L}}(a,a') = \langle a, \varphi_{\mathcal{L}}(a')\rangle_{A,\text{N-T}} = \widehat{h}_{\varphi_{\mathcal{L}}(a')}(a)$.

⌟

Proof: 1: $b_{\mathcal{L}}(a,a') = \widehat{h}_{\mathcal{L}}(a+a') - \widehat{h}_{\mathcal{L}}(a) - \widehat{h}_{\mathcal{L}}(a') = \widehat{h}_{\mathcal{L}}(\tau_{a'}a) - \widehat{h}_{\mathcal{L}}(a) - \widehat{h}_{\mathcal{L}}(a')$. Then $b(\cdot,a') + \widehat{h}_{\mathcal{L}}$ is a representative in the class $h_{\tau_{a'}^*(\mathcal{L})}$ by functoriality. And it is a quadratic function, thus by uniqueness, we are done.

2: Because the pullback of p to $A \times \{\mathcal{L}\}$ is $\mathcal{L}$ by(9.7.2.34), and thus this follows from functoriality and(15.13.1.7).

3: By(15.7.4.3) and item1, $b(a,a') = \widehat{h}_{\varphi_{\mathcal{L}}(a')}(a)$. Thus we are done by item2. □

Cor. (15.13.1.9) [Regulator]. The Néron-Tate pairing induces a non-degenerate pairing $A(K)/A(K)_{\text{tor}} \times \widehat{A}(K)/\widehat{A}(K)_{\text{tor}} \to \mathbb{R}$. The discriminant of this pairing is called the **regulator** of A, denoted by $R(A/K)$. ⌟

Proof: Let $\mathcal{L} \in \text{Pic}(A)$ be ample, then $\varphi_{\mathcal{L}} : A \to \widehat{A}$ is an isogeny, thus $\varphi_{\mathcal{L}} : A(K)/A(K)_{\text{tor}} \to \widehat{A}(K)/\widehat{A}(K)_{\text{tor}}$ is injective, and by(15.14.1.7), the image is a subgroup of $\widehat{A}(K)/\widehat{A}(K)_{\text{tor}}$ of the same rank, thus we are done by(15.13.1.8) item3 and(15.13.1.4). □

Cor. (15.13.1.10). Let A be an Abelian variety, $c \in \mathrm{Pic}(A)$ an even ample class, $c' \in \mathrm{Pic}(A)$, then $\widehat{h}_{c'} = O(\widehat{h}_c^{1/2})$. ⌟

Proof: By(15.7.4.15), φ_c is isogeny thus surjective, thus we can assume $c' = \varphi_c(a')$ for some $a' \in A(K)$. Then by(15.13.1.8), $\widehat{h}_{c'}(a) = b_c(a, a')$. Because b_c is positive semi-definite by(15.13.1.3), by Cauchy-Schwartz(3.1.3.7), $|\widehat{h}_{c'}(a)|^2 \leq b(a,a)b(a',a') = 4\widehat{h}_c(a)\widehat{h}_c(a')$. □

Hilbert's Irreducibility Theorem

Prop. (15.13.1.11) [Runge's Theorem]. ⌟

Prop. (15.13.1.12) [Hilbert's Irreducibility Theorem]. Let C be a smooth irreducible projective curve over a number field K and let $f : C \to \mathbb{P}^1$ be a surjective rational function on C over K, then for all $n \in \mathbb{N}$ except for a set of natural density 0, the divisor $f^*[n]$ is a prime divisor over K. ⌟

Proof: Cf.[Diophantine Geometry, P319]. □

Local Height Pairings

Cf.[Sil99]Chap6 or [Local Heights on Curves, Gross, in Arithmetic Geometry] and [B-G06] or [Introduction to Diophantine Geometry, Lang].

Canonical Heights on Semi-Abelian Varieties

Cf.[Points of small height on semiabelian varieties]Section3 or [Poonen, Bogomolov plus Mordell-Lang].

Def. (15.13.1.13) [Canonical Height on Semi-Abelian Varieties]. ⌟

2 Isogenies

Thm. (15.13.2.1) [Masser-Wüstholz/Pellarin]. Let $F \in \texttt{NField}, d = [F : \mathbb{Q}]$. If $E, E' \in \mathcal{E}\mathrm{ll}/F$ are isogenous, then there exists an isogeny $\psi : E \to E'$ over F with degree$\leq \kappa(d)(1 + h^+(j(E)))^2$, where $\kappa(d)$ depends only on d and is effective. ⌟

Proof: **?** □

Cor. (15.13.2.2) [Bounded on Rational Isogenies]. Let $F \in \texttt{NField}, d = [F : \mathbb{Q}]$ and $E \in \mathcal{E}\mathrm{ll}/F$ without CM, and there is a cyclic isogeny $\varphi : E \to E'$ over F with degree δ, then $\delta \leq \kappa(d)(1 + h^+(j(E)))^2$. ⌟

Proof: Let $\psi : E \to E'$ be an isogeny of degree$\leq \kappa(d)(1 + h^+(j(E)))^2$. In fact we can assume that ψ is cyclic. Then $\varphi^\vee \circ \psi \in \mathrm{End}(E) = \mathbb{Z}$. Thus $\varphi = \pm\psi$ has degree$\leq \kappa(d)(1 + h^+(j(E)))^2$. □

Tate's Hom Conjecture

References are [Fal86] and [Tat66].

Lemma (15.13.2.3). Let $k \in \texttt{Field}, A_1, A_2 \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, and $\ell \in \mathbf{P}\backslash \mathrm{char}\, k$, then the natural map

$$\mathrm{Hom}(A_1, A_2) \otimes \mathbb{Z}_\ell \to \mathrm{Hom}_{\mathbb{Z}_\ell}(T_\ell(A_1), T_\ell(A_2))$$

is injective. ⌟

Proof: Same as the proof of the Elliptic case**?** Cf.[Silverman]. □

Thm. (15.13.2.4) [Tate's Hom Conjecture, Tate/Faltings]. Let $k \in \texttt{Field}^{\text{fin}}$ or $k \in \texttt{GField}$, $\ell \in \mathbf{P} \setminus \{\text{char}\, k\}$, $A_1, A_2 \in \mathcal{A}b\,\mathcal{V}ar\,/k$, then

$$\text{Hom}(A_1, A_2) \otimes \mathbb{Z}_\ell \to \text{Hom}_{\text{Gal}_k}(T_\ell(A_1), T_\ell(A_2))$$

is an isomorphism. ⌟

Proof: Firstly notice that

$$\text{Hom}(A_1, A_2)_{\mathbb{Q}_\ell} \to \text{Hom}_{\text{Gal}_k}(V_\ell(A_1), V_\ell(A_2))$$

is injective, and it suffices to show this is surjective: This follows from(15.13.2.3) and the fact $\mathbb{Q}_\ell$ is flat over $\mathbb{Z}_\ell$ and

$$\text{Coker}\Big(\text{Hom}(A_1, A_2) \otimes \mathbb{Z}_\ell \to \text{Hom}_{\text{Gal}_k}(T_\ell(A_1), T_\ell(A_2))\Big)$$

is torsion-free, because if $[f] \in \text{Hom}_{\text{Gal}_k}(T_\ell(A_1), T_\ell(A_2))$ satisfies $n[f] = [g]$ for $g \in \text{Hom}(A_1, A_2) \otimes \mathbb{Z}_\ell$, then we may assume $n \in \ell^{\mathbb{Z}_+}$, and then g vanishes on $A_1[n]$, then $g = nf$ for some $f \in \text{Hom}(A_1, A_2)$. **?** □

Cor. (15.13.2.5) [Faltings Isogeny Theorem]. Let $k \in \texttt{Field}^{\text{fin}}$ or $k \in \texttt{GField}$, $\ell \in \mathbf{P} \setminus \{\text{char}\, k\}$, $A_1, A_2 \in \mathcal{A}b\,\mathcal{V}ar\,/k$, then A_1, A_2 are isogenous iff $T_\ell(A_1) \cong T_\ell(A_2)$ as Gal_k-modules. ⌟

3 Heights of Abelian Varieties

Cf.[Milne, Abelian Varieties] and [Faltings Height].

Def. (15.13.3.1) [Faltings Heights]. Let $F \in \texttt{NField}$ and $A \in \mathcal{A}b\,\mathcal{V}ar\,/F$, take the Néron model $\mathcal{A}/\mathcal{O}_F$, then $\mathcal{K}_{\mathcal{A}/\mathcal{O}_F}$ is an invertible sheaf, and thus $\omega_{\mathcal{A}/\mathcal{O}_F}$ is an invertible $\mathcal{O}_F$-sheaf, represented by a fractional ideal $M \subset F$, and $M \otimes_R F = \Gamma(A, \mathcal{K}_{A/F})$ by(9.1.1.14).

We define a norm on $M \otimes_F F_v = \Gamma(A_v, \mathcal{K}_{A_v/F_v})$ for each $v \in \Sigma_F^\infty$:

$$||\omega||_v = \Big((\frac{i}{2})^g \int_{A(\overline{F}_v)} \omega \wedge \overline{\omega}\Big)^{1/2}.$$

This make $\widetilde{M}$ a metrized line bundle on $\mathcal{O}_F$(16.2.1.1).

Then we define the **Faltings height** of A:

$$H_{\text{Fal}}(A) = H((\widetilde{M}, |\cdot|))\text{(16.2.1.2)}, \quad h_{\text{Fal}}(A) = \frac{1}{[F:\mathbb{Q}]} \log H_{\text{Fal}}(A).$$

More explicitly, take a non-zero holomorphic g-form ω on A, and for $v \in \Sigma_F^0$, let ω_v be a Néron differential on A_v, then

$$h_{\text{Fal}}(A) = \frac{-1}{[F:\mathbb{Q}]}\Big(\sum_{v \in \Sigma_F^0} \log |\frac{\omega}{\omega_v}|_v + \sum_{v \in \Sigma_F^\infty} \frac{[F_v : \mathbb{Q}_v]}{2} \log \Big|(\frac{\mathrm{i}}{2})^g \int_{A(\overline{F}_v)} \omega \wedge \overline{\omega}\Big|\Big).$$

⌟

Def. (15.13.3.2) [Stable Faltings Height]. Let $F \in \mathtt{NField}$ and $A \in \mathcal{A}b\,\mathcal{V}ar\,/F$, then by**??** there exists a finite extension L/F s.t. A_L is semistable. Then the Néron model of A_L are stable under base change**?**. Then we can define the **stable Faltings height** $h_{\mathrm{st}}(A) = h(A_L)$, which is invariant of L chosen. ⌟

Prop. (15.13.3.3). Let $F \in \mathtt{NField}$ and $A \in \mathcal{A}b\,\mathcal{V}ar\,/F$, then $h_{\mathrm{Fal}}(A) = h_{\mathrm{Fal}}(A^\vee)$. ⌟

Proof: Cf.[Szpiro, La Conjecture de Mordell, Séminaire Bourbaki, 1983/84]. □

Prop. (15.13.3.4) [Colmez]. If A, A' are isogenous, then $h_{\mathrm{Fal}}(A) = h_{\mathrm{Fal}}(A')$. ⌟

Proof: □

Thm. (15.13.3.5) [Heights and Isogenies]. Let $F \in \mathtt{NField}$, $\mathcal{A}_1, \mathcal{A}_2$ be semi-Abelian schemes over $\mathcal{O}_F$ of relative dimension g with proper generic fiber $A_1, A_2 \in \mathcal{A}b\,\mathcal{V}ar\,/F$. Let $\varphi : \mathcal{A}_1 \to \mathcal{A}_2$ be an isogeny with kernel $\mathcal{G}/\mathcal{O}_F$, then

$$h_{\mathrm{st}}(A_2) = h_{\mathrm{st}}(A_1) + \frac{1}{2}\log\deg(\varphi) - [F : \mathbb{Q}]\log e^*\Omega^1_{\mathcal{G}/\mathcal{O}_F}.$$

⌟

Proof: Cf.[Faltings, Lemma5] or [Faltings height].**?** □

Thm. (15.13.3.6)[Finiteness of Heights in an Isogeny Class]. Let $F \in \mathtt{NField}$ and $A \in \mathcal{A}b\,\mathcal{V}ar\,/F$ be semistable, then the set of Faltings height of $B \in \mathcal{A}b\,\mathcal{V}ar\,/F$ isogenous to A is finite. ⌟

Proof: This is the hardest part of the proof.**?** Cf.[Conrad Seminar, L20]. □

Modular Heights

Def. (15.13.3.7) [Modular Heights]. Consider the Siegel modular varieties $\mathcal{M}_{g,d}/\mathbb{Q}$ parametrizing Abelian schemes(19.1.3.3), then for any $F \in \mathtt{NField}$, $(A, \lambda) \in \mathcal{A}b\,\mathcal{V}ar^{\dim=g,\mathrm{polar}=d}\,/F$ defines a F-point $j((A, \lambda))$ of $\mathcal{M}^{g,d}$. Then we can define the **modular height** $h_M(A, \lambda)$ to be $h(j((A, \lambda)))$, where h is the Weil height associated to the canonical ample divisor on $\mathcal{M}^{g,d}$(19.1.3.4), which is defined up to a bounded function on $\mathcal{M}^{g,d}$. ⌟

Prop. (15.13.3.8) [Comparison of Heights]. For $F \in \mathtt{NField}$, there are constants c_1, c_2, c_3 s.t. for any semistable $(A, \lambda) \in \mathcal{A}b\,\mathcal{V}ar^{\mathrm{polar}}\,/F$,

$$|h_{\mathrm{Fal}}(A) - c_1 h_M(A, \lambda)| < c_2 \log h_M(A, \lambda) + c_3.$$

⌟

Proof: **?** Hard. Cf. [Chai and Faltings, 1990]. □

Prop. (15.13.3.9) [Height I]. Let $F \in \mathtt{NField}$ and $g, d, C \in \mathbb{Z}_+$, then up to isomorphism, there are only f.m. semistable $(A, \lambda) \in \mathcal{A}b\,\mathcal{V}ar^{g,\mathrm{polar}=d}\,/k$ s.t. $h_M(A, \lambda) < C$. ⌟

Proof: By the definition of Siegel modular varieties, two objects in $(A, \lambda) \in \mathcal{A}b\,\mathcal{V}ar^{g,\mathrm{polar}=d}\,/F$ corresponds to the same point of $\mathcal{M}^{g,d}$(15.13.3.7) iff they are isomorphic over $\overline{F}$. And by Northcott's theorem(15.2.1.24) the image of polarized Abelian varieties with bounded modular heights is finite. Thus the assertion follows from(15.13.5.2). □

Cor. (15.13.3.10) [Height II]. Let $F \in \texttt{NField}$ and $g, C \in \mathbb{Z}_+$, then up to isomorphism, there are only f.m. semistable $A \in \mathcal{A}b\mathcal{V}ar^g/F$ s.t. $h_{\text{Fal}}(A) < C$, by(15.13.3.8).

(Is this true for non-semistable varieties**?**). ⌟

Proof: By the proposition(15.13.3.9) and(15.13.3.8), the set of isomorphism classes of semistable Abelian varieties $(B, \lambda) \in \mathcal{A}b\mathcal{V}ar^{g,\text{polar}=d}/F$ is finite. Now notice for any $A \in \mathcal{A}b\mathcal{V}ar/F$, $B = (A \times A^\vee)^4$ is principally polarized by(15.7.7.2), and $h(B) = 8h(A)$ by(15.13.3.3), so we are done. □

Elliptic Curve case

Prop. (15.13.3.11)[Heights of Elliptic Curves]. For $F \in \texttt{NField}$ and $E \in \mathcal{E}ll/F$. For each $v \in \Sigma_F^\infty$, let $\tau_v \in \mathcal{H}$ in the fundamental domain s.t. $E_{\overline{K}_v} \cong E_{\tau_v}$. Then

$$12[F:\mathbb{Q}]h_{\text{Fal}}(E/F) = \log\left|\operatorname{Nm}_{F/\mathbb{Q}} N_{E/F}\right| - \sum_{v \in \Sigma_F^\infty}[F_v:\mathbb{Q}_v]\log\left|\Delta(\tau_v)(\operatorname{Im}\tau_v)^6\right|.$$

⌟

Proof: Choose any Weierstrass model $W: y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$, and let Δ be its discriminant, and take

$$\omega = \Delta.\Big(\frac{\mathrm{d}x}{2y + a_1x + a_3}\Big)^{\otimes 12}.$$

Then notice this ω is invariant under change of variables, thus $-\sum_{v\in\Sigma_F^0}\log|\frac{\omega}{\omega_v}|_v = |\operatorname{Nm}_{F/\mathbb{Q}} N_{E/F}|$**?**. □

Prop. (15.13.3.12). For $F \in \texttt{NField}, E \in \mathcal{E}ll/F$,

$$O(1) \le h^+(j(E)) + \frac{1}{[F:\mathbb{Q}]}\log|\operatorname{Nm}_{F/\mathbb{Q}}\Upsilon_{E/F}| - 12h_{\text{Fal}}(E/F) \le 6\log(1 + h^+(j(E))) + O(1).$$

In particular, if E/F is semistable, then

$$|h^+(j(E)) - 12h_{\text{Fal}}(E/F)| \le 6\log(1 + h^+(j(E))) + O(1),$$

which is a special case of(15.13.3.8). ⌟

Proof: Cf.[Heights and Elliptic Curves, P258]**?**. □

Cor. (15.13.3.13). For any $\varepsilon \in \mathbb{R}_+$, we have: $E \in \mathcal{E}ll/\mathbb{Q}$,

$$h_{\text{Fal}}(E/\mathbb{Q}) + O(1) \le \frac{1}{12}\max(|j(E)|, |\Delta_E^{\min}j(E)|) \le (1+\varepsilon)h_{\text{Fal}}(E/\mathbb{Q}) + O_\varepsilon(1),$$

$$h_{\text{Fal}}(E/\mathbb{Q}) + O(1) \le \frac{1}{12}\max(|c_4(E)|^3, |c_6(E)|^2) \le (1+\varepsilon)h_{\text{Fal}}(E/\mathbb{Q}) + O_\varepsilon(1).$$

⌟

Proof: By definition, $h^+(j(E)) + \log|\Upsilon_E| = \log\max(|j\Delta_E^{\min}, |\Delta_E^{\min}|)$. So the first inequality follows from(15.13.3.12) and the fact $\log(1+h) < \varepsilon h + O_\varepsilon(1)$ for $h \in \mathbb{R}_+$.

The second inequality follows from the first by the definition of Δ and j(15.11.1.5). □

Cor. (15.13.3.14) [Northcott Property for Elliptic Curves]. For $d, C \in \mathbb{R}_+$, there exists only f.m. pairs (F, E) where $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F$ s.t. $F = \mathbb{Q}(j(E))$, $\deg(F) \le d$ and $h_{\mathrm{Fal}}(E/F) \le C$. ⌟

Proof: It follows from(15.13.3.12) that for such pairs (F, E), $h^+(j(E))$ is bounded from above, so by Northcott, there are only f.m. possibilities for $j(E)$. Then it suffices to show that for any $E \in \mathcal{E}\mathrm{ll}/\overline{\mathbb{Q}}$, there are only f.m. $E' \in \mathcal{E}\mathrm{ll}/\mathbb{Q}(j(E))$ s.t. $j(E') = j(E)$ and $h(E'/\mathbb{Q}(j(E))) \le C$.

Denote $F = \mathbb{Q}(j(E))$, it follows from(15.13.3.12) that for any such E', $|\mathrm{Nm}_{F/\mathbb{Q}} \Upsilon_{E'/F}|$ is bounded. Choose $S \in \Sigma_F$ s.t. $S(6) \cup \Sigma_F^\infty \cup \mathrm{Ram}_{E/F} \subset S$ and $\mathrm{cl}(\mathcal{O}_{F,S}) = 1$, **?** □

4 Small Points

Notation (15.13.4.1).

- Let $F \in \mathtt{NField}$ and $G \in \mathrm{semi}\,\mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$ with maximal subtorus T of dimension t and quotient $A = G/T$ of dimension g.
- Let $\mathcal{L}$ be the canonical line bundle and h be a canonical height on A(15.13.1.13).
- For each $x \in G(\overline{\mathbb{Q}})$, use $\mathcal{O}(x)$ to denote the Galois orbit of x.
- A **torsion subvariety** is a subvariety $Y \subset G$ of the form $Y = x + B$ where x is a torsion point and $B \subset G$ is an semi-Abelian subvariety.

⌟

Def. (15.13.4.2) [Small Sequences]. A sequence $(x_n)_{n\in\mathbb{N}} \subset G(\overline{F})$ is called

- **strict** if no infinite subsequence is contained in a proper torsion subvariety of A.
- **generic** if no infinite subsequence is contained in a proper subvariety of A.
- **small** if $\lim_{n\to\infty} h(x_n) = 0$.

⌟

Prop. (15.13.4.3). If $X \in \mathcal{V}\mathrm{ar}/\overline{\mathbb{Q}}$ and $(x_n) \in X^{\mathbb{N}}$ is a Zariski dense sequence in X, then (x_n) has a generic sequence. ⌟

Proof: This follows from the fact that there are only countably many proper subvarieties of X. □

Thm. (15.13.4.4) [Strong Equidistribution Conjecture, Bilu/Szpiro-Ullmo-Zhang/Kuhne]. For any strict small sequence(15.13.4.2) $(x_i) \in A^{\mathbb{N}}$, there is a weak convergence of measures on $G_{\mathbb{C}_v}^{\mathrm{an}}$:

$$\frac{1}{\#\mathcal{O}_v(x_i)} \sum_{y\in\mathcal{O}_v(x_i)} \delta_y \rightharpoonup \frac{1}{\deg_{\mathcal{L}}(\overline{G})} c_1(\overline{\mathcal{L}_v})^{\wedge(g+t)}.$$

Notice for $v \in \inf \Sigma_F$, $c_1(\overline{\mathcal{L}_v})^{\wedge(g+t)}$ is a Haar measure on $G_{\mathbb{C}_v}^{\mathrm{an}}$. ⌟

Proof: Cf.[Points of small height on semiabelian varieties]P2078**?**. The proof is Arakelov, and is similar to that of the Abelian variety case. □

Cor. (15.13.4.5) [Mordell-Lang plus Bogomolov, Poonen/Remond]. Let $\Gamma \subset G(\overline{F})$ be a f.g. subgroup, with divisible hull Γ'. For $\varepsilon \in \mathbb{R}_+$, denote $\mathbb{D}(\Gamma', \varepsilon) \subset G(\overline{F})$ the metric nbhd in the metric defined by the canonical height**?**. Then for any closed subvariety $X \subset A$, there exists some $\varepsilon \in \mathbb{R}_+$ s.t. $X(\overline{F}) \cap \Gamma'_\varepsilon$ is contained in a finite union $\cup_j Z_j$ where each $Z_j \subset X_{\overline{F}}$ is a torsion subvariety(15.13.4.1). ⌟

Proof: ?. Cf.[Poonen]. □

Cor. (15.13.4.6) [Bogomolov Conjecture, Ullmo-Zhang]. If $X \subset A$ is subvariety but not a torsion subvariety, then there exists $\varepsilon \in \mathbb{R}_+$ s.t. $\{P \in X(\overline{F}) | h(P) \leq \varepsilon\}$ is not Zariski-dense in X. ⌟

Proof: ? □

Cor. (15.13.4.7) [Manin-Mumford-Lang Conjecture, Raynaud]. By Bogomolov conjecture(15.13.4.6) and(15.13.1.5), if $X \subset G$ is subvariety but not a torsion subvariety, then $X(\overline{\mathbb{Q}}) \cap G(\overline{\mathbb{Q}})_{\mathrm{tor}}$ is not Zariski-dense in X. ⌟

Thm. (15.13.4.8) [Equidistribution of Small Points, Zhang]. If $(x_n)_{n \in \mathbb{N}}$ is a small and strict sequence in A, then for any continuous function on A^{an},

$$\lim_{n \to \infty} \frac{1}{\#\mathcal{O}(x_n)} \sum_{y \in O(x_n)} f(y) = \int_{A^{\mathrm{an}}} f \mathrm{d}x.$$

⌟

Proof: Firstly (x_n) is generic: If there is an infinite subsequence with Zariski closure a proper subvariety $X \subset A$, then it follows from Bogomolov's conjecture(15.13.4.6) that X is a torsion subvariety. Then (x_n) is not strict, contradiction.

□

Cor. (15.13.4.9). Let $S \subset A^{\mathrm{an}}$ be a closed subset, then S contains only f.m. non-Galois-conjugate maximal torsion subvarieties. And if S' is the complement in S of all the Galois orbits of maximal torsion subvarieties contained in S, then there exists $\varepsilon \in \mathbb{R}_+$ s.t. for any $x \in A(\overline{\mathbb{Q}})$ s.t. $O(x) \subset S'$, $h(x) > \varepsilon$. ⌟

Proof: ? □

Thm. (15.13.4.10) [Theorem of Successive Minima]. Let $F \in \mathtt{NField}, X \in \mathcal{V}\mathrm{ar}^d/F$, and $\mathcal{L}$ an ample line bundle on X with a semipositive adelic metric $|| \cdot ||$. For $1 \leq i \leq d$, define

$$\lambda_i = \sup_{Y \subset X, \dim Y = i} \Big(\inf_{P \in X(\overline{\mathbb{Q}}) \setminus Y(\overline{\mathbb{Q}})} h_{\mathcal{L}}(P) \Big),$$

then

$$\lambda_d \geq h_{\mathcal{L}}(X) \geq \frac{1}{d}(\lambda_1 + \ldots + \lambda_d).$$

⌟

Proof: Cf.[Small Points and Adelic metric, Shouwu Zhang].? □

Small Points on $\mathbb{G}_m^n$

References are [Sch96] and [B-G06].

Small Points on Elliptic Curves

Conj. (15.13.4.11)[Lang's Height Conjecture]. For any $F \in \texttt{NField}$, there exists $c_1(F), c_2(F) \in \mathbb{R}_+$ s.t. for any $E \in \mathcal{E}\mathrm{ll}/F$ and $P \in E(F) \setminus E(F)_{\mathrm{tor}}$,

$$h_{\text{N-T}}(P) \geq c_1(F) \log |\operatorname{Nm}_{F/\mathbb{Q}} \Delta_{E/F}^{\min}| + c_2(F).(15.11.4.23)$$

⌟

Thm& Conj.Cor. (15.13.4.12) [Silverman]. This conjecture is true when we restrict to $E \in \mathcal{E}\mathrm{ll}/F$ with $j(E) \in \mathbb{Z}$. ⌟

Proof: Cf.[Sil86]P263. □

5 Finiteness Theorems(Faltings)

Prop. (15.13.5.1). Let $L/F \in \texttt{NField}$ be Galois, then for any $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$, there exists f.m. isomorphism classes of $B \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$ s.t. $A_L \cong B_L$. ⌟

Proof: Cf.[Conrad note, L14]**?** □

Prop. (15.13.5.2) [Weak Finiteness, Faltings]. Let $F \in \texttt{NField}$ and $(A, \lambda) \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^{g,\mathrm{polar}=d}/F$, then there exists only f.m. isomorphism classes of $(B, \lambda') \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^{g,\mathrm{polar}=d}/F$ s.t. $(A_{\overline{F}}, \lambda) \cong (B_{\overline{F}}, \mu)$. ⌟

Proof: Firstly, by(15.7.12.11), any such B is also semistable, so the set of good reductions are stable under base change, thus the set of good reductions of A and B in Σ_F are the same.

Then by(15.14.1.1) and(14.4.1.28), for $\ell \in \mathbf{P}\backslash\{2\}$, there is a finite extension L/F s.t. every ℓ-torsion points of such B are in $B(L)$.

Now any such B are isomorphic to A over L as above: Given any isomorphism $\alpha : (A_{\overline{F}}, \lambda) \cong (B_{\overline{F}}, \mu)$, for $\alpha \in \mathrm{Gal}_L$, α and $\sigma(\alpha)$ has the same action on ℓ-torsion points, as all these points are L-rational, so $\sigma(\alpha)^{-1} \circ \alpha$ acts trivially on $A[\ell]$, which implies by(15.7.7.6) that $\sigma = \alpha(\sigma)$, so σ is defined over L and we are done.

Finally we finish using(15.13.5.1) and(15.7.7.3). □

Thm. (15.13.5.3) [Finiteness I]. Let $F \in \texttt{NField}$ and $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$, then there are only f.m. isomorphism classes of Abelian varieties $B \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$ isogenous to A. ⌟

Proof: If A is semistable, then by(15.7.12.11), any $B \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$ isogenous to A is also semistable. Then we are done by(15.13.3.10) and(15.13.3.6).

For a general A, there exists a finite extension L/F s.t. A_L is semistable by**??**. Then the general case reduced to the semistable case by using(15.13.5.1). □

Thm. (15.13.5.4)[Finiteness II, Shafarevich/Faltings]. Let $F \in \texttt{NField}, 0 \subset_{\mathrm{fin}} S \subset \Sigma_F$, then there are only f.m. isomorphism classes of $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^g/F$ having good reduction at all finite places outside S. ⌟

Proof: By(15.13.5.3), it suffices to show that there are only f.m. isogeny classes of $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^g/F$ having good reduction at all finite places outside S. But then we can use(15.7.12.19) and the fact there are only f.m. such polynomials $P_\ell(A_v, t)$ because of Weil conjecture. □

Mordell-Lang Conjecture

Thm. (15.13.5.5) [Mordell-Lang Conjecture, Falting-Vojta/Hindry/Raynaud/McQuillan]. Let $F \in$ `NField` and G/F be a semi-Abelian variety. Suppose $X \subset A$ is a closed subvariety that is not a translate of a semi-Abelian subvariety of A, and $\Gamma \subset A(\overline{F})$ is a f.g. subgroup, with divisible hull Γ', then $X(\overline{F}) \cap \Gamma'$ is not Zariski dense in X. ⌟

Proof: ? □

Applications to Curves

Prop. (15.13.5.6) [Genus 0 Curves]. For $F \in$ `GField` of characteristic$\neq 2$ and any smooth complete curve C/F genus 0 is a conic in $\mathbb{P}^2$. Thus by(6.12.8.2), it is isomorphic to $\mathbb{P}^1$ iff it has a rational point. But by Hasse-Weil principle, this is equivalent to it having a rational point over each local field of F, and this can be understood via Hilbert symbol. ⌟

Thm. (15.13.5.7) [Shafarevich's Conjecture, Faltings]. Let $F \in$ `GField` and $S \subset \Sigma_F$ a finite set of places, $g \in \mathbb{Z}_+$, then there are only f.m. isomorphism classes of smooth curves over k of genus g having good reduction at all finite places outside S. ⌟

Proof: This follows from(15.7.10.16)(15.7.10.15) and(15.7.7.3)(15.13.5.4). □

Prop. (15.13.5.8) [Kodaira-Parshin]. Let $F \in$ `NField` and S is a finite set of places of F containing all places over 2, then for any complete non-singular curve C/F of genus≥ 1 having good reduction at non-Archimedean places outside S, there exists a finite extension L/F and a constant N, s.t.: For any $P \in C(F)$, there exists a complete smooth curve C^P over L and a finite map $\varphi^P : C^P \to C_L$, that satisfies

- C^P has good reduction at places not above S.
- $g(C^P) \leq N$.
- φ_P is ramified exactly at P.

⌟

Proof: Cf.[Mil08]P115, 145.? □

Thm. (15.13.5.9)[Uniform Mordell Conjeture1922, Faltings1983]. For $g \in \mathbb{Z}_{\geq 2}$ and $d \in \mathbb{Z}$, there exists $C(g, d) \in \mathbb{Z}_+$ s.t. for any $F \in$ `NField` with $\deg(F) = d$ and C/F be a complete non-singular curve of genus g, we have

$$\#C(F) \leq C(g, d).$$

⌟

Proof: We only prove that $\#C(F)$ is finite?.

Using the construction of Kodaira-Parshin(15.13.5.8), there is a finite extension L/F s.t. any $P \in C(F)$ corresponds to a curve C^P over L and a map $\varphi_P : C^P \to C_L$. By Shafarevich's conjecture applied to L(15.13.5.7), there are only f.m. isomorphism classes of C^P. But for different P, Q s.t. $C^P \cong C^Q$, the maps φ_P, φ_Q are non-isomorphic, as they are ramified at different places. So we are done by de Franchis' theorem(6.12.1.34). □

Prop. (15.13.5.10)[Manin-Mumford]. Let $F \in$ `NField` and C/F be a complete non-singular curve of genus $g \geq 2$, and J the Jacobian of C. Fix an embedding $C \hookrightarrow J$ over F, then $\#C(\overline{F}) \cap J(\overline{F})_{\text{tor}} < \infty$. ⌟

Proof: This follows from the Manin-Mumford-Lang conjecture(15.13.4.7), as C is a not a torsion subvariety. □

6 Galois Cohomologies of Abelian Varieties

Prop. (15.13.6.1) [Fundamental Exact Sequence]. Let $\varphi : X \to X'$ be an étale isogeny between Abelian varieties over a field k, then there is an exact sequence

$$0 \to \ker(\varphi)(k^s) \to X(k^s) \to X'(k^s) \to 0$$

by(9.1.5.5), thus taking Galois cohomology, there is an exact sequence

$$0 \to X'(k)/\varphi(X(k)) \xrightarrow{\delta} H^1(G_k, X[\varphi]) \to H^1(G_k, X)[\varphi] \to 0.$$

⌟

Cor. (15.13.6.2). By(15.7.6.14), if $n \in \mathbb{Z} \cap K^\times$, then there is an exact sequence

$$0 \to X(k^s)/nX(k^s) \xrightarrow{\delta} H^1(G_k, X[n]) \to H^1(G_k, X)[n] \to 0.$$

And the first map is described as follows: for $P \in X(k^s)$, let $[n]Q = P$ where $Q \in K(k^s)$, then P is mapped to the 1-cocycle $f(\sigma) = \sigma(Q) - Q$. ⌟

Prop. (15.13.6.3). Let F be a global field or the function field of a non-singular smooth curve over an alg.closed field k, $\varphi : X \to X' \in \mathcal{A}b\mathcal{V}ar/F$ an étale isogeny, then by restriction(8.7.1.10), there is an exact sequence

$$\begin{array}{ccccccccc} 0 & \longrightarrow & X'(F)/\varphi(X(F)) & \longrightarrow & H^1(\mathrm{Gal}_F, X[\varphi]) & \longrightarrow & H^1(\mathrm{Gal}_F, X)[\varphi] & \longrightarrow & 0 \\ & & \downarrow & & \downarrow \mathrm{res} & & \downarrow \mathrm{res} & & \\ 0 & \longrightarrow & \prod_{v\in\Sigma_F^{\mathrm{fin}}} X'(F_v)/\varphi(X(F_v)) & \longrightarrow & \prod_{v\in\Sigma_F^{\mathrm{fin}}} H^1(\mathrm{Gal}_{F_v}, X[\varphi]) & \longrightarrow & \prod_{v\in\Sigma_F^{\mathrm{fin}}} H^1(\mathrm{Gal}_{F_v}, X)[\varphi] & \longrightarrow & 0 \end{array}.$$

Where v are extended to K^s arbitrarily. ⌟

Def. (15.13.6.4) [(Classical)Selmer Groups]. Let F be a global field or the function field of a non-singular smooth curve over an alg.closed field k, $\varphi : A \to A' \in \mathcal{A}b\mathcal{V}ar/F$ an étale isogeny, the φ-**Selmer group** of A/F is a subgroup of $H^1(\mathrm{Gal}_F, A[\varphi])$ defined by

$$\mathrm{Sel}^\varphi(A/F) = \ker\Big(H^1(\mathrm{Gal}_F, A[\varphi]) \to \prod_{v\in\Sigma_F} H^1(\mathrm{Gal}_{F_v}, A)[\varphi]\Big).$$

Notice the kernel is independent of the extension of v to F^s, because any two such extensions induce conjugate groups Gal_{F_v} in Gal_F and use(8.7.1.12). ⌟

Def. (15.13.6.5)[Shafarevich-Tate Group]. The **Shafarevich-Tate group** of $A \in \mathcal{A}b\mathcal{V}ar/F$ is the subgroup of $H^1(\mathrm{Gal}_F, A[\varphi])$ defined by

$$Ш(A/F) = \ker\Big(H^1(\mathrm{Gal}_F, A) \to \prod_{v\in\Sigma_F^{\mathrm{fin}}} H^1(\mathrm{Gal}_{F_v}, A)\Big).$$

Notice the kernel is independent of the extension of v to F^s, because any two such extensions induces conjugate groups Gal_{F_v} in Gal_F and use(8.7.1.12).

For $f : A \to B \in \mathcal{A}b\mathcal{V}ar/F$, there is a natural map $f_* : Ш(A/F) \to Ш(B/F)$. ⌟

Prop. (15.13.6.6) [Selmer Groups and Shafarevich-Tate Groups]. Let C be a proper Dedekind scheme or a non-singular curve over a field k with fraction field F, $\varphi : A \to A'$ an étale isogeny of Abelian varieties over F, then there is an exact sequence

$$0 \to A'(K)/\varphi(A(K)) \to \mathrm{Sel}^{\varphi}(A/K) \to Ш(A/K)[\varphi] \to 0.$$

⌟

Proof: This exact sequence is a consequence of (15.13.6.3) and (15.13.6.4)(15.13.6.5). □

Remark (15.13.6.7) [Computability]. It is difficult to characterize $A'(K)/\varphi(A(K)) \subset \mathrm{Sel}^{\varphi}(A/K)$. ⌟

Prop. (15.13.6.8) [$\mathrm{Sel}^{\varphi}(A)$ **is Finite].** Let F be a global field or the function field of a non-singular smooth curve over an alg.closed field k, $\varphi : A \to A'$ an étale isogeny of Abelian varieties over F, then if S is a finite set of places of F containing all the places dividing $\deg(\varphi)$, and the places that A has bad reductions, then any element in $\mathrm{Sel}^{\varphi}(A/F)$ is unramified at all finite places outside S. In particular, $\mathrm{Sel}^{\varphi}(A/F)$ is finite, by (8.7.3.11). ⌟

Proof: By definition of Sel^{φ} and (15.13.6.3), if $\xi \in \mathrm{Sel}^{\varphi}(A/F)$, then for any $v \in \Sigma_F^0$, there is some $P \in A(F_v^s)$ s.t. $\xi_\sigma = \sigma(P) - P \in A[\varphi]$ for any $\sigma \in G_v$. But if A has good reduction at v and $\sigma \in I_v$, then $\sigma(P) - P$ mapsto $\widetilde{O} \in \widetilde{A}_v$. But notice $A[\varphi] \subset A[m]$ which maps injectively into $\widetilde{A}_v(k_v)$ by (15.11.4.19) if v is not dividing $\deg(\varphi)$. Thus in this case, $\xi_\sigma = 0$ for any $\sigma \in I_v$. □

Cor. (15.13.6.9) [ℓ^∞**-Selmer Groups].** If $\ell \in \mathbf{P} \setminus \mathrm{char}\, F$, then the ℓ-primary part $Ш(A/F)[\ell^\infty] = \varinjlim_{n\geq 1} Ш(A/F)[\ell^n]$ is isomorphic to $(\mathbb{Q}_\ell/\mathbb{Z}_\ell)^{\delta_\ell} \times T_\ell$ for some $\delta_\ell \in \mathbb{N}$ and $T_\ell \in \mathcal{A}\mathrm{b}^{\mathrm{fin}}$. And define

$$\mathrm{Sel}^{\ell^\infty}(A/F) = \varinjlim_{n\geq 1} \mathrm{Sel}^{\ell^n}(A/F),$$

called the ℓ^∞**-Selmer group**. Then by taking limits of the exact sequence in (15.13.6.6), there is an exact sequence

$$0 \to A(F) \otimes \mathbb{Q}_\ell/\mathbb{Z}_\ell \to \mathrm{Sel}^{\ell^\infty}(A/F) \to Ш(A/F)[\ell^\infty] \to 0.$$

If we define the ℓ^∞**-Selmer rank** $\mathrm{rank}_\ell(A/F) = \mathrm{rank}(A/F) + \delta_\ell$, then

$$\mathrm{Sel}^{\ell^\infty}(A/F) = (\mathbb{Q}_\ell/\mathbb{Z}_\ell)^{\mathrm{rank}_\ell(A/F)} \cdot \widetilde{Ш}(A/F)[\ell^\infty],$$

where $\#\widetilde{Ш}(A/F)[\ell^\infty] < \infty$. Notice $\mathrm{rank}_\ell(A/F)$ is a cohomological number. ⌟

Conj. (15.13.6.10) [Tate-Shafarevich]. For $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$, $\#Ш(A/F) < \infty$. ⌟

Proof: □

Remark (15.13.6.11). There are still no $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) \geq 2$ s.t. $Ш(E/\mathbb{Q})$ can be shown to be finite. ⌟

Prop. (15.13.6.12) [Cassels-Tate Pairing]. Let $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}/F$ and $\widehat{A}$ its dual, then there is a bilinear **Cassels-Tate pairing** $Ш(A/K) \times Ш(\widehat{A}/K) \to \mathbb{Q}/\mathbb{Z}$ and the kernel on both sides are the set of divisible elements. ⌟

Proof: Cf.[Birch and Swinnerton-Dyer Conjecture, P10].**?** □

Cor. (15.13.6.13) [Principally Polarized Case]. If $K \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/F$ has a principal polarization λ that comes from a rational divisor D, then the pullback pairing $Ш(A/K) \times Ш(A/K) \to \mathbb{Q}/\mathbb{Z}$ is alternating. In particular, if $\#Ш(A/F) < \infty$, then it is a perfect square, by(3.1.3.16).

In particular, if $E \in \mathcal{E}\mathrm{ll}/F$ and $\#Ш(E/F) < \infty$, then it is a perfect square. ⌟

Proof: □

Remark (15.13.6.14). This is not right for general Abelian varieties. ⌟

The discussion of Selmer groups and ranks are continued in B-S.D Conjecture21.6.

Elliptic Curves

Mazur's Control Theorem

Thm. (15.13.6.15) [Mazur]. For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, and E has good ordinary reduction over all primes lying over p. Assume $F_\infty = \cup_n F_n$ is a $\mathbb{Z}_p$-extension of F, then the natural map

$$\mathrm{Sel}(E/F_n)_p \to \mathrm{Sel}(E/F_\infty)_p^{\mathrm{Gal}(F_\infty/F_n)}$$

has finite kernels and cokernels of bounded orders as $n \to \infty$. ⌟

Proof: Cf.[Mazur's Control Theorem for Elliptic Curves]. □

15.14 Rational Points

Main references are [Sta], [Abelian Varieties notes Conrad], [Mil08], [B-G06], [Abelian Variety van der Geer], [BLR90], [Sil16] and [Sil99], [Sil11], http://www-personal.umich.edu/~asnowden/teaching/2013/679/index.html.

1 Mordell-Weil Theorem

Prop. (15.14.1.1)[Local Chevalley-Weil Theorem for Abelian Varieties]. Let S be a Dedekind scheme with function field F, Let A be an Abelian variety over F and $m \in \mathbb{Z} \cap F^*$. Let $s \in S$ be a closed point s,t. A has good reduction over $\mathcal{O}_{S,s}$ and $m \neq 0 \in \kappa(s)$, then for any $P \in A(\overline{F})$, the extension $\kappa(P)/\kappa([m]P)$ is unramified at all places over v. ⌟

Proof: By base change, we may assume $Q = [m]P$ is a rational point. Let w be a place of $\kappa(P)$ that $w|v_s$ with valuation ring R_w. As A has good reduction in v, A extends to an Abelian scheme $\overline{A}$ over $\mathcal{O}_{S,s}$, then the valuation criterion of properness shows P extends to a R_w-valued point of $\overline{A}$. Now the theorem follows from(15.7.6.14) and(6.6.5.16). □

Cor. (15.14.1.2). Let F be a global field, $X \in \mathcal{A}b\,\mathcal{V}ar\,/F$ and $n \in \mathbb{Z} \cap F^*$, $L = K(X[n](\overline{F}))$, i.e. the composite of all fields in $\overline{F}$ obtained by adjoining $[n]^{-1}x, x \in X(F)$, then L is a finite field extension of F. ⌟

Proof: This follows from the proposition and(14.4.1.28). □

Lemma (15.14.1.3)[Weak Mordell-Weil Theorem]. Let $F \in$ `GField` and $X \in \mathcal{A}b\,\mathcal{V}ar\,/F$, then for $n \in \mathbb{Z} \cap F^*$, $X(F)/nX(F)$ is finite. ⌟

Proof: This follows from the finiteness of the Selmer group(15.13.6.8) and(15.13.6.6). □

Prop. (15.14.1.4)[Mordell-Weil Theorem]. Let $F \in$ `GField`, then the group $X(F)$ of rational points of an Abelian variety X is f.g. ⌟

Proof: Because of(15.14.1.3) and(15.13.1.3), this follows from(3.1.3.15) applied to $M = X(K')$ and the symmetric bilinear form on $X(K')$ given by(15.13.1.3). □

Remark (15.14.1.5) [Computability]. The difficulty of computing $X(F)$ lies entirely at computing $X(F)/nX(F)$ for some n, for which, see(15.13.6.7). ⌟

Cor. (15.14.1.6) [Rank]. $X(F) \cong \mathbb{Z}^r \oplus X(F)_{\mathrm{tor}}$, where $X(F)_{\mathrm{tor}}$ is a finite group, and r is called the **rank of** X. ⌟

Cor. (15.14.1.7) [Isogenous Varieties have the same Rank]. Let $F \in$ `GField` and $X, X' \in \mathcal{A}b\,\mathcal{V}ar\,/F$ are isogenous, then $\mathrm{rank}(X) = \mathrm{rank}(X')$. In particular, $\mathrm{rank}(X) = \mathrm{rank}(\widehat{X})$. ⌟

Proof: The isogeny implies $X(F)/X(F)_{\mathrm{tor}} \to \widehat{X}(F)/\widehat{X}(F)_{\mathrm{tor}}$ is injective. Thus $\mathrm{rank}(X) \leq \mathrm{rank}(\widehat{X})$. The converse follows from(15.7.6.3). □

2 Lang-Néron Theorem

Main references are [Con06].

Def. (15.14.2.1) [Regular Extensions]. A field extension K/k is called **primary** if k is separably closed in K. It is called **regular** if it is separable and primary. ⌟

Prop. (15.14.2.2). Let K/k be a primary extension, then

- If $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, then any Abelian subvariety of A_K is defined over k.
- If $A, B \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, then any homomorphism $A_K \to B_K$ is defined over k.

⌟

Proof:

□

Prop. (15.14.2.3) [K/k-Images and K/k-Traces]. For a field extension K/k, the **K/k-image** is a functor $\mathrm{Im}_{K/k} : \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/K \to \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$ left adjoint to the base change functor, and **K/k-trace** is a functor $\mathrm{tr}_{K/k} : \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/K \to \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$ right adjoint to the base change functor.

Then for K/k primary, $\mathrm{Im}_{K/k}$ and $\mathrm{tr}_{K/k}$ exist, and are resp. left and right inverses to the base change functor. Also there is a natural isomorphism

$$\widehat{\mathrm{Im}_{K/k}(A)} \cong \mathrm{tr}_{K/k}(\widehat{A}).$$

The adjunction maps are denoted by

$$\tau_{A,K/k} : \mathrm{tr}_{K/k} A \to A, \quad \lambda_{A,K/k} A \to \mathrm{Im}_{K/k} A.$$

⌟

Proof: It suffices to prove for $\mathrm{Im}_{K/k}$, and $\mathrm{tr}_{K/k}$ follows by double duality theorem(15.7.4.18). For this, Cf.[Con06]P16**?**. □

Prop. (15.14.2.4). Let K/k be a primary extension and $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/K$, the unique map $\mathrm{tr}_{K/k} A \to \mathrm{Im}_{K/k} A$ descending $\lambda_{A,K/k} \circ \tau_{A,K/k}$ is an isogeny. ⌟

Proof: Cf.[Con06]P22**?**. □

Prop. (15.14.2.5). Let K/k be a regular extension, then for any $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/K$, the finite group $\ker(\tau_{A,K/k})$ is connected and coconnected. In particular, $\tau_{A,K/k}(K) : \mathrm{tr}_{K/k}(A)(K) \to A(K)$ is injective. ⌟

Prop. (15.14.2.6) [Lang-Néron]. Let K/k be a f.g. regular extension, then $A(K)/\mathrm{tr}_{K/k}(A)(k)$ is a f.g. Abelian group. ⌟

Proof: Cf.[Con06]P23**?**. □

Prop. (15.14.2.7) [Grothendieck]. Let $K \in \texttt{Field}, K = \overline{K}$, with prime field k, then any Abelian variety of CM-type over K is isogenous to an Abelian variety defined over a finite extension of k. ⌟

Proof: Cf.[Oort, The isogeny class of a CM-type abelian variety is defined over a finite extension of the prime field]. □

3 Elliptic Curve case

Torsion Points

Main references are [Maz78].

Prop. (15.14.3.1) [Controlling Torsion Points]. Let K be a number field, let E be given by a Weierstrass equation

$$E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6 \in \mathcal{O}_K[X, Y].$$

Let $P = (x_0, y_0) \in E(K)$ be a torsion point of exact order m, then

- If m is not a p-power, then $x_0, y_0 \in \mathcal{O}_K$.
- If $m = p^n$, then for any place v of K, $v(x) \geq -2\lfloor\frac{v(p)}{p^n - p^{n-1}}\rfloor$, $v(y) \geq -3\lfloor\frac{v(p)}{p^n - p^{n-1}}\rfloor$.

⌟

Proof: This follows by base change E to each $\mathcal{O}_{K,v}$ and use(15.11.4.20). □

Cor. (15.14.3.2) [Integrality of Torsion Points in $\mathbb{Q}$]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $P = (x_0, y_0) \in E(\mathbb{Q})$ a torsion point of exact order m. then if m is not a p-power, $x_0, y_0 \in \mathbb{Z}$. If $m = p^n$, then $\lfloor\frac{v(p)}{p^n - p^{n-1}}\rfloor = 0$ unless $p = 2$ and $n = 1$. Thus $x_0 \in \frac{1}{4}\mathbb{Z}, x_0 \in \frac{1}{8}\mathbb{Z}$, and if $m \geq 3$, $x_0, y_0 \in \mathbb{Z}$.

The former case can occur, for example

$$E : y^2 + xy = x^3 + 4x + 1, \quad (-\frac{1}{4}, \frac{1}{8}) \in E(\mathbb{Q})[2].$$

⌟

Prop. (15.14.3.3) [Nagell–Lutz]. Let F be a number field and $E \in \mathcal{E}\mathrm{ll}/F$ be given by a Weierstrass equation

$$E : y^2 = x^3 + Ax + B \in \mathbb{Z}[x, y],$$

Let $P = (x_0, y_0) \in E(\mathbb{Q})_{\mathrm{tor}}$, then

- $x_0, y_0 \in \mathbb{Z}$.
- Either $y_0 = 0$, i.e. $[2](P) = O$ or y_0^2 divides $4A^3 + 27B^2$.

⌟

Proof: 1: Let P has exact order m. If $m = 2$, then $y_0 = 0$, and then $x_0 \in \mathbb{Z}$ as it is integral over $\mathbb{Z}$. If $m \geq 2$, the results follows from(15.14.3.1).

2: Suppose $[2](P) = (x_1, y_1) \neq O$, then $y_0 \neq 0$, and $x_0, y_0, x_1 \in \mathbb{Z}$. Now(15.11.1.9) shows $x_1 = \varphi(x_0)/4\psi(x_0)$ where

$$\varphi(X) = X^4 - 4AX^2 - 8BX + A^2, \quad \psi(X) = X^3 + AX + B.$$

And they satisfy a polynomial equation

$$f(X)\varphi(X) - g(X)\psi(X) = 4A^2 + 27B^2$$

where $f(X) = 3X^2 + 4A$, $g(X) = 3X^3 - 5AX - 27B$. Then because $y_0^2 = x_0^3 + Ax_0 + B$, we get

$$y_0^2(4f(x_0)x_1 - g(x_0)) = 4A^2 + 27B^2.$$

□

Prop. (15.14.3.4). If $p \in \mathbf{P}$ and $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has a rational torsion point of order p, then E is isogenous to $E'/\mathbb{Q}$ with a rational point of order p and $\mathbb{Q}(E'[p])$ is a ramified extension of $\mathbb{Q}(\mu_p)$. ⌟

Proof: Cf.[Elliptic Curves, Group Schemes and Mazur's Theorem, P26]?. □

Prop. (15.14.3.5). If $p > 13 \in \mathbf{P}$ and $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has a rational torsion point of order p, then $\mathbb{Q}(E[p])$ is an unramified extension of $\mathbb{Q}(\mu_p)$. ⌟

Proof: Cf.[Elliptic Curves, Group Schemes and Mazur's Theorem, P29]?. □

Lemma (15.14.3.6) [Mazur-Tate]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $p \in \mathbf{P}_{\geq 17} \cup \{11\}$, $E[p] = 0$. ⌟

Proof: Cf.`http://www-personal.umich.edu/~asnowden/teaching/2013/679/index.html`. □

Lemma (15.14.3.7). For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, $E[13] = 0$. ⌟

Proof: Cf.`http://www-personal.umich.edu/~asnowden/teaching/2013/679/index.html`. □

Lemma (15.14.3.8) [Kubert]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, then

- E doesn't contain a rational torsion point of exact order N where $N \in \{14, 15, 16, 18, 20, 21, 24, 25, 27, 35, 49\}$.
- $E(\mathbb{Q})_{\mathrm{tor}}$ doesn't contain a subgroup isomorphic to $\mathbb{Z}/(2) \times \mathbb{Z}/(10)$ or $\mathbb{Z}/(2) \times \mathbb{Z}/(12)$.

⌟

Proof: Cf.[Kubert. Universal bounds on the torsion of elliptic curves.]?

Firstly, notice for $N \in \{11, 14, 15, 17, 19, 20, 21, 24, 27, 32, 36, 49\}$, $X_0(N)$ has genus 1(20.2.3.18). And by taking the cusp as the origin, $X_0(N)$ is an elliptic curve. Then Kubert finds that $\mathrm{rank}(X_0(N)) = 0$, and can find all the rational points. Only for $N = 21$ or $N = 27$ there are non-cusp rational points. So it suffices to show that for $X_0(21)$ and $X_0(27)$, the quadratic twists of the elliptic curves corresponding to the rational non-cusp points of $X_0(N)$ don't have rational 21 torsion-points.

For $N = 21$, the non-cusp rational points of $X_0(N)$ are given by quadratic twists of

$$y^2 = x^3 + 45x - 18$$

$$y^2 = x^3 - 75x - 262$$

$$y^2 = x^3 - 1515x - 46106$$

$$y^2 = x^3 - 17235x - 870894.$$

For $N = 27$, the non-cuspidal rational points of $X_0(N)$ are given by quadratic twists of

$$y^2 + y = x^3 - 30x - 5.$$

For the second case, let P be a generator of $\mathbb{Z}/(2)$ and Q a generator of $\mathbb{Z}/(10)$ or $\mathbb{Z}/(12)$, then the dual map $E/P \to E \to E/Q$ is a cyclic isogeny, thus corresponds to a rational point on $Y_0(20)$ or $Y_0(24)$, which in fact has no rational point.

For $N = 16$, ?

For $N = 18$, ?

For $N = 25$, ?

For $N = 35$, let $E = X_0(35)/w_5$, where w_5 is the Atkin-Lehner involution. Then E is an elliptic curve, and $E(\mathbb{Q}) \cong \mathbb{Z}/(3)$. Then Kubert computed that the preimages of these points are cusps. □

Thm. (15.14.3.9) [Mazur]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, $E(\mathbb{Q})_{\mathrm{tor}}$ can only be isomorphic to one of the following 15 groups:

- $\mathbb{Z}/(n)$ for $n \leq 10$ or $n = 12$, where $n \in \mathbb{Z}_+$.
- $\mathbb{Z}/(2) \oplus \mathbb{Z}/(2n)$ for $n \leq 4$, where $n \in \mathbb{Z}_+$.

Moreover, each of these groups occur, by(15.14.3.11). ⌟

Proof: This follows from(15.14.3.6)(15.14.3.7) and(15.14.3.8). Notice the existence of elliptic curves with these torsion groups can also be shown using modular curves**?**. □

Thm. (15.14.3.10) [Uniform Boundedness of Torsion Groups, Merel]. For any $d \in \mathbb{Z}_+$ there is a constant $N(d)$ s.t. for any number field $F \in \mathtt{NField}$ of degree d and any $E \in \mathcal{E}\mathrm{ll}/F$,

$$\#E(F)_{\mathrm{tor}} \leq N(d).$$

⌟

Proof: **?** □

Prop. (15.14.3.11) [Bounding Torsion Points]. Proposition(15.11.4.19) is useful in controlling torsion points of E. For example: If $E/\mathbb{Q}$ is an elliptic curve with Weierstrass equation

- $E : y^2 + y = x^3 - x + 1$, then $\Delta = -13 \cdot 47$, so E has good reduction modulo 2. But it can be calculated that $\widetilde{E}(\mathbb{F}_2) = \widetilde{O}, E(\mathbb{Q})[2] = O$, thus $E(\mathbb{Q})_{\mathrm{tor}} = O$.
- $E : y^2 = x^3 + 3$, then $\Delta = -2^4 \cdot 3^5$, so E has good reduction modulo p for $p \geq 5$. But it can be calculated that $\#\widetilde{E}(\mathbb{F}_5) = 6, \#\widetilde{E}(\mathbb{F}_7) = 13$, so $E(\mathbb{Q})[p] = O$ for any prime p, and $E(\mathbb{Q})_{\mathrm{tor}} = O$. In particular, $(1, 2) \in E(\mathbb{Q})$ has infinite order.
- $E : y^2 = x^3 + x$, then $\Delta = -2^6$, so E has good reduction modulo p for $p \geq 3$. But it can be calculated that $\widetilde{E}(\mathbb{F}_3) \cong \mathbb{Z}/(4)$, $\widetilde{E}(\mathbb{F}_5) \cong \mathbb{Z}/(2) \times \mathbb{Z}/(2)$, thus $E(\mathbb{Q})_{\mathrm{tor}} \cong 0$ or $\mathbb{Z}/(2)$. The latter case is right, as $(0, 0) \in E(\mathbb{Q})$.
- $E : y^2 = x^3 + 2$.
- $E : y^2 = x^3 + 8$.
- $E : y^2 = x^3 + 4$.
- $E : y^2 = x^3 + 4x$.
- $E : y^2 - y = x^3 - x^2$.
- $E : y^2 = x^3 + 1$.
- $E : y^2 = x^3 - 43x + 166$. then $\Delta = -2^{19} \cdot 13$, thus E has good reduction modulo $3, 5$. But it can be calculated that $\#\widetilde{E}(\mathbb{F}_3) = 7 = \#\widetilde{E}(\mathbb{F}_3)$, thus $E(\mathbb{Q})_{\mathrm{tor}} \cong 0$ or $\mathbb{Z}/(7)$. By(15.14.3.3), for any torsion point (x, y), $y | 2^7$, thus we can find rational points

  $$\{(3, \pm 8), \quad (-5, \pm 16), \quad (11, \pm 32)\}.$$

  And using doubling formula(15.11.1.9) for $P = (3, 8)$,

  $$x([2](P)) = -5, \quad x([4](P)) = 11, \quad x([8](P)) = 3.$$

  Thus P must have order 7, and $E(\mathbb{Q})_{\mathrm{tor}} \cong \mathbb{Z}/(7)$.

- $E : y^2 + 7xy = x^3 + 16x$.
- $E : y^2 + xy + y = x^3 - x^2 - 14x + 29$.
- $E : y^2 + xy = x^3 - 45x + 81$.
- $E : y^2 + 43xy - 210y = x^3 - 210x^2$.
- $E : y^2 = x^3 - 4x$.
- $E : y^2 = x^3 + 2x^2 - 3x$.
- $E : y^2 + 5xy - 6y = x^3 - 3x^2$.
- $E : y^2 + 17xy - 120y = x^3 - 60x^2$.

⌟

Ranks

Conj. (15.14.3.12) [Unboundedness Conjecture]. For $F \in$ `GField`, the rank of elliptic curves over F can take arbitrary large values. ⌟

Proof: □

Remark (15.14.3.13). For function fields, this is proven by Tate-Shafarevich. For $F = \mathbb{Q}$, this is a consequence of the conjecture: for any $k \in \mathbb{Z}_+$, there exists a cube-free integer D s.t. D can be written as a sum of two positive cubes in at least k ways. Cf. [Silverman, Integral Points on Curves of Genus 1]. ⌟

Conj. (15.14.3.14) [Lang]. For any $\varepsilon > 0$, there exists a constant $C_\varepsilon > 0$ s.t. for any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, there exists a basis $\{P_1, \ldots, P_r\}$ of the free part of $E(\mathbb{Q})$ satisfying

$$\max_{i \leq i \leq r} \widehat{h}(P_i) \leq C_\varepsilon^{r^2} |D_{E/\mathbb{Q}}|^{\frac{1}{12}+\varepsilon}.$$

where $D_{E/\mathbb{Q}}$ is the minimal discriminant of $E/\mathbb{Q}$ and $\widehat{h}$ is the canonical height. ⌟

Proof: □

Conj. (15.14.3.15) [Rank Distribution]. The distribution of elliptic curves ordered by height(15.11.4.21) satisfies

$$\mathbf{P}_{\text{rank}}(r) = \begin{cases} 0.5 & r = 0 \\ 0.5 & r = 1 \\ 0 & r \geq 2 \end{cases}.$$

In particular, $\mathbb{E}(r) = 0.5$ ⌟

Prop. (15.14.3.16) [Bhargava-Shankar]. $\mathbb{E}(r) \leq 0.99$, if it exists. ⌟

Proof: □

4 Modular Curves

Main references are [Maz78], [Maz76] and [M-T73].

Thm. (15.14.4.1) [Mazur]. Let $p \in \mathbf{P}_{\geq 5}$, and n be the nominator of $\frac{N-1}{12}$, then $J_0(p)(\mathbb{Q})_{\mathrm{tor}}$ is a cyclic group of order n, generated by the class $[(0)-(\infty)]$. ⌟

Proof: Cf.[Maz78]Chap3.1.2.. □

Thm. (15.14.4.2) [Mazur]. Let $N \in \mathbb{Z}_+$ s.t. $g(X_1(N)) > 0$(i.e. $N = 11$ or $N \geq 13$), then $Y_1(N)(\mathbb{Q}) = \varnothing$. ⌟

Proof: Cf.[Maz78]Chap3.5.3. □

Thm. (15.14.4.3) [Mazur]. If $p \in \{11\} \cup \mathbf{P}_{\geq 17}$, then $\# X_{\mathrm{split}}(p)(\mathbb{Q}) < \infty$. ⌟

Proof: Cf.[Maz78]Chap3.6. □

Thm. (15.14.4.4) [Mazur/Momose/Merel]. If $p \in \{11\} \cup \mathbf{P}_{\geq 17}$, then for any $P \in Y_{\mathrm{split}}(p)(\mathbb{Q})$, $j(P) \in \mathbb{Z}$. ⌟

Proof: Cf.[Bilu-Parent]. □

Def. (15.14.4.5) [Modular Units on $X_{\mathrm{split}}(p)$]. As the ⌟

Prop. (15.14.4.6). Situation as in **?**, $\tau \in \mathbf{H}$ s.t. $|q(\tau)| \leq 1/p$, then

- If $p|c$, then
$$\Big|\log|U_c(\tau)| - (p-1)^2 \log|q(\tau)|\Big| \leq 4\pi^2 \frac{p^2}{\log|q(\tau)^{-1}|} + O(p\log p).$$
- If $p \nmid c$, then
$$\Big|\log|U_c(\tau)| + 2(p-1)\log|q(\tau)|\Big| \leq 8\pi^2 \frac{p^2}{\log|q(\tau)^{-1}|} + O(p).$$

⌟

Proof: □

Prop. (15.14.4.7). For any $p \in \mathbf{P}_{\geq 3}$ and $P \in Y_{\mathrm{split}}(\mathbb{C})$,
$$\log|j(P)| \leq 2\pi\sqrt{p} + \max\Big(6\log p, \frac{1}{2(p-1)}\Big|\log|U(P)|\Big| - 6\log p\Big) + O(1).$$

⌟

Proof:

□

Cor. (15.14.4.8). For any $p \in \mathbf{P}$ and $P \in Y_{\mathrm{split}}(p)(\mathbb{Z})$, $0 \leq \log|U(P)| \leq 24p\log p$.

In particular, by(15.14.4.7), there exists constant $C > 0$ s.t. for any $p \in \mathbf{P}$ and $P \in Y_{\mathrm{split}}(p)(\mathbb{Z})$, $\log|j(P)| \leq 2\pi p^{1/2} + 6\log p + C$. ⌟

Proof: □

Prop. (15.14.4.9). There exists an effective constant $\kappa > 0$ s.t. for any $p \in \mathbf{P}$ and an elliptic curve $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM and endowed with a structure of normalizer of split Cartan subgroup in level p, then $h^+(j(E)) \geq \kappa p$. ⌟

Proof: For such an elliptic curve E with two p-isogenies $\varphi_1 : E \to E_1, \varphi_2 : E \to E_2$. Then $\varphi = \varphi_1^\vee \circ \varphi_2 : E_1 \to E_2$ is a cyclic p^2-isogeny. Then it follows from(15.13.2.2) that $h^+(j(E)) \geq \kappa_1 p$ for some constant κ_1 independent of p and E.

(15.13.3.5) shows that $h_{\mathrm{st}}(E_1) \leq h_{\mathrm{st}}(E) + \frac{1}{2}\log p$, and(15.13.3.12) shows that for any $X \in \mathcal{E}\mathrm{ll}/F$,

$$|h^+(j(X)) - 12h_{\mathrm{st}}(X/F)| \leq 6\log(1 + h^+(j(X))) + O(1).$$

Thus the assertion follows. □

Thm. (15.14.4.10) [Bilu-Parent/Bilu−Parent−Rebolledo/Balakrishnan-Dogra-Müller-Tuitman-Vonk]. For $p \in \mathbf{P}$, every point in $X_{\mathrm{split}}(p)(\mathbb{Q})$ is either a CM point or a cusp iff $p > 7$. ⌟

Proof: Firstly it follows from(15.14.4.4)(15.14.4.8) and(15.14.4.9) that this hols for p large. Then**?**
□

Lemma (15.14.4.11). $X_{\mathrm{split}}(13)(\mathbb{Q})$ consists of 6 CM-points and one cusp. Moreover, $X_{\mathrm{nonsplit}}(13)(\mathbb{Q})$ consists of 7 CM-points. ⌟

Proof: □

Conclusions

Prop. (15.14.4.12)[Rational Points of Modular Curves]. Situation as in(19.3.4.1), if $g(X_H(p)) > 0$, and $X_H(p)$ is defined over $\mathbb{Q}$, then

- $X_H(p) = X_0(p)$ has only f.m. $\mathbb{Q}$-points, and they can be calculated.
- $X_H(p) = X_{\mathrm{split}}(p)$ has only f.m. $\mathbb{Q}$-points for $p \neq 13$.
- For $X_H(p) = X_{\mathrm{nonsplit}}(p)$, nothing is known.**?**
- $X_H(p) = X_{S_4}(p)$ has no rational points for $p > 13$.

⌟

Proof: □

5 Effective Bounds on Rational Curves(Chabauty)

The idea is: By the embedding $X \to J(X)$, to calculate $X(\mathbb{Q})$, calculate $J(X)(\mathbb{Q})$ first, then determine which points are in $X(\mathbb{Q})$.

Coleman Integration

Prop. (15.14.5.1) [Coleman Integration]. For $J \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/\mathbb{Q}_p$, there is a **Coleman integration map**:

$$J(\mathbb{Q}_p) \times H^0(J/\mathbb{Q}_p, \Omega^1) \to \mathbb{Q}_p : (Q, \omega) \mapsto \int_0^Q \omega.$$

s.t. on an open subset $U \subset J$, the integration can be calculated locally by writing ω in power series. ⌟

Chabauty-Kim Method

Thm. (15.14.5.2) [Chabauty-Coleman]. Let $X \in \mathcal{C}ur^g/\mathbb{Q}$, and $p \in \mathbf{P}$ a good reduction of X. Suppose $r' < g$(e.g. $r < g$)**?**, then

-
- If $p > 2g$, then $\#X(\mathbb{Q}) \leq \#X(\mathbb{F}_p) + 2r' \leq \#X(\mathbb{F}_p) + (2g - 2)$.

⌟

6 Finite Fields

Prop. (15.14.6.1) [Esnault]. Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}}, X \in \mathcal{S}m\mathcal{P}roj\mathcal{V}ar/\mathbb{F}_q$ s.t. $\mathrm{CH}_0(X_{\overline{R(X)}}) = \mathbb{Z}$, then $\#X(\mathbb{F}_q) \equiv 1 (\mathrm{mod}\ q)$. In particular, X has a rational point. ⌟

Proof: Cf.[Weil 1 Proof]. □

Cor. (15.14.6.2). Any rationally chain connected varieties over a finite field $k = \mathbb{F}_q$ s.t. $\mathrm{CH}_0(X_{\overline{R(X)}}) = \mathbb{Z}$, then $X(K) \equiv 1 \mod q$. In particular, X has a rational point. ⌟

Cor. (15.14.6.3)[Manin-Lang]. If $X/\mathbb{F}_q$ is a smooth projective Fano variety, then $X(\mathbb{F}_q) \equiv 1 \mod q$. ⌟

Proof: This is because by(6.11.4.4), any Fano variety is rationally chain connected. □

7 Vojta's Conjecture

8 Bombieri-Lang Conjecture

Conj. (15.14.8.1) [Bombieri-Lang]. Let $F \in \mathtt{NField}$ and X is a variety over F of general type(i.e. with maximal Kodaira dimension(6.11.3.5)), then there are f.m. subvarieties $X_i \subset X$ of lower dimensions s.t. $X(F) = \cup_i X_i(F)$. ⌟

Proof: □

Thm. (15.14.8.2) [Mordell Conjecture, Faltings]. By(15.13.5.9), for $F \in \mathtt{NField}$ and C/F be a complete non-singular curve of genus $g \geq 2$, then $\#C(F) < \infty$. ⌟

9 Uniform-Boundedness

Conj.Cor. (15.14.9.1) [Uniform-Boundedness for Torsion Points of Abelian Varieties]. The Morton-Silverman boundedness conjecture(15.17.4.1) implies that for any $D, g \in \mathbb{Z}_+$, there exists $\eta(D, g) \in \mathbb{Z}_+$ s.t. for any $F \in \mathtt{NField}$ with $[F : \mathbb{Q}] = D$ and $A \in \mathcal{A}b\mathcal{V}ar/F$, $\#A(F)_{\mathrm{tor}} \leq \eta(D, g)$. ⌟

Proof: Cf.[Fak03]P3.**?** □

10 Hilbert's 10-th Problem

Conj. (15.14.10.1)[Hilbert's 10-th Problem]. Let $F \in \mathtt{NField}$, X be a projective scheme over $\mathcal{O}_K$, it there an algorithm to determine in a finite number of operations whether $X(K) = \varnothing$. ⌟

Proof: □

Remark (15.14.10.2) [Mazur-Rubin]. If the BSD conjecture holds for all elliptic curves over any number fields, then Hilbert's 10-th problem has a negative answer for any number field. ⌟

Proof:

□

15.15 Tate Conjecture & Hodge Conjecture

Main references are [Tat91], [Tat65b], [RECENT PROGRESS ON THE TATE CONJECTURE, Totaro] and [Tate Conjecture over Finite Fields, Milne].

1 Statements

Prop. (15.15.1.1) [ℓ-adic Cycle Classes]. Let $k \in \texttt{Field}$ and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$, $\overline{X} = X \otimes_k k^s$, $\ell \in \mathbf{P} \setminus \operatorname{char} k$, then there exists a cycle map

$$c^r : \mathrm{CH}^r(\overline{X}) \to \mathrm{H}^{2r}_{\text{ét}}(\overline{X}, \mathbb{Q}_\ell(r)),$$

as étale cohomology is a Weil cohomology theory**?**. Let $A^r_{\text{ét},\ell}(\overline{X})$ be the image, and $A^r_{\text{ét},\ell}(X)$ be the image of $\mathrm{CH}^r(X) \subset \mathrm{CH}^r(\overline{X})$ under this map. Then there are maps

$$A^r_{\text{ét},\ell}(\overline{X}) \otimes \mathbb{Q}_\ell \subset H^{2r}(\overline{X}, \mathbb{Q}_\ell(r)), \quad A^r_{\text{ét},\ell}(X) \otimes \mathbb{Q}_\ell \subset H^{2r}(\overline{X}, \mathbb{Q}_\ell(r))^{\mathrm{Gal}_k}.$$

⌟

Conj. (15.15.1.2) [Tate]. Situation as in(15.15.1.1), if k is f.g. over its prime field, then
$(T^r(X/k), \ell)$**:** $A^r_{\text{ét},\ell}(X) \otimes \mathbb{Q}_\ell = H^{2r}(\overline{X}, \mathbb{Q}_\ell(r))^{\mathrm{Gal}_k}$.
$(E^r(X/k), \ell)$**:** $A^r_{\text{ét},\ell}(\overline{X}) \cong GH^r(\overline{X})$. In particular, $A^r_{\text{ét},\ell}(\overline{X})$ doesn't depend on ℓ.
$(S^r(X/k), \ell)$**:** Fr_X acts semisimply on the 1-eigenpart $\mathrm{H}^{2r}_{\text{ét}}(X, \mathbb{Q}_\ell(r))_1$.

⌟

Proof: □

Conj. (15.15.1.3) [Integral Tate Conjecture]. Situation as in(15.15.1.1), if k is f.g. over its prime field, then we may ask if

$$A^r_{\text{ét},\ell}(X) \otimes \mathbb{Z}_\ell = H^{2r}(\overline{X}, \mathbb{Z}_\ell(r))^{\mathrm{Gal}_k}.$$

Cf.[Tate Conjecture, Milne, P3]. ⌟

Prop. (15.15.1.4) [(E^1) Holds]. The Kummer exact sequence of étale sheaves on $\overline{X}$: $0 \to \mu_{\ell^n} \to \mathbb{G}_m \xrightarrow{\ell^n} \mathbb{G}_m \to 0$ induces an injection $\mathrm{Pic}(\overline{X})/\ell^n \mathrm{Pic}(\overline{X}) \hookrightarrow H^2(\overline{X}, \mu_{\ell^n})$. Taking limits gives an injection $\mathrm{Pic}(\overline{X}) \otimes \mathbb{Q}_\ell \hookrightarrow H^2(\overline{X}, \mathbb{Q}_\ell(1))$. And c^1 is just

$$c^1 : Z^1(\overline{X}) \to \mathrm{Pic}(\overline{X}) \to \mathrm{Pic}(\overline{X}) \otimes \mathbb{Q}_\ell \hookrightarrow \mathrm{H}^2_{\text{ét}}(\overline{X}, \mathbb{Q}_\ell(1)).$$

Thus the kernel of c^1 is just the $\mathrm{Pic}(X)$ modulo ℓ^∞-divisible elements and torsion elements, but $\mathrm{Pic}^0(\overline{X})$ is ℓ^∞-divisible as it is the k^s-points of an Abelian variety over k^s. And also $\mathrm{Pic}(\overline{X})/\mathrm{Pic}_{\mathrm{num}=0}(\overline{X}) \to \mathrm{Pic}(X_{\overline{k}})/\mathrm{Pic}^\tau(X_{\overline{k}}) = N^1(X_{\overline{k}})$ is injective by[Sta]0CC5**?**, and $N^1(X_{\overline{k}})$ is finite free, so $\mathrm{Pic}_{\mathrm{num}=0}(\overline{X}) = \mathrm{Pic}(\overline{X})_{\mathrm{tor}}$, and $A^1_{\text{ét},\ell}(\overline{X}) = GH^1(X)$. ⌟

Remark (15.15.1.5) [Hodge & Tate Conjecture]. In characteristic 0, we can embed k into $\mathbb{C}$ and use étale-singular comparison to see the Hodge conjecture implies the Tate conjecture.**?** ⌟

Prop. (15.15.1.6). Situation as in(15.15.1.2), let $X, Y \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$, then $(T^1(X \times_k Y)) \iff (T^1(X)) + (T^1(Y))$. ⌟

Proof:

□

Prop. (15.15.1.7). Situation as in(15.15.1.2), let $f : X \to Y \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$ be a dominant rational map, then $(T^1(X/k)) \Rightarrow (T^1(Y/k))$. ⌟

Proof:

□

Cor. (15.15.1.8). The Fermat curve $S_n : z_0^n + z_1^n + z_2^n + z_3^n = 0$ is dominated by the product of two curves

$$C_1 : x_0^n + x_1^n = x_2^n, \quad C_2 : y_0^n + y_1^n = -y_2^n$$

by

$$C_1 \times C_2 \to S : ([x_0, x_1, x_2], [y_0, y_1, y_2]) \mapsto [x_0y_2, x_1y_2, y_0x_2, y_1x_2],$$

so $(T^1(S_n))$ holds. ⌟

2 over Finite Fields

Main references are [Milne, Tate Conjecture over Finite Fields], and [Endomorphisms of abelian varieties over finite fields, Tate, 1966].

Prop. (15.15.2.1) [(T^1)]. Let $\#k < \infty$ and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$, Tate proved that $H^{2r}(\overline{X}, \mathbb{Q}_\ell(r))^{\mathrm{Gal}_k} \cong \mathrm{H}^{2r}_{\text{ét}}(X, \mathbb{Q}_\ell(r))$, and the Kummer sequence gives an exact sequence**?** ⌟

Proof: □

Connection with B-S.D

Prop. (15.15.2.2) [Tate]. Let $\#k < \infty, X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$, then $(T^r(X/k))$ and $(E^r(X/k))$ hold iff

$$\mathrm{ord}_{s=r}(Z(X, s)) = -\operatorname{rank} GH^r(X).$$

⌟

Proof: □

Prop. (15.15.2.3) [(T^1) and BSD]. Let $\#k < \infty$ and C a smooth complete curve over k with function field K, $\mathcal{E}/C$ is a regular elliptic surface with generic fiber $E \in \mathcal{E}\mathrm{ll}/K$, then $(T^1(\mathcal{E}/k))$ is equivalent to the BSD conjecture for E/K. ⌟

Proof: □

Prop. (15.15.2.4) [Grothendieck]. Let $\#k < \infty$ and C a smooth complete curve over k with function field K, $\mathcal{E}/C$ is a regular elliptic surface with generic fiber $E \in \mathcal{E}\mathrm{ll}/K$, then

$$\mathrm{Br}(\mathcal{E}/k) \cong Ш(E/K).$$

$\acute{k}$ ⌟

Proof: Cf.[Grothendieck, Alexander, Le groupe de Brauer. III. 1968]. □

3 K3 Surfaces

Main references are [The Tate Conjecture For K3 Surfaces In Odd Characteristic, Pera], [The Tate Conjecture For K3 Surfaces—A Survey Of Some Recent Progress], [2-adic integral canonical models and the Tate conjecture in characteristic 2].

Thm. (15.15.3.1) [Charles, Pera]. $(T^1(X))$ holds if X is a K3 surface. ⌟

Proof: Cf.[The Tate Conjecture For K3 Surfaces In Odd Characteristic, Pera] and [2-adic integral canonical models and the Tate conjecture in characteristic 2].? □

Cor. (15.15.3.2) [Lieblich-Maulik-Snowden]. There are only finitely many isomorphism classes of K3 surfaces over a finite field of characteristic ≥ 5. ⌟

Proof: [Finiteness of K3 surfaces and the Tate conjecture, Lieblich-Maulik-Snowden]. □

Kuga-Satake construction

4 Hodge Conjecture

Main references are [Hodge cycles on abelian varieties, Deligne].

Def. (15.15.4.1) [Hodge Classes]. For $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{C}$, define $\mathrm{Hdg}^{2k}(X) = H^{2k}_{\mathrm{Betti}}(X, \mathbb{Q}) \cap H^{k,k}_{\mathrm{Betti}}(X)$, called the **Hodge classes** of X of degree $2k$. ⌟

Prop. (15.15.4.2). If $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{C}$ and $Z \subset Z^r(X)$, then $[Z] \subset \mathrm{Hdg}^k(X)$. ⌟

Proof: ?? □

Conj. (15.15.4.3) [Hodge]. For $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{C}$, every Hodge class is algebraic. ⌟

Proof: □

Arithmetic Theory

Thm. (15.15.4.4) [Deligne]. Let $k \in \mathtt{Field}^0, k = \overline{k}$, $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, and let $t \in H^{2p}_{\mathbb{A}}(X)(p)$. Then if t is a Hodge cycle w.r.t. one embedding $\sigma : k \to \mathbb{C}$, then it is absolutely Hodge. ⌟

Proof: □

Def. (15.15.4.5) [Hodge Classes]. Let $k \in \mathtt{Field}^0, k = \overline{k}$, and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/k$, then for any embedding $\sigma : k \hookrightarrow \mathbb{C}$, $H^n_{\mathrm{dR}}(X/k)$ satisfies

$$H^n_{\mathrm{dR}}(X/k) \otimes_{k,\sigma} \mathbb{C} \cong H^n_{\mathrm{dR}}(X, \mathbb{C}) \cong H^n_{\mathrm{Betti}}(X, \mathbb{C}).??$$

Thus we can define the space $\mathrm{Hdg}^{2k}(X)$ of **Hodge cycle** on X of degree $2k$ w.r.t. σ as the subspace of elements in $H^{2k}_{\mathrm{dR}}(X/k)$ that are mapped to $(2\pi\,\mathrm{i})^k$ times a Hodge class of σX of degree $2k$(15.15.4.1).

This notion is independent of the embedding σ. ⌟

Proof: ? □

15.16 Schemes over $\mathbb{F}_1$

References are [Connes, Schemes over $\mathbb{F}_1$ and Zeta-Functions], [Sou04].

1 Geometry of Monoids

Cf.[Toric Singularities, Kato].

Notation (15.16.1.1).
- In this section, monoids are assumed to be commutative and have a zero element and neutral element.

⌟

Def. (15.16.1.2) [Ideals in Monoids]. For $M \in \mathcal{CM}\mathrm{on}^{0,1}$, an **ideal(of monoids)** of M is a subset $I \subset M$ s.t.
- $0 \in I$.
- $x \in I, y \in M \implies xy \in I$.

And a **prime ideal(of monoids)** of M is an ideal $\mathfrak{p} \subset M$ s.t. $M \setminus \mathfrak{p}$ is a multiplicative subset of M. ⌟

Def. (15.16.1.3) [Spectrum of Monoids]. For $M \in \mathcal{CM}\mathrm{on}^{0,1}$ and $I \in \mathrm{Ideal}(M)$, let $D(I)$ be the the set of primes ideals of M not containing I. Then if $\mathrm{Spec}(M)$ is the set of prime ideals of M, $D(I)$ defines a the Zariski topology on $\mathrm{Spec}(M)$. ⌟

Prop. (15.16.1.4) [Abelian Groups and Monoids]. For $H \in \mathcal{A}\mathrm{b}$, denote $\mathbb{F}_1[H] = H \cup \{0\} \in \mathcal{CM}\mathrm{on}^{0,1}$. Then this defines $\mathcal{A}\mathrm{b}$ as a full subcategory of $\mathcal{CM}\mathrm{on}^{0,1}$, and the inclusion is left adjoint to taking invertible elements: For any $H \in \mathcal{A}\mathrm{b}, M \in \mathcal{CM}\mathrm{on}^{0,1}$,

$$\mathrm{Hom}_{\mathcal{CM}\mathrm{on}^{0,1}}(\mathbb{F}_1[H], M) = \mathrm{Hom}_{\mathcal{A}\mathrm{b}}(H, M^\times).$$

⌟

Mon-Functors

$\mathbb{F}_1$-Schemes

Def. (15.16.1.5) [$\mathbb{F}_1$-Schemes]. An **$\mathbb{F}_1$-scheme** is a topological space with a sheaf of monoids that is locally isomorphic to the spectrum of a commutative monoids. The category of $\mathbb{F}_1$-schemes is denoted by $\mathcal{S}\mathrm{ch}\,/\mathbb{F}_1$. ⌟

Def. (15.16.1.6). An **finitely generated $\mathbb{F}_1$-scheme** is a scheme that has a finite cover by affine schemes $U_i = \mathrm{Spec}\, A_i$ s.t. each A_i are f.g. monoids. ⌟

Def. (15.16.1.7) [Ascend Functor]. The functor $\mathcal{CM}\mathrm{on}^{0,1} \to \mathcal{CR}\mathrm{ing} : A \mapsto \mathbb{Z}[A]$ defines a functor

$$- \otimes \mathbb{Z} : \mathcal{S}\mathrm{ch}\,/\mathbb{F}_1 \to \mathcal{S}\mathrm{ch}\,.$$

⌟

Prop. (15.16.1.8). For $X \in \mathcal{S}\mathrm{ch}\,/\mathbb{F}_1$, X is f.g. iff $X_{\mathbb{Z}}$ is finitely generated. ⌟

Proof: ? □

Def. (15.16.1.9) [Ring Monoids]. For $R \in \mathcal{CR}\text{ing}$, define $\operatorname{Spec} R \in \mathcal{S}\text{ch}/\mathbb{F}_1$ to be the affine scheme corresponding to the multiplicative monoid $(R, \times)$.

Then we have $\operatorname{Hom}_{\mathbb{F}_1}(\operatorname{Spec} R, X) = \operatorname{Hom}_{\mathcal{S}\text{ch}}(\operatorname{Spec} R, X_{\mathbb{Z}})$ for any $X \in \mathcal{S}\text{ch}/\mathbb{F}_1$. ⌟

Prop. (15.16.1.10)[Zeta Polynomials]. For any $X \in \mathcal{S}\text{ch}^{\text{fg}}/\mathbb{F}_1$, there exists $e \in \mathbb{Z}_+$ and $N(T) \in \mathbb{Z}[T]$ s.t. for any $p \in \texttt{Prime}, q \in p^{\mathbb{Z}_+}$, if $(q-1, e) = 1$, then

$$\#X(\mathbb{F}_q) = N(q).$$

Such N is called the **zeta polynomial** of X. ⌟

Proof: This is quite easy, Cf.[Remarks on zeta functions and K-theory over F1, Dietmar]. □

Def. (15.16.1.11)[Zeta Functions of $\mathbb{F}_1$-Schemes]. For $X \in \mathcal{S}\text{ch}^{\text{fg}}/\mathbb{F}_1$, if $N_X(T) = a_0 + a_1 T + \ldots + a_n T^n$ is the zeta polynomial of X(15.16.1.10), then the **zeta function($\mathbb{F}_1$)** of X is defined to be

$$\zeta_X(s) = \lim_{q \to 1} Z_q(X, q^{-s})(q-1)^{N(1)} = s^{a_0}(s-1)^{a_1} \ldots (s-n)^{-a_n}.$$

And the **Euler characteristic($\mathbb{F}_1$)** of X is defined to be

$$\chi(X) = N_X(1) = \sum a_i.$$

⌟

Prop. (15.16.1.12). This zeta function so defined(15.16.1.11) fulfills the requirement of the motivic zeta function as in [Manin, Zeta functions].? ⌟

Prop. (15.16.1.13). Let $\underline{X}$ be a Mon-scheme and X its geometric realization, then the restriction of $\underline{X}$ to $\mathcal{A}\text{b}$ via $\mathbb{F}_1$ is:

$$\underline{X}(\mathbb{F}_1[H]) = \coprod_{x \in X} \operatorname{Hom}_{\mathcal{A}\text{b}}(\mathcal{O}_{X,x}^{\times}, H), \quad H \in \mathcal{A}\text{b}.$$

⌟

2 Zeta Functions

Conj. (15.16.2.1). For any $n \in \mathbb{Z}_+$, there should be a field $\mathbb{F}_{1^n}$, s.t.

- $\operatorname{Spec} Z$ is over $\mathbb{F}_1$, and
- $\mathbb{F}_{1^n} \otimes_{\mathbb{F}_1} \mathbb{Z} = \mathbb{Z}[T]/(T^n - 1)$.

⌟

Proof: □

Conj. (15.16.2.2). There exists a "curve" $C = \overline{\operatorname{Spec} \mathbb{Z}}$ over $\mathbb{F}_1$ whose zeta-function is $Z_C(s) = \Lambda(s)$. ⌟

Proof: □

Prop. (15.16.2.3). One expects $\overline{\operatorname{Spec} Z}$ to be of infinite genus. ⌟

Proof: [Manin, Zeta Functions and Motives]. □

3 Absolute Motives via Zeta Functions

Remark (15.16.3.1) [Absence of Absolute Motives]. Because of the absence of direct products of $\mathbb{Z}$-schemes, we cannot use correspondence to define morphisms between absolute motives. As a result, we can only observe them through the zeta function, and observe the imaginary morphisms between by their induced morphisms on zeta functions. ⌟

4 K-Theory of $\mathbb{F}_1$-Schemes

Def. (15.16.4.1) [$K_n^+(A)$]. For $A \in \mathcal{CM}\mathrm{on}$, define $\mathrm{GL}(n; A)$ to be the set of group of $n \times n$ matrices s.t. each row and column has exactly one non-zero element which lies in $A^\times$. Then $\mathrm{GL}(n; A) \cong A^\times \rtimes \mathrm{Sym}_n$, and there are natural embeddings $\mathrm{GL}(n; A) \hookrightarrow \mathrm{GL}(n+1; A)$.

Then we can define $\mathrm{GL}(A) = \varinjlim_n \mathrm{GL}(n; A)$, and define the **K-group of monoids** as $K_j^+(A) = \pi_j(\mathrm{BGL}(A)^+)$, where $+$ is the Quillen's plus construction. ⌟

Cor. (15.16.4.2). $K_j(\mathbb{F}_1) = \pi_j^{\mathrm{st}}(\mathbb{S})$. ⌟

Proof: **?** □

Def. (15.16.4.3) [$K_n^Q(A)$]. For $A \in \mathcal{CM}\mathrm{on}$, let $\mathcal{P}$ be the category of f.g. pointed projective A-modules, and $\mathcal{E}$ be the class of split exact sequences in $\mathcal{P}$, then $(\mathcal{P}, \mathcal{E})$ is a quasi-exact category, and we can define the **K-group of monoids** as $K_i^Q(A) = K_i(\mathcal{P}, \mathcal{E})$(10.1.2.5). ⌟

Prop. (15.16.4.4). For $A \in \mathcal{A}\mathrm{b}$, $K_n^+(A) = K_n^Q(A)$(15.16.4.1)(15.16.4.3) for any $n \in \mathbb{N}$.

In particular,

$$K_i^+(A) = K_i(A^\times) = \begin{cases} Z \times A^\times & , i = 0 \\ \pi_i^{\mathrm{st}}(\mathbb{S}) & , i > 0 \end{cases}.$$

And there are maps $K_i^+(A) = K_i(A^\times) \to K_i^Q(A)$. ⌟

Proof: Any projective pointed A-module is free**?**, so the usual proof for $A \in \mathcal{CR}\mathrm{ing}$ pass through(**?**Cf. Higher K-theory, 2).

And then $\mathcal{P}$ is just the product of the category of pointed sets and $\{A\}$. Thus $\mathbb{B}Q(\mathcal{P}) = \mathbb{B}Q(\mathcal{S}\mathrm{et}_{\mathrm{pt}}) \times \mathbb{B}A$, and the assertion follows.

The map $K_i(A^\times) \to K_i^Q(A)$ comes from the fact any projective $A^\times$-modules are free. □

15.17 Arithmetic Dynamical Systems

References are [Sil07] and [Fak03].

Def. (15.17.0.1) [Rational Maps]. A map $\varphi : \mathbb{P}^N \to \mathbb{P}^M$ is called a **rational map of degree** d if ⌟

Prop. (15.17.0.2) [Fakhruddin's Trick]. Let $k \in \texttt{Field}, \#k = \infty$, X a projective variety over k, $\varphi : X \to X$ a morphism, $\mathcal{L} \in \mathrm{Pic}(X)$ a very ample line bundle and $d \in \mathbb{Z}_+$ s.t. $\varphi^*(\mathcal{L}) \cong \mathcal{L}^{\otimes d}$, then there exists $N \in \mathbb{Z}_+$ and an embedding $\iota : X \to \mathbb{P}^N_k$ with a morphism $\psi : P^N_k \to P^N_k$ s.t. $\psi \circ \iota = \iota \circ \psi$. ⌟

Proof: Cf.[Fak03]P2. □

Thm. (15.17.0.3). For $k \in \texttt{Field}, k = \overline{k}$, $A \in \mathcal{A}b\mathcal{V}ar/k$ with a group G acting freely, then $X = A/G$ has a line bundle $\mathcal{L}$ and a morphism $\varphi : X \to X$ s.t. $\varphi^*(\mathcal{L}) \cong \mathcal{L}^{\otimes d}$ for some $d \in \mathbb{Z}_{\geq 2}$. And if $\mathrm{char}\, k = 0$, then for any $X \in \mathcal{S}m\mathcal{P}roj/k$ with $\mathrm{Kod}(X) \geq 0$ and a line bundle $\mathcal{L}$ and a morphism $\varphi : X \to X$ s.t. $\varphi^*(\mathcal{L}) \cong \mathcal{L}^{\otimes d}$ for some $d \in \mathbb{Z}_{\geq 2}$ is of the form $X = A/G$ for $A \in \mathcal{A}b\mathcal{V}ar/k$ with a group G acting freely. ⌟

Proof: Cf.[Fak03]P8. □

1 over Finite Fields

2 over Local Fields

3 over Global Fields

Heights

Canonical Heights

Def. (15.17.3.1) [Quasi-Homogenous Functions]. Let $N \subset \mathbb{R}$ be a multiplicatively-closed subset of $\mathbb{R}$ acting on a set $S \in \mathcal{S}et$. Then a function $h : S \to \mathbb{R}$ is called a **quasi-homogenous function** of degree $d \in \mathbb{R}_+$ iff for any $n \in N$, there exists $C(n) \in \mathbb{R}_+$ s.t.

$$|h(nx) - n^d h(x)| \leq C(n), \forall x \in S.$$

⌟

Prop. (15.17.3.2) [Tate's Limiting Argument]. Situation as in(15.17.3.1), there exists a unique homogenous function $\widehat{h} : S \to \mathbb{R}$ of degree d s.t. $\widehat{h} - h$ is bounded, which is given by

$$\widehat{h}(x) = \lim_{|n| \to \infty} \frac{h(nx)}{n^d}.$$

⌟

Proof: Cf.[B-G06]P285. □

Prop. (15.17.3.3). For $F \in \texttt{NField}$ and $f : \mathbb{P}^1_F \to \mathbb{P}^1_F$ of degree> 1, then the canonical height

$$\widehat{h}_f : \alpha \mapsto \lim_{n \to \infty} \frac{h(f^{(n)}(\alpha))}{d^n}$$

is the unique function s.t. $\widehat{h}_f \circ f = d\widehat{h}_f$, and $\widehat{h}_f \sim h$. ⌟

Prop. (15.17.3.4). For $F \in \texttt{NField}, E \in \mathcal{E}ll/F$ and $f = \varphi_{E,2}$, $\widehat{h}_f(\mathrm{pr}(P)) = 2\widehat{h}_E(P)$ for any $P \in E(F)$. ⌟

4 Uniform-Boundeness

Conj. (15.17.4.1) [Uniform-Boundedness Conjecture, Morton-Silverman]. For $D, N, d \in \mathbb{Z}_+$ and $d \geq 3$, there exists $\kappa(D, N, d) \in \mathbb{Z}_+$ s.t. for any $F \in \texttt{NField}$ with $[F : \mathbb{Q}] = D$ and each morphism $\psi : \mathbb{P}^N_F \to \mathbb{P}^N_F$ defined by homogenous polynomials of degree d, $\# \operatorname{PrePer}(\psi; F) \leq \kappa(D, N, d)$. ⌟

Proof: □

Remark (15.17.4.2). By[Fak03]P4, by restriction of scalars, it suffice to consider the case $F = \mathbb{Q}$. ⌟

Conj. (15.17.4.3). For $F \in \texttt{NField}$ and $N \in \mathbb{Z}_+, d \in \mathbb{Z}_{\geq 2}$, there exists a finite set $S(d, N, F) \subset \mathbb{P}^N(F)$ s.t. for any morphism $f : \mathbb{P}^N_F \to \mathbb{P}^N_F$ defined by homogenous polynomials of degree d, $S(d, N, F) \nsubseteq f(\mathbb{P}^N(F))$. ⌟

Proof: □

Prop. (15.17.4.4). This conjecture is a consequence of the Bombieri-Lang conjecture(15.14.8.1), by[Fak03]P4. ⌟

Proof: □

5 Arithmetic Dynamical Mordell-Lang Conjecture

References are [Poo14].

Prop. (15.17.5.1)[p-adic Interpolation of Iterates, Poonen]. Let K be a valued field s.t. $|p| = 1/p$, and $f \in \mathcal{O}_K\langle X_1, \ldots, X_d\rangle^d$ satisfies $f(\underline{X}) \equiv \underline{X} (\operatorname{mod}\ p^c)$ for some $c > 1/(p-1)$. Then there exists $g \in \mathcal{O}_K\langle X_1, \ldots, X_d, T\rangle$ s.t. $g(\underline{X}, n) = f^{\circ n}(n) \in \mathcal{O}_K\langle \underline{X}\rangle^d$ for any $n \in \mathbb{N}$. Moreover, $g(\underline{X}, T+1) = f(g(\underline{X}, T))$ holds. ⌟

Proof: The hypothesis implies that $h(f(\underline{X})) \equiv f(\underline{X}) (\operatorname{mod}\ p^c)$ for any $h(\underline{X}) \in \mathcal{O}_K[\underline{X}]^d$, and by taking limits this is also true for any $h \in \mathcal{O}_K\langle \underline{X}\rangle^d$. Thus if we define the linear operator

$$\Delta(h)(\underline{X}) = h(f(\underline{X})) - f(\underline{X}),$$

then for any $m \in \mathbb{N}$, Δ^m maps $\mathcal{O}_K\langle \underline{X}\rangle^d$ into $p^{mc}\mathcal{O}_K\langle \underline{X}\rangle^d$. Then because $|m!| > p^{-m/(p-1)}$(2.6.3.28), so the Mahler series

$$g(\underline{X}, T) = \sum_{m \in \mathbb{N}} \binom{T}{m} \Delta^m(\underline{X})$$

converges in $\mathcal{O}_K\langle \underline{X}\rangle^d$. And

$$g(\underline{X}, n) = \sum_{m=0}^{n} \binom{n}{m} \Delta^n(\underline{X}) = (\Delta + \mathrm{id})^n(\underline{X}) = f^{\circ n}(\underline{X}).$$

For the last assertion, the equation clearly holds for $T \in \mathbb{N}$, so by comparing coefficients, it holds for any T. □

1 Metrized Line Bundles

Def. (16.2.1.1)[Metrized Line Bundles]. Let F be a number field, a **metrized line bundle** $(\mathcal{L}, |\cdot|)$ is a line bundle on $\mathcal{O}_F$ together with norms $||\cdot||_v$ on the free F_v-module $M \otimes_R F_v$ of rank 1 for $v \in \Sigma_F^\infty$. ⌟

Def. (16.2.1.2) [Heights and Degree of Metrized Line Bundles]. Let F be a number field and $(\mathcal{L}, |\cdot|)$ be a metrized line bundle on $\mathcal{O}_F$(16.2.1.1), for each $v \in \Sigma_F^0$, $\mathcal{L}_v = \mathcal{O}_{F,v} m_v$ for some $m_v \in \mathcal{L}_v$, so we define $||m||_v = |m/m_v|_v$ for $m \in \mathcal{L}_v$, and define the **height of** $\mathcal{L}$ to be

$$H((\mathcal{L}, |\cdot|)) = \prod_{v \in \Sigma_F} ||m||_v^{-1}, \quad m \neq 0 \in M$$

which is independent of m by product formula. Also we define

$$h(M) = \frac{1}{[F:\mathbb{Q}]} \log H(M),$$

called the **degree of** $\mathcal{L}$. $h((\mathcal{L}, |\cdot|))$ is invariant under change of number fields. ⌟

17 p-Adic Geometry

17.1 $\mathbb{F}_p$-Schemes

1 Perfect Schemes

Def. (17.1.1.1)[Perfect Schemes]. An $\mathbb{F}_p$-scheme is called **perfect** if the Frobenius is an isomorphism on it. Equivalently, this means every affine subscheme is the spectrum of a perfect scheme.

Let Perf be the category of perfect qcqs $\mathbb{F}_p$-schemes endowed with the V-topology(6.1.4.43). ⌟

Def. (17.1.1.2)[Perfection]. There is a **perfection** functor $X \mapsto X_{perf}$ from the category of schemes to the category of perfect schemes, it is defined as the glueing of the perfection $R \to R_{perf}$(5.5.1.3) as it commutes with colimits. ⌟

Prop. (17.1.1.3)[Perfection and Properties]. Let $f : X \to Y$ be a morphism of $\mathbb{F}_p$-schemes, then the following properties holds true for f iff it holds true for f_{perf}:

1. Qco.
2. Quasiseparated.
3. Affine.
4. Separated.
5. Integral.
6. Universally closed.
7. Universal homeomorphism.

The following properties holds for f_{perf} if it holds for f:

1. Closed immersion.
2. Open immersion.
3. immersion
4. Étale
5. (Faithfully)Flat.

⌟

Proof: Cf.[Projectivity of Witt Vectors Affine Grassmannian, 3.4]. □

Prop. (17.1.1.4). If X is an $\mathbb{F}_p$-scheme and $\mathcal{L}$ is a line bundle on X, then $\mathcal{L}$ is ample iff the pullback to X_{perf} is ample. ⌟

Proof: Cf.[Projectivity of Witt Vectors Affine Grassmannian, 3.6]. □

Prop. (17.1.1.5). If X is an $\mathbb{F}_p$-scheme, then $X_{ét} \to X_{perf,ét} : Y \to Y_{perf}$ is an equivalence of sites. ⌟

Proof: □

Prop. (17.1.1.6) [Perfectly Finitely Presented Morphisms]. Let $f : X \to Y$ be a morphism in Perf(17.1.1.1), then f is called a **perfectly finitely presented morphism** if it satisfies the following equivalent conditions:

- Any open affine subscheme $\operatorname{Spec} B \subset X$ mapping to an open affine subscheme $\operatorname{Spec} A \subset Y$, $A \to B$ is perfectly f.p.(5.5.1.5).
- There is an open affine covering $\operatorname{Spec} A_i \to X$ mapping to an open affine covering $\operatorname{Spec} B_i \to Y$ that $B_i \to A_i$ are all perfectly f.p.
- For any cofiltered system $\{Z_i\} \in \mathrm{Perf}_{/Y}$ with affine transition maps, there is a bijection $\operatorname{colim} \operatorname{Hom}_Y(Z_i, X) \cong \operatorname{Hom}_Y(\lim Z_i, X)$.

In particular, perfectly finitely presented is local on the base and target. ⌟

Proof: Cf.[Projectivity of Witt Vectors Affine Grassmannian, 3.11]. □

Prop. (17.1.1.7) [Perfect Base Change]. If

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow{f'} & & \downarrow{f} \\ Y' & \xrightarrow{g} & Y \end{array}$$

is a pullback diagram of perfect $\mathbb{F}_p$-schemes, then for any complex $K^\bullet$ of Qco sheaves on X, the base change map(6.3.3.18)

$$Lg^* Rf_* K \to Rf'_* Lg' K$$

is an isomorphism. ⌟

Proof: It is clearly we need only check for the affine case, then let $X = \operatorname{Spec} B, Y = \operatorname{Spec} A, Y' = \operatorname{Spec} A'$, and $X' = \operatorname{Spec} B \otimes_A A'$, then it suffices to prove that

$$K \otimes^L_A A' \cong K \otimes^L_B B'.$$

This follows from the fact $B \otimes_A A' = B \otimes^L_A A'$, by(5.5.1.7). □

Prop. (17.1.1.8) [Cartier Isomorphism]. If ⌟

17.2 ℓ-adic Étale Cohomologies over Finite Fields

Basic References are [Conrad Seminar note in Stanford], [Seminar on Gross-Zagier over Function Fields, Lei Fu], [Seminar notes on Weil 2 Bhatt], [K-W01], [Etale Cohomology and Weil Conjecture], [A course on Weil Conjectures, Szamuely], [Deligne's proof of the Weil Conjecture, Jannsen].

Notation (17.2.0.1).

- $p \in \mathbf{P}, r \in \mathbb{Z}_+, q = p^r$, $k \cong \mathbb{F}_q$. Denote k_n the unique extension of k of degree n in $\overline{k}$.
- $\ell \in \mathbf{P} \backslash p$.
- $X_0 \in \mathcal{S}\mathrm{ch}^{\mathrm{ft}}/k$, $X = X_0 \otimes_k \overline{k}$ is its base change.
- If $\mathcal{F}_0$ is a sheaf on X_0, then $\mathcal{F} = \mathcal{F}_0 \otimes_k \overline{k}$.
- If $x_0 \in X_0(\overline{k})$, $x = x_0 \otimes_{\kappa(x)} \overline{k}$, and $\overline{x} \in x$ is a point over x_0.
- Fix a CDVR $(\Lambda, K, \mathfrak{m}, k)$ of characteristic $(0, \ell)$.
- For a Noetherian ring A with a distinguished ideal $I \subset A$, let $A_n = A/I^n$.

⌟

1 Weil Sheaves

Weil Sheaves

Def. (17.2.1.1) [Weil Groups]. Cf.[Conrad, L19].**?** ⌟

Def. (17.2.1.2) [Weil Sheaves]. By Galois descent, the pullback induces an equivalence of categories between the category of constructible $\overline{\mathbb{Q}}_\ell$-sheaves on X_0 to the category of constructible $\overline{\mathbb{Q}}_\ell$-sheaves on X with an specified $G(X/X_0) = G_k \cong \widehat{\mathbb{Z}}$-actions. In practice, sometimes it is hard to verify the action of $\mathbb{Z} \subset \widehat{\mathbb{Z}}$ is continuous, which leads to the following definition:

The category $\mathrm{W}\mathcal{S}\mathrm{h}_\ell(X_0)$ of **Weil-sheaves** on X_0 consists of pairs $\mathcal{G}_0 = (\mathcal{G}, F_\mathcal{G})$ where $\mathcal{G}$ is a constructible $\overline{\mathbb{Q}}_\ell$-sheaf on X and an isomorphism $F_\mathcal{G} : F_X^*\mathcal{G} \to \mathcal{G}$(6.2.10.1). Notice F_X^* is not $\overline{k}$-linear! There are natural definition of morphisms of Weil-sheaves. A **lisse Weil-sheaf** is a Weil-sheaf $\mathcal{G}_0$ s.t. $\mathcal{G}$ is lisse. ⌟

Prop. (17.2.1.3) [Constructible $\overline{\mathbb{Q}}_\ell$-Sheaves as Weil Sheaves]. For any constructible $\overline{\mathbb{Q}}_\ell$-sheaf $\mathcal{F}_0$ on X_0, the canonical $F_X^* \operatorname{pr}^* \mathcal{F}_0 \cong (\operatorname{pr} \circ F_X)^* \mathcal{F}_0 = \operatorname{pr}^* \mathcal{F}_0$ makes $\mathcal{F}$ into a Weil-sheaf. ⌟

Prop. (17.2.1.4).

- $\mathrm{W}\mathcal{S}\mathrm{h}_\ell(X_0)$ is an Abelian category, and contains the category of lisse $\overline{\mathbb{Q}}_\ell$-sheaves as an Abelian subcategory.
- The constructions like $R^i f_*, R^i f_!, f^*$ is functorial thus is definable on $\mathrm{W}\mathcal{S}\mathrm{h}_\ell(X)$ by(8.4.2.19).
- The specified isomorphism $F_\mathcal{G} : F_X^*\mathcal{G} \to \mathcal{G}$ gives us an action F_X^* of F_X on $H^i_{\text{ét},c}(X, \mathcal{G})$, just like in(8.4.1.36).
- (Frobenius Actions on Stalks)Let $x_0 \in X_0(\overline{k}), x = x_0 \otimes_{\kappa(x)} \overline{k}, \overline{x} \in x$, there is an Frobenius action $F_{x_0}^*$ of x_0 on $\mathcal{G}_{\overline{x}}$ given as follows: Pulling back $\mathcal{G}_0$ to a Weil-sheaf on x_0, then $F_x^*\mathcal{G}_x \cong \mathcal{G}_x$ gives an isomorphism $\mathcal{G}_{F^{i+1}(\overline{x})} \cong \mathcal{G}_{F^i(\overline{x})}$, whose $\deg(x_0)$-th iterate gives the action $\mathcal{G}_{\overline{x}} \cong \mathcal{G}_{F^{\deg(x_0)-1}(\overline{x})} \cong \ldots \cong G_{F(\overline{x})} \cong \mathcal{G}_{\overline{x}}$. For different choice of $\overline{x}$, the actions are conjugate.

  And if $\mathcal{G}_0$ is a constructible sheaf on X_0, then $F_{x_0}^*$ acts via $\varphi_{x_0}^{-1}$**?**.

⌟

Prop. (17.2.1.5) [Weil Sheaves and Representation]. When X_0 is geo.connected, there is an equivalence of categories

$$\mathrm{W}\mathcal{S}\mathrm{h}_\ell(X_0)\cong \mathrm{Rep}_\ell(W(X_0,\overline{x})):\mathcal{G}_0\mapsto(\mathcal{G}_0)_{\overline{x}},$$

and the correspondence defined in(8.4.7.27) is a sub-correspondence of this.

Thus the notion of **geometric irreducible/semisimple** is definable for Weil-sheaves. ⌟

Proof: Because by the correspondence(8.4.7.27), $\mathcal{G}$ corresponds to a representation of $\pi_1(X,\overline{x})$, and $\pi_1(X,\overline{x})$ acts trivially on the Galois cover X/X_0. Now a representation of $W(X_0,\overline{x})$ is equivalent to an automorphism $\rho(\sigma)$(where $\sigma\in W(X_0,\overline{x})$ satisfies $\deg(\sigma)$ corresponds to the geometric Frobenius) that $\rho(\sigma)\rho(\pi_1(X,\overline{x}))\rho(\sigma^{-1})=\rho(\sigma\pi_1(X,\overline{x})\sigma^{-1})$, which is equivalent to an isomorphism $F_X^*\mathcal{G}\to\mathcal{G}$. □

Prop. (17.2.1.6) [Weil Sheaves and Eigenvalues]. If X_0 is geo.connected, a lisse Weil-sheaf $\mathcal{G}_0$ on X_0 is a usual $\overline{\mathbb{Q}}_\ell$-sheaf iff some deg1 element σ in $W(X,\overline{x})$ acts on $\mathcal{G}_{0\overline{x}}$ with eigenvalues which are ℓ-adic units. ⌟

Proof: This is purely a Galois representation problem, concerning whether the representation of $W(X_0,\overline{x})$ can be extended to a representation of $\pi_1(X_0,\overline{x})$, and it is a continuity problem.

Firstly the representation of $\pi_1(X,\overline{x})$ stabilizes a lattice O_E^n for some $E/\mathbb{Q}_\ell$ finite, and then extends E to contain coefficients of $\rho(\sigma)$ and even its rational form. Then notice $\pi_1(X_0,\overline{x})$ is the profinite completion of $W(X_0,\overline{x})$, thus it suffices to see if the image $\rho(W(X_0,\overline{x}))$ is compact, and this is equivalent to eigenvalues of $\rho(\sigma)$ are units. □

Prop. (17.2.1.7) [Determinential Criterion]. If X_0 is a normal variety, then a irreducible lisse Weil-sheaf on X_0 is an actual $\overline{\mathbb{Q}}_\ell$-sheaf iff its determinant bundle is. ⌟

Proof: Use geometric monodromy group. Cf.[Conrad L19 P7].

First assume that $\mathcal{G}_0$ is geometrically irreducible, then(17.2.4.4) shows that there is a nonzero power $\sigma^m=gz$ where $g\in G_{geo}(\overline{\mathbb{Q}}_\ell)$ and $z\in Z(G(\overline{\mathbb{Q}}_\ell))$. Now G_{geo} is a semisimple algebraic group(17.2.4.4), so the determinential character maps $G_{geo}(G(\overline{\mathbb{Q}}_\ell))$ to a finite group, because connected semisimple algebraic group has no nontrivial character as $[G,G]=G$**?**. So the determinant of g is an l-unit, and $\det(\sigma^m)=\det(z)$ is a unit. But z is a scalar by Schur's lemma, thus z is an l-adic unit. Now it suffices to show the eigenvalue of g are all l-units.

Now consider $\rho(\pi_1(X,\overline{x}))$ is a compact group in $\mathrm{End}(V)$, thus it generates a finite $\mathcal{O}_E$-submodule A , which is full-rank lattice in $\mathrm{End}(V)$ by Jacobson density theorem**?** and the fact ρ is absolutely irreducible. g normalized A, because σ and z both normalizes $\rho(\pi_1(X,\overline{x}))$, so the eigenvalue of the conjugate action of g are all l-units, but its eigenvalue are of the form $\lambda_i\lambda_j^{-1}$ where λ_k are eigenvalues of g, so this together with the fact $\det(g)$ is l-units shows that all λ_i are l-units.

For the general case, Cf.[Conrad L19 P7].**?** □

Cor. (17.2.1.8) [Filtration of Weil Sheaf]. If X_0 is a normal variety, then for any irreducible lisse Weil-sheaf $\mathcal{G}_0$, there is some $b\in\overline{\mathbb{Q}}_\ell^\times$ and a lisse Weil-sheaf $\mathcal{F}_0$ that $\mathcal{G}_0\cong\mathcal{F}_0\otimes\mathcal{L}_b$, where $\mathcal{L}_b$ is the Weil-sheaf corresponding to the character $W(X_0,\overline{x})\to\overline{\mathbb{Q}}_\ell^\times:x\mapsto b^{\deg(x)}$, which is a pull back from $\operatorname{Spec}\mathbb{F}_q$.

More generally, for any lisse Weil-sheaf, there is a filtration that each quotient is of the form $\mathcal{F}_0^{(i)}\otimes\mathcal{L}_{b_i}$ for some $b_i\in\overline{\mathbb{Q}}_\ell^\times$ and $\mathcal{F}_0^{(i)}$ lisse $\overline{\mathbb{Q}}_\ell$-sheaves. ⌟

Proof: Just choose $b = \chi_{\det}(\sigma)^{1/n}$, where $\deg(\sigma) = 1$, then

$$\wedge(\mathcal{G}_0 \otimes \mathcal{L}_{b^{-1}}) \cong \wedge(\mathcal{G}_0) \otimes \mathcal{L}^{-1}_{\chi_{\det}(\sigma)}$$

which has unit eigenvalues thus is a lisse $\overline{\mathbb{Q}}_\ell$-sheaf. □

2 Trace Formulae

Def. (17.2.2.1) [Zeta-Functions]. For $\mathcal{F} \in \mathrm{W}\mathcal{S}\mathrm{h}(X_0)$, the **zeta-function** associated to $\mathcal{F}_0$ is defined to be

$$Z(X_0, \mathcal{F}_0; T) = \prod_{x_0 \in |X_0|_0} \det(1 - F^*_{x_0} T^{\deg(x)} | \mathcal{F}_{\overline{x}})^{-1} \in 1 + T\Lambda[[T]],$$

where $F^*_{x_0}$ is defined in(17.2.1.4). Notice if $\mathcal{F}_0 \in \mathcal{S}\mathrm{h}((X_0)_{\text{ét}})$, then $F^*_{x_0} = \varphi^{-1}_{\kappa(x_0)}$ by(17.2.1.4). ⌟

Prop. (17.2.2.2). Situation as in(17.2.2.1),

$$Z(X_0, \mathcal{F}_0; T) = \exp(\sum_{n \geq 1} \sum_{x \in X_0(k_n)} \mathrm{tr}(F^*_x | \mathcal{F}_{\overline{x}}) \frac{T^n}{n})$$

⌟

Proof: By(3.5.7.26),

$$\begin{aligned} Z(X_0, \mathcal{F}_0; T) &= \prod_{x_0 \in X(\overline{k})} \exp(\sum_{n \geq 1} \mathrm{tr}((F^*_{x_0})^n | \mathcal{F}_{\overline{x}}) \frac{T^{n \deg(x)}}{n}) \\ &= \exp(\sum_{n \geq 1} \sum_{x_0 \in X_0(\overline{k})} \deg(x) \, \mathrm{tr}((F^*_{x_0})^n | \mathcal{F}_{\overline{x}}) \frac{T^n}{n}) \\ &= \exp(\sum_{n \geq 1} \sum_{x_0 \in X_0(k_n)} \mathrm{tr}(F^*_{x_0} | \mathcal{F}_{\overline{x}}) \frac{T^n}{n}) \end{aligned}$$

where in the last equality, notice there are exactly $\deg(x_0)$ many points in $X_0(\overline{k})$ over $x_0 \in X_0(k_n)$. □

Cor. (17.2.2.3). If $\mathcal{F} = \mathbb{Q}_\ell$, then

$$Z(X_0, \mathbb{Q}_\ell; T) = \prod_{x_0 \in |X_0|_0} \frac{1}{1 - T^{\deg(x_0)}}$$

is just the Z-function defined in(21.2.3.1). ⌟

Lemma (17.2.2.4) [Weil Trace Formula]. Let $X_0 \in \mathcal{S}\mathrm{ch}^{\mathrm{sep,ft}}/k$, A be a Noetherian $\mathbb{Z}/(\ell^n)$-algebra, $\mathcal{F}_0 \in D^b_{ctf}(X_0, A)$, then

$$\sum_{x_0 \in X_0(k)} \mathrm{tr}(F^*_{x_0} | \mathcal{F}_{\overline{x}}) = \mathrm{tr}(F^*_X | [R\Gamma_c(X, \mathcal{F})])$$

⌟

Proof: Cf.[Fu11]P596**?**. □

Prop. (17.2.2.5) [General Trace Formula for Frobenius]. Let $X_0 \in \mathcal{S}\mathrm{ch}^{\mathrm{sep,ft}}/k, \mathcal{F}_0 \in D^b_{\mathrm{const}}(X_0, \overline{\mathbb{Q}}_\ell)$, then

$$\sum_{x_0 \in X_0(k)} \mathrm{tr}(F^*_{x_0}|\mathcal{F}_{\overline{x}}) = \mathrm{tr}(F^*_X|[R\Gamma_c(X,\mathcal{F})]).$$

⌟

Proof: Cf.[Fu11]P596**?**. □

Prop. (17.2.2.6) [Grothendieck-Lefschetz Trace Formula for Weil Sheaves]. For $S_0 \in \mathcal{S}\mathrm{ch}^{\mathrm{ft}}/k, f_0 : X_0 \to S_0 \in \mathcal{S}\mathrm{ch}^{\mathrm{sep,ft}}/S, \mathcal{F}_0 = (\mathcal{F}, F_{\mathcal{F}}) \in \mathrm{W}\mathcal{S}\mathrm{h}(X_0)$(17.2.1.2),

$$Z(X_0,\mathcal{F}_0;T) = \prod_{n=0}^{2\dim X_0} Z(S_0, R^n f_{0!}\mathcal{F}_0; T)^{(-1)^n}.$$

In particular, for $S = \operatorname{Spec} k, X_0 \in \mathcal{S}\mathrm{ch}^{\mathrm{sep,ft}}/k$, by base change and(17.2.1.4),

$$Z(X_0,\mathcal{F}_0;T) = \prod_{n=0}^{2\dim X_0} \det(1 - F^*_X T|H^n_{\text{ét},c}(X,\mathcal{F}))^{(-1)^{n+1}}$$

Notice by(8.4.5.7), the higher proper pushforwards just vanish. ⌟

Proof: Use the filtration in(17.2.1.8), notice that the trace is additive for a filtration, so we can reduce to the case $\mathcal{G}_0 = \mathcal{F}_0 \otimes \mathcal{L}_b$ and $\mathcal{G}_{\overline{x}} = \mathcal{F}_{\overline{x}} \otimes \mathcal{L}_{b,\overline{x}}$, then the Euler factors are

$$\det(1 - b^{\deg(x)}\varphi^{-1}_{\kappa(x)} T^{\deg(x)}|\mathcal{F}_{\overline{x}})$$

and the cohomology factor is

$$\det(1 - F^*_X T|H^i_{\text{ét},c}(X,\mathcal{F}\otimes\mathcal{L}_b)) = \det(1 - bF^*_X T|H^i_{\text{ét},c}(X,\mathcal{F}))$$

where the projection formula(8.4.5.8) is used, noticing the $\mathcal{L}_b$ is pulled back from $\operatorname{Spec}\mathbb{F}_q$. Then the assertion is clear from(17.2.2.5) and(17.2.2.2)(17.2.1.4). □

Cor. (17.2.2.7). $Z(X_0,\mathcal{F}_0;T)$ is a rational function in T. ⌟

3 Weights and Purity

Determinantial Weights

Prop. (17.2.3.1) [Structure of Weil Group of Curves]. If X_0 is a smooth curve over $\mathbb{F}_q$, then the image of $\pi_1(X,\overline{x})$ in $W(X_0,\overline{x})^{ab}$ is a product of a finite group and a pro-p group. ⌟

Proof: Let K be the function field of X_0, $\overline{X_0}$ be the regular completion of X_0, with $S_0 = \overline{X_0} - X_0$, then we have an isomorphism $\pi_1(\overline{X_0},\overline{x}) \cong G_K$ Cf.[Étale Cohomology Lei Fu P136]**?**. So we can use global class field theory:

$$\begin{array}{ccccccccc}
 & & \pi_1(\overline{X},\overline{x})^{ab} & \longrightarrow & \pi_1(\overline{X_0},\overline{x})^{ab} & \longrightarrow & G_k \cong \widehat{\mathbb{Z}} & \longrightarrow & 0 \\
 & & \downarrow & \searrow & \uparrow & & \uparrow & & \\
0 & \longrightarrow & I_K & \longrightarrow & W(\overline{X_0},\overline{x})^{ab} \cong W(K,k) & \longrightarrow & W(k) \cong \mathbb{Z} & \longrightarrow & 0 \\
 & & \downarrow\cong & & \downarrow\cong & & \downarrow\cong & & \\
0 & \longrightarrow & K^*\backslash(A^*_K)^1/\prod_v \mathcal{O}^*_v & \longrightarrow & K^*\backslash A^*_K/\prod_v \mathcal{O}^*_v & \longrightarrow & q^{\mathbb{Z}} & \longrightarrow & 0
\end{array}$$

So the image of $\pi_1(\overline{X},\overline{x})$ factors through $\pi_1(\overline{X},\overline{x})\to\pi_1(\overline{X},\overline{x})^{ab}\to K^*\backslash A_K^*/\prod_v\mathcal{O}_v^*$ which is the class number of K, is finite.

In this diagram, $W(X_0,\overline{x})$ corresponds to $K^*\backslash A_K^*/\prod_{v\notin S_0}\mathcal{O}_v^*$, so

$$0\to\ker(W(X_0,\overline{x})\to W(\overline{X_0},\overline{x}))\to\mathrm{Im}(\pi_1(X_0,\overline{x}))\to\mathrm{Im}(\pi_1(\overline{X_0},\overline{x}))\to 0$$

But the kernel is a quotient of $\prod_{v\in S_0}\mathcal{O}_v^*$, which is a pro$-p$ group times a finite group, so finally $\mathrm{Im}(\pi_1(X_0,\overline{x}))$ is a product of a pro-p-group times a finite group. □

Lemma (17.2.3.2) [Curve Rank 1 case]. If X_0/k is a smooth curve and $\chi: W(X_0,\overline{x})\to\overline{\mathbb{Q}}_\ell^\times$ be a continuous character, then there exists a $c\in\overline{\mathbb{Q}}_\ell^\times$ that χ is a product of a character of finite order and the character $\sigma\mapsto c^{\deg(\sigma)}$.

In particular, the Weil-sheaf corresponding to χ is punctually ι-pure of weight $2\log_q|\iota(c)|$. ⌟

Proof: By(18.3.1.3), the image of χ is in $\mathcal{O}_E^*$ for some $E\in\ell$-`LField`, so by(17.2.3.1), it has an open subgroup which is pro-p and pro-ℓ so trivial, thus $\pi_1(X_0,\overline{x})$ is mapped to a finite group.

In particular there is an n that $\chi^n=\mathrm{id}$ on $\pi_1(X_0,\overline{x})$, so there is some b that $\chi^n=b^{\deg(\sigma)}$, hence if c is an n-th roots of b and we let $\chi'=\chi/c^{\deg(\sigma)}$, then $(\chi')^n=1$. □

Cor. (17.2.3.3) [Rank 1 Lisse Sheaf is Pure]. If X_0/k is a smooth curve, then any lisse Weil-sheaf of rank 1 is pure. ⌟

Def. (17.2.3.4) [Determinential Weight]. Let $\mathcal{F}_0$ be a lisse Weil-sheaf on a geometrically connected smooth scheme X_0, and $0=\mathcal{F}_n\subset\mathcal{F}_{n-1}\subset\ldots\subset\mathcal{F}_0$ be a filtration of lisse sheaves that the quotients are irreducible, we define the **determinential ι-weights** of $\mathcal{F}_0$ to be that of the ι-weights of the top wedge products of the successive quotients divided by their ranks, which exists by(17.2.3.3).

Notice that the determinential ι-weights are unchanged when $\mathcal{F}_0$ is replaced by its semisimplification $\mathcal{F}_0^s=\oplus_{i\geq 0}(\mathcal{F}_i/\mathcal{F}_{i-1})$. ⌟

Purity

Def. (17.2.3.5) [Purity]. For an embedding $\iota:\overline{\mathbb{Q}}_\ell\to\mathbb{C}$, $\mathcal{F}_0\in\mathcal{W}\mathrm{Sh}(X_0)$ is called **ι-pure** of weight w if for any closed point $x\in X$, the $\overline{\mathbb{Q}}_\ell$-eigenvalues of $F_{x_0}^*$ on the stalks $\mathcal{F}_x$(17.2.1.4) are algebraic and satisfy $|\iota(\alpha_i)|=(q^{\deg(x)})^{w/2}$.

It is called **pure of weight** w iff for any closed point $x\in X$, the $\overline{\mathbb{Q}}_\ell$-eigenvalues are $q^{\deg(x)}$-Weil numbers of weight w(14.4.1.13), i.e. ι-pure for any embedding $\iota:\overline{\mathbb{Q}}_\ell\to\mathbb{C}$.

It is said to be **(ι-)mixed** with weights $w_1,\ldots,w_n$ if it has a filtration of constructible $\overline{\mathbb{Q}}_\ell$-sheaves that each quotient is pure of weight w_i respectively. ⌟

Example (17.2.3.6). $\mathbb{Q}_\ell(r)$ is pure of weight $-2r$. ⌟

Proof: This is because the geometric Frobenius $\varphi_{\kappa(x)}^{-1}$ acts by $1/q^{d_x}$-th power, which is additively multiplying by $(q^{d_x})^{-2/2}$. □

Prop. (17.2.3.7) [Permanence Properties].

- $f_0:X_0\to Y_0$ is a morphism, and $\mathcal{G}_0$ is a Weil-sheaf on Y_0, then if $\mathcal{G}_0$ is ι-pure, then $f_0^*\mathcal{G}_0$ is also ι-pure, and the converse is also true if f is surjective.
- If $f_0:X_0\to Y_0$ is finite, and $\mathcal{G}_0$ is a Weil-sheaf on X_0, then if $j_0^*(\mathcal{G}_0)$ is ι-pure, then $\mathcal{G}_0$ is ι-pure.

- Let k'/k be a finite field extension, then a Weil-sheaf $\mathcal{G}_0$ on X_0 is pure of weight β iff $(\mathcal{G}_0)_{k'}$ is on $(X_0)_{k'}$.

⌟

Proof: 1 is because the stalk corresponds.
2: This is because the stalks can be calculated, by**?**.
3: **?** □

Semicontinuity of Weights

Def. (17.2.3.8) [Maximal Weight]. For a general Weil-sheaf $\mathcal{G}_0$ on X_0, we can also define the **maximal ι-weight** of $\mathcal{G}_0$ as

$$w(\mathcal{G}_0)=\sup_{x\in|X_0|}\sup_{\alpha_i}2\log_{N(x)}(|\iota(\alpha_i)|).$$

⌟

Lemma (17.2.3.9). $|X_0(k_n)|=O(q^{n\dim X})$ ⌟

Proof: We can pass to the reduced structure of X_0, then we can use excision to pass to the integral case. Then choose an open affine dense subset U_0 of X_0, then by Noetherian normalization, it factors through a finite map $f:U_0\to\mathbb{A}^{\dim X_0}_{k_n}$, so

$$|U(k_n)|\leq(\deg f)q^{n\dim X_0}$$

Then we can use induction on dimension, because $\dim(X_0-U_0)<\dim X_0$. □

Lemma (17.2.3.10). Let $\mathcal{G}_0$ be a Weil-sheaf on X_0 and β be a real number that $\beta\geq w(\mathcal{G}_0)$, then the L-function

$$\iota(L(X_0,\mathcal{G}_0,t))=\prod_{x\in|X_0|}\iota(\det(1-t^{d_x}F_x,\mathcal{G}_{0,\overline{x}})^{-1})$$

converges for $|t|<q^{-\beta/2-\dim X_0}$ and has no zero or pole there. ⌟

Proof: We can show that it has no zero or pole using the fact that the logarithmic derivative has no poles(when it is convergent). We suppress the isomorphism $\iota:\overline{\mathbb{Q}}_\ell\to\mathbb{C}$ and calculate:

$$\frac{d\log}{dt}L(X_0,\mathcal{G}_0,t)=\sum_{x\in|X_0|}\sum_{n\geq1}d_x(\mathrm{tr}(F_x^n))t^{d_xn-1}\mathbf{??}=\sum_{n\geq1}\sum_{x\in|X_0|,d_x|n}d_x(\mathrm{tr}(F_x^{n/d_x}))t^{n-1}$$

Notice by assumption on β, $|\mathrm{tr}(F_x^{n/d_x})|\leq rq^{n\beta/2}$, where $r=\max_{x\in|X_0|}\dim_{\overline{\mathbb{Q}}_\ell}\mathcal{G}_{0,x}$ is finite because it has a stratification by(8.4.7.15), so

$$|\frac{d\log}{dt}L(X_0,\mathcal{G}_0,t)|\leq\sum_{n\geq1}\sum_{x\in|X_0|,d_x|n}d_xrq^{n\beta/2}t^{n-1}=\sum_{n\geq1}|X_0(k_n)|rq^{n\beta/2}t^{n-1}$$

converges for $|t|<q^{-\beta/2-\dim X_0}$ by(17.2.3.9). □

Lemma (17.2.3.11) [Semicontinuity of Weights for Curves]. If X_0/k be a smooth curve and $U_0\xrightarrow{j_0}X_0$ be a nonempty open with $S_0=X_0-U_0$. Let $\mathcal{G}_0$ be a Weil-sheaf on X_0 s.t. the restriction $j_0^*\mathcal{G}_0$ is lisse and $H^0_S(X,\mathcal{G})=0$, then $w(j_0^*(\mathcal{G}_0))\leq\beta$ implies $w(\mathcal{G}_0)\leq\beta$. ⌟

Proof: For any point x, consider an affine open subset of X_0, then reduce to the affine case, and because $H^0_S(X,\mathcal{G})=0$ and the excision sequence(8.4.5.5), we have $\mathcal{G}\hookrightarrow j_*j^*\mathcal{G}$, so the weights of $\mathcal{G}_0$ are no more than that of $j_*j^*\mathcal{G}$, and replacing $\mathcal{G}_0$ with $j_{0*}j_0^*\mathcal{G}_0$, we can assume $\mathcal{G}_0=j_{0*}j_0^*\mathcal{G}_0$. Then

$$H^0_c(X,\mathcal{G})=H^0_c(X,j_*j^*\mathcal{G})=H^0_c(U,j^*\mathcal{G})=0$$

by Poincare duality and the fact j_* is exact because it is finite.

Now by Grothendieck-Lefschetz trace formula,

$$L(X_0,\mathcal{G}_0,t)=L(U_0,j_0^*(\mathcal{G}_0),t)\cdot\prod_{s\in|S_0|}\det(1-t^{d_s}F_s,\mathcal{G}_{\overline{s}})^{-1}=\frac{\det(1-F_Xt|H^1_{\text{ét},c}(X,\mathcal{G}))}{\det(1-F_Xt|H^2_c(X,\mathcal{G}))}$$

Denote $\mathcal{F}_0=j_0^*\mathcal{G}_0$, then

$$H^2_c(X,\mathcal{G})=H^2_c(U,\mathcal{F})=(\mathcal{F}_{\overline{x}})_{\pi_1(U,\overline{x})}(-1)$$

So the weights of eigenvalues of F_X on $H^2_c(X,\mathcal{G})\leq$ weights of $\mathcal{F}+2$, hence the L-function converges for $|t|<q^{-\beta/2-1}$. Now the LHS has $L(U_0,j_0^*(\mathcal{G}_0),t)$ converges for $|t|<q^{-\beta/2-1}$ because $w(\mathcal{F}_0)\leq\beta$, and so for the points in S_0, we also have $\det(1-t^{d_s}F_s,\mathcal{G}_{\overline{s}})$ has no zero there, which means they have weights$\leq\beta+1$. Now consider replacing $\mathcal{G}_0$ with $\mathcal{G}_0^{\otimes k}$ and let $k\to\infty$, then their weights$\leq\beta$. □

Prop. (17.2.3.12) [Semicontinuity of Weights]. Let X_0 be geo.normal, $\mathcal{G}_0$ be a lisse sheaf on X_0 and $j_0:U_0\to X_0$ be an open dense subscheme, then

- $w(\mathcal{G}_0)=w(j_0^*\mathcal{G}_0)$.
- If $j_0^*(\mathcal{G}_0)$ is ι-pure of weights β, then $\mathcal{G}_0$ is also ι-pure of weights β.
- Let X_0 be irreducible and normal, and $\mathcal{G}_0$ is irreducible, then if $j_0^*\mathcal{G}_0$ is ι-mixed, then $\mathcal{G}_0$ is ι-pure.

⌟

Proof: 1: The weights is local so we may assume X_0 is irreducible, and then for any closed point x, we can connect it with U_0 with a curve(choose an affine open and use Noetherian Normalization to choose an irreducible component of an arbitrary curve in $\mathbb{A}^n$). Notice $H^0_S(X,\mathcal{G})=0$ because it is lisse thus $H^0(X,\mathcal{G})$ is determined by stalk thus $H^0(X,\mathcal{G})\to H^0(U,\mathcal{G}|_U)$ is injective. So we finish by the curve case(17.2.3.11).

2: Apply item1 to $\mathcal{G}_0$ and $\mathcal{G}_0^\vee$.

3: It is ι-mixed so it has ι-pure Weil-sheaf constituents. Now by(8.4.7.15) we can find an open dense U_0 that restriction to U_0 has constituents ι-pure lisse sheaves. But it is also irreducible because $\pi_1(U_0,\overline{a})\to\pi_1(X_0,\overline{a})$ is surjective?, so it is ι-pure and item2 shows $\mathcal{G}_0$ is ι-pure. □

L^2-Norms and Maximal Weights

Def. (17.2.3.13). As in(17.2.8.1), for any $\mathcal{G}_0\in D^b_{cons}(X_0,\overline{\mathbb{Q}}_\ell)$, we have a a function

$$f^{\mathcal{G}_0}:X_0(\mathbb{F}_{q^n})\to\overline{\mathbb{Q}}_\ell:x\mapsto\sum_i(-1)^i\operatorname{tr}(F_x^{n/d_x}|(H^i(\mathcal{G}_0))_{\overline{x}}),$$

Fix an arbitrary isomorphism $\overline{\mathbb{Q}}_\ell\cong\mathbb{C}$, we can consider the usual L^2-norm for functions on $X_0(k_n)$, denoted by $(f,g)_n$. ⌟

Def. (17.2.3.14). Notice the equation form(17.2.3.10) can be rewritten as

$$\frac{d\log}{dt}L(X_0,\mathcal{G}_0,t)=\sum_{n\geq 1}\sum_{x\in|X_0|,d_x|n}d_x(\mathrm{tr}(F_x^{n/d_x}))t^{n-1}=\sum_n(f^{\mathcal{G}_0},1)_n t^{n-1}.$$

Now we define another closed related function

$$\varphi^{\mathcal{G}_0}(t)=\sum_n||f^{\mathcal{G}_0}||_n^2t^{n-1},$$

which works better with Fourier transform we are about to define later. ⌟

Lemma (17.2.3.15). There is a constant C that $||f^{\mathcal{G}_0}(x)||^2\leq Cq^{n(w(\mathcal{G}_0)+\dim X_0)}$, so $\varphi^{\mathcal{G}_0}(t)$ converges for $|t|\leq q^{-w(\mathcal{G}_0)-\dim X_0}$. ⌟

Proof: The proof is similar to that of(17.2.3.10) thus omitted. □

Def. (17.2.3.16) [Norm of a Weil Sheaf]. Define the Norm of a Weil-sheaf as

$$||\mathcal{G}_0||=\sup\{\rho|\limsup_n\frac{||f^{\mathcal{G}_0}||_n^2}{q^{n(\rho+\dim X_0)}}>0\}$$

Then $q^{-||\mathcal{G}_0||-\dim X_0}$ is just the radius of convergence of the function $\varphi^{\mathcal{G}_0}(t)$, and $||\mathcal{G}_0||\leq w(\mathcal{G}_0)$ by lemma(17.2.3.15) above. ⌟

Prop. (17.2.3.17) [Radius of Convergence]. Let $\mathcal{G}_0$ be a ι-mixed sheaf on a smooth curve X_0 over k, and $H^0_{\text{ét},c}(X,\mathcal{G})=0$, then $||\mathcal{G}_0||=w(\mathcal{G}_0)=\beta$. ⌟

Proof: It suffices to show $w(\mathcal{G}_0)\leq||\mathcal{G}_0||$. First notice we can assume X_0 is reduced because the nilpotents corredsponds to zero Frobenius eigenvalues, and also it is connected, because the function $f^{\mathcal{G}_0}$ is additive in X. Now we study by cases:

1: If $\mathcal{G}_0$ is a lisse ι-pure sheaf on a smooth affine curve X_0, we may assume $\mathcal{G}_0\neq 0$, then $\mathcal{G}_0\otimes\overline{\mathcal{G}_0}$(17.2.5.2) is ι-real of weight 2β and $(f^{\mathcal{G}_0\otimes\overline{\mathcal{G}_0}},1)_n=||f^{\mathcal{G}_0}||_n^2$, so $\varphi^{\mathcal{G}_0}(t)$ is just the logarithmic derivative of the L-function $L(X_0,\mathcal{G}_0\otimes\overline{\mathcal{G}_0},t)$, thus(17.2.3.10) shows its convergence radius$\geq q^{-\beta-1}$. And notice the H^0_c terms vanish so the poles can only appear as the zeros of H^2_c term, so(17.2.5.3) shows the poles of the $L(X_0,\mathcal{G}_0\otimes\overline{\mathcal{G}_0},t)$ has weight $2\beta+2$, thus the poles can only appear on $|t|=q^{-\beta-1}$.

Now consider each local Euler factor $\det(1-F_xt^{d_x}|(\mathcal{G}_0\otimes\overline{\mathcal{G}_0})_x)^{-1}$ has non-negative coefficients, they have poles because $\mathcal{G}_0\neq 0$, and their poles have weight β because of purity, thus their product also has (real)poles, by previous argument, the pole has weight $\beta+1$, thus it has convergence radius at most $q^{-\beta-1}$, so we are done.

2: If $\mathcal{G}_0$ is a ι-mixed, consider its semisimplification $\mathcal{G}_0^{ss}=\mathcal{F}_0\oplus\mathcal{H}_0$, where $\mathcal{F}_0$ is ι-pure of weight $w(\mathcal{G}_0)$, and $w(\mathcal{H}_0)\leq w(\mathcal{F}_0)$.

Then $f^{\mathcal{G}_0}=f^{\mathcal{F}_0}+f^{\mathcal{H}_0}$, and

$$\varphi^{\mathcal{G}_0}(t)=\varphi^{\mathcal{F}_0}(t)+\sum_{n\geq 1}2\,\mathrm{Re}(f^{\mathcal{F}_0},f^{\mathcal{H}_0})_nt^{n-1}+\varphi^{\mathcal{H}_0}(t)$$

then by item1 $\varphi^{\mathcal{F}_0}(t)$ has convergence radius $q^{-w(\mathcal{G}_0)-1}$, and by(17.2.3.15) $\varphi^{\mathcal{H}_0}(t)$ has radius at least $q^{-w(\mathcal{H}_0)-1}>q^{-w(\mathcal{G}_0)-1}$, and by Cauchy inequality the middle term satisfies

$$|2\,\mathrm{Re}(f^{\mathcal{F}_0},f^{\mathcal{H}_0})_n|\leq 2||f^{\mathcal{F}_0}||_n||f^{\mathcal{H}_0}||_n\leq Cq^{n(w(\mathcal{F}_0)+w(\mathcal{H}_0)/2+1)}$$

So the middle term has convergence radius$>$ $q^{-w(\mathcal{G}_0)-1}$, so their sum has convergence radius $q^{-w(\mathcal{G}_0)-1}$. □

4 Geometric Monodromy

Def. (17.2.4.1) [Notations]. Let X_0 be a geometrically connected normal scheme over $k = \mathbb{F}_q$ in this subsection. ⌟

Def. (17.2.4.2) [Geometric Monodromy Group]. Let $\mathcal{G}_0$ be a Weil-sheaf associated to a representation $(V,\rho) = GL(\mathcal{G}_{\overline{x}})$ of $W(X_0,\overline{x})$, the **geometric monodromy group** G_{geo} associated to $\mathcal{G}_0$ is the Zariski Closure of $\rho(\pi_1(X,\overline{x})) \subset GL(V)$.

Every element in $\rho(W(X_0,\overline{x}))$ normalizes G_{geo} by continuity, so choosing an arbitrary generator $\sigma \in W(\overline{k}/k)$, we have an action of $W(\overline{k}/k)$ on G_{geo}. Define $G = W(\overline{k}/k) \ltimes G_{geo}$ the **arithmetic monodromy group** of $\mathcal{G}_0$. ⌟

Lemma (17.2.4.3). If G_{geo} is connected, then there is a positive integer N that the semidirect sequence

$$1 \to G_{geo} \to \deg^{-1}(N\mathbb{Z}) \xrightarrow{\deg} N\mathbb{Z} \to 1$$

is direct, i.e. $\deg^{-1}(N\mathbb{Z}) \cong G_{geo} \times \mathbb{Z}$. ⌟

Proof: Choose a $\deg(g) = 1$. The representation G_{geo} splits as a characters of $Z(G)$, and then some g^n stablizes these characters, hence stablizes $Z(G)$, which then it descends to an action on G_{adj}, whose automorphism is the automorphism of the Dynkin diagram**?**, so finite, so some g^m fixes G_{adj} after changing a semidirect product, thus induces a map $\mathrm{Hom}(G_{adj}, Z(G))$, but G_{adj} is semisimple(9.3.3.19), so the connected component is mapped to 1 in $Z(G)$(9.3.3.17), so there are only f.m. such homomorphism, showing g^k is 1, so the product is exact for $N = k$. □

Prop. (17.2.4.4) [Geometric Monodromy Group is Semisimple]. Let $\mathcal{G}_0$ be a geometrically semisimple lisse Weil-sheaf(17.2.1.5), then

- G_{geo} and G^0_{geo} are semisimple algebraic group.
- Let $Z = Z(G(\overline{\mathbb{Q}}_\ell))$, then the map $\psi : Z \to W(\overline{k}/k)$ has finite kernel and cokernel. In particular, Z contains an element of finite degree, and it is surjective after a finite base change of fields.

And notice in fact if $\mathcal{G}_0$ is semisimple, then it is automatically geometrically semisimple by(18.1.2.10). ⌟

Proof: 1: L G_{geo} is semisimple iff G^0_{geo} is semisimple. Pass to a finite étale covering, we may assume $G_{geo} = G^0_{geo}$. Let $R(G^0_{geo})$ be the radical and $R_u(G^0_{geo})$ be the unipotent radical, then R is normal in G^0 and G^0 is normal in G, so by(18.1.2.10) $V = GL(\mathcal{G}_{\overline{x}})$ is irreducible $R(G^0_{geo})$ representation, but it is solvable, so V is a direct sum of 1-dimensional representations, and $R_u(G^0_{geo})$ is trivial, in particular G^0_{geo} is reductive. So it is semisimple if the maximal Abelian quotient G^{ab}_{geo} is finite(9.3.3.17).

let T_1 be the maximal central torus of G^0_{geo}, then lemma(17.2.4.3) shows after a finite base change of fields, we may assume $G = G_{geo} \times \mathbb{Z}$, consider the composite $W(X_0,\overline{x}) \to G_{geo} \times \mathbb{Z} \to G_{geo} \to G^{ab}_{geo}$, then $\pi_1(X,\overline{x})$ is Zariski dense in G^{ab}_{geo}, and (17.2.3.3) shows clearly G^{ab}_{geo} has no maximal torus thus finite.

2: $\ker\psi \subset Z(G_{geo}(\overline{\mathbb{Q}}_\ell))$ is finite since G_{geo} is semisimple. To find an element in $Z(G)$ of positive degree, we may use the same method as before to find an element ζ that commutes with G^0_{geo}, and pass to a power, we may assume it acts trivially on G_{geo}/G^0_{geo}.

For any $g \in G_{geo}$, consider $vp_g(n) = g\zeta^n g^{-1}\zeta^{-n} \in G^0_{geo}$, so $\varphi_g(m+n) = \varphi_g(n)\zeta^n\varphi_g(m)\zeta^{-n} = \varphi_g(n)\varphi_g(m)$, thus it is a homomorphism, and if $g' \in G^0_{geo}$, then

$$\varphi_g = \varphi_{g(g^{-1}g'g)} = \varphi_{g'g} = g'\varphi_g(g')^{-1}$$

so φ_g has image in $Z(G^0_{geo})$, which is finite, so $\varphi_g(n)=1$ for some n, then ζ^n commutes with G_{geo} so $\zeta^n\in Z(G)$. □

Cor. (17.2.4.5) [Weights and Center Element Actions]. Let $\mathcal{G}_0$ be a semisimple lisse Weil-sheaf on X_0, if $z\in Z(G(\overline{\mathbb{Q}}_\ell))$ satisfies $\deg(z)=n\neq 0$, which exists by(17.2.4.4), then if z acts on V with eigenvalues α_i, then $\frac{2}{n}\log_q(|\iota(\alpha_i)|)$ is just the determinential ι-weights of $\mathcal{G}_0$. ⌟

Proof: z is in the center, thus by Shur's lemma, it acts on each irreducible part of $\mathcal{G}_0$ by a constant. Thus the determinential weights are clear, by definition. □

Cor. (17.2.4.6) [Properties of Determinential Weights]. Let X_0/k be a smooth curve, $\mathcal{F}_0,\mathcal{G}_0$ be lisse Weil-sheaves on X_0, then

- If α_i are the determinential ι-weights of $\mathcal{F}_0$ and β_j be that of $\mathcal{G}_0$, then $\alpha_i+\beta_j$ are those of $\mathcal{F}_0\otimes\mathcal{G}_0$ with multiplicity.
- For $\gamma\in\mathbb{R}$, let $r(\gamma)$ be the sum of ranks of all irreducible constituents of $\mathcal{F}_0$ which have determinential weight γ w.r.t ι, then the determinential weights of $\wedge^r\mathcal{F}_0$ are the numbers $\sum_\gamma n(\gamma)\gamma$ with $\sum n(\gamma)=r$ and $0\leq n(\gamma)\leq r(\gamma)$, $n(\gamma)\in\mathbb{Z}$ with multiplicity.

⌟

Proof: Firstly notice the determinential weight is unchanged when we change $\mathcal{F}_0,\mathcal{G}_0$ to their semisimplification $\mathcal{F}_0^{ss},\mathcal{G}_0^{ss}$(17.2.3.4). And notice $(\mathcal{F}_0\otimes\mathcal{G}_0)^{ss}=((\mathcal{F}_0)^{ss}\otimes(\mathcal{G}_0)^{ss})^{ss}$, thus the determinential weights of $\mathcal{F}_0\otimes\mathcal{G}_0$ are also unchanged. Similarly for the wedge product.

2: We may assume $\mathcal{F}_0,\mathcal{G}_0$ are irreducible, and let $\mathcal{H}_0=(\mathcal{F}_0\otimes\mathcal{G}_0)^{ss}$, $G^{\oplus}_{geo},G^{ss}_{geo}$ be the geometric monodromy group of $\pi_1(X,\overline{x})$ in $GL(\mathcal{F}_{\overline{x}}\oplus\mathcal{G}_{\overline{x}})$ and $GL(\mathcal{H}_{\overline{x}})$ correspondingly, then $G^{\oplus}_{geo}\to G^{ss}_{geo}$ is surjective because they are both the geometric monodromy group of $\mathcal{H}_{\overline{x}}$. So also $G^{\oplus}\to G^{ss}$ is surjective. So if g be an element in the center of $G^{\oplus}$ that has nonzero degree, then it maps to the center of G^{ss} of nonzero degree. And the action of g on each factor $\mathcal{F}_x,\mathcal{G}_x$ is a constant, so action on H_x is also a constant, so we are done.

3: Easy from2. □

5 Real Sheaves

Def. (17.2.5.1) [ι-Real Sheaf]. Let $\mathcal{F}_0$ be a Weil-sheaf on X_0, then $\mathcal{F}_0$ is called **ι-real** if for any $x\in|X_0|$, the characteristic polynomial $\iota(\det(1-F_xt;\mathcal{F}_{\overline{x}}))$ of F_x real coefficients. ⌟

Prop. (17.2.5.2). Any ι-pure Weil-sheaf of weight w is a direct sum of a ι-real ι-pure Weil-sheaf. In fact, $\mathcal{F}_0\oplus\mathcal{F}_0^\vee(-w)=\mathcal{F}_0\oplus\overline{\mathcal{F}_0}$ is ι-real. ⌟

Lemma (17.2.5.3) [Eigenvalue of Cohomology and Stalk in Curve case]. Let X_0/k be a smooth curve, $\mathcal{F}_0\in\mathrm{W\mathcal{S}h}(X_0)$ is lisse, then the eigenvalues of F_X on $H^0(X,\mathcal{F})$ or $H^2_{\text{ét},c}(X,\mathcal{F})$ is related to the determinential weights of $\mathcal{F}_0$ and the eigenvalue of F_x on $\mathcal{F}_{\overline{x}}$. ⌟

Proof: Let $V=\mathcal{F}_{\overline{x}}$, then

$$H^0(X,\mathcal{F})=V^{\pi_1(X,\overline{x})},\quad H^2_c(X,\mathcal{F})=V_{\pi_1(X,\overline{x})}(-1).$$

Then the base change sheaf of the sheaf $V^{\pi_1(X,\overline{x})}$ or $V_{\pi_1(X,\overline{x})}(-1)$ on $\operatorname{Spec}k$ is the maximal subsheaf/quotient lisse sheaf of $\mathcal{F}_0$ that is constant on X. Then it has determinential weights just the action of F_X on the stalk by(17.2.4.5), which are also determinential weights of $\mathcal{F}_0$ by(17.2.4.6). □

Lemma (17.2.5.4) [Rankin-Selberg Method]. Let X_0/k be a smooth curve, $\mathcal{F}_0 \in \mathrm{W}\mathcal{S}\mathrm{h}(X_0)$ is lisse, and w be the largest determinential weight of $\mathcal{F}_0$, then for any $x \in |X_0|$, $w_{N(x)}(\alpha) \le w$. ⌟

Proof: By the arbitraryness of x, we can replace X_0 by an affine open nbhd of x. Then $H^0_c(X, \mathcal{G}) = 0$ by Artin vanishing(8.4.2.12). By Grothendieck trace formula,

$$\prod_{x\in|X_0|} \iota\det(1 - t^{d_x}F_x| \otimes^{2k} \mathcal{F}_{\overline{x}})^{-1} = \frac{\iota\det(1 - tF_X^*|H^1_c(X, \otimes^{2k}\mathcal{F}))}{\iota\det(1 - tF_X^*|H^2_c(X, \otimes^{2k}\mathcal{F}))}$$

Now the weight of root t_0 of $\det(1-tF_X^*|H^2_c(X, \otimes^{2k}\mathcal{F}))$ has weight$\le$(determinential weight of $\mathcal{G}_0^{\otimes 2k}$)$+$ 2(17.2.5.3) $\le 2kw + 1$(17.2.4.6), so $|t_0| \ge q^{-k\beta-1}$.

Now by the formula**??** and noticing $\mathrm{tr}(F_x^n, \otimes^{2k}\mathcal{F}_{\overline{x}}) = (\mathrm{tr}(F_x, \mathcal{F}_{\overline{x}}))^{2k}$, so $(1 - t^{d_x}F_x| \otimes^{2k} \mathcal{F}_{\overline{x}})^{-1}$ has non-negative coefficients, which means their convergence radius are no less than $q^{-k\beta-1}$, equivalently, $(1 - t^{d_x}F_x| \otimes^{2k} \mathcal{F}_{\overline{x}})$ has no zeros with eigenvalue$< q^{-k\beta-1}$.

So for any eigenvalue α of F_x acting on $\mathcal{F}_{\overline{x}}$, $|\iota(\alpha^{-2k/d_x})| \le q^{-k\beta-1}$, or equivalently,

$$|\iota(\alpha)|^2 \le N(x)^{\beta+1/k}.$$

Now let $k \to \infty$, we are done. □

Lemma (17.2.5.5) [Real Sheaf Mixed Curve case]. Let X_0/k be smooth curve and $\mathcal{F}_0 \in \mathrm{W}\mathcal{S}\mathrm{h}(X_0)$ is ι-lisse, then all irreducible constituents of $\mathcal{F}_0$ is ι-pure, and their ι-weights coincides with their determinential weights. ⌟

Proof: For $\beta \in \mathbb{R}$, let $\mathcal{F}_0(\beta)$ be the sum of constituents of $\mathcal{F}_0$ of determinential weight β, and let $n(\beta) = \mathrm{rank}(\mathcal{F}_0(\beta))$, then we need to show that $w_{N(x)}(\alpha_i(\beta)) = \beta$ for any eigenvalue of $\mathcal{F}_x$ on $\mathcal{F}(\beta)_{\overline{x}}$.

By definition of determinential weight, for each γ, we have $\sum w_{N(x)}(\alpha_j(\gamma)) = n(\gamma)\gamma$. Now let $N = \sum_{\gamma>\beta} n(\gamma)$, then any determinential weight of $\wedge^{N+1}\mathcal{F}_0$ has weight$\le \beta + \sum_{\gamma>\beta} n(\gamma)\gamma$: This is clear by(17.2.4.6) as the determinential weights of $\wedge^{N+1}\mathcal{F}_0$ is of the form $\sum_\gamma a(\gamma)\gamma$ that $0 \le a(\gamma) \le \gamma$ and $\sum_\gamma a(\gamma) = N + 1$.

But now $\alpha_i(\beta)\prod_{\gamma>\beta}\prod_{i=1}^{n(\gamma)} \alpha_j(\gamma)$ is an eigenvalue of $(\wedge^{N+1}\mathcal{F}_0)_{\overline{x}}$, but by lemma(17.2.5.4), $w_{N(x)}(\alpha_i(t)) \le t$. Thus we must have equality $w_{N(x)}(\alpha_i(\beta)) = \beta$. □

Prop. (17.2.5.6) [Real Sheaf is Mixed]. Let X_0 be an algebraic scheme over $\mathbb{F}_q$, then

- Any ι-real Weil-sheaf on X_0 is ι-mixed.
- If X_0 is irreducible and normal, any irreducible constituent of a lisse of an ι-real sheaf is ι-pure.

⌟

Proof: Cf.[Bhatt P28], [KW, P36].

We have the following devissages:

- Choose an open subset $j_0 : U_0 \hookrightarrow X_0, S_0 = X_0 - U_0$ and consider the fundamental excision sequence(8.4.5.4), we can reduce to an open affine subscheme $U_0 \subset X_0$.
- We may base change to a finite field extension.**?**
- So we may reduce to the case X_0 is smooth, irreducible affine, and $\mathcal{G}_0$ is lisse, with all the irreducible constituents geometrically irreducible(by base change, because they are geometrically semisimple(17.2.4.4)). And we may assume $\dim X_0 > 1$ because the curve case is proven.
- Change k to the alg.closure of k in the function field of X_0, we can assume X_0 is geometrically irreducible by(6.4.3.16).

Embed X_0 in some projective space $\mathbb{P}_0^N$, then by a suitable Bertini theorem, the linear subspaces of codimension $\dim X - 1$ that intersects X with a non-empty smooth irreducible curve C_L is dense in the Grassmannian. Now the closed points in any C_L is a pure-point for the any irreducible component $\mathcal{F}_0$ of $\mathcal{G}_0$ of the same weights. Now let L vary, then there is a dense subset of a finite extension of X_0 that $\mathcal{F}_0$ is pure. So we are done. □

6 Deligne's Purity Theorem

Thm. (17.2.6.1) [Deligne's Purity Theorem]. If $f : X_0 \to Y_0$ is a separated morphism of algebraic scheme over k, and $\mathcal{F}_0$ is a lisse $\overline{\mathbb{Q}}_\ell$-sheaf on X that is mixed weights$\leq n$, then for any integer $i \geq 0$, the sheaf $R^i f_{0!}\mathcal{F}_0$ is also ι-mixed of weights$\leq n + i$.

Moreover, each ι-weight of of $R^i f_! \mathcal{F}$ is equivalent modulo $\mathbb{Z}$ to an ι-weight of $\mathcal{F}$. In particular, if all ι-weights of $\mathcal{F}$ is integral, then so is $R^i f_! \mathcal{F}$. ⌟

Proof: This follows from(17.2.6.6). □

Cor. (17.2.6.2). If X_0 is a smooth separated algebraic scheme over k, $\mathcal{F}_0$ is mixed of weight $\geq n$, then $\mathrm{H}^i_{\text{ét}}(X, \mathcal{F})$ is mixed of weights $\geq n + i$. ⌟

Proof: By Poincaré duality(8.4.7.51), $H^{2d-n}_{\text{ét},c}(X, \mathcal{F}^\vee(d)) = (\mathrm{H}^n_{\text{ét}}(X, \mathcal{F}))^\vee$ as Galois representation, and $\mathcal{F}^\vee(d)$ is still a lisse sheaf pure of weight $-w - 2d$, thus Deligne's purity theorem(17.2.6.1) shows that $H^{2d-n}_{\text{ét},c}(X_{\overline{k}}, \mathcal{F}^\vee(d))$ has weight $\leq (-w - 2d) + (2d - n) = -w - n$, thus we are done. □

Cor. (17.2.6.3) [Weil's Conjecture]. Let X_0 be a smooth separated algebraic k-scheme, and $\mathcal{F}_0$ is a lisse $\overline{\mathbb{Q}}_\ell$-sheaf which is pure of weight w, then the image of $H^n_{\text{ét},c}(X, \mathcal{F})$ in $\mathrm{H}^n_{\text{ét}}(X, \mathcal{F})$ is pure of weight $w + n$. ⌟

Proof: The morphism $H^n_{\text{ét},c}(X, \mathcal{F}) \to \mathrm{H}^n_{\text{ét}}(X, \mathcal{F})$ defined in(8.4.5.6) is compatible with Frobenius, so from(17.2.6.2) we know the image has weights$\geq w + n$, so combined with Deligne's purity theorem(17.2.6.1), we know it is pure of weight $w + n$. □

Cor. (17.2.6.4). If $f_0 : X_0 \to Y_0$ is a smooth proper map of algebraic schemes and $\mathcal{F}_0$ is ι-pure of weight β, then $R^i f_{0,*}\mathcal{F}_0$ is ι-pure of weight $\beta + i$. ⌟

Proof: Use proper base change of(8.4.5.5) to reduce to the case of(17.2.6.3). Notice in the proper case, $Rf_* = Rf_!$. □

Cor. (17.2.6.5) [Riemann Hypothesis]. If $X_0 \in \mathcal{S}m\mathcal{P}rpr/k$, then $\mathrm{H}^n_{\text{ét}}(X; \mathbb{Q}_\ell)$ as a Weil-sheaf over $\operatorname{Spec} k$, is pure of weight n. ⌟

Reduction to Curve case

Prop. (17.2.6.6). Deligne's purity theorem(17.2.6.1) can be reduced to case that X_0 is a smooth geometrically connected affine curve$\subset \mathbb{A}^1_{\mathbb{F}_q}$ and $\mathcal{F}_0$ a lisse $\overline{\mathbb{Q}}_\ell$-sheaf. ⌟

Proof: We have the following dévissages about the Deligne's :

1. It is trivial in case f_0 is quasi-finite. This is because of(8.4.5.7), as the fiber has dimension 0.
2. We can replace X_0 by an affine open $U_0 \subset X_0$ by Noetherian induction and excision sequence(8.4.5.5), which commutes with Frobenius action.
3. If the conclusion is true for g_0, h_0, then it is true for $f_0 = g_0 \circ h_0$, this follows from the Leray spectral sequence(8.4.5.5), which is Frobenius equivariant by(8.4.1.35).

4. We can replace Y_0 with an affine open $U_0 \subset Y_0$: If the image f_0 is not dense, then trivial, if it is dense, then choose any affine open U_0, then it suffices to prove for $f_0 : f_0^{-1}(U_0) \to Y_0$ by item2, then then by item3 it suffice to prove for $f_0 : f_0^{-1}(U_0) \to U_0$, because $U_0 \hookrightarrow Y_0$ is quasi-finite and use item1.

Now we claim we can reduce to the case of $f_0 : X_0 \to Y_0$ surjective affine smooth with the fibers being geometrically irreducible curves: By devissage2 and 4, we may assume X_0, Y_0 is affine, thus f_0 is affine. Take a generic point η of Y_0(How to pass to the reduced case**?**), then $(X_0)_\eta \to \operatorname{Spec} k(\eta)$ is affine hence by Noetherian normalization(5.2.4.22) there is a finite map $X_\eta \to \mathbb{A}^n_{k(\eta)}$, and this spread out to a finite morphism $f_0^{-1}(U_0) \to U_0$ for some affine open $U_0 \subset Y_0$ because f_0 is of f.t.. Then by Devissage1 and 3 we are reduced to the case $A^1_{Y_0} \to Y_0$. Now by(8.4.7.15), there is an affine open $U_0 \subset A^1_{Y_0}$ that $\mathcal{F}_0|_{U_0}$ is lisse, so by Devissage2 we may change X_0 to U_0.

That is we reduced to the case that $\mathcal{F}_0$ is lisse and X_0 is open in $\mathbb{A}^1_{Y_0}$ so f_0 is smooth affine, in particular open(6.6.4.4), so we can replace Y_0 by $f(X_0)$ and assume f_0 is surjective. Then the fiber are all geometrically irreducible curves.

Then the assertion about weights are clear from proper base change(8.4.5.5) and the curve case.

For the ι-mixedness, we may use(17.2.5.2) and(17.2.5.6) to reduce to showing that $R^i f_!$ maps ι-real sheaves to ι-real sheaves.

for a geometric point $\overline{x} \to x \to X_0$, let $C \to C_0$ be the fiber, which is affine irreducible, so $H^0_c(X, \mathcal{F}) = 0$ by Poincaré duality(8.4.7.51) and Artin vanishing theorem(8.4.2.12), so

$$\iota L(C_0, \mathcal{G}_0, t) = \frac{\iota \det(1 - tF_X^*|H^1_c(C, \mathcal{G}|_C))}{\iota \det(1 - tF_X^*|H^2_c(C, \mathcal{G}|_C))}$$

by Grothendieck-Lefschetz formula(17.2.2.6). Now we can use Poincare duality and the definition that $\mathcal{G}_0$ is pure of weight β, we know $H^2_c(C, \mathcal{G}|_C)$ is pure of weight $\beta+2$, by(17.2.5.3). And $H^2_c(C, \mathcal{G}|_C)$ has weights smaller than $\beta + 1$ by the curve case, so the two polynomial is coprime, and both has constant coefficient 1, which shows they are both real. And then by proper base change(8.4.5.5), this just says $R^i f_{0!}\mathcal{G}_0$ is ι-real. □

Third Reduction

Prop. (17.2.6.7). If $X_0 \subset \mathbb{A}^1_{\mathbb{F}_q}$ is a smooth affine curve and $\mathcal{F}_0$ a lisse $\overline{\mathbb{Q}}_\ell$-sheaf, the Deligne's purity theorem is true. ⌟

Proof: We have the following devissages:

- We only need to check for $H^1_c(X, \mathcal{F})$, because H^0_c vanish by Poincaré duality(8.4.7.51) and Artin vanishing theorem(8.4.2.12) and , $H^2_c(X, \mathcal{F})$ is dealt with in(17.2.5.3).
- We are free to pass to finite base change.
- We may assume $\mathcal{F}_0$ is geometrically irreducible: By(17.2.4.4), all the irreducible constituents of $\mathcal{F}_0$ are geometrically semisimple, so pass to a finite base change, we may assume that its irreducible filtration is just the geometric irreducible filtration, then because $H^0_c = 0$, H^1_c is left exact.
- We can assume that $\mathcal{F}_0$ can be extended to a lisse sheaf on ∞. This is because we can choose a closed point and move it to ∞ by using Möbius transform, after a finite base change.

- We can assume $\mathcal{F}_0$ is not geometrically constant: if $\mathcal{F}_0 \cong \underline{\overline{\mathbb{Q}}_\ell}$, then let $i : U_0 \to P^1_{\mathbb{F}_q}$ and $Z_0 = P^1_{\mathbb{F}_q} - U_0$, then there is a short exact sequence

$$0 \to j_{0!}(\underline{\overline{\mathbb{Q}}_\ell}) \to j_*(\underline{\overline{\mathbb{Q}}_\ell}) \to \mathcal{Q} \to 0$$

where $\mathcal{Q}$ is supported at S, so its higher compact cohomology vanish, and weights of $H^0(\mathcal{Q}) = \prod_{s\in S}(j_{0*}(\mathcal{F}_0))_{\overline{s}}$ is no more than the maximal weight of $\underline{\overline{\mathbb{Q}}_\ell}$ on X_0, which is 0, by semicontinuity of weights for curves(17.2.3.11). And $j_*(\underline{\overline{\mathbb{Q}}_\ell})$ is also geometrically constant, thus its cohomology is $\mathrm{Pic}(\mathbb{P}^1)[n] = 0$ by(8.4.7.42), so $H^1(P^1, j_{0!}(X_0))$ has weights zero.

The actual proof will use the following lemma(17.2.6.8). After that, notice by(17.2.8.6)

$$(T_\psi(G_0))|_{\{0\}} = R\Gamma_c(\mathbb{A}^1, \mathcal{G})[1] = R\Gamma_c(U, \mathcal{F})[1] = H^1_c(U, \mathcal{F})$$

Then to understand the Frobenius eigenvalues of $H^1_c(U, \mathcal{F})$, it suffices to understand the weights of $T_\psi(\mathcal{G}_0)$, i.e.

$$w(T_\psi(\mathcal{G}_0)) \le w + 1$$

Then we use(17.2.3.17), notice the condition is satisfied by lemma(17.2.6.8), so $w(T_\psi(\mathcal{G}_0)) = ||T_\psi(\mathcal{G}_0)||$, and also $w(G_0) = ||G_0||$ for the same reason as $H^0_c(\mathbb{A}^1, \mathcal{G}) = H^0_c(U, \mathcal{F}) = 0$ by Poincare duality. Now(17.2.8.10) gives the result.

□

Lemma (17.2.6.8) [Key Assertions of Weil Proof]. If $\mathcal{G}_0 = j_{0!}(\mathcal{F}_0)$ where $j_0 : U_0 \hookrightarrow A^1_{\mathbb{F}_q}$, $\psi : \mathbb{F}_q \to \overline{\mathbb{Q}}_\ell$ is a fixed non-trivial additive character, then

- $T_\psi(\mathcal{G}_0)$ is a sheaf placed at degree 0.
- $H^0_c(\mathbb{A}^1, T_\psi(\mathcal{G}_0)) = 0$.
- $T_\psi(\mathcal{G}_0)$ is ι-mixed.

┘

Proof: 1: By(17.2.8.6), we need to show $H^i_c(\mathbb{A}^1, \mathcal{G}_0 \otimes \mathcal{L}(\psi_a)) = 0$ for $i \neq 1$, and this is equivalent to

$$H^i_c(\mathbb{A}^1, j_!\mathcal{F} \otimes \mathcal{L}(\psi_a)) = H^i_c(U, F \otimes \mathcal{L}(\psi_a)) = 0.$$

Notice by vanishing result(8.4.5.6), only need to show $i = 0, i = 2$, $i = 0$ case is done by Poincare duality(8.4.7.51) and Artin vanishing(8.4.2.12) because it is smooth and $\mathcal{F}$ is lisse.

$H^2_c(\mathcal{G}_0 \otimes \mathcal{L}(\psi_a)) = V_{\rho\otimes\chi_a}|_{\pi_1(U,\overline{x})}(-1)$ by(17.2.5.3), and $\rho \otimes \chi_a$ irreducible as ρ does, so if $V_{\rho\otimes\chi_a}|_{\pi_1(U,\overline{x})} \neq 0$, then $\rho \otimes \psi_a$ is trivial representation. Then $\mathcal{G} \cong \mathcal{L}_{\psi_{-a}}$ on $\mathbb{P}^1_{\overline{k}}$ as an étale sheaf on $\mathbb{A}^1 \cup \{\infty\} = \mathbb{P}^1$ by our reduction, so we have the character ψ_{-a} factors through $\pi_1(\mathbb{P}^1, \overline{x})$, i.e.

$$\begin{array}{ccccc} \pi_1(\mathbb{A}^1, \overline{x}) & \longrightarrow & \pi_1(\mathbb{P}^1, \overline{x}) = 0 & & \\ \downarrow & & \downarrow & & \\ \pi_1(\mathbb{A}^1_0, \overline{x}) & \longrightarrow & \pi_1(\mathbb{P}^1_0, \overline{x}) & \xrightarrow{\psi_{-a}} & \overline{\mathbb{Q}}_\ell \end{array}.$$

But this is in contradiction with the fact the Artin-Schreier cover is geometrically irreducible**?**.

2: Denote $T_\psi(\mathcal{G}_0) = \mathcal{K}_0$, then by(17.2.8.5) and Fourier inversion(17.2.8.8):

$$H^0_c(\mathbb{A}^1, \mathcal{K}) = \mathcal{H}^{-1}((T_{\psi^{-1}}(\mathcal{K}_0))_0) = \mathcal{H}^{-1}(T_{\psi^{-1}} \circ T_\psi(j_{0!}(\mathcal{F}_0))_0) = \mathcal{H}^{-1}(j_{0!}(\mathcal{F}_0)(-1))_0 = 0$$

because $\mathcal{F}_0$ is placed at degree 0.

3: To show ι-mixed, the only thing we can do it show it is embedded in a ι-real sheaf: Consider the ι-real sheaf

$$\mathcal{H}_0 = \mathrm{pr}_2^*(j_{0!}\mathcal{F}_0) \otimes m^*(\mathcal{L}(\psi)) \oplus \mathrm{pr}_2^*(j_{0!}\mathcal{F}_0^\vee) \otimes m^*(\mathcal{L}(\psi^{-1}))(-w)$$

Then

$$(R^i\pi_!^1(\mathcal{H}_0))_{\overline{x}} = H^i(\{\overline{x}\} \times \mathbb{A}^1, \mathcal{H}_0) = H^i(j_{0!}\mathcal{F}_0 \otimes \mathcal{L}(\psi_x)) \oplus H^i(j_{0!}\mathcal{F}_0^\vee \otimes \mathcal{L}(\psi_{x^{-1}}^{-1}))(-w)$$

which we proved to vanish for $i \neq 1$. So using Poincare duality on $\{\overline{x}\} \times \mathbb{A}^1$,

$$\det(1-tF_x^{d_x}|(R^1\pi_!^1(\mathcal{H}_0)_{\overline{x}})) = \det(1-tF_X|H_c^1(\{\overline{x}\}\times\mathbb{A}^1, H_0|_{\{\overline{x}\}\times\mathbb{A}^1})) = \prod_{y\in\mathbb{F}_{q^n}} \det(1-tF_y^{d_y}|(\mathcal{H}_0)_{\overline{(x,y)}})^{-1}$$

which is real, so by(17.2.5.5), the direct summand $T_\psi(\mathcal{G}_0)$ is ι-mixed. □

Remark (17.2.6.9). If we use the machinery of perverse sheaf and show that Fourier transform preserves perversity, then item1, 2 will be a direct consequence, Cf.[Bhatt notes, P39]. In fact, this is just the bigger picture, given in [Weil conjectures Perverse Sheaves and l-adic Fourier Transform Kiehl/Weissauer]. ⌟

7 Semisimplicity and Hard Lefschetz

Prop. (17.2.7.1) [Semisimplicity Theorem]. If X_0 is smooth and $\mathcal{F}_0$ is a lisse and ι-pure $\overline{\mathbb{Q}}_\ell$-sheaf, then $\mathcal{F}_0$ is semisimple, thus geometrically semisimple by(17.2.4.4) . ⌟

Proof: Let $\mathcal{F}'$ be the sum of irreducible lisse subsheaves of $\mathcal{F}$, then it is the largest semisimple subsheaf of $\mathcal{F}$. It is stable under $G(\overline{\mathbb{F}_q}/\mathbb{F}_q)$, thus can be descended to a lisse subsheaf $\mathcal{F}_0'$ of $\mathcal{F}_0$, and let $\mathcal{F}'' = \mathcal{F}_0/\mathcal{F}_0'$, we want to show the exact sequence

$$0 \to \mathcal{F}_0' \to \mathcal{F}_0 \to \mathcal{F}_0'' \to 0$$

splits geometrically. Notice this exact sequence defines an element in $\mathrm{Ext}_X^1(\mathcal{F}'', \mathcal{F}') = H^1(X, (\mathcal{F}'')^\vee \otimes \mathcal{F}')$**?**. $\mathcal{F}_0$ is pure, hence so does $(\mathcal{F}_0'')^\vee \otimes \mathcal{F}_0'$, thus $H^1(X, (\mathcal{F}'')^\vee \otimes \mathcal{F}')$ is ι-mixed of weights≥ 1. But the exact sequence is compatible with Frobenius action, it defines a Frobenius fixed element, which then must vanish. □

Cor. (17.2.7.2). If $f : X \to Y$ is proper between smooth algebraic schemes, then the sheaves $R^i f_* \mathbb{Q}_\ell$ are semisimple. ⌟

<u>Hard Lefschetz</u>

Def. (17.2.7.3). The setup is k is a finite field, $F \in \mathtt{Field}^0$ and $\mathscr{H}$ is a cohomology theory $\mathcal{S}m\mathcal{P}roj/k \to \mathcal{CR}ing^{gr}/F$ which satisfies

- (Poincaré duality)$\mathscr{H}^i(X) \otimes_F \mathscr{H}^{2n-i}(X) \to \mathscr{H}^{2n}(X)$ is a perfect pairing, and the Frobenius $F_X^* = q^n$ on $\mathscr{H}^{2n}(X)$.
- (Weak Lefschetz)If $\mathcal{L}$ is an ample line bundle on X and $H \subset X$ is a smooth divisor in $|\mathcal{L}|$, then

$$f^* : \mathscr{H}^i(X) \to \mathscr{H}^i(Y)$$

  is an isomorphism for $i = n-2$ and injective for $i = n-1$.

- (Zeta Function)Let $\mathscr{P}^i(X;T)=\det(1-F_X^*T|\mathscr{H}^i(X))$, then the Hasse-Weil zeta function

$$Z(X;T)=\prod_{i=0}^{2n}\mathscr{P}(X;T)^{(-1)^{i+1}}.$$

⌟

Prop. (17.2.7.4). Crystalline and ℓ-adic cohomologies satisfy the hypothesis(17.2.7.3). ⌟

Proof: □

Prop. (17.2.7.5). Situation as in(17.2.7.3), then $\mathscr{P}^i(X;T)=P^i_{\text{ét}}(X;T)$. ⌟

Proof: ? □

Cor. (17.2.7.6).

- The characteristic polynomial $P_{\text{ét}}(X;T)$ is independent of ℓ chosen.
- $\dim_F\mathscr{H}^i(X)=\dim_{\mathbb{Q}_\ell}\mathrm{H}^i_{\text{ét}}(X)$.
- (Hard Lefschetz)If $\mathcal{L}$ is an ample line bundle on X, then

$$\mathscr{H}^{n-i}(X)\xrightarrow{c_1(\mathcal{L})^i}\mathscr{H}^{n+i}(X)$$

is an isomorphism.

⌟

Cor. (17.2.7.7).

$$b_d\geq b_{d-2}\geq\ldots,\quad b_{d-1}\geq b_{d-3}\geq\ldots$$

8 Deligne-Fourier Transformation

Sheaf to Functions Correspondence

Def. (17.2.8.1) [Sheaf to Functions Correspondence]. For a complex $K_0\in D^b_{cons}(X_0,\overline{\mathbb{Q}}_\ell)$, we can associate a function

$$f^{K_0}:X_0(\mathbb{F}_{q^n})\to\overline{\mathbb{Q}}_\ell:x_0\mapsto\mathrm{tr}((F_{x_0}^*)^{n/d_x}|(K_0)_{\overline{x}})=\mathrm{tr}((\varphi_{x_0}^{-1})^{n/\deg(x_0)}|(K_0)_{\overline{x}})(17.2.1.4).$$

⌟

Prop. (17.2.8.2). We can use Grothendieck formula for a constructible sheaf(17.2.2.6) to relate the function f^{K_0} to the compact cohomologies of $\mathcal{H}^iK_0$, and we can translate many know theorems:

- $f^{f^*K_0}=f^{K_0}\circ f$.
- $$f^{K_0}\cdot f^{T_0}=f^{K_0\otimes^L T_0}?$$

- (Base Change)(8.4.5.5) asserts that given a Cartesian diagram

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow{f'} & & \downarrow{f} \\ Y' & \xrightarrow{g} & Y \end{array}$$

  then it says in case Y' is a closed point of Y,

$$f^{Rf_!K_0}(y) = \sum_{x\in X_y(\mathbb{F}_{q^n})} f^{K_0}(x)$$

  where $y \in Y(\mathbb{F}_{q^n})$, and more generally

$$\sum_{x'\in X'_{y'}} f^{K_0}(g'(x')) = \sum_{x\in X_{g(y')}} f^{K_0}(x)$$

- The projection formula(8.4.5.8) turns out to say something trivial:

$$\sum_{x\in X_y} (f^{K_0}(f(x)) \cdot f^{T_0}(x)) = f^{K_0}(y) \cdot (\sum_{x\in X_y} f^{T_0}(x))$$

⌟

Prop. (17.2.8.3). $f^{\mathcal{L}_0(\psi)}(x) = \psi(-x)$, by(8.4.7.32). ⌟

Deligne-Fourier Transforms on $\mathbb{A}^1$

Use notations as in Artin-Schreier Theory.

Def. (17.2.8.4) [Deligne-Fourier Transform]. Consider the multiplication map $m : \mathbb{A}_0 \times \mathbb{A}'_0 \to \mathbb{A}_0$, let the sheaf $\mathcal{L}(\psi)$ be placed at A_0, and $K_0 \in D^b_c(\mathbb{A}'_0, \overline{\mathbb{Q}}_\ell)$ be placed at $\mathbb{A}'_0$, then define the **Deligne-Fourier transform**

$$T_\psi : D^b_c(\mathbb{A}'_0, \overline{\mathbb{Q}}_\ell) \to D^b_c(\mathbb{A}_0, \overline{\mathbb{Q}}_\ell) : K_0 \mapsto R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes^L m^*\mathcal{L}_0(\psi))[1]$$

⌟

Lemma (17.2.8.5). $f^{T_\psi K_0}(x) = -\sum_{y\in\mathbb{F}_{q^n}} f^{K_0}(y)\psi^{-1}(xy)$ for any $x \in \mathbb{F}_{q^n}$. ⌟

Proof: By(17.2.8.2),

$$\begin{aligned} f^{T_\psi K_0}(x) &= \sum_{y\in\mathbb{F}_{q^n}} f^{(\mathrm{pr}_2^* K_0\otimes^L m^*\mathcal{L}_0(\psi))[1]}((x,y)) \\ &= -\sum_{y\in\mathbb{F}_{q^n}} f^{\mathrm{pr}_2^* K_0}((x,y)) \cdot f^{m^*\mathcal{L}_0(\psi)}((x,y)) \\ (17.2.8.3) &= -\sum_{y\in\mathbb{F}_{q^n}} f^{K_0}(y)\psi(-xy). \end{aligned}$$

□

Prop. (17.2.8.6). For $a \in \mathbb{A}^1(\mathbb{F}_{q^n})$,

$$(T_\psi(K_0))_a = R\Gamma_c(K \otimes^{\mathrm{L}} \mathcal{L}(\psi_a))[1]$$

where $\psi_a : \mathbb{F}_{q^n} \to \overline{\mathbb{Q}}_\ell^\times$ maps $x \mapsto \psi(ax)$. In particular, $\mathcal{H}^i((T_\psi(K_0))_0) = H^i_{\text{ét},c}(\mathbb{A}^1, K)$, so we placed the complex into a family of deformations. ⌟

Proof: By base change(8.4.5.5),

$$(T_\psi(K_0))_a = R\Gamma_c((\mathrm{pr}_2^* K_0 \otimes^L m^*\mathcal{L}_0(\psi)|_{\{a\}\times\mathbb{A}^1})[1] = R\Gamma_c(K \otimes^L \mathcal{L}(\psi_a))[1].$$

□

Lemma (17.2.8.7). If $\delta_0 = i_{0*}\overline{\mathbb{Q}}_\ell$ is the skyscraper sheaf where $i_0 : \{0\} \hookrightarrow \mathbb{A}^1$, then

$$T_\psi(\overline{\mathbb{Q}}_\ell[1]) = \delta_0(-1).$$

⌟

Proof: For the Artin-Schreier cover $\wp : x \mapsto x^q - x$, by(8.4.7.31),

$$\wp_*\overline{\mathbb{Q}}_\ell \cong \bigoplus_{x\in\mathbb{F}_q} \mathcal{L}(\psi_x).$$

As $\wp$ is finite, $\wp_*$ is exact(8.4.1.18), so using the Leray spectral sequence(8.4.5.5), we can calculate

$$H^1_c(\mathbb{A}^1, \mathcal{L}(\psi_x)) = 0 = H^1_c(\mathbb{A}^1, \overline{\mathbb{Q}}_\ell), \quad H^2_c(\mathbb{A}^1, \mathcal{L}(\psi_x)) = 0\text{(8.4.5.7)}, \quad H^2_c(\mathbb{A}^1, \mathcal{L}(\psi_x)) = \delta_0(x)\overline{\mathbb{Q}}_\ell(-1)\text{(17.2.5.3)}$$

So

$$(R\pi^1_!(m^*\mathcal{L}_0(\psi)[1])[1])_x = R\Gamma_c(\mathcal{L}(\psi_x))[2] = \delta_0(-1).$$

□

Prop. (17.2.8.8) [Fourier Inversion]. For $K_0 \in D^b_c(\mathbb{A}_0, \overline{\mathbb{Q}}_\ell)$, $T_{\psi^{-1}}T_\psi(K_0) = K_0(-1)$. ⌟

Proof: Consider

$$\begin{array}{ccccc}
\mathbb{A}^1_0 \times \mathbb{A}^1_0 \times \mathbb{A}^1_0 & \xrightarrow{\mathrm{pr}_{23}} & \mathbb{A}^1_0 \times \mathbb{A}^1_0 & \xrightarrow{\mathrm{pr}_2} & \mathbb{A}^1_0 \\
\downarrow \mathrm{pr}_{12} & & \downarrow \mathrm{pr}_1 & & \\
\mathbb{A}^1_0 \times \mathbb{A}^1_0 & \xrightarrow{\mathrm{pr}_2} & \mathbb{A}^1_0 & & \\
\downarrow \mathrm{pr}_1 & & & & \\
\mathbb{A}^1_0 & & & &
\end{array}$$

And we will use the following Cartesian diagrams:

$$\begin{array}{ccc}
\mathbb{A}^3_0 & \xrightarrow{\alpha:(x,y,z)\mapsto(y,z-x)} & \mathbb{A}^2_0 \\
\downarrow \pi^{13} & & \downarrow \mathrm{pr}_2 \\
A^2_0 & \xrightarrow{\beta:(x,z)\mapsto z-x} & A^1_0
\end{array}, \qquad
\begin{array}{ccc}
A^1_0 & \longrightarrow & * \\
\downarrow \Delta & & \downarrow i_0 \\
A^2_0 & \xrightarrow{\beta} & A^1_0
\end{array}$$

Then

$T_{\psi^{-1}}T_\psi K_0$ $\qquad$ $(T_{\psi^{-1}}T_\psi f)(x)$

$= R\pi^1_!(\mathrm{pr}_2^* R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes m^*\mathcal{L}_0(\psi)) \otimes m^*\mathcal{L}_0(\psi^{-1}))[2]$ $\qquad = \sum_y (\sum_z f(z)\psi(-yz))\psi(xy)$

By base change(8.4.5.5) :

$= R\pi^1_!(R\pi^{12}_! \mathrm{pr}_{23}^*(\mathrm{pr}_2^* K_0 \otimes m^*\mathcal{L}_0(\psi)) \otimes m^*\mathcal{L}_0(\psi^{-1}))[2]$

By projection formula(8.4.5.5) :

$= R\pi^1_! R\pi^{12}_!(\mathrm{pr}_{23}^*(\mathrm{pr}_2^* K_0 \otimes m^*\mathcal{L}_0(\psi) \otimes \mathrm{pr}_{12}^* m^*\mathcal{L}_0(\psi^{-1})))[2]$ $\qquad = \sum_y \sum_z f(z)\psi(-yz)\psi(xy)$

Combine the character:

$= R\pi^1_! R\pi^{12}_!(\mathrm{pr}_{23}^* \mathrm{pr}_2^* K_0 \otimes \alpha^* m^*\mathcal{L}_0(\psi))[2]$ $\qquad = \sum_y \sum_z f(z)\psi(-y(z-x))$

Change order of summation:

$= R\pi^1_! R\pi^{13}_!(\pi^{13*} \mathrm{pr}_2^* K_0 \otimes \alpha^* m^*\mathcal{L}_0(\psi))[2]$ $\qquad = \sum_z \sum_y f(z)\psi(-y(z-x))$

By projection formula:

$= R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes R\pi^{13}_1 \alpha^* m^*\mathcal{L}_0(\psi))[2]$ $\qquad = \sum_z f(z) \sum_y \psi(-y(z-x))$

By base change:

$= R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes \beta^* R\pi^2_!(m^*\mathcal{L}_0(\psi))[2] = R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes \beta^* T_\psi \overline{\mathbb{Q}}_\ell[-1])[2]$

By(17.2.8.7) :

$= R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes \beta^* \delta_0[-2])[2] = R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes \beta^* \delta_0(-1))$ $\qquad = \sum_z f(z) q^n \delta_0(z-x)$

Use base change and noticing$i_0$is finite thus proper and exact:

$= R\pi^1_!(\mathrm{pr}_2^* K_0 \otimes R\Delta_! \overline{\mathbb{Q}}_\ell(-1))$ $\qquad = \sum_z \sum_{x=z} q^n$

By projection formula:

$= R\pi^1_! R\Delta_!(\Delta^* \mathrm{pr}_2^* K_0 \otimes \overline{\mathbb{Q}_\ell})(-1)$ $\qquad = q^n \sum_{\{z|z=x\}} f(z)$

$= K_0(-1)$ $\qquad = q^n f(x)$

□

Prop. (17.2.8.9) [Plancherel Formula].

$$||f^{T_\psi(K_0)}||_n = q^{n/2}||f^{K_0}||_n.$$

⌟

Proof: By definition and using(17.2.8.5),

$$\begin{aligned} ||f^{T_\psi(K_0)}||_n^2 &= \sum_{x\in\mathbb{F}_{q^n}} f^{T_\psi(K_0)}(x)\overline{f^{T_\psi(K_0)}(x)} \\ &= \sum_{x,y,z} f^{K_0}(y)\overline{f^{K_0}(z)}\psi(-xy)\psi(xz) \\ &= q^n \sum_{z=y} f^{K_0}(y)\overline{f^{K_0}(z)} \end{aligned}$$

$$= q^n (f, f)_n$$

□

Cor. (17.2.8.10). Notice by the definition of norm of a Weil-sheaf $\mathcal{G}_0$, we have

$$||T_\psi(K_0)|| \leq ||K_0|| + 1$$

⌟

9 Integrality Problems

Def. (17.2.9.1) [Integral Sheaves]. Let X_0 be a separated algebraic scheme over k and $\mathcal{F}_0$ a lisse constructible sheaf on X_0, then $\mathcal{F}_0$ is called an **integral lisse sheaf** if for all $x_0 \in X_0$, all the eigenvalues of F_x^* acting on $\mathcal{F}_{\overline{x}}$ are algebraic integers. ⌟

Prop. (17.2.9.2) [Deligne]. If $\mathcal{F}_0$ is an integral lisse sheaf(17.2.9.1) on X_0, then all coefficients of $H^i_{\text{ét},c}(X, \mathcal{F})$ are integral. ⌟

Proof: Cf.[Weil 1 Proof, P21]. □

Cor. (17.2.9.3). All eigenvalues of $H^i_{\text{ét},c}(X, \mathcal{F})$ are algebraic integers. ⌟

17.3 Trigonometric Sums

References are [Kats's work] and [Weil conjectures and Fourier transform].

1 Katz's Trigonometric Sums

Def. (17.3.1.1) [Generalized Trigonometric Sums]. For $p \in \mathbf{P}, q \in p^{\mathbb{Z}}$, $\psi \neq 1 \in \chi(\mathbb{F}_q)$, and $h : X \to \mathbb{A}^1_{\mathbb{F}_q} \in \mathcal{S}\mathrm{ch}^{\mathrm{fg}}/\mathbb{A}^1_{\mathbb{F}_q}$, the generalized **trigonometric sum** is defined to be the exponential sum

$$\sum_{x \in X(\mathbb{F}_q)} \psi(h(x)).$$

⌟

Thm. (17.3.1.2) [Katz]. Let $h : X \to \mathbb{A}^1 \in \mathcal{S}\mathrm{ch}^{\mathrm{fg}}/\mathbb{A}^1$, then there exists $C \in \mathbb{R}_+$ s.t. for any $p \in \mathbf{P}$ and $q \in p^{\mathbb{Z}_+}, \psi \neq 1 \in \chi(\mathbb{F}_q)$,

$$|\sum_{x \in A(\mathbb{F}_q)} \psi(h(x))| \leq C q^{N + \frac{1}{2}},$$

where N is the supremum of the dimension of the fiber of $h_{\mathbb{C}}$.

And if moreover the generic fiber $h_{\overline{\eta}}$ is geo.irreducible or has dimension$< N$, then for any $p \in \mathbf{P}$ and $q \in p^{\mathbb{Z}_+}, \psi \neq 1 \in \chi(\mathbb{F}_q)$,

$$|\sum_{x \in A(\mathbb{F}_q)} \psi(h(x))| \leq C q^{N}.$$

⌟

Proof: Cf.[K-W01]P228. □

2 Gauss Sums

Def. (17.3.2.1) [Gauss Sums and Heilbronn Sums]. For $p \in \mathbf{P}$ and $f(X) \in \mathbb{Z}[X]$, a **Gauss sum** is a summation

$$G_p(f) = \sum_{n=1}^{p} e^{2\pi\,\mathrm{i}\, f(n)/p}.$$

A special case is the summation

$$G_p(a,k) = G_p(aX^k) = \sum_{n=1}^{p} e^{2\pi\,\mathrm{i}\, an^k/p}$$

where $k \in \mathbb{Z}_+, a \in \mathbb{Z} \setminus (p)$.

And a **Heilbronn sum** is the summation

$$H_p(a) = e^{2\pi\,\mathrm{i}\, an^p/p^2}.$$

Notice if $k_0 = \gcd(k, p-1)$, then $G_p(a,k) = G_p(a,k_0)$. Thus for $G_p(a,k)$, we always assume $k|p-1$. ⌟

Prop. (17.3.2.2). For $p \in \mathbf{P}_{\geq 3}, a, b, c \in \mathbb{Z}$ and $(a,p) = 1$,

$$|\sum_{t=0}^{p-1} e^{2\pi\,\mathrm{i}\, \frac{at^2+bt+c}{p}}| = \sqrt{p}.$$

⌟

Proof: It is easy to reduce to the case $b=c=0$. Then

$$\Big|\sum_{t=0}^{p-1} e^{2\pi\,\mathrm{i}\,\frac{at^2}{p}}\Big|^2 = \sum_{t=0}^{p-1}\sum_{s=0}^{p-1} e^{2\pi\,\mathrm{i}\,\frac{a(t^2-s^2)}{p}} = \sum_{x=0}^{p-1}\sum_{y=0}^{p-1} e^{2\pi\,\mathrm{i}\,\frac{axy}{p}} = p.$$

□

Prop. (17.3.2.3). For $p\in\mathbf{P}_{\geq 3}, n\in\mathbb{Z}_+, a\in\mathbb{Z}$,

$$\Big|\sum_{t=1}^{p^{n+1}} e^{2\pi\,\mathrm{i}[\frac{at^2}{p}+\frac{ht}{p^{n+1}}]}\Big| = \begin{cases} p^{n+\frac{1}{2}} & ,p^n|h, p\nmid a\\ 0 & ,p^n\nmid h\end{cases}.$$

⌟

Proof:

$$\sum_{t=1}^{p^{n+1}} e^{2\pi\,\mathrm{i}[\frac{at^2}{p}+\frac{ht}{p^{n+1}}]} = \sum_{t=1}^{p} e^{2\pi\,\mathrm{i}[\frac{at^2}{p}+\frac{ht}{p^{n+1}}]}\Big(\sum_{r=1}^{p^n} e^{2\pi\,\mathrm{i}\,\frac{hr}{p^n}}\Big).$$

Then the assertion follows from(17.3.2.2). □

Prop. (17.3.2.4) [Burgess]. For $p\in\texttt{Prime}, s\in\mathbb{Z}_+$ and $b_1,\ldots,b_s\in\mathbb{F}_p$,

$$\Big|\sum_{x\in\mathbb{F}_p}\Big(\frac{\prod_i(x+b_i)}{p}\Big)\Big|\leq s^2\sqrt{p},$$

unless $s\in 2\mathbb{Z}_+$ and up to permutation $b_1=b_2, b_3=b_4,\ldots,b_{s-1}=b_s$. ⌟

Proof: This is clear for $s=1$, and for $s\geq 2$, use Weil conjecture on the the hyperelliptic curve

$$y^2=\prod_i(x+b_i).$$

□

Prop. (17.3.2.5) [Burgess Multiplicative Character Bound]. For any $\beta\in\mathbb{R}_{>1/4}$, there exists $C(\beta), e(\beta)\in\mathbb{R}_+$ s.t. for any $\chi:\mathbb{F}_p^\times\to\mathbb{C}^\times$ and $x_0\in\mathbb{Z}$,

$$\Big|\sum_{x=x_0}^{x_0+N-1}\chi(x)\Big|\leq C(\beta)N^{1-e(\beta)}.$$

⌟

Proof: ? □

Cor. (17.3.2.6). For any $\varepsilon\in\mathbb{R}_+$, there exists $C(\varepsilon)\in\mathbb{R}_+$ s.t. for any $p\in\texttt{Prime}$, any interval of length $C(\varepsilon)p^{1/4+\varepsilon}$ contains a square and a non-square. ⌟

Thm. (17.3.2.7) [Weil]. For $p\in\mathbf{P}$ and $f(X)\in\mathbb{F}_p[X]$ with $\deg(f)=k$,

$$|G_p(f)|\leq k\sqrt{p}.$$

⌟

Proof: Cf.[Larry Guth]P56, and a weaker bound is found in [Larry Guth]P62. □

Monomial Gauss Sums and Heilbronn Sums

Conj. (17.3.2.8).

$$|G_p(a,k)| \le \min\Big((k-1)\sqrt{p}, (1+\eta)\sqrt{2kp\log(kp)}\Big),$$

where $\eta \to 0$ as k and p/k both tend to infty. ⌟

Proof: □

Prop. (17.3.2.9).

$$|G_p(a,k)| \le \min(p, (k-1)\sqrt{p}).$$

⌟

Proof: $|G_p(a,k)| \le p$ is trivial. For the second assertion, notice

$$G_p(a,k) = \sum_{\chi \in \mathrm{Diri}(p), \chi^k = \mathbf{1}, \chi \neq \mathbf{1}} \chi^{-1}(a)\tau(\chi)(17.3.3.3),$$

and use the fact $|\tau(\chi)| = \sqrt{p}$ for each χ. □

Thm. (17.3.2.10) [Heath.Brown-Konyagin]. Situation as in(17.3.2.1),

$$G_p(a,k) = O(\min(k^{5/8}p^{5/8}, k^{3/8}p^{3/4})).$$

⌟

Proof: Cf.[B-K20]P223. □

Lemma (17.3.2.11). Situation as in(17.3.2.1), if $h = (p-1)/k$, and

$$A(h) = \{(x_1, \ldots, x_4) \in \mu_h(\mathbb{Z}_p)^4 | x_1 + x_2 = x_3 + x_4\},$$

then

$$|G_p(a,k)| \le \min(k^{4/5}, p^{1/8})(\#A(h))^{1/4}.$$

⌟

Proof: Cf.[B-K20]P224. □

Lemma (17.3.2.12). Situation as in(17.3.2.11), if $h < p^{2/3}$, then $\#A(h) = O(h^{5/2})$. ⌟

Proof: Cf.[B-K20]P225. □

Thm. (17.3.2.13) [Heath.Brown-Konyagin]. Situation as in(17.3.2.1),

$$\sum_{r=1}^{p} |H_p(a+rp)|^4 = O(p^{7/2}),$$

in particular,

$$H_p(a) = O(p^{7/8}).$$

⌟

Proof: □

Lemma (17.3.2.14). Situation as in(17.3.2.1), if

$$f(X) = X + \frac{X^2}{2} + \ldots + \frac{X^{p-1}}{p-1} \in \mathbb{Z}_p[X],$$

and

$$B = \{(x_1, x_2) \in \mathbb{Z}_p^2 | f(x_1) = f(x_2)\},$$

then

$$\sum_{r=1}^{p} |H_p(a+rp)|^4 = O(p^3 + p^2 \# B).$$

⌟

Proof: Cf.[B-K20]P224. □

Lemma (17.3.2.15). Situation as in(17.3.2.14), then $\# B = O(p^{3/2})$. ⌟

Proof: Cf.[B-K20]P225. □

3 Dirichlet Characters

Def. (17.3.3.1) [Dirichlet Character]. For $F \in \mathtt{NField}$ and a modulus $\mathfrak{m}$ for F, a **Dirichlet character modulo** $\mathfrak{m}$ is a functor $\mathrm{Cl}_{\mathfrak{m}}(F) = J^{\mathfrak{m}}/P^{\mathfrak{m}} \to \mathbb{C}^\times$.

A **primitive Dirichlet character** modulo $\mathfrak{m}$ is a Dirichlet character modulo $\mathfrak{m}$ that is injective. The set of Dirichlet characters modulo $\mathfrak{m}$ is denoted by $\mathrm{Diri}(\mathfrak{m})$, and the set of primitive Dirichlet characters modulo $\mathfrak{m}$ is denoted by $\mathrm{Diri}'(\mathfrak{m})$.

Usually we consider the case $F = \mathbb{Q}$ and $\mathfrak{m} = m \cdot \infty$. In which case, a Dirichlet character is just a homomorphism $(\mathbb{Z}/(m))^\times \to \mathbb{C}^\times$. ⌟

Prop. (17.3.3.2) [Kronecker Characters]. For $a \in \mathbb{Z}^\times$, denote $\chi_a \in \mathrm{Diri}(4a)$ the character $\chi_a(m) = \left(\frac{a}{m}\right)$. Notice $\chi_a \neq \mathbf{1}$ if $a \neq 1$. ⌟

Proof: □

Def. (17.3.3.3) [Gauss Sums]. For $\chi \in \mathrm{Diri}(N)$, the **Gauss sum** of χ is defined to be

$$\tau(\chi) = \sum_{n \in \mathbb{Z}/(N)} \chi(n) e^{2\pi \mathrm{i}\, n/N}.$$

⌟

Prop. (17.3.3.4). $\tau(\overline{\chi}) = \chi(-1)\overline{\tau(\chi)}$. ⌟

Prop. (17.3.3.5). $\sum_{n \in \mathbb{Z}/(N)} \chi(n) e^{2\pi \mathrm{i}\, nm/N} = \overline{\chi(m)}\tau(\chi)$(17.3.3.3). ⌟

Proof: If $(m, N) = 1$, then this follows from

$$\tau(\chi) = \sum_{n (\mathrm{mod}\ N)} \chi(mn) e^{2\pi \mathrm{i}\, mn/N} = \chi(m) \sum_{n (\mathrm{mod}\ N)} \chi(n) e^{2\pi \mathrm{i}\, mn/N}.$$

If $(m,N)\neq 1$, then we need to show the LHS is 0. Let $m=dM,N=dN_1$. Because χ is primitive character mod N, there is some $c\equiv 1 \mod N_1$ that $\chi(c)\neq 1$, otherwise χ is defined mod N_1. Notice

$$\sum_{n(\text{mod } N)}\chi(n)e^{2\pi\,\mathrm{i}\,nm/N}=\sum_{r(\text{mod } N_1)}\{\sum_{n(\text{mod } N),n\equiv r(\text{mod } N_1)}\chi(n)\}e^{2\pi\,\mathrm{i}\,rM/N_1}$$

But $r\mapsto cr$ is a permutation of $\{n(\text{mod } N),n\equiv r(\text{mod } N_1)\}$, thus

$$\sum_{n(\text{mod } N),n\equiv r \mod N_1}\chi(n)=\sum_{n \mod N,n\equiv r \mod N_1}\chi(cn)=\chi(c)\sum_{n(\text{mod } N),n\equiv r \mod N_1}\chi(n)$$

which means this sum vanishes. □

Prop. (17.3.3.6). $|\tau(\chi)|^2=N$. ⌟

Proof: For any m,

$$|\sum_{n \mod N}\chi(n)e^{2\pi inm/N}|^2=\sum_{(n_1n_2,N)=1}\chi(n_1)\overline{\chi(n_2)}e^{2\pi i(n_1-n_2)m/N},$$

summing over $m\in(\mathbb{Z}/(N))^*$,

$$\varphi(N)|\tau(\chi)|^2=\sum_{m \mod N}\sum_{(n_1n_2,N)=1}\chi(n_1)\overline{\chi(n_2)}e^{2\pi\,\mathrm{i}(n_1-n_2)m/N}=\sum_{n_1\equiv n_2 \mod N,(n_1n_2,N)=1}N=\varphi(N)N$$

□

Cor. (17.3.3.7). From this and(17.3.3.5) and also(17.3.3.4), we get that

$$\chi(n)=\frac{\chi(1)\tau(\chi)}{N}\sum_{m(\text{mod } N)}\overline{\chi(m)}e^{2\pi imn/N}.$$

⌟

Cor. (17.3.3.8). If χ is real(i.e. $\chi^2=1$), by(17.3.3.4), $\tau(\chi)^2=\chi(-1)N$. ⌟

Cor. (17.3.3.9). For $p\geq 3\in\mathbf{P}$,

$$\tau(\left(\frac{-}{p}\right))^2=\left(\frac{-1}{p}\right)p.$$

More precisely,

$$\tau(\left(\frac{-}{p}\right))^2=\varepsilon_p\sqrt{p},\quad \varepsilon_p=\begin{cases}1 & p\equiv 1(\text{mod } 4)\\ -1 & p\equiv 3(\text{mod } 4)\end{cases}.$$

⌟

Proof: **?** □

Prop. (17.3.3.10) [Finite Fourier Transform]. Let ψ be a non-trivial character on a finite field $\mathbb{F}_q$, then let $g_\psi=\sum_{x\in\mathbb{F}_q}\psi(x^2)$, then

- $|g_\psi|^2=q^{1/2}$.
- $g_\psi(a)=(\frac{a}{\mathbb{F}_q})g_\psi(1)$.

⌟

Proof: Use Fourier transform on $\mathbb{F}_q$**?**. □

4 Kloosterman Sums

References are [K-W01].

Def. (17.3.4.1) [Generalized Kloosterman Sums]. Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}, m \in \mathbb{Z}_+$, and $\psi \in \chi(\mathbb{F}_q)$, then the generalized **Kloosterman sum** is defined to be

$$\mathrm{Kloos}_m(q,\psi,a) = \sum_{x_1,\ldots,x_m\in\mathbb{F}_q^\times, x_1\ldots x_m=a} \psi(x_1+\ldots+x_m) \in \mathbb{C}.$$

And $\mathrm{Kloos}_2(q,\psi,a)$ is denoted by $\mathrm{Kloos}(q,\psi,a)$. ⌟

Thm. (17.3.4.2) [Weil/Deligne]. $|\mathrm{Kloos}_m(q,\psi,a)| \le \min(mq^{\frac{m-1}{2}}, q^{m/2})$. ⌟

Proof: Let $X_0 = \mathrm{Spec}\,\mathbb{F}_q[X_1,\ldots,X_m]/(X_1\ldots X_m = a)$ and $h : X \to \mathbb{A}^1_{\mathbb{F}_q} : (x_1,\ldots,x_m) \mapsto x_1+\ldots+x_m$. Let $\mathcal{L}(\psi^{-1})$ be the Artin-Schreier sheaf on $\mathbb{A}^1_{\mathbb{F}_q}$(8.4.7.30), then by(8.4.7.32), for any $x \in X(\mathbb{F}_q)$, the Frobenius action $F^*_{x_0}$ at x_0 on $h^*(\mathcal{L}(\psi^{-1}))$ is multiplication by $\psi(h(x))$.

Then it follows from(17.2.2.5) that

$$\mathrm{Kloos}_m(q,\psi,a) = \mathrm{tr}(F^*_X) = \mathrm{tr}(F^*_X|[\mathrm{R}\Gamma(X, h^*\mathcal{L}(\psi^{-1}))]).$$

Thus, to show that $|\mathrm{Kloos}_m(q,\psi,a)| \le mq^{\frac{m-1}{2}}$, it suffices to show the following:

- $$\dim H^k_{\text{ét},c}(X_{\overline{\mathbb{F}_q}}, h^*(\mathcal{L}(\psi^{-1}))) = m\delta_{k,m-1}.$$
- $H^{m-1}_{\text{ét},c}(X_{\overline{\mathbb{F}_q}}, h^*(\mathcal{L}(\psi^{-1})))$ is pure of weight $m-1$.

For this, Cf.[Deligne, Applications de la formule des traces aux sommes trigonometriques, in SGA4.5]Thm7.4.?

For the second inequality, Cf.[K-W01]P227.? □

Def. (17.3.4.3) [Kloosterman Sums]. For $m \in \mathbb{Z}_+$ and $u, v \in \mathbb{Z}$, a classical **Kloosterman sum** is defined to be the summation

$$\mathrm{Kloos}(u,v,\mod m) = \sum_{r\in(\mathbb{Z}/m)^*} e^{2\pi\mathrm{i}\,\frac{ur+v[r^{-1}]}{m}} \in \mathbb{C}.$$

⌟

Prop. (17.3.4.4) [Properties of Kloosterman Sums].

- $\mathrm{Kloos}(u,v,\mod m) = \mathrm{Kloos}(v,u,\mod m)$.
- $\mathrm{Kloos}(ac,b,\mod m) = \mathrm{Kloos}(a,bc,\mod m)$ if $(c,m)=1$.
- If $m_1,m_2 \in \mathbb{Z}_+, (m_1,m_2) = 1$, and choose $n_1,n_2 \in \mathbb{Z}$ s.t. $n_1m_1 \equiv 1 \mod m_2$ and $n_2m_2 \equiv 1 (\mod m_1)$, then

$$\mathrm{Kloos}(a,b,\mod m_1m_2) = \mathrm{Kloos}(n_2a,n_2b,\mod m_1)\,\mathrm{Kloos}(n_1a,n_1b,\mod m_2).$$

- If $p \in \mathbf{P}$ and $p|m$, then
$$\mathrm{Kloos}(pa,pb,pm) = p\,\mathrm{Kloos}(a,b,m).$$

⌟

Lemma (17.3.4.5). If $p \in \mathbf{P}, m, n, u, v \in \mathbb{Z}_+$ s.t. $m/2 \le n < m$, and $\gcd(u, v, p) = 1$, then

$$|\operatorname{Kloos}(u, v, \mod p^m)| \le Cp^n,$$

where $C = \begin{cases} 4 & , p = 2 \ \& \ m - n \ge 3 \\ 2 & , \text{otherwise} \end{cases}$. ⌟

Proof: In this case, for $s \in \mathbb{Z} \setminus (p)$ and $t \in \mathbb{Z}$, it is easy to verify that

$$[s + p^n t]^{-1} \equiv [s^{-1}] - p^n [s^{-1}]^2 t (\mod p^m).$$

So

$$\begin{aligned} \operatorname{Kloos}(u, v, \mod p^m) &= \sum_{s \in (\mathbb{Z}/p^n)^*} e^{2\pi \mathrm{i} \frac{us + v[s^{-1}]}{p^m}} \sum_{t=1}^{p^{m-n}} e^{2\pi \mathrm{i} \frac{(u - v[s^{-1}]^2)t}{p^{m-n}}} \\ &\le p^{m-n} \#\{s \in (\mathbb{Z}/p^n)^* | us^2 \equiv v (\mod p^{m-n})\} \\ &= p^m \#\{s \in (\mathbb{Z}/p^{m-n})^* | us^2 \equiv v (\mod p^{m-n})\} \\ &\le Cp^n \end{aligned}$$

where $C = \begin{cases} 4 & , p = 2 \ \& \ m - n \ge 3 \\ 2 & , \text{otherwise} \end{cases}$. □

Thm. (17.3.4.6) [Weil-Estermann]. The Kloosterman sum(17.3.4.3) satisfies

$$|\operatorname{Kloos}(u, v, \mod m)| \le \tau\Big(\frac{m}{(u, v, m)}\Big) \sqrt{\gcd(u, v, m) m}.$$

⌟

Proof: As the assertion is multiplicative in m, by(17.3.4.4), it suffices to show for $m = p^k$, where $p \in \mathbf{P}, k \in \mathbb{Z}_+$. If $\gcd(a, b, p^k) = p^k$, then the assertion is trivial. And if $\gcd(a, b, p^k) < p^k$, then it follows from(17.3.4.4) that we can reduce to the case $\gcd(a, b, p^k) = 1$.

If $p = 2$ and $k = 1$, the assertion is trivial, and if $p = 2$ and $k \ge 2$, then the assertion follows from the lemma(17.3.4.5).

If $p \ge 3$, and $2|k$, then the assertion follows from(17.3.4.5).

So suppose $p \ge 3$ and $2 \nmid k$. If $k = 1$ and $p \nmid uv$, this is just theorem of Weil(17.3.4.2). And if $k = 1$ and $p|uv$, this is also trivial, because $\operatorname{Kloos}(u, v, \mod p) \in \{0, 1\}$.

So suppose $m > 1$ and denote $n = \frac{k-1}{2}$. In this case, for $s \in \mathbb{Z} \setminus (p)$ and $t \in \mathbb{Z}$, it can be verified that

$$[(s + p^n t)^{-1}] \equiv [s^{-1}] - p^n [s^{-1}]^2 t + p^{2n} [s^{-1}]^3 t^2 (\mod p^k).$$

So

$$\operatorname{Kloos}(u, v, \mod p^k) = \sum_{s \in (\mathbb{Z}/p^n)^*} e^{2\pi \mathrm{i} \frac{us + v[s^{-1}]}{p^k}} \Big(\sum_{t \in (\mathbb{Z}/p^{n+1})^*} e^{2\pi \mathrm{i} [\frac{(u - v[s^{-1}]^2)t}{p^{n+1}} + \frac{v[s^{-1}]^3 t^2}{p}]} \Big).$$

It follows from(17.3.2.3) that

$$\sum_{t \in (\mathbb{Z}/p^{n+1})^*} e^{2\pi \mathrm{i} [\frac{(u - v[s^{-1}]^2)t}{p^{n+1}} + \frac{v[s^{-1}]^3 t^2}{p}]} = \begin{cases} p^{n + \frac{1}{2}} & , us^2 \equiv v (\mod p^n), p \nmid v \\ 0 & , us^2 \not\equiv v (\mod p^n) \end{cases}.$$

So

$$\operatorname{Kloos}(u, v, \mod p^k) = p^{n + \frac{1}{2}} \#\{s \in (\mathbb{Z}/p^n)^* | us^2 \equiv v (\mod p^n)\} \le 2p^{n + \frac{1}{2}} = 2p^{\frac{m}{2}}.$$

□

5 Irrational Trigonometric Sums

Conj. (17.3.5.1). Given $k \in \mathbb{Z}_+$, then for any $N \in \mathbb{Z}_+$,

$$\sum_{n=1}^{N} e^{2\pi \mathrm{i}\sqrt{2}n^k} = \widetilde{O}(N^{1/2}).$$

⌟

Proof: □

Def. (17.3.5.2). For $\alpha \in \mathbb{R}$ and $D, N \in \mathbb{Z}_+$, define

$$R_{D,N}(\alpha) = \sum_{d\in\mathbb{Z}_+, d\leq D} \min(N, ||d\alpha||^{-1}).$$

Then this $R_{D,N}$ satisfies:

- $D \leq R_{D,N}(\alpha) \leq DN$.
- If α is (C,μ)-Diophantine, then $R_{D,N}(\alpha) \leq C^{-1}DN^{\mu-2}\log N$.
- $R_{D,N}(\sqrt{2}) \sim D\log N$.

⌟

Proof: □

Thm. (17.3.5.3)[Weyl]. Let $P(X) = \alpha X^k + \sum_{j=1}^{k-1}\alpha_j X^k \in \mathbb{R}[X]$, $N, N_1, N_2 \in \mathbb{Z}_+$, $N_1 < N_2 \leq N_1 + N$, then for each $\delta \in \mathbb{R}_+$, there exists $C(\delta) \in \mathbb{R}_+$ s.t.

$$\Big|\sum_{n=N_1}^{N_2} e^{2\pi \mathrm{i} P(n)}\Big|^{2^{k-1}} \leq C(\delta)N^\delta N^{2^{k-1}-k} R_{k!N^{k-1},N}(\alpha)(17.3.5.2).$$

In particular, if α is μ-Diophantine, then by(17.3.5.2), for each $\delta \in \mathbb{R}_+$, there exists $C'(\delta) \in \mathbb{R}_+$ s.t.

$$\Big|\sum_{n=N_1}^{N_2} e^{2\pi \mathrm{i} P(n)}\Big|^{2^{k-1}} \leq C'(\delta)N^{\delta+\mu-2} N^{2^{k-1}-1}.$$

⌟

Proof: Cf.[Larry Guth]P19. □

Thm. (17.3.5.4) [Vinogradov]. Let $P(X) = \sum_{j=1}^{k}\alpha_j X^k \in \mathbb{R}[X]$, then there exists $C_k \in \mathbb{R}_+$ s.t. for $N \in \mathbb{Z}_+$,

$$|\sum_{n=1}^{N} e^{2\pi \mathrm{i} P(n)}| \leq C_k N^{1-\frac{1}{10k^2\log k}},$$

unless there exists $\frac{a}{q} \in \mathbb{Q}$ s.t. $1 \leq q \leq N$ and

$$|\alpha_k - \frac{a}{q}| \leq \frac{1}{N^{k-1}}.$$

⌟

Proof: Cf.[Larry Guth]P44.?

For $\alpha = (\alpha_1, \ldots, \alpha_n) \in (\mathbb{R}/\mathbb{Z})^k$, denote

$$W_{k,N}(\alpha) = \sum_{n=1}^{N} e^{2\pi \mathrm{i}\, P_\alpha(n)}, \quad P_\alpha(X) = \alpha_k X^k + \ldots + \alpha_1 X.$$

For $l \in \mathbb{Z}_+$, define the linear operator

$$T_l : (\mathbb{R}/\mathbb{Z})^k \to (\mathbb{R}/\mathbb{Z})^k : P_\alpha(X + l) - P_\alpha(X) = P_{T_l(\alpha)}(X).$$

Notice that for any $s \in \mathbb{Z}_+$,

$$\int_{(\mathbb{R}/\mathbb{Z})^k} |W_{k,N}(\beta)|^{2s} \mathrm{d}\beta = J_{s,k}(N) \overset{\triangle}{=} \#\{(a_1, \ldots, a_s, b_1, \ldots, b_s) \in [N]_+^{2s} | \sum_i a_i^j = \sum_i b_i^j, \forall j \in [1, k]\}.$$

Lemma (17.3.5.5) [W-BDG]. For $s, k, N \in \mathbb{Z}_+$ and $\varepsilon \in \mathbb{R}_+$, there exists $C(k, \varepsilon) \in \mathbb{R}_+$ s.t.

$$J_{k,N}(N) \le C(k, \varepsilon) N^\varepsilon (N^s + N^{2s - \binom{k+1}{2}}).$$

┘

Proof: □

Lemma (17.3.5.6) [Vinogradov]. For $s, k, N \in \mathbb{Z}_+$, there exists $C(k) \in \mathbb{R}_+$ s.t.

$$J_{k,N}(N) \le C(k) N^{2s - \binom{k+1}{2}} + k^{2 - \frac{s}{k^2 \log k}}.$$

┘

Proof: □

Denote

$$\varphi_{s,k} : \mathbb{R}^s \to \mathbb{R}^k : (a_1, \ldots, a_n) \mapsto (\sum_i a_i, \sum_i a_i^2, \ldots, \sum_i a_i^k),$$

Then we have:

Lemma (17.3.5.7). For $\gamma \in \mathbb{R}_+$, a sequence $(a_1, \ldots, a_n) \in \mathbb{R}$ is said to be in WS_γ if $|a_i - a_j| > \gamma$ for any $i \neq j$. Then there exists $C(k, \gamma) \in \mathbb{R}_+$ s.t. for any rectangular R with lengths greater than $1/N$, we have:

$$\#\Big\{(a_1, \ldots, a_k) \in (\frac{\mathbb{Z}}{N})^k \cap [0, 1]^k \cap WS_\gamma | \varphi_{s,k}(\underline{a}) \in R\Big\} \le C(k, \gamma) N^k \operatorname{Vol}(R).$$

17.4 p-adic Modular Forms

Main references are [p-adic Modular Forms]

17.5 Formal and Rigid Geometry

Main references are [Bos15] and [BGR84], but there are other approaches, such as given by Berkovich, or given by Huber, and used in Scholze's work, which is most natural because it behaves well w.r.t. the formal model.

1 Affinoid K-Spaces

Def. (17.5.1.1) [Affinoid K-Space]. an affinoid algebra A can be viewed as the function ring on the space $\operatorname{Sp} A$ of maximal ideals of A with the usual Zariski topology called the **affinoid K-space associated to A**. A morphism of affinoid algebras induce a map on their $\operatorname{Sp} A$. This is because residue fields of maximal ideals are finite over K. So we *define* the category of affinoid K-spaces as the opposite category of affinoid K-algebras. ⌟

Cor. (17.5.1.2). The category of affinoid spaces admits fiber products, because of(11.2.4.30). ⌟

Prop. (17.5.1.3). By the properties of a Jacobson space(4.12.3.24)(4.12.3.21), the affinoid K-space has good properties w.r.t. closed, open hence irreducible compared to $\operatorname{Spec} A$ in Zariski topology. In particular, it is a Noetherian space. ⌟

Def. (17.5.1.4) [Canonical Topology]. The affinoid K-space has another topology, called the **canonical topology**, generated by $X(f,\varepsilon) = \{x | f(x) \leq \varepsilon\}$ as a subbasis. And this topology is in fact generated by $X(f) = X(f,1)$ as a subbasis. ⌟

Proof: For the last assertion, notice $f(x)$ assume value in $|\overline{K}|$, which is dense in $\mathbb{R}_+$, so we can assume $\varepsilon \in |\overline{K}|$(by approximation from below), hence $\varepsilon^n = |c|$, where $c \in K$, so $X(f,\varepsilon) = X(f^n, c) = X(c^{-1}f^n)$. □

Prop. (17.5.1.5). $\{x | f(x) = \varepsilon\}$ is open in $\operatorname{Sp} A$. ⌟

Proof: We let $f(x) = \varepsilon$ and $k = A/\mathfrak{m}_x$, let the minipoly of f in $A/\mathfrak{m}_x$ be P of degree n, and let $g = P(f)$, then $g(x) = 0$, and if $|g(y)| < \varepsilon^n$, then $|f(y)| = \varepsilon$, otherwise $|f(y) - \alpha_i| \geq |\alpha_i| = \varepsilon$ for every root α_i of P, hence $|P(f(y))| \geq \varepsilon^n$, contradiction. □

Cor. (17.5.1.6). By the proof, we have, $X(f_1, \ldots, f_r)$, $f_i \in \mathfrak{m}_x$ forms a basis of x in $\operatorname{Sp} A$.(Replace every $X(f_i)$ by $\{y || f_i(y)| = \varepsilon\}$, then by some $X(g_i)$ for $g_i \in \mathfrak{m}_x$. ⌟

Def. (17.5.1.7) [Affinoid Subdomain]. For an affinoid K-space X, a subset U is called a **affinoid subdomain** of X if there is an closest affinoid space map $X' \to X$ with image in U, i.e. any other these maps factor through it. The definition is weird but the situation is clarified by the following proposition. ⌟

Prop. (17.5.1.8). For an affinoid subdomain $i : X' \to X$,

- i is injective and $\operatorname{Im} i = U$.
- i^* induce an isomorphism $A/\mathfrak{m}_{i(x)}^k \cong A'/\mathfrak{m}_x^k$.
- $\mathfrak{m}_x = \mathfrak{m}_{i(x)} A'$.

⌟

Proof: Consider a point $y \in U$, there is a commutative diagram $\begin{array}{ccc} A & \xrightarrow{i^*} & A' \\ \downarrow & \swarrow_{\alpha} & \downarrow \\ A/\mathfrak{m}_y^n & \xrightarrow{\sigma} & A'/\mathfrak{m}_y^n A' \end{array}$. Then there is a map $\alpha : A' \to A/\mathfrak{m}_y^n$ that makes the upper diagram commutative by universal property of subdomain, and the lower triangle is commutative by universal properties again. Then we see σ is surjective and notice the kernel of the projection is $\mathfrak{m}_y A'$ is in the kernel of α, thus σ is injective.

Now the case $n = 1$ shows $\mathfrak{m}_y A'$ is maximal, hence i is surjective and the inverse image is just one point. □

Prop. (17.5.1.9) [Special Subdomains]. There are three special affinoid subdomain of X: **Weierstrass domain** $X(f_1, \ldots, f_r)$, **Laurent domain** $X(f_1, \ldots, f_r, g_1^{-1}, \ldots, g_s^{-1})$, **rational domain** $X(\frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0}) = \{x \mid |f_i(x)| \leq |f_0(x)|\}$ for $(f_0, \ldots, f_r) = (1)$. They are all open by(17.5.1.5). ⌟

Proof: The Weierstrass domain corresponds to $A \to A\langle X_1, \ldots, X_r\rangle/(X_i - f_i)$.

The Laurent domain corresponds to $A \to A\langle X_1, \ldots, X_{r+s}\rangle/(X_i - f_i, 1 - X_{r+j} g_j)$.

The rational domain corresponds to $A \to A\langle X_1, \ldots, X_r\rangle/(f_i - f_0 X_i)$.

They are affinoid subdomains is in fact, easily checked. □

Lemma (17.5.1.10). Weierstrass domain are Laurent, and Laurent domain are rational, this is because intersection of rational domains are rational.

Any rational domain is a Weierstrass domain of a Laurent domain. ⌟

Proof: Notice a Laurent subdomain is a finite intersections of $X(\frac{f}{1})$ and $X(\frac{1}{g})$, so it is rational.

For a rational domain U, f_0 is a unit in $\mathcal{O}(U)$, hence its inverse has a bounded value, then $|cf_0| > 1$ for some $c \in K^*$. Hence U is Weirerstrass in $X((cf_0)^{-1})$. □

Cor. (17.5.1.11) [Pullback & Composition of Affinoid Subdomain]. The pullback(hence intersections) of affinoid subdomains is affinoid subdomain and it is just the set-theoretic inverse image, and specialness are preserved.

The affinoid subdomain of an affinoid subdomain is affinoid subdomain, and Weierstrassness and rationalness are preserved(while Laurentness not). ⌟

Proof: Pullback: fiber product exist in the category of affinoid K-spaces, then the universal property is checked. The set-theoretic property follows from(17.5.1.8).

Speciality: Clear.

Transitivity: Clear by universal property.

For the speciality, if $V = X(f_i)$, $U = V(g_j)$ is Weierstrass, then because by(11.2.4.26) A is dense in $A\langle f_i\rangle$, we can replace g_j by elements from A, by adding elements of small sup-norm, because valuation is non-Archimedean. Then $U = X(f_i, g_j)$. For the rational subdomain $V = X(\frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0})$, use(17.5.1.10), it suffices to prove for $U = V(g)$ or $U = V(g^{-1})$. For this, notice the image of $A[f_0^{-1}]$ is dense in $A\langle \frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0}\rangle$, by(11.2.4.26), so as before, we change g that it $g_0 f_0^n g \in A$ for some n. Now

$$V(g) = V \cap \{x \in X \mid |g_0(x)| \leq |f_0^n(x)|\}, \quad V(g^{-1}) = V \cap \{x \in X \mid |g_0(x)| \geq |f_0^n(x)|\}.$$

But now f_0^n is a unit in $A\langle \frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0}\rangle$, so $|f(x)|_{\sup} \geq |c|$ for some $c \in K^*$, so

$$V(g) = V \cap X(\frac{g_0}{f_0^n}, \frac{c}{f_0^n}), \quad V(g^{-1}) = V \cap X(\frac{f_0^n}{g_0}, \frac{c}{g_0}).$$

is rational in X. □

Cor. (17.5.1.12). For a special subdomain U of X, the canonical topology induces the canonical topology of U, by the transitivity property of affinoid subdomains and(17.5.1.10). In fact, by(17.5.1.14), any affinoid subdomain is open and the topology coincides. ⌟

Prop. (17.5.1.13). Let $\varphi : Y = \mathrm{Sp}\, B \to X = \mathrm{Sp}\, A$ be a morphism, if x is a point of X that $A/\mathfrak{m}_x \to B/\mathfrak{m}_x B$ is a surjection, then there is an affinoid nbhd U of x that φ restricts to a closed immersion on $\varphi^{-1}(U)$. If $A/\mathfrak{m}_x^n \cong B/\mathfrak{m}^n$ for all n, then there is an affinoid nbhd U of x that φ restricts to an isomorphism $\varphi^{-1}(U) \cong U$. ⌟

Proof: Cf.[Rigid and Formal Geometry P57]. □

Cor. (17.5.1.14). Every affinoid subdomain of X is open and has the restriction topology of X(canonical topology), because it satisfies the second condition of(17.5.1.13), by(17.5.1.8). ⌟

Lemma (17.5.1.15). If $f \subset A\langle X_1, \ldots, X_n\rangle$ is X_n-distinguished of order $\leq s$ for each element of $\mathrm{Sp}\, A$, then the set of elements that f is X_n-distinguished of exact order s is a rational subdomain of A. ⌟

Proof: Let $f = \sum f_v X_n^v$, let the constant coefficient of f_v be a_v, then the set is in fact $U = \{x \in \mathrm{Sp}\, A | |a_v(x)| \leq |a_s(x)|\}$. This is because, if f is distinguished of order s_x at x, then $a_{s_x} \neq 0$ because f_{s_x} is a unit, and $|a_v|_x \leq |f_v| \leq |f_{s_x}| = |a_{s_x}|_x$ for $v \leq s_x$ and strict inequality holds for $v > s_x$. In particular, $a_0, \ldots, a_s$ cannot have a common zero, so it is truly a rational subdomain. □

Prop. (17.5.1.16). If $f \subset A\langle X_1, \ldots, X_n\rangle$ is X_n-distinguished of order s for each element of $\mathrm{Sp}\, A$, then the map
$$A\langle X_1, \ldots, X_{n-1}\rangle \to A\langle X_1, \ldots, X_n\rangle/(f)$$
is finite. ⌟

Proof: Cf.[Rigid And Formal Geometry P79]. □

Presheaf of Affinoid Functions

Def. (17.5.1.17). The **weak Grothendieck category**(affine topology) on an affinoid space X has coverings defined by the finite cover by affinoid subdomains, called **affinoid covering**.

The **strong Grothendieck category**(fpqc topology) on an affinoid space X is defined by: objects are unions of affinoid subdomains $U = \cup U_i$ that for any morphism from an affinoid space $\varphi : Z \to U \subset X$, the pullback covering $\cup \varphi^{-1}(U_i)$ has a finite subcover by affinoid subdomains. A covering is defined by the same finiteness property.

The strong Grothendieck topology satisfies completeness conditions G_0, G_1, G_2 defined in(6.1.1.10), as easily verified.

The weak Grothendieck topology is a temporary notion, it will be obsolete after Tate's acyclicity theorem is proved. Admissible opens and admissible covers are notions w.r.t. the strong Grothendieck topology. ⌟

Proof: The weak Grothendieck category is a Grothendieck category by(17.5.1.11). The strong Grothendieck category is a Grothendieck category because: the finiteness condition lifts along base change, and also for base change, because we can first choose a finite subcover, then choose a finite subcover of the base change covering of that finite covering. □

Def. (17.5.1.18). For n functions $f_1, \ldots, f_n$ without common zeros, the rational subdomains $U_i = X(\frac{f_1}{f_i}, \ldots, \frac{f_n}{f_i})$ is an affinoid covering, called the **rational covering**. For n functions $f_1, \ldots, f_n$, there is a **Laurent covering** $X(\prod f_i^{\varepsilon_i}), \varepsilon_i = \pm 1$. ⌟

Prop. (17.5.1.19). Morphisms of affinoid spaces are continuous in weak Grothendieck topology by(17.5.1.11). It is also continuous in the strong Grothendieck topology, as one can check the finiteness conditions. ⌟

Prop. (17.5.1.20). Let X be an affinoid K-space, for any $f \in \mathcal{O}_X(X)$, consider the following sets:

$$U_1 = \{x||f(x)| < 1\}, \quad U_2 = \{x||f(x)| > 1\}, \quad U_3 = \{x||f(x)| > 0\}.$$

Then any finite union of sets of the form is admissible, and any finite cover by finite union of sets of the form is an admissible covering. ⌟

Proof: We first show that U_1 is admissible open, the others are similar. Let ε_n be an ascending sequence of elements in $\sqrt{|K^*|}$ converging to 1, then $U_1 = \cup_n X(\varepsilon_n^{-1} f)$ is a union of open subsets because $\varepsilon_n \in \sqrt{|K^*|}$. Now for any affinoid space Z mapping into U_1, $|\varphi^*(f)(z)|_{\sup} < 1$ for all $z \in Z$, thus by maximal principle(11.2.4.21), $|f|_{\sup} < 1$, thus the cover $U_1 = \cup_n X(\varepsilon_n^{-1} f)$ can be refined by a finite cover, thus it is admissible open.

For the admissibility of covering, the proof is similar, but use the following lemma(17.5.1.21). □

Lemma (17.5.1.21). For any affinoid K-algebra A, if f_i, g_j, h_k are system of functions on A that: for every $x \in A$, either $|f_i(x)| < 1, |g_j > 1$ or $h_k(x) > 0$, then we can replace $>, <$ by $\geq, \leq$ and elements in $\sqrt{|K^*|}$ that the same condition is true. ⌟

Proof: Cf.[Rigid and Formal Geometry P97]. □

Cor. (17.5.1.22). The strong Grothendieck category is finer than the Zariski category, because any standard affine open set is of the form U_3 and also Zariski covering is open covering because $\mathrm{Sp}(A)$ is Noetherian(11.2.4.16). ⌟

Def. (17.5.1.23) [Presheaf of Affinoid Functions]. There is a **presheaf of affinoid functions** defined on the weak Grothendieck topology because of the universal property of the affinoid subdomains.

Then the stalk $\mathcal{O}_{X,x}$ are local ring with maximal ideal $\mathfrak{m}_x\mathcal{O}_{X,x}$. Hense let $X = \mathrm{Sp}\, A$, the stalk map factor thorough $A \to A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X}$, and

$$A/\mathfrak{m}_x^n \cong A_{\mathfrak{m}_x}/\mathfrak{m}_x^n A_{\mathfrak{m}_x} \cong \mathcal{O}_{X,x}/\mathfrak{m}_x^n\mathcal{O}_{X,x}$$

so it induces isomorphisms between their $\mathfrak{m}_x$-adic completions. ⌟

Proof: By(17.5.1.8), there is an isomorphism $K' = \mathcal{O}_X(X)/\mathfrak{m}_x \cong \mathcal{O}_X(U)/\mathfrak{m}_x\mathcal{O}(U)$. Take the converse and pass to direct colimit(it is exact), $\mathcal{O}_{X,x}/\mathfrak{m}_x O_{X,x} \cong K'$. This map will be regarded as evaluation at x. The kernel $\mathfrak{m}_x\mathcal{O}_{X,x}$ is a maximal ideal. There are no other maximal ideals in $\mathcal{O}_{X,x}$ because if f in not in the kernel, then $f(x) \neq 0$, and multiply by an element in K^*, it can be made $|f(x)| \geq 1$, and then $U(f^{-1})$ is an affinoid subdomain containing x that f is invertible in it.

For the second assertion, for an affinoid subdomain $\mathrm{Sp}\, A'$, there are maps

$$A/\mathfrak{m}^n \to A'/\mathfrak{m}^n \to \mathcal{O}_{X,x}/\mathfrak{m}^n\mathcal{O}_{X,x}.$$

We first show these are isomorphisms: the first map is an isomorphism by(17.5.1.8), then take direct colimit, the composition map is also isomorphism.

$A/\mathfrak{m}_x^n \cong A_{\mathfrak{m}_x}/\mathfrak{m}_x^n A_{\mathfrak{m}_x}$ is classical.

$A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X}$ is injective because by Krull's intersection theorem(5.2.2.15), $A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X} \to \widehat{\mathcal{O}_{X,x}} \cong \widehat{A_{\mathfrak{m}}}$ is injective. □

Cor. (17.5.1.24). $f \in A = \mathcal{O}_X(X)$ vanish iff it vanish at every stalk, this is because $A \to \prod_{\mathfrak{m}} A_{\mathfrak{m}} \to \prod \mathcal{O}_{X,x}$ is injective. ⌟

Cor. (17.5.1.25). Giving a covering of affinoid subdomain of an affinoid space $X_i \to X$, then $\mathcal{O}_X(X) \to \prod \mathcal{O}_{X_i}(X_i)$ is an injection. (This is because the kernel vanishes at each stalk.) ⌟

Cor. (17.5.1.26). For a subdomain of an affinoid space X, the corresponding ring map is flat. ⌟

Proof: Cf.[Formal and Rigid Geometry P68]. □

Prop. (17.5.1.27). The stalk $\mathcal{O}_{X,x}$ is Noetherian, in particular it is $\mathfrak{m}$-adically separated by Krull's intersection theorem(5.2.2.15). ⌟

Proof: First it is $\mathfrak{m}$-adically separated, because by(17.5.1.23), for a $f \in \cap \mathfrak{m}^n \mathcal{O}_{X,x}$, we can choose an affinoid subdomain $\operatorname{Sp} A$ that $f \in A$(17.5.1.8), then $f \in \mathfrak{m}^n A$, so by Krull's intersection theorem(5.2.2.15), we have $f = 0$ in $A_{\mathfrak{m}}$.

In the same way, any f.g. ideal $\mathfrak{a}$ of $\mathcal{O}_{X,x}$ is $\mathfrak{m}$-adically closed, this is because it is generated by an ideal in the affinoid algebra of a nbhd, and then $\mathcal{O}_{x,X}/\mathfrak{a}$ is separated as the stalk of an affinoid algebra $A'/\mathfrak{a}'$.

Now pass a chain of f.g. ideals to their completion, then that chain is stationary because $\widehat{\mathcal{O}}_{X,x} = \widehat{A}_{\mathfrak{m}_x}$ is Noetherian(5.1.1.43). And now this chain is also stationary because ideals are closed in $\mathfrak{m}$-adic topology. □

Locally Closed Immersions

Def. (17.5.1.28) [Immersions]. A morphism of affinoid spaces is called a **closed immersion** iff the corresponding ring map is surjective. It is called a **locally closed immsetion** iff it is injective and the stalk map are all surjective. It is called an **open immersion** iff it is injective and the corresponding stalk maps are isomorphism. All these notions are stable under compositions.

An affinoid subdomain is an open immersion by(17.5.1.8)(17.5.1.23) and(17.5.1.27). ⌟

Lemma (17.5.1.29). Base change by affinoid subdomain of closed/locally closed/open immersions are of the same type. ⌟

Proof: This is obvious for locally close and open, because affinoid subdomains are open(17.5.1.14), for the closed immersion, use(11.2.4.32). □

Prop. (17.5.1.30). A closed immersion of affinoid spaces is equivalent to a locally closed immersion that the corresponding ring map is finite. ⌟

Proof: Cf.[Rigid and Formal Geometry P70]. A closed immersion $X' \to X$ is a locally closed immersion because the canonical topology of $\operatorname{Sp} A$ restricts to the canonical topology on $\operatorname{Sp} A/\mathfrak{a}$(17.5.1.4), then use(11.2.4.32), and the fact direct limit is exact. □

Prop. (17.5.1.31)[Clopen Immersion]. The image of an open and closed immersion is Zariski closed and open. In particular, it is a Weierstrass subdomain. ⌟

Proof: Cf.[Rigid and Formal Geometry P71]. □

Def. (17.5.1.32). A **Runge immersion** is a closed immersion followed by an open immersion of Weierstrass subdomain. Runge immersion is table under base change of affinoid subdomains by(17.5.1.29) ⌟

Prop. (17.5.1.33) [Equivalent Definition of Runge Immersions]. For a morphism $\sigma : A \to A'$, $\mathrm{Sp}\, A' \to \mathrm{Sp}\, A$ is a Runge immersion iff $\sigma(A)$ is dense in A' iff $\sigma(A)$ contains a set of affinoid generator of A' over A. ⌟

Proof: For a Runge immersion, $\sigma(A)$ is dense in A', because this is true for Weierstrass subdomain and closed immersion.

If $\sigma(A)$ is dense in A', then by(11.2.4.28), we can modify a set of affinoid generators by a set of affinoid generators in $\sigma(A)$.

If h_i is a set of affinoid generators in $\sigma(A)$, then $A \to A\langle h_i\rangle \to A'$ is a Runge immersion. □

Cor. (17.5.1.34). Runge immersion is stable under composition. ⌟

Prop. (17.5.1.35). An open and Runge immersion is an immersion of Weierstrass subdomain. ⌟

Proof: By localizing on this Weierstrass subdomain, and notice Weierstrass subdomain is stable under composition(17.5.1.11), we reduce to clopen immersion case, and result follows by(17.5.1.31). □

Lemma (17.5.1.36) [Extension of Runge Immersion]. For a morphism of affinoid spaces $X' \to X = \mathrm{Sp}\, A$, if $f_1, \ldots, f_n, g$ generate A, for $\varepsilon \in \sqrt{\{|K^*|\}}$, denote $X_\varepsilon = \{x||f_i(x)| \leq \varepsilon|g|\}$, this is a rational subdomain. The inverse image of X_ε is X'_ε, then if $X'_{\varepsilon_0} \to X_{\varepsilon_0}$ is a Runge immersion for some ε_0, then there is a $\varepsilon > \varepsilon_0$ that $X'_\varepsilon \to X_\varepsilon$ is also a Runge immersion. ⌟

Proof: Cf.[Rigid and Formal Geometry P73]. □

Prop. (17.5.1.37) [Gerritzen-Grauert]. For a locally closed immersion $\varphi : X' \to X$, there is a finite cover of X of rational subdomains X_i that $\varphi^{-1}(X_i) \to X_i$ are Runge immersions. ⌟

Proof: Cf.[Formal and Rigid Geometry P79]. □

Cor. (17.5.1.38) [Gerritzen-Grauert]. Any affinoid subdomain is equivalent to a finite union of rational subdomains. ⌟

Proof: An affinoid subdomain is an open immersion by(17.5.1.28), so $\varphi^{-1}(X_i) \to X_i$ is open and Runge, so it is Weierstrass by(17.5.1.35). In particular, $X \cap X_i$ is rational in X by transitivity, thus the result. □

Tate's Acyclicity

Lemma (17.5.1.39) [Reduction of Weak Grothendieck Topology].

- Every affinoid covering has a refinement of rational covering.
- For every rational covering, there is a Laurent covering $\{V_i\}$ that restriction on each V_i is rational covering generated by units.
- Every rational covering generated by units has a refinement of Laurent covering.

⌟

Proof: 1: By(17.5.1.38), we can assume the covering consists of rational subdomains $U_i = X(\frac{f_{i1},\ldots,f_{ii_k}}{f_{i0}})$, then consider the elements $f_{v_1\ldots v_n} = \prod_{i=1}^n f_{iv_i}$, where at least some $v_i = 0$. Denote the set of these elements by I.

Firstly, these elements has no common zero on X, thus generating a rational covering of X: for any $x\in U_i$, f_{i0} doesn't vanish at x, thus the product $\prod_{j\neq i} f_{jv_j}$ vanishes for all choices of v_j, but this is impossible because for each j, $(\{f_{ik}\}_k)=(1)$.

Secondly, this is a refinement of U_i: We show $X_{f_{v_1\ldots v_n}}\subset U_k$ where $v_k=0$. For this, consider $x\in X_{f_{v_1\ldots v_n}}$, then $x\in U_j$ for some j. If $j=k$, we are done, otherwise,

$$|f_{v_1\ldots\mu_k\ldots v_n}(x)|\leq |f_{v_1\ldots 0\ldots\mu_k\ldots v_n}(x)|\leq |f_{v_1\ldots v_n}(x)|.$$

Where the last inequality is because $(v_1,\ldots,0,\ldots,\mu_k,\ldots,v_n)$ has a 0, thus $f_{v_1\ldots 0\ldots\mu_k\ldots v_n}\in I$.

2: For a rational covering, f_i is invertible in the ring of $U=X(\frac{f_0}{f_i},\ldots,\frac{f_n}{f_i})$, thus it has a inverse that attains maximum value on U(11.2.4.21). Hence there is a $c\in K^*$ that $|c|^{-1}<\inf(\max\{|f_i(x)|\})$.

I claim the Laurent covering w.r.t. the elements $cf_0,\ldots,cf_n$ satisfies the requirement. Because for example, on $V=X((cf_0)\cdots(cf_s)(cf_{s+1})^{-1}\cdots(cf_n)^{-1})$, $|f_i(x)|<|f_j(x)|$ for $i\leq s<j$, so the covering restricted to V is just the rational covering generated by $f_{s+1},\ldots,f_n$, and they are all invertible in $\mathcal{O}(V)$.

3: In fact the Laurent covering generated by the element $f_if_j^{-1}$ for $i<j$ is a refinement of the rational covering generated by $f_1,\ldots,f_n$, because in any one of this Laurent subdomains V, for any two i,j, either $|f_i(x)|<|f_j(x)|$ or $|f_j(x)|<|f_i(x)|$ for all $x\in V$, so there is a maximal one f_s, then $V\subset X(\frac{f_0}{f_s},\ldots,\frac{f_n}{f_s})$. □

Prop. (17.5.1.40) [Tate's Acyclicity Theorem]. The presheaf of affinoid functions on an affinoid space $X=\operatorname{Sp}A$ is a sheaf w.r.t the weak Grothendieck category. In fact, for any A-module M, the presheaf $\widetilde{M}=M\otimes_A\mathcal{O}_X$ is a sheaf w.r.t. the weak Grothendieck topology, called the **quasi-coherent** sheaf on X.

Moreover, for any finite cover of affinoid subdomains, the Čech cohomology group $\check{H}^q(\operatorname{Sp}A,\widetilde{M})$ vanish for $q\neq 0$. ⌟

Proof: It suffices to prove the last assertion. First reduce to the case of Laurent covering by(17.5.1.39) and(6.3.2.10)(6.3.2.11). Noticing the base change invariance of the specialities of affinoid subdomains(17.5.1.11). Even more, by(6.3.2.12) and an induction process, it suffices to prove for the simple Laurent covering $X(f),X(f^{-1})$.

It suffices to prove for the sheaf of affinoid functions $\mathcal{O}_X$, because for any Qco sheaf $\widetilde{M}$, choose a free resolution of M, then use dimension shifting, notice the covering is finite(the flatness of the algebra map(17.5.1.26) is used to deduce the long exact sequence).

For the sheaf $\mathcal{O}_X$, the main tool is the following commutative diagram:

$$\begin{array}{ccccccccc}
 & & & & 0 & & 0 & & \\
 & & & & \downarrow & & \downarrow & & \\
 & & & & (X-f)A\langle X\rangle\times(1-fY)A\langle Y\rangle & \xrightarrow{\delta''} & (X-f)A\langle X,X^{-1}\rangle & \longrightarrow & 0\\
 & & & & \downarrow & & \downarrow & & \\
0 & \longrightarrow & A & \xrightarrow{\varepsilon'} & A\langle X\rangle\times A\langle Y\rangle & \xrightarrow{\delta'} & A\langle X,X^{-1}\rangle & \longrightarrow & 0\\
 & & \| & & \downarrow & & \downarrow & & \\
0 & \longrightarrow & A & \xrightarrow{\varepsilon} & A\langle f\rangle\times A\langle f^{-1}\rangle & \xrightarrow{\delta} & A\langle f,f^{-1}\rangle & \longrightarrow & 0
\end{array}$$

where δ' is given by $(h_1(X),h_2(Y))\mapsto h_1(X)-h_2(X^{-1})$, and δ'' is induced by δ'. The columns are all exact, and the first row and the second row are exact. ε is injective by(17.5.1.25). Then the last row is also exact, by spectral sequence. □

Prop. (17.5.1.41) [Strong/Weak Topos The same]. If X is an affinoid K-space, the category of sheaves w.r.t the strong Grothendieck topology is equivalent to the category of sheaves w.r.t. the weak Grothendieck topology by pushforward and pullback of sheaves by(6.1.2.25) because the strong and weak Grothendieck category satisfies the conditions.

In particular, this applies to the case $\mathcal{O}_X$ by(17.5.1.40), the resulting sheaf is called the **sheaf of rigid analytic functions** on X, also denoted by $\mathcal{O}_X$. ⌟

2 Rigid Analytic Spaces

Def. (17.5.2.1). A **G-ringed K-space** is a pair $(X, \mathcal{O}_X)$ where X is a G-topological space and $\mathcal{O}_X$ is a sheaf of K-algebras. It is called **local G-ringed K-space** if the stalks are all local rings. Their morphisms are defined routinely. ⌟

Prop. (17.5.2.2) [Morphisms Between Affinoid Spaces]. An affinoid K-space with the sheaf of analytic functions $(X, \mathcal{O}_X)$(17.5.1.41) is an example of local G-ringed K-space(17.5.1.23).

A continuous homomorphism of rings induces a local G-ringed morphism. And all morphisms come from these.

Moreover, an affinoid K-space is a complete G-ringed K-space(i.e. rigid)(6.1.1.10). ⌟

Proof: It is a G-space by(17.5.1.40)(17.5.1.41), morphisms by(17.5.1.19), notice the $\mathfrak{m}_x$ generate the maximal ideal of $\mathcal{O}_{X,x}$(17.5.1.23), so the morphism is local.

To show all morphisms are like these, we need to show a morphism $\sigma : A \to B$ gives at most one $\operatorname{Sp} B \to \operatorname{Sp} A$: the morphism is local, so it maps $\mathfrak{m}_{\varphi(x)}$ to $\mathfrak{m}_x$, and from the commutative diagram

$$\begin{array}{ccc} A/\mathfrak{m}_{\varphi(x)} & \longrightarrow & B/\mathfrak{m}_x \\ \downarrow\cong & & \downarrow\cong \\ \mathcal{O}_{\varphi(x),\operatorname{Sp} A}/\mathfrak{m}_{\varphi(x)}\mathcal{O}_{\varphi(x),\operatorname{Sp} A} & \longrightarrow & \mathcal{O}_{x,\operatorname{Sp} B}/\mathfrak{m}_x\mathcal{O}_{x,\operatorname{Sp} B} \end{array}$$

(17.5.1.23) shows $\mathfrak{m}_{\varphi(x)}$ is mapped into $\mathfrak{m}_x$, so $\mathfrak{m}_{\varphi(x)} = (\sigma^*)^{-1}\mathfrak{m}_x$, which shows φ is unique set-theoretically, and on the level of structure sheaf, the uniqueness of $\mathcal{O}_{\operatorname{Sp} A}(V) \to \mathcal{O}_{\operatorname{Sp} B}(\varphi^{-1}(V))$ is unique by the definition of affinoid subdomain(17.5.1.7). □

Def. (17.5.2.3) [Rigid Spaces]. The category of **rigid (analytic) space** is a full subcategory of local G-ringed K-spaces that it is complete G_0, G_1, G_2, and it has an admissible covering $\{X_i \to X\}$ that $(X_i, \mathcal{O}_X|_{X_i})$ are affinoid K-spaces.

It follows easily that an admissible open subset of a rigid space is again rigid. ⌟

Prop. (17.5.2.4) [Glueing Rigid Spaces]. Glueing rigid analytic spaces is legitimate, so does glueing morphisms on the source. ⌟

Proof: First glue the set, then use(6.1.1.12) to glue G-topology, finally the glue of structure sheaf is similar to(6.1.5.3). □

Cor. (17.5.2.5) [Spectrum Adjointness]. If X is rigid and Y is affinoid, then $\operatorname{Hom}(X, Y) \cong \operatorname{Hom}(\mathcal{O}_Y(Y), \mathcal{O}_X(X))$. This follows from(17.5.2.2) and glue(17.5.2.4). ⌟

Prop. (17.5.2.6) [Fiber Products]. Fiber products exist in the category of rigid analytic space. This is fiber product of affinoid spaces are affinoid so we can glue them by universal property, the same as(6.2.7.15). ⌟

Prop. (17.5.2.7). An affinoid space is connected in the weak Grothendieck topology iff it is connected in the strong Grothendieck topology iff it is connected in the Zariski topology. ⌟

Proof: Firstly the weak and strong are equal because any strong covering of X has a refinement of weak covering, and a weak covering is a strong covering. So it suffices to prove the equivalence of the last two.

One direction is trivial, for the other direction, use Tate's acyclicity, if $X_1, X_2 \to \mathrm{Sp}\, A$, $X_1 \cap X_2 = 0$, then $A = \mathcal{O}_X(X_1) \times \mathcal{O}_X(X_2)$, so $\mathrm{Spec}\, A$ is not connected, neither do $\mathrm{Sp}\, A$. □

Prop. (17.5.2.8). We can define the connected components of X as the equivalence classes of elements that can be reached using connected admissible open subsets of X. Then the connected components are admissible and forms an admissible cover of X. ⌟

Proof: Notice that there exists a finite covering consisting of connected Zariski subsets, by(17.5.2.7) and the fact $\mathrm{Sp}\, A$ has f.m. connected components because $\mathrm{Spec}\, A$ does as A is Noetherian(11.2.4.12) and(17.5.1.3).

Thus we are done, because by(17.5.1.22), a Zariski covering is admissible, and clearly the connected components of X are just this Zariski covering. □

Rigid GAGA

Lemma (17.5.2.9). Let Z be an affine scheme algebraic over K, and Y a rigid K-space, then the set of morphisms of local G-ringed spaces $(Y, \mathcal{O}_Y) \to (Z, \mathcal{O}_Z)$ corresponds to K-algebra morphisms from $\mathcal{O}_Z(Z)$ to $\mathcal{O}_Y(Y)$. ⌟

Proof: Cf.[Formal and Rigid Geometry P111]. □

Def. (17.5.2.10)[Rigid Analytification]. There is a partial functor X^{rig} from the category of schemes X locally algebraic over a valued field K to the category of rigid K-spaces that are right adjoint to the forgetful functor from the category of rigid K-spaces to local ringed K-space, called the **GAGA functor**.

The existence of this functor is proven in(17.5.2.14). ⌟

Def. (17.5.2.11)[Analytification of Affine Schemes]. Let $T_n(r)$ be the elements $\sum a_v \zeta^v$ in T_n that $\lim a_v r^{|v|} = 0$. Then choose a $c \in K$, $|c| > 1$, define $T_n^{(i)} = T_n(|c|^i)$. Then $T_n^{(i)} = K\langle c^{-i}X_1, \ldots, c^{-i}X_n\rangle$, so clearly $\mathrm{Sp}(T_n^{(i)})$ is an affinoid subdomain of $\mathrm{Sp}(T_n^{(i+1)})$ by(17.5.1.9). Thus there is a chain of inclusions of affinoid subdomains:

$$B^n = \mathrm{Sp}(T_n^{(0)}) \hookrightarrow \mathrm{Sp}(T_n^{(1)}) \hookrightarrow \mathrm{Sp}(T_n^{(2)}) \hookrightarrow \ldots$$

Then we can use(17.5.2.4) to glue them together as $\mathbb{A}_K^{n,rig}$. ⌟

Prop. (17.5.2.12). The maximal spectrum $\mathrm{Max}(K[X_i]) = \cup_n \mathrm{Spa}(T_n^{(i)})$ as sets. ⌟

Proof: It suffices to show the following two.

- For any maximal ideal $\mathfrak{m} \subset T_n$, $\mathfrak{m}' = \mathfrak{m} \cap K[X_i]$ is maximal.
- For any maximal ideal $\mathfrak{m}' \subset K[X_i]$, there is some N that $\mathfrak{m}' T_n^{(i)}$ is maximal in $T_n^{(i)}$ for all $i > N$.

For 1: Consider the $K \subset K[X_i]/\mathfrak{m}' \subset T_n/\mathfrak{m}$, $T_n/\mathfrak{m}$ is a finite extension of K by(11.2.4.10), then so does $K[X_i]/\mathfrak{m}'$, by(5.2.1.3). To prove $\mathfrak{m}' = \mathfrak{m} \cap K[X_i]$, consider the following diagram:

$$\begin{array}{ccc} K[X_i]/\mathfrak{m}' & \longrightarrow & T_n/\mathfrak{m}'T_n \\ \| & & \downarrow \\ K[X_i]/\mathfrak{m}' & \longrightarrow & T_n/\mathfrak{m} \end{array}$$

As $K[X_i]/\mathfrak{m}'$ is finite over K, it is complete, but $K[X_i]$ is dense in T_n, thus the horizontal maps are surjective. But then the lower horizontal is isomorphism, then the upper horizontal is also isomorphism, and then the vertical map is isomorphism, thus we are done.

For 2, $K[X_i]/\mathfrak{m}'$ is a finite extension of K, thus has a unique valuation, let N be large that $|\overline{X}_i| \leq |c|^N$, then for $i > N$, the quotient map factors uniquely as $K[X_i] \to T_n^{(i)} \to K/\mathfrak{m}'$. Then the kernel $\mathfrak{m}$ of $T_n^{(i)}$ is a maximal ideal(same reason as before) that satisfies $\mathfrak{m} \cap K[X_i] = \mathfrak{m}'$. Then we finish by item1. □

Cor. (17.5.2.13) [Analytification for Affine Schemes]. Similarly, for an affine scheme $Z = \operatorname{Spec} K[X_i]/\mathfrak{a}$ of f.t over K, we construct its analytification Z^{rig} as the glue of the inclusions:

$$\operatorname{Sp}(T_n^{(0)}/\mathfrak{a}) \hookrightarrow \operatorname{Sp}(T_n^{(1)}/\mathfrak{a}) \hookrightarrow \dots$$

Then Z^{rig} is the analytification of $K[X_i]/\mathfrak{a}$.

And we see from the proof of(17.5.2.12) the maximal spectrum $\operatorname{Max}(K[X_i]/\mathfrak{a}) = \cup_n \operatorname{Spa}(T_n^{(i)}/\mathfrak{a})$ as sets. ⌟

Proof: The canonical map $K[X_i]/\mathfrak{a} \to T_n^{(i)}/\mathfrak{a}$ glue together to be a morphism $\mathcal{O}_Z(Z) \to O_{Z^{rig}}(Z^{rig})$, which by(17.5.2.9) corresponds to a map $Z^{rig} \to Z$ of local ringed spaces.

Now any other morphism $Y \to Z$ from a rigid K-space Y to Z, choose an affinoid K-space covering Y_i of Y, then the map $Y_i \to Z$ corresponds by(17.5.2.9) to a morphism $\sigma : K[X_i]/\mathfrak{a} \to \mathcal{O}_{Y_i}(Y_i)$, thus if we choose i large enough that $|\sigma(X_i)| \leq |c|^i$, then σ can be extended uniquely to

$$K[X_i]/\mathfrak{a} \to T_n^{(i)}/\mathfrak{a} \xrightarrow{\sigma} \mathcal{O}_{Y_i}(Y_i),$$

By the universality of affinoid subdomains. This σ corresponds to a morphism $Y_i \to \operatorname{Sp}(T_n^{(i)}) \to Z^{rig}$, and these clearly glue together to give a morphism $Y \to Z^{rig}$, thus proving the universal property. □

Prop. (17.5.2.14) [General Analytification]. For any locally algebra scheme X over K, choose an affine covering Z_i, consider the analytification of Z_i by(17.5.2.13), then $Z_i \cap Z_j$ obviously has the inverse image as the rigid analytification by universal property, thus unique, so the analytifications of Z_i can be glued to an analytification of X.

Moreover, the underlying set of X^{rig} is identified with the closed pts of the scheme X, because this is the case of Z_i(17.5.2.11). ⌟

Prop. (17.5.2.15). Rigid analytification preserves fiber products. ⌟

Proof: This follows from the construction of fibered product of schemes(6.2.7.15), so we only need to prove the affine case. For this, Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr, Satz 1.8]. □

Prop. (17.5.2.16) [Stalks]. For a point $z \in Z^{rig}$, the completion of $\mathcal{O}_{Z^{rig},z}$ and $\mathcal{O}_{Z,z}$ are the same. ⌟

Proof: Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr, Satz 2.1]. □

3 Coherent Sheaves on Rigid Spaces

Prop. (17.5.3.1). For an affinoid K-space X, there is a Qco module construction $M \to M \otimes_A \mathcal{O}_X$ as in(17.5.1.40) in the weak Grothendieck topology, and it extends uniquely to a sheaf w.r.t. the strong Grothendieck topology by(17.5.1.41), also denoted by $M \otimes_A \mathcal{O}_X$. This is a faithfully exact, fully faithful functor between Abelian categories from $\mathcal{A}b$ to $\mathcal{O}_X$-modules, and it preserves tensor product and direct sums. ⌟

Proof: Because $\Gamma(X, M \otimes_A \mathcal{O}_X) = M$ and obviously fully faithful, this map is fully faithful, and it is exact because the restriction map of an affinoid subdomain is flat(17.5.1.26), and shifification is exact. □

Def. (17.5.3.2)[Coherent Sheaves]. For an $\mathcal{O}_X$-module $\mathcal{F}$ on a rigid space X, **finite type, of finite presentation, coherence** are defined w.r.t the strong topology as X is a ringed site. All these notions are stable under passing to an admissible open subspaces. ⌟

Proof: For the passing of coherence to admissible open subspaces, use the fact that restriction maps are flat(17.5.1.26). □

Cor. (17.5.3.3). Notice $\mathcal{O}_X^n = A^n \otimes_A \mathcal{O}_X$, by(17.5.3.1) and the fact A is Noetherian, passing to a refinement covering, $\mathcal{F}$ is coherent iff there is an admissible affinoid covering $\mathfrak{U} : X_i \to X$ that $F|_{X_i}$ is associated to a finite $\mathcal{O}_{X_i}$-module. In this case, $\mathcal{F}$ is said to be **$\mathfrak{U}$-coherent**. Thus the coherent sheaves form a weak Serre subcategory of $\mathcal{O}_X$-modules.

In particular, $\mathcal{O}_X$ is coherent. ⌟

Prop. (17.5.3.4). If $\mathcal{F}, \mathcal{G}$ are all $\mathfrak{U}$-coherent modules, then:

- $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ and $\mathcal{F} \oplus \mathcal{G}$ are $\mathfrak{U}$-coherent,
- if $\mathcal{F} \to \mathcal{G}$ is a $\mathcal{O}_X$-module morphism, then the kernel and image are all $\mathfrak{U}$-coherent.
- If $\mathcal{I}$ is a $\mathfrak{U}$-coherent sheaf of ideal of $\mathcal{O}_X$, then $\mathcal{I}\mathcal{F}$ is $\mathfrak{U}$-coherent.

⌟

Proof: The first and the second are consequences of(17.5.3.1), noticing A_i is Noetherian. The third is an image of $\mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$. □

Lemma (17.5.3.5). If $\mathcal{F}$ is $\mathfrak{U}$ coherent for a simple Laurent covering $\mathfrak{U}$, then $H^1(\mathfrak{U}, \mathcal{F}) = 0$. ⌟

Proof: The goal is to show any element in $\mathcal{F}(U_1 \cap U_2)$ can be represented by $u_1 + u_2$, where $u_i \in \mathcal{F}(U_i)$. Let $U_1 = \operatorname{Sp} A\langle f\rangle, U_2 = \operatorname{Sp} A\langle f^{-1}\rangle, U_1 \cap U_2 = \operatorname{Sp} A\langle f, f^{-1}\rangle$. Now $A\langle f\rangle = A\langle X\rangle/(X - f), A\langle f^{-1}\rangle = A\langle Y\rangle/(Yf - 1), A\langle f, f^{-1}\rangle = A\langle X, Y\rangle/(X - f, Yf - 1)$, and we endow them with the residue norm.

Now we want to give norms to $M_1 = \mathcal{F}(U_1), M_2 = \mathcal{F}(U_2), M_{12} = \mathcal{F}(U_1 \cap U_2)$. M_i are finite $\mathcal{O}_X(U_i)$-modules, so there are elements $v_i, w_j, i \leq m, j \leq n$ that generate M_1, M_2 respectively. So there are attached morphisms

$$(A\langle f\rangle)^m \to M_1, \quad (A\langle f^{-1}\rangle)^n \to M_2, \quad (A\langle f, f^{-1}\rangle)^m \to M_{12}$$

And endow them with the residue norm, which is complete..

Notice that to prove the assertion, it suffice to show for each $\varepsilon > 0$, there is an α that for each $u \in_{12}$, there are u_1 and u_2 in M_i respectively that $|u_i| < \alpha|u|$ and $|u - u_1 - u_2| < \varepsilon|u|$, because then we can use iteration and completeness to get the result.

Giving $\beta > 1$, any $g \in A\langle f, f^{-1}\rangle$ can be lifted to an element $\sum c_{ij}X^iY^j$ that $|c_{ij}| \leq \beta|g|$. Then by regrouping terms that $i \geq j$ or $i < j$, there are two element $g^+ \in A\langle f\rangle$ and $g^- \in A\langle f^{-1}\rangle$ that $g^+ + g^-$ restricts to g on $U_1 \cap U_2$, and $|g^+|, |g^-| \leq \beta|g|$.

Now that $\mathcal{F}$ is coherent, so v_i and w_j both generate M_{12} separately. Then there are equations $v_i = \sum c_{ij}w_j$ and $w_i = \sum d_{ij}v_j$, where $c_{ij}, d_{ij} \in A\langle f, f^{-1}\rangle$. The image of $A\langle f\rangle$ is dense in $A\langle f, f^{-1}\rangle$(11.2.4.26), so there are elements $c'_{ij} \in A\langle f^{-1}\rangle$ s.t. $\max_{ijl} |c_{ij} - c'_{ij}||d_{jl}| < \beta^{-2}\varepsilon$.

Now I claim the above approximation process is true for $\alpha = \beta^2 \max(|c'_{ij}| + 1)$. For this, notice for any $u = \sum a_i v_i$ with $a_i \in A\langle f, f^{-1}\rangle$, which we may assume $|a_i| \leq \beta|u|$ by the definition of the norm on M_{12}, then $a_i = a_i^+ + a_i^-$, that $|a_i^*| \leq \beta|a_i|$. Consider the following element

$$u^+ = \sum a_i^+ v_i \in M_1, \quad u^- = \sum a_i^- \sum c'_{ij}w_j \in M_2$$

Then it is easily verified that $|u^*| < \alpha|u|$, and

$$u - u^- - u^+ = \sum\sum a_i^-(c_{ij} - c'_{ij})w_j = \sum\sum\sum a_i^-(c_{ij} - c'_{ij})d_{jl}v_l.$$

which has norm smaller than $\max |a_i^-(c_{ij} - c'_{ij})d_{jl}| \leq \beta^2|u| \cdot \beta^{-2}\varepsilon = \varepsilon|u|$, finishing the proof. □

Prop. (17.5.3.6)[Kiehl]. An $\mathcal{O}_X$-module $\mathcal{F}$ on an affinoid K-space $\operatorname{Sp} A$ is coherent iff it is associated to a finite A-module. ⌟

Proof: The converse is obvious, for the other direction, by(17.5.1.39), it suffices to prove for $\mathfrak{U}$ a Laurent covering, and further, it suffices to prove for the simplest Laurent covering $X(f), X(f^{-1}) \to X$ because: $U(f,g) \cup U(f,g^{-1}) \cup U(f^{-1},g) \cup U(f^{-1},g^{-1}) = (U(f,g) \cup U(f,g^{-1})) \cup (U(f^{-1},g) \cup U(f^{-1},g^{-1}))$.

Thus the above lemma shows that $H^1(\mathfrak{U}, \mathcal{F}) = 0$. Now I prove that for any finite affinoid covering $\mathfrak{U} = \cup \operatorname{Sp} A_i$, if $H^1(\mathfrak{U}, \mathcal{F}) = 0$ for any coherent sheaf $\mathcal{F}$, then any $\mathfrak{U}$-coherent sheaf $\mathcal{F}$ is associated to a finite A-module, this will finish the proof.

Consider any maximal ideal $\mathfrak{m}_x$ of A, $\mathfrak{m}_x \otimes_A \mathcal{O}_X$ is a coherent sheaf as $\mathfrak{m}_x$ is finite because A is Noetherian, so there is a short exact sequence

$$0 \to \mathfrak{m}_x\mathcal{F} \to \mathcal{F} \to \mathcal{F}/\mathfrak{m}_x\mathcal{F} \to 0$$

of $\mathfrak{U}$-coherent sheaves, because $A/\mathfrak{m}_x$ is a field, thus flat.

Now for any affinoid space U' in U_i for some i, the section of this exact sequence is exact, because the ring morphism associated to an affinoid subdomain is flat(17.5.1.26). In particular, this can be applied to any intersections of U_i, in particular the Čech complex of these sheaves. Then the long exact sequence and the fact $H^1(\mathfrak{U}, \mathfrak{m}_x\mathcal{F}) = 0$ shows

$$0 \to \mathfrak{m}_x\mathcal{F}(X) \to \mathcal{F}(X) \to \mathcal{F}/\mathfrak{m}_x\mathcal{F}(X) \to 0$$

Next we want to show $\mathcal{F}/\mathfrak{m}_x\mathcal{F}(X) \to \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U_i)$ is isomorphism for any $x \in U_i$. To prove this, first for any affinoid subspace $U' = \operatorname{Sp} B$ contained in some U_j, let $U' \cap U_i = \operatorname{Sp} B_i$, $\mathcal{F}|_{U'} = M' \otimes_A \mathcal{O}_{U'}$, we show $\mathcal{F}/\mathfrak{m}_x\mathcal{F}(U') \cong \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U' \cap U_i)$, this is equivalent to

$$M'/\mathfrak{m}_x M' \to M'/\mathfrak{m}_x M' \otimes_B B_i = M'/\mathfrak{m}_x M' \otimes_{B/\mathfrak{m}_x B} B_j/\mathfrak{m}_x B_j$$

is an isomorphism. But $B/\mathfrak{m}_x B \cong B_j/\mathfrak{m}_x B_j$: This is true when $x \in U'$ by(17.5.1.8), and they are both trivial ring if $x \notin U'$. Then look at the morphism of Čech complex induced by $\mathcal{F}/\mathfrak{m}_x\mathcal{F} \to$

$\mathcal{F}/\mathfrak{m}_x\mathcal{F}|_{U_i}$, then it is an isomorphism, by what we just proved, so its H^0 is also isomorphism, which is $\mathcal{F}/\mathfrak{m}_x\mathcal{F}(X) \cong \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U_i)$.

Finally, by the commutative diagram $\begin{array}{ccc} \mathcal{F}(X) & \longrightarrow & \mathcal{F}/\mathfrak{m}_x\mathcal{F}(X) \\ \downarrow & & \downarrow \\ \mathcal{F}(U_i) & \longrightarrow & \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U_i) \end{array}$, the right vertical arrow is isomorphism, so if denote $\mathcal{F}(U_i)$ by M_i, then $\mathcal{F}(X)$ generate $M_i/\mathfrak{m}_x M_i$ for every x, then consider $L = M_i/\mathcal{F}(X)$, then $\mathfrak{m}_x L = L$ for every x, then by Nakayama, for each maximal ideal $\mathfrak{m}$, there is a $m \in \mathfrak{m}$ that $(1+m)L = 0$, so $Ann(L) = (1)$, so $L = 0$, i.e. $\mathcal{F}(X)$ generate M_i for each i.

Now choose f_i in $\mathcal{F}(X)$ that generate M_i simultaneously, then the map $\mathcal{O}_X^n \to \mathcal{F}$ is a surjection of $\mathfrak{U}$-coherent sheaves, its kernel $\mathcal{G}$ is also coherent by(17.5.3.4), now all the above argument works for $\mathcal{G}$, so there is a surjection $\mathcal{O}_X^m \to \mathcal{G}$, so $\mathcal{O}_X^m \to \mathcal{O}_X^n \to \mathcal{F} \to 0$, so $\mathcal{F}$ is associated to the cokernel of the map $A^m \to A^n$. □

Cor. (17.5.3.7). Coherence for a $\mathcal{O}_X$-module on a rigid K-space is affinoid local on the target. ⌟

Cohomology on Rigid Analytic Spaces

Lemma (17.5.3.8). The category of $\mathcal{O}_X$-modules on a rigid K-space is a Grothendieck category by(4.8.3.29). ⌟

Def. (17.5.3.9) [Derived Cohomologies]. Consider the right derived functor for Γ and more general f_*, these are left exact by(6.1.2.9). Then $R^p f_*\mathcal{F} = (f_*\mathcal{H}^p(\mathcal{F}))^\sharp$ by Grothendieck spectral sequence.

The Cech-to-Derived spectral sequence(6.3.2.13) is applied: $H^p(\{U_i \to U\}, \mathcal{H}^q(F)) \Rightarrow H^{p+q}(U, F)$, $\check{H}^p(U, \mathcal{H}^q(F)) \Rightarrow H^{p+q}(U, F)$ and $\check{H}^1(U, F) \cong H^1(U, F)$.

In particular, if $H^q(U_{i_0 i_1 \ldots i_r}, \mathcal{F}) = 0, q > 0$, then $H^p(\{U_i \to U\}, \mathcal{F}) = H^p(U, \mathcal{F})$(6.3.2.15). And it is enough to have $\check{H}^q(U_{i_0 i_1 \ldots i_r}, \mathcal{F}) = 0, q > 0$ by(6.3.2.16). ⌟

Cor. (17.5.3.10). A Qco sheaf on an affinoid space has vanishing higher sheaf cohomology by Tate's acyclicity(17.5.1.40) and(6.3.2.16). ⌟

Properties of Rigid K-Spaces

This subsubsection is strongly suggested to read after reading the parallel part of schemes.

Def. (17.5.3.11). A morphism is called a **closed immersion** if there is an admissible affinoid covering that it restricts to a closed immersion of affinoid spaces(It is compatible with definition(17.5.1.28) before by(17.5.3.15)). It is called an **open immersion** iff it is injective and the corresponding stalk maps are isomorphisms. The **(quasi-)separatedness, quasi-compactness, finiteness** are defined similarly as for schemes. ⌟

Lemma (17.5.3.12) [Nike's Trick]. In a rigid analytic K-space X and $\operatorname{Sp} A$, $\operatorname{Sp} B$ be affinoid subspaces, then there is an admissible affinoid covering of $\operatorname{Sp} A \cap \operatorname{Sp} B$. ⌟

Proof: This is analogous to the scheme case(6.4.1.1), but the proof is different: X has an admissible covering, this restricts to an admissible covering of $\operatorname{Sp} A \cap \operatorname{Sp} B$, and any admissible covering can be refined by an affinoid admissible covering. □

Prop. (17.5.3.13) [Affinoid Communication Theorem]. A property P of affinoid open subsets of X is called **affiniod local** if: $\operatorname{Sp} A$ has $P \Rightarrow$ all affinoid subdomains of $\operatorname{Sp} A$ has P, and any admissible affinoid cover of $\operatorname{Sp} A$ has $P \Rightarrow \operatorname{Sp} A$ has P. Notice a stalk-wise property is obviously affine-local.

Now if we call X has $\widetilde{P}$ if there is an admissible affinoid covering $A_i \to X$ that A_i has P. Then the following are equivalent:

- all open affinoid subsets of X has P.
- all open subspace of X has $\widetilde{P}$.
- X has a cover of open subspaces that has $\widetilde{P}$.
- X has $\widetilde{P}$.

⌟

Proof: The proof is the same as the scheme case(6.4.1.2). □

Prop. (17.5.3.14). Separated morphism is quasi-separated because closed immersion is affinoid hence quasi-compact(17.5.1.3). ⌟

Prop. (17.5.3.15) [Finite Morphism]. For a morphism $\varphi : X \to Y$ of rigid K-spaces

- It is finite iff the inverse image of any affinoid space is affinoid, and $\varphi_*\mathcal{O}_Y$ is a coherent $\mathcal{O}_X$-module. In particular, finiteness is local on the target because coherence do.
- It is closed immersion iff it is finite and $\mathcal{O}_Y \to \varphi_*\mathcal{O}_X$ is surjective, this shows the definition of closed immersion is compatible with before.

⌟

Proof: Coherence is affinoid local on the target by Kiehl's theorem, so it suffices to prove the inverse image of any affinoid space is affinoid for a finite morphism: Consider any affinoid subdomain $U \subset X$ with inverse image $\varphi^{-1}(U)$, by Kiehl's theorem, $B = \mathcal{O}_X(f^{-1}(U))$ is finite over $A = \mathcal{O}_Y(U)$, thus can be given an affinoid K-algebra structure(11.2.4.33). Now

$$\varphi^{-1}(U) \xrightarrow{\chi} \operatorname{Sp} B \xrightarrow{\rho'} \operatorname{Sp} A$$

χ is locally an isomorphism, as ρ is finite, so χ is an isomorphism.

The second assertion is because locally $\mathcal{O}_Y, \varphi_*\mathcal{O}_X$ are both Qco so surjectivity is equivalent to the global section is surjective(17.5.3.1). □

Prop. (17.5.3.16). Closed/Open immersion, quasi-compactness, (quasi-)separatedness are all local on the target, and stable under base change. ⌟

Proof: Closed immersion is local on the target because finiteness do and surjectiveness of $\mathcal{O}_Y \to \varphi_*\mathcal{O}_X$ is checked locally. Open immersion is local on the target because stalk and injectivity are all checked locally.

Then Closed/Open immersion are stable under base change because the affinoid case is true(17.5.1.29).

Quasi-compact is easily seen local on the target and stable under base change.

(Quasi-)Separateness is local on the target because closed immersion and quasi-compact do.

(Quasi-)Separateness is stable under base change because closed immersion and quasi-compact do, because diagonal commutes with base change(4.1.1.48). □

Prop. (17.5.3.17). Morphisms between affinoid K-spaces are separated. Moreover, because of localness, any finite morphism is separated. ⌟

Proof: The diagonal is $\operatorname{Sp} A \to \operatorname{Sp} A\widehat{\otimes}_B A$, whose ring map is surjective. □

Prop. (17.5.3.18). By(4.1.1.50), for $X \to S$ and $Y \to S$, the map $X = X \times_Y Y \to X \times_S Y$ is an immersion. It is closed immersion if $Y \to S$ is separated, and it is qc if $Y \to S$ is quasi-separated. ⌟

Cor. (17.5.3.19). If $s : S \to X$ is a section of $f : X \to S$, the above proposition applies to this case, because $S = S \times_X X \to S \times_S X = X$. ⌟

Prop. (17.5.3.20). A morphism is quasi-separated iff there is an admissible affinoid covering W_i that, for any two affinoid open U, V that are mapped to an affinoid open, their intersection is quasi-compact. This is because quasi-compact is local on the target.

A morphism is separated iff there is an admissible affinoid covering W_i that, for any two affinoid open U, V that are mapped to an affinoid open, their intersection is affinoid open and $\mathcal{O}(U)\widehat{\otimes}_{\mathcal{O}(W_i)}\mathcal{O}(V) \to \mathcal{O}(U \cap V)$ is surjective. This is because closed immersion is local on the target(17.5.3.16). ⌟

Cor. (17.5.3.21). If $g \circ f$ is (quasi-)separated, then so is f. ⌟

Cor. (17.5.3.22). If X is (quasi-)separated, then $X \to Y$ is (quasi-)separated. ⌟

4 Proper Mapping Theorem

Def. (17.5.4.1). For a rigid space X over affinoid space Y, if $U \subset U' \subset X$ be affinoid subspaces, U is called **relatively compact** in U' iff there is a set of affinoid generators f_i of $\mathcal{O}_X(U')$ over $\mathcal{O}_Y(Y)$ that $|f_i(x)| < 1$ on U. This is denoted by $U \Subset_Y U'$. ⌟

Prop. (17.5.4.2). If X_1, X_2 are affinoid spaces over an affinoid space Y, and U_i are affinoid space of X_i, then

- if $U_1 \Subset_Y X_1$, then $U_1 \times_Y X_2 \Subset_{X_2} X_1 \times_Y X_2$.
- if $U_i \Subset_Y X_i$, then $U_1 \times_Y U_2 \Subset_Y X_1 \times_Y X_2$.
- If $U_i \Subset_Y X_i$, and X_i are affinoid subspaces of a rigid space separable over Y, then $U_1 \cap U_2 \Subset_Y X_1 \cap X_2$.
- If $U_1 \Subset_Y X_1$, and $i : T \to X_1$ is a closed immersion, then $i^{-1}(U_1) \Subset_Y i^{-1}(X_1)$.

The proof is easy. For the last one, should notice $|f(x)| = |f(i(x))|$, because it is closed immersion, so the residue field is the same. ⌟

Def. (17.5.4.3)[Proper Morphism]. A **proper** morphism $\varphi : X \to Y$ of rigid K-spaces is a separated morphism that there is an admissible affinoid covering Y_i of Y that there are two admissible affinoid coverings X_{ij}, X'_{ij} of $\varphi^{-1}(Y_i)$ that $X_{ij} \Subset_{Y_i} X'_{ij}$ for any i, j. ⌟

Prop. (17.5.4.4). Properness is stable under base change and composition ⌟

Proof: The base change follows directly from(17.5.4.2).

For the composition, Cf.[Formal and Rigid Geometry P131](difficult). □

Prop. (17.5.4.5). Properness is local on the target. ⌟

Proof: This is because separatedness is local on the target(17.5.3.16) and the second condition of properness is itself local. □

Prop. (17.5.4.6). If $g \circ f : X \to Y \to Z$ is proper and g is separated, then f is proper. ⌟

Proof: By(17.5.3.18), $\tau : X \to X \times_Z Y$ is closed immersion, and f is separated by(17.5.3.21). Now proper is local, so we may assume Z is affinoid, so there are two admissible covering X_i, X_i' of X that $X_i \Subset_Z X_i'$, and choose an admissible affinoid covering $Y_i \to Y$, then $X_j \times_Z Y_i, X_j' \times_Z Y_i$ are admissible coverings of Y_i that is $X_j \times_Z Y_i \Subset_{Y_i} X_j' \times_Z Y_i$. And it can be pulled back to an affinoid admissible coverings of $f^{-1}(Y_i)$ that $\tau^{-1}(X_j \times_Z Y_i) \Subset_{Y_i} \tau^{-1}(X_j' \times_Z Y_i)$, because τ is closed immersion. So $X \to Y$ is proper. □

Prop. (17.5.4.7). Finite morphism is proper, in particular, closed immersion is proper. ⌟

Proof: Finite morphism is separated by(17.5.3.17), and locally, assume both space are affinoid, $X = \mathrm{Sp}\, B \to \mathrm{Sp}\, A = Y$, then B is a finite A-module, in priori a f,g, A-algebra, so there is a set of generators f_i of B over A that (by multiplying a constant in K^*) $|f_i|_{sup} < 1$(11.2.4.21), so $X \Subset_Y X$, hence it is proper. □

Prop. (17.5.4.8) [Proper and Analytification]. For a morphism between schemes locally of f.t. over K, it is proper iff its rigid analytification is proper. ⌟

Proof: Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr. Math. Inst. Univ. Münster, 2. Serie, Heft 7 (1974) Satz 2.16]. □

For the following: Cf.[Formal and Rigid Geometry P132].

Prop. (17.5.4.9) [Proper Mapping theorem, Kiehl]. The higher direct images of a proper map of rigid analytic spaces takes coherent sheaves to coherent sheaves. ⌟

Proof: □

Prop. (17.5.4.10). For a scheme X locally of f.t. over K, an $\mathcal{O}_X$-module $\mathcal{F}$ on X gives rise to an $\mathcal{O}_{X^{rig}}$-module on X^{rig}, and it is coherent iff $\mathcal{F}$ is coherent. ⌟

Proof: □

Prop. (17.5.4.11). For a proper scheme over K, $H^q(X, \mathcal{F}) \cong H^q(X^{rig}, \mathcal{F}^{rig})$ for $\mathcal{F}$ coherent. ⌟

Proof: □

Prop. (17.5.4.12). When X is proper, coherent sheaves on X^{rig} corresponds to coherent sheaves on X. This gives an analog of Chow's theorem when applied to $X = \mathbb{P}^n_K$ and $\mathcal{F}'$ is a sheaf of ideals in $\mathcal{O}_{X^{rig}}$. ⌟

Proof: □

5 Formal Geometry

Main references for this subsection is [Bos15], [Hartshorne] and [Topics in Algebraic Geometry, Illusie].

Def. (17.5.5.1) [Formal Spectrum Spf A]. Let A be a complete adic ring(11.2.1.8) with an ideal of definition $\mathfrak{a}$ that the A is $\mathfrak{a}$-adically complete and separated. Then we let $\mathrm{Spf}\, A$ be the ringed space with underlying topological space $\mathrm{Spec}(A/\mathfrak{a})$(open primes of A), and the structure sheaf $\mathcal{O}$ that $\mathcal{O}(D(f)) = A\langle f^{-1}\rangle$(11.2.1.10). ⌟

Proof: To construct this sheaf, we first check that $\mathcal{O}(D(f)) = A\langle f^{-1}\rangle = \varprojlim_n (A/\mathfrak{a}^n[f^{-1}])$ defines a sheaf on the site of subspaces of Spf A of the form $D(f)$: For any open covering $\{D(f_i)\}$ of $D(f)$, there are exact sequences:

$$0 \to (A/\mathfrak{a}^n)_f \to \prod_i (A/\mathfrak{a}^n)_{f_i} \to \prod_{i,j} (A/\mathfrak{a}^n)_{f_i f_j}$$

by(5.4.2.3). Then we take inverse limit, which is exact by Mittag-Leffler(5.9.3.2), to get an exact sequence, which is just the sheaf condition of $\mathcal{O}$. Then, we can use(6.1.2.25) to extend this sheaf to a sheaf on Spf A. □

Prop. (17.5.5.2) [Stalks of Spf A**].** Let $x \in$ Spf A correspond to a prime $\mathfrak{p}_x$ in A. Then the stalk of Spf A at x is just $\mathcal{O}_x = \varinjlim_{x\in D(f)} A\langle f^{-1}\rangle$, which is a local ring with maximal ideal $\mathfrak{m}_x$ containing $\mathfrak{p}_x\mathcal{O}_x$. Moreover, $\mathfrak{m}_x = \mathfrak{p}_x\mathcal{O}_x$ iff $\mathfrak{a}$ is f.g.. So Spf A is a local ringed space, called the **affine formal scheme** of A. ⌟

Proof: Cf.[Bos15]P159.**?** □

Remark (17.5.5.3). In many case, for example in Scholze's treatment of the p-adic geometry, the ideal of definition $\mathfrak{a}$ is assumed to be f.g., because we need this to show that the $\mathfrak{a}$-adic completion of $A[f^{-1}]$ is $(\mathfrak{a})$-adically complete(5.2.3.6), so that we can interpret $D(f) \subset$ Spf A as an affine formal scheme Spf$(A\langle f^{-1}\rangle)$(11.2.1.11).

Another way to get around this finiteness condition is to consider formal spectrum for a larger class of rings, called the **admissible rings**, which is a complete and separated topological ring with a basis consisting of open ideals, and with an ideal of definition $\mathfrak{a}$ that $\mathfrak{a}^n \to 0$ for $n \to 0$. ⌟

Prop. (17.5.5.4) [Affine Formal Adjointness]. Morphisms between local topologically ringed spaces Spf $B \to$ Spf A corresponds to continuous homomorphisms $A \to B$. ⌟

Def. (17.5.5.5) [Formal Schemes]. The category of **formal schemes** is the full subcategory of the category of local topologically ringed topological spaces $(X, \mathcal{O}_X)$ consisting of objects that is locally isomorphic to an affine formal scheme Spf A.

The category of formal schemes contains the category of schemes, by mapping Spec A to Spf A, where A is endowed with the discrete topology. ⌟

Prop. (17.5.5.6) [Glueing and Fiber Products]. Formal Schemes can easily be glued, and also spectrum adjointness holds as in(17.5.2.5). Finally there are fibered products, constructed as in(6.2.7.15), where the affine case corresponds to completed tensor product(11.2.1.12). ⌟

Def. (17.5.5.7)[Formal Completion of Schemes Along a Closed Subscheme]. Let X be a scheme and Y a closed subscheme of X defined by a Qco ideal $\mathcal{I} \subset \mathcal{O}_X$, then consider the sheaf $\mathcal{O}_Y$ defined by restricting the projective limit $\varprojlim_n \mathcal{O}_X/\mathcal{I}^n$ to Y, then $(Y, \mathcal{O}_Y)$ is a locally topologically ringed space, called the **formal completion** of X along Y. ⌟

Noetherian Adic Formal Schemes

Cf.[Hartshorne Chap2.9] and [Sta]30.23. and Illusie.

Def. (17.5.5.8) [Noetherian Formal Adic Schemes]. ⌟

Def. (17.5.5.9) [Coherent Sheaves on Noetherian Formal Adic Schemes]. ⌟

Prop. (17.5.5.10). Let A be a Noetherian ring and I an ideal, let X be a proper scheme over A and $\mathcal{F}$ a coherent sheaf on X, then for any $p \geq 0$, the inverse systems $(H^p(X, I^n\mathcal{F}))$ and $(I^n H^p(X, \mathcal{F}))$ are isomorphic pro-A-modules. ⌟

Proof: Cf.[Sta]02OA. □

Thm. (17.5.5.11) [Theorem of Formal Functions]. Let A be a Noetherian ring with an ideal I, X be a proper scheme over A and $\mathcal{F}$ a coherent scheme on X. Then for any $p \geq 0$, the system of maps

$$H^p(X, \mathcal{F})/I^n H^p(X, \mathcal{F}) \to H^p(X, \mathcal{F}/I^n\mathcal{F})$$

induce an isomorphism of limits

$$H^p(X, \mathcal{F})^\wedge \cong \varprojlim_n H^p(X, \mathcal{F}/I^n\mathcal{F}).$$

⌟

Proof: Cf.[Sta]02OC. □

Prop. (17.5.5.12) [Grothendieck's Existence Theorem]. Cf.[Sta]0883. ⌟

Prop. (17.5.5.13) [Grothendieck's Algebrization Theorem]. Cf.[Sta]089A. ⌟

6 Admissible Formal Schemes

Remark (17.5.6.1) [Setup]. For a good theory of Admissible formal schemes, let the base ring R be an adic ring with an ideal of definition I that satisfies either one of the following situation:

- R is an adic valuation ring with a principal ideal of definition.
- R is Noetherian and has no I-torsion.

⌟

Def. (17.5.6.2) [Admissible Formal Schemes]. Let R be an adic ring, then a formal R-scheme X is called **locally of topologically finite type/finite presentation/admissible** if there is an open affine covering $\operatorname{Spf} A_i$ of X that A_i satisfies those properties(11.2.1.13).

X is called **topologically of finite type** if it is locally of topologically finite type and quasi-compact. It is called **topologically of finite presentation** if it is locally of topologically finite presentation, quasi-compact and quasi-separated. ⌟

Prop. (17.5.6.3) [Induced Admissible Formal Subscheme]. Let X be a formal R-scheme that is locally of topologically finite type, and let $\mathcal{O}_X$ be its structure sheaf. Then we can look at the ideal sheaf $\mathcal{I} \subset \mathcal{O}_X$ consisting of all elements locally killed by a power of I^n. This is a qco sheaf, as $\mathcal{I}(U) = \{f \in \mathcal{O}(U) | I^n f = 0 \text{ for some } n\}$, because the quotient by the RHS is locally topologically of finite type and has no I-torsion, thus admissible, by(11.2.1.15), and admissibility is local(11.2.1.16).

In particular we can take the closed subscheme $X_{adm} \subset X$ corresponding to $\mathcal{I}$, then it is an admissible formal scheme, called the **induced admissible formal subscheme** of X. ⌟

7 Formal Models

Prop. (17.5.7.1)[Generic Fiber Functor]. Let R be a complete valuation ring of height 1 with field of fraction 1 with field of fraction K, then the functor $A \mapsto A \otimes_R K$ from the category of R-algebras topologically of finite type to the category of affinoid K-algebras ⌟

Proof: Cf.[Bos15]P174. □

Def. (17.5.7.2)[Formal Models]. In view of(17.5.7.1), one would like to describe all formal R-schemes that the generic fiber X_{rig} is isomorphic to a given rigid K-space X_K. But first notice $A \mapsto A \otimes_R K$ kills all R-torsion, in particular the generic fiber functor only depends on the induced admissible formal scheme X_{adm}(17.5.6.3). So given any rigid K-space X_K, any admissible formal R-scheme X satisfying $X_{rig} \cong X_K$ is called a **formal R-model** of X_K. ⌟

Def. (17.5.7.3)[Admissible Formal Blowing-up]. ⌟

17.6 p-adic Uniformizations

1 Mumford Curves

References are [Schottky Groups and Mumford Curves, 1980], [Mihran Papikian, Non-archimedean uniformization and monodromy pairing].

Def. (17.6.1.1) [p-adic Schottky Groups]. For $p \in \mathbf{P}$, a **p-adic Schottky group** is a discrete, f.g. free subgroup $\Gamma \subset PGL_2(\mathbb{Q}_p)$. ⌟

Prop. (17.6.1.2). A subgroup $\Gamma \subset PGL(2, \mathbb{Q}_p)$ is a p-adic Schottky group if it is discrete, f.g. and torsion-free. ⌟

Proof: Γ acts on the Bruhat-Tits building Δ of $PGL(2, \mathbb{Q}_p)$, and the stabilizer is $\Gamma \cap PGL(2, \mathbb{Z}_p)$, which is a finite group as Γ is discrete and $PGL(2, \mathbb{Z}_p)$ is compact. Thus it is trivial as Γ is torsion-free. Thus Γ acts freely on Δ, so Γ must be a free group.? □

Def. (17.6.1.3). A p-adic Schottky group Γ acts on $\mathbb{P}^1(\mathbb{C}_p)$. Denote $\mathcal{L}_\Gamma$ is the set of limit points of this action, $\Omega_\Gamma = \mathbb{P}^1(\mathbb{C}_p) - \mathcal{L}_\Gamma$. ⌟

Thm. (17.6.1.4) [Mumford]. Let Γ is a p-adic Schottky group of rank g, then there is a smooth complete curve $X_\Gamma/\mathbb{Q}_p$ of genus g with an analytic isomorphism $\Omega_\Gamma/\Gamma \cong X_\Gamma(\mathbb{C}_p)$. Such a curve X_Γ is called a p-adic **Mumford curve**. ⌟

Proof:

□

Thm. (17.6.1.5) [Mumford]. Let Γ is a p-adic Schottky group of rank $g \geq 2$, then the corresponding Mumford curve X_Γ has split degenerate stable reduction. Conversely, and smooth complete curve over $\mathbb{Q}_p$ with split degenerate stable reduction is a Mumford curve.

Where split degenerate reduction means that the normalization of all components of $\widetilde{X}$ are $\mathbb{F}_p$-rational, and all nodes are $\mathbb{F}_p$-rational with two $\mathbb{F}_p$-rational branches. ⌟

Proof:

□

Prop. (17.6.1.6) [Herrlich]. Suppose $p \in \mathbf{P}$ and $X/\mathbb{Q}_p$ is a Mumford curve with genus $g \geq 2$, then

$$\#\operatorname{Aut}(X) \leq \begin{cases} 84(g-1) & ,p=2 \\ 24(g-1) & ,p=3 \\ 30(g-1) & ,p=5 \\ 12(g-1) & ,p=3 \end{cases}$$

⌟

Proof: □

17.7 Rapoport-Zink Spaces

Main references are [Period Spaces for p-Divisible Groups, Rapoport-Zink], [Kot85], [On the Classification and Specialization of F-Isocrystals with Additional Structure, Rapoport-Richartz, 1996] and [Rap95].

Notation (17.7.0.1).

- Use notations from18.4.

⌟

1 $B(G)$ and Isocrystals with Structures

Notation (17.7.1.1).

- Let $L = K_0E$ where $E \in p-\texttt{LField}$. Thus $e(L) = e(E)$.
- Let $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}_p$ be a linear algebraic group.

⌟

Remark (17.7.1.2). The σ-conjugacy classes of $GL(n; K_0)$ are in bijection with the isomorphism classes of n-dimensional isocrystals, so the Dieudonné-Manin classification of isocrystals can be translated to a classification of σ-conjugacy classes of $GL(n; K_0)$. And this generalizes to other connected reductive group G/K as well, and the description of the set of σ-conjugacy classes $B(G)$ are useful in studying the points mod p of Shimura varieties. ⌟

Def. (17.7.1.3)[$B(G)$]. Denote $B(G) = H^1(\langle\sigma\rangle, G(K_0))$, which is equal to the set of φ-conjugate classes of $G(K_0)$, i.e. $x \sim y \in G(K)$ iff $x = gx\sigma(g)^{-1}$ for some $g \in G(K)$. ⌟

The Newton Map

Def. (17.7.1.4) [Equivalent Pairs]. Two pairs $(\mu, b), (\mu', b')$ as in(17.7.1.24) are called **equivalent** if there exists $g \in G(K_0)$ s.t. $b' = gb\sigma(g)^{-1}$, and the cocharacters $\mu', g\mu g^{-1}$ define the same filtration on $\mathrm{Rep}_{\mathbb{Q}_p}(G)$. Equivalent, $\mathcal{I}_{b,\mu} = \mathcal{I}_{b',\mu'}$. ⌟

Def. (17.7.1.5) [Slope Morphisms]. Let $\mathbb{D} = \mathrm{Spec}\,\mathbb{Q}_p[\{T^{1/k}\}_{k\in\mathbb{Z}}] = \mathbb{D}(\mathbb{Q})_{\mathbb{Q}_p}$ be the pro-algebraic torus over $\mathbb{Q}_p$ with character group $\mathbb{Q}$, and $b \in G(K_0)$, then there is a morphism $\nu_b : \mathbb{D}_{K_0} \to G_{K_0}$, called the **slope morphism** associated to b, which is defined as follows:

For any $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$, there is an associated isocrystal defined in(17.7.1.20), then there is a morphism $\nu_\rho \in \mathrm{Hom}_{K_0}(\mathbb{D}, \mathrm{GL}(V))$ that $\mathbb{D}$ acts on the isotypical component V_λ of V by the character $\lambda \in \mathbb{Q} = X^*(\mathbb{D})$. Then for any $x \in \mathbb{D}(R)$, the mapping $\rho \to \nu_\rho(x)$ gives an automorphism of the standard fiber functor on $\mathrm{Rep}_{\mathbb{Q}_p}(G)$, so by Tannakian duality corresponds to a unique element $y \in G(R)$ that $\rho(y) = \nu_\rho(x)$ for any ρ. The homomorphism $x \mapsto y$ is functorial in R and thus defines an element $\nu \in \mathrm{Hom}_L(\mathbb{D}, G)$. ⌟

Remark (17.7.1.6). Notice the group $\mathbb{Q}^*$ acts on $\mathbb{D}$, and for $s \in \mathbb{Q}^*$ and $v \in \mathrm{Hom}_{K_0}(\mathbb{D}, G)$, denote by v^s the composite $\mathbb{D}_{K_0} \xrightarrow{s} \mathbb{D}_{K_0} \xrightarrow{v} G_{K_0}$, and $\mathbb{D} \to \mathbb{G}_m$ the natural morphism, then for any v, there is a suitable s that sv factors through a morphism also denoted by $\nu^s : \mathbb{G}_{m,K_0} \to G_{K_0}$, as G is algebraic. ⌟

Prop. (17.7.1.7) [Characterizing the Slope Morphism]. The slope morphism associated to $b \in G(K_0)$ can be characterized intrinsically to be the unique morphism $\nu \in \mathrm{Hom}_L(\mathbb{D}, G)$ s.t.: There exists some $s \in \mathbb{Z}_+, c \in G(L)$ that

- $s\nu \in \mathrm{Hom}_L(\mathbb{G}_m, G)$,
- $c\nu^s c^{-1}$ is defined over $\mathbb{Q}_{p^s}$.
- $c(b\sigma)^s c^{-1} = c\nu^s(p)c^{-1}\sigma^s$.

⌟

Proof: Cf.[Kottwitz, P13]. □

Cor. (17.7.1.8). σ acts on $\nu_b \in \mathrm{Hom}_{K_0}(\mathbb{D}, G)$, and it satisfies the following properties:

- $\nu_{\sigma(b)} = \sigma(\nu_b)$.
- $\nu_{gb\sigma(g)^{-1}} = g\nu_b g^{-1}$.
- $b\nu^\sigma b^{-1} = \nu$.

⌟

Proof: 1 follows from the fact $(V \otimes_{\mathbb{Q}_p} K_0, b\sigma) \xrightarrow{\sigma,\cong} (V \otimes_{\mathbb{Q}_p} K_0, \sigma(b)\sigma)$.

2 follows from the fact $(V \otimes_{\mathbb{Q}_p} K_0, b\sigma) \xrightarrow{\rho(g),\cong} (V \otimes_{\mathbb{Q}_p} K_0, gb\sigma(g)^{-1}\sigma)$by(17.7.1.20).

3 follows from 2 as $b = b\sigma(b)\sigma(b)^{-1}$. □

Cor. (17.7.1.9) [Newton Map]. If G/F is a connected reductive group with a maximal torus T and Weyl group W_T, we get a map of sets

$$\nu : B(G) \to \mathcal{N}(G) = (\mathrm{int}(G(K_0))\backslash \mathrm{Hom}_{K_0}(\mathbb{D}, G)^{\langle\sigma\rangle}) = (X_*(T)_{\mathbb{Q}}/W_T)^{\mathrm{Gal}_{\mathbb{Q}}}$$

called the **Newton map**, and it is functorial in G. It follows from the Dieudonné-Manin classification(8.8.4.13) that when $k = \overline{k}$ and $G = \mathrm{GL}(n)$, this Newton map is injective. ⌟

Def. (17.7.1.10) [Kottwitz-Decent Elements]. $[b] \in B(G)$(17.7.1.3) is called **Kottwitz-decent** if there is some $s \in \mathbb{Z}_+$ and some $b \in [b]$ that $\nu_b^s : \mathbb{D} \to G$ factors through $\mathbb{D} \to \mathbb{G}_m$ and

$$(b\sigma)^s = \nu_b^s(p)\sigma^s \in G(K_0) \rtimes \langle\sigma\rangle.$$

it can be verified that this doesn't depends on the choice of b. ⌟

Prop. (17.7.1.11). If G is connected, then any $[b] \in B(G)$ is Kottwitz decent(17.7.1.10). ⌟

Proof: Cf.[Kottwitz]. □

Prop. (17.7.1.12). If $b \in G(K_0)$ satisfies the descent condition for s in(17.7.1.10), then $b \in G(\mathbb{Q}_{p^s})$ and ν is defined over $\mathbb{Q}_{p^s}$. ⌟

Proof: Set $b_s = b\sigma(b)\ldots\sigma^{s-1}(b)$, then iterating(17.7.1.8), $b_s\nu^{\sigma^s}b_s^{-1} = \nu$. And we have $b_s = \nu^s(p)$, so $\nu^{\sigma^s} = \nu$, so ν is defined over $\mathbb{Q}_{p^s}$.

To show the first assertion, notice $(b\sigma)(b\sigma)^s = (b\sigma)^s(b\sigma)$ shows

$$\nu^s(p)\sigma^s b\sigma = b\sigma\nu^s(p)\sigma^s = \nu^s(p)b\sigma^{s+1}(17.7.1.8).$$

and then $b\sigma^s = \sigma^s b$. □

Cor. (17.7.1.13). If $b_1, b_2 \in [b]$ are Kottwitz-decent w.r.t the same $s \in \mathbb{Z}_+$, then they are conjugate w.r.t. $G(K_0 \cap \mathbb{Q}_{p^s})$.

In particular, for any descent $b \in G(\mathbb{Q}_{p^s})$ and any $V \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$, the induced isocrystal(17.7.1.20) is defined over the field $\mathbb{Q}_{p^s}$, and it only depends on $[b] \in B(G)$. ⌟

Proof: Suppose $b_2 = gb_1\sigma(g)^{-1}$, then $\nu_2 = g\nu_1 g^{-1}$, and the descent equations are

$$(b_1\sigma)^2 = s\nu_1(p)\sigma^s, \quad g(b_1\sigma)^s g^{-1} = gs\nu_1(p)g^{-1}\sigma^s.$$

Comparing these two, g commutes with σ^s, so $g \in G(K_0 \cap \mathbb{Q}_{p^s})$. □

Prop. (17.7.1.14) [Scheme J and Conjugacy Classes]. For $b_1, b_2 \in G(K_0)$, then the functor

$$J(R) = \{g \in G(R \otimes_{\mathbb{Q}_p} K_0) | g(b_1\sigma) = (b_2\sigma)g\}$$

is representable by a smooth affine scheme over $\mathbb{Q}_p$. When $b_1 = b_2 = b$, denote the scheme by J_b.

Assume $b_1, b_2 \in G(W(k')[\frac{1}{p}])$ where $k' = \overline{k'} \subset k$, and J' the corresponding smooth affine scheme, then $J' \to J$ is an isomorphism. In particular, $B(G) \to B'(G)$ is injective, and it is surjective if G is connected and $k = \overline{k}$. ⌟

Proof: Choose an embedding $G \subset \mathrm{GL}(n)_{\mathbb{Q}_p}$ and let G be defined by functions $f_1, \ldots, f_k$, consider the functor:

$$F(R) = \{g \in \mathrm{Mat}(n; R \otimes_{\mathbb{Q}_p} K_0) | g = b\sigma(g)b^{-1}\},$$

then it is representable by an affine space by(17.7.1.15) applied to the σ-linear map $g \mapsto b\sigma(g)b^{-1}$.

So there is a f.d. $\mathbb{Q}_p$-vector space $W \subset \mathrm{Mat}(n; K_0)$ that $F(R) = W \otimes_{\mathbb{Q}_p} R$. Choose a basis (A_i) of W, then $J(R)$ is just the subfunctor of $r_i \in R$ that

$$f_k(\sum r_i A_i) = 0, \quad \det(\sum r_i A_i) \neq 0.$$

Taking a basis of K_0 over $\mathbb{Q}_p$, then these are polynomials with coefficients in $\mathbb{Q}_p$. It is automatically smooth by Cartier's theorem(9.1.4.2).

The assertion about base change follows from(17.7.1.15).

The surjectivity follows from(17.7.1.11) and(17.7.1.12). □

Lemma (17.7.1.15). Let N be a f.d. isocrystal over K_0 w.r.t. σ^s for some $s \neq 0$, then the following functor

$$F : \mathcal{CR}\mathrm{ing}_{\mathbb{Q}_p} \to \mathcal{A}\mathrm{b} : R \mapsto (V \otimes_{\mathbb{Q}_p} R)^{\varphi = \mathrm{id}}$$

is representable by a vector space over $\mathbb{Q}_p$. ⌟

Proof: $F(R) = V^{\varphi=\mathrm{id}} \otimes_{\mathbb{Q}_p} R$, so it suffices to show $\dim_{\mathbb{Q}_p} V^{\varphi=\mathrm{id}} < \infty$. Firstly assume that L is alg.closed, then this is a consequence of Dieudonné-Manin classification(8.8.4.13). This functor F doesn't depend on k as long as $k = \overline{k}$: if k'/k is a field extension and $k' = \overline{k'}$, then the corresponding functor F' defined by $N \otimes_{W(k)[\frac{1}{p}]} W(k)[\frac{1}{p}]$ coincide with F.(This is also by Dieudonné-Manin classification.) □

Cor. (17.7.1.16). Assume $[b] \in B(G)$ is Kottwitz-decent for $s \in \mathbb{Z}_+$(17.7.1.10), then J_b is a $\mathbb{Q}_{p^s}/\mathbb{Q}_p$-inner form of the centralizer $G_{\nu^s(p)}$(17.7.1.12). ⌟

Proof: The descent equation shows $b_s = s\nu(p)$, so the adjoint $b_{ad} : g \mapsto (b\sigma)g(b\sigma)^{-1} = b\sigma(g)b^{-1}$ defines an element in $H^1(G(\mathbb{Q}_{p^s}/\mathbb{Q}_p), \mathrm{Aut}(G_{s\nu(p)}(\mathbb{Q}_{p^s})))$, because

$$\sigma^k b_{ad} : g \mapsto ((\sigma(b\sigma^{-1}(g))b^{-1})) = \sigma^k(b)\sigma(g)\sigma^k(b)^{-1}.$$

so

$$b_{ad} \circ \sigma(b_{ad}) \circ \ldots \circ \sigma^{s-1}(b_{ad}) : g \mapsto b_s g b_s^{-1} = s\nu(p)g(s\nu(p))^{-1} = g.$$

So it defines an inner form, which is just

$$J'(R) = G_{s\nu(p)}(\mathbb{Q}_{p^s})^{b_{ad}\sigma} = \{g \in G_{s\nu(p)}(R \otimes_{\mathbb{Q}_p} \mathbb{Q}_{p^s}) | g(b\sigma) = (b\sigma)g\}$$

Now it suffices to show $J'(R)$ is just $J(R)$ defined in(17.7.1.14). For this, notice any $g \in J(R)$ commutes with $b\sigma$ thus commutes with $s\nu(p)$ by(17.7.1.8), and the descent condition $(b\sigma)^n = s\nu(p)\sigma^n$ shows it commutes with σ^n, so $g \in J'(R)$. □

Prop. (17.7.1.17) [Basic Elements]. Let G be a connected reductive group and $k = \overline{k}$, then the following are equivalent for $b \in G(K_0)$:

- The slope morphism ν factors through the center $Z(G)$ of G.
- b is σ-conjugate to an element in $T(K_0)$ where T is an elliptic maximal torus of G.
- J_b in(17.7.1.14) is an inner form on G.

In this case, b and its conjugacy class $\overline{b}$ are called **Kottwitz-basic**. The set of Kottwitz-basic classes in $B(G)$ is denoted by $B(G)_b$. ⌟

Proof: Cf.[Kottwitz]. □

Prop. (17.7.1.18). Situation as in(17.7.1.17), if $[G, G]$ is simply-connected, then $G \to G_{\mathrm{ab}}$ induces a bijection $B(G)_b \cong B(G_{\mathrm{ab}})$. In particular, $B(G)_b$ is trivial if G is semisimple and simply-connected. ⌟

Proof: Cf.[Kottwitz, P17]. □

F-Isocrystals with G-Structures

Def. (17.7.1.19) [Isocrystals with G-structures]. Given $S \in \mathcal{S}\mathrm{ch}^p$, an **Isocrystal with G-structures** over S is an exact faithful tensor functor(4.2.1.2)

$$M : \mathrm{Rep}_{\mathbb{Q}_p}(G) \to \text{F-Isoc}(S)(8.8.4.2).$$

The category of isocrystals with G-structures over S is denoted by $\text{F-Isoc}_G(S)$. ⌟

Prop. (17.7.1.20) [Associated Isocrystals with G-Structure]. For $b \in G(K_0)$, there is a functor

$$\mathcal{I}_b : \mathrm{Rep}_{\mathbb{Q}_p}(G) \to \text{F-Isoc}(k) : V \mapsto (V \otimes_{\mathbb{Q}_p} K_0, \rho(b) \circ (\mathrm{id} \otimes \sigma)).$$

this is an isocrystal with G-structures over K_0 associated to b.

If $g \in G(K_0)$ and $b' = gb\sigma(g)^{-1}$, then multiplying by g implies a natural isomorphism between $\mathcal{I}_b$ and $\mathcal{I}_{b'}$. ⌟

Cor. (17.7.1.21) [Isocrystals and $B(G)$]. From any isocrystal with G-structures on S, we get a function

$$S \to B(G) : s \mapsto [b]_s.$$

And if $k = \overline{k}$ and $S = \operatorname{Spec} k$, then the isomorphism classes of isocrystals with G-structure over S are in bijection with $B(G)$. ⌟

Proof: ? Cf.[RR96, P171]. □

Prop. (17.7.1.22) [Newton Map Constency]. If S is connected locally Noetherian, and $M \in \text{F-Isoc}_G(S)$ s.t. $\nu \circ b_M$ is constant, then b_M is constant. ⌟

Proof: Cf.[RR96, P173].? □

Cor. (17.7.1.23). If S is locally Noetherian, then $M \in \text{F-Isoc}_G(S)$, and $[b_0] \in B(G)_b$, then

$$\{s \in S | [b_M(s)] = [b_0]\} \subset S$$

is closed. ⌟

Proof: □

Weakly-Admissible Pairs

Prop. (17.7.1.24) [Associated Filtered Isocrystals]. Let K be a field extension of K_0, and $\mu : \mathbb{G}_{m,K} \to G_K$ be a cocharacter over K, then the associated isocrystal over K_0 prolongs to a filtered isocrystal over K(18.4.8.22),

$$\mathcal{I}_{b,\mu} : \mathrm{Rep}_{\mathbb{Q}_p}(G) \to \varphi\text{-}\mathcal{M}\mathrm{od}\,\mathrm{Fil}_K : V \mapsto (V \otimes_{\mathbb{Q}_p} K_0, \rho(b) \circ (\mathrm{id} \otimes \sigma), \mathrm{Fil}^\bullet_\mu),$$

where the filtration comes from μ by weight-filtrations(because $\mathbb{G}_m$ is diagonalizable(9.2.3.1)). ⌟

Def. (17.7.1.25) [Weakly-Admissible Pairs]. Let G be a reductive group, then a pair (μ, b) as in(17.7.1.24) is called a **(weakly)admissible pair** if for any $V \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$, the filtered isocrystal $\mathcal{I}_b(V)$ is weakly admissible**??**(18.4.4.10).

It suffices to check this condition for one faithful representation V. ⌟

Proof: This is because for a faithful representation V, any $\mathbb{Q}_p$-representation appears as a direct summand of $V^{\otimes n} \otimes \widehat{V}^{\otimes m}$(18.5.1.16). Then the assertion follows from the fact direct summands and tensor products of weakly admissible filtered isocrystals are weakly admissible(18.4.8.26). □

2 Period Domain

Def. (17.7.2.1) [Associated Partial Flag Variety]. Let $[\mu] : \mathbb{G}_m \to G$ be a conjugacy class of cocharacters defined over a finite extension field $E/\mathbb{Q}_p$(18.5.2.5), then there is associated a faithful tensor functor

$$\mathrm{Rep}_{\mathbb{Q}_p} \to \mathrm{gr}^{\mathbb{Z}}_E \to \mathrm{Fil}_E$$

Now call two cocharacters equivalent if their associated functor are isomorphic. Consider the functor

$$\mathcal{CR}\mathrm{ing}_E \to \mathcal{S}\mathrm{et} : R \mapsto \{\text{the equivalence classes in the } G(R)\text{-conjugacy class of } \mu_R\}$$

and also consider the closed algebraic subgroup $P(\mu) \subset G$ over E:

$$P(\mu)(R) = \{g \in G(R) | g\mu_R g^{-1} \text{ is equivalent to } \mu_R\}$$

then the functor above is representable by the G_E-homogenous variety $\mathcal{F} = G_E/P(\mu) \in \mathcal{S}\mathrm{ch}\,/E$. ⌟

Prop. (17.7.2.2). $\mathcal{F}$ is a projective variety, or equivalently, $P(\mu)$ is a parobolic subgroup. ⌟

Proof: If V is a faithful representation in $\mathrm{Rep}_{\mathbb{Q}_p}(G)$, we denote $\mathrm{Flag}(V)$ the partial flag variety over $\mathbb{Q}_p$ which associates to any $\mathbb{Q}_p$-algebra R the filtration $\mathrm{Fil}^\bullet$ of $V \otimes_{\mathbb{Q}_p} R$ s.t. $\mathrm{gr}^i(R)$ are direct summands and $\mathrm{rank}\,\mathrm{Fil}^i = \dim_E \mathrm{Fil}^i_\mu(V_E)$. Then $\mathrm{Flag}(V)$ is a projective variety, by classical results, and there is a closed immersion

$$\mathcal{F} \hookrightarrow \mathrm{Flag}(V)_E$$

because the isocrystal on other representations are determined by this faithful representation. □

Def. (17.7.2.3)[p-adic Period Space]. Let $\breve{E}=E(\mathbb{Q}_p^{\mathrm{ur}})^\wedge$ be the completion of the maximal unramified extension of E, then there is a rigid-analytic structure on $\breve{\mathcal{F}}=\mathcal{F}_{\breve{E}}$. define the **$p$-adic period space** $(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}\subset\breve{\mathcal{F}}^{\mathrm{rig}}$ associated to $(G,b,[\mu])$ the set of points ξ conjugate to μ that (ξ,b) is weakly admissible.

Let J_b be the algebraic group associated to b as in(17.7.1.14), then $J_b(\mathbb{Q}_p)\subset G(K_0)$ acts on $\breve{\mathcal{F}}^{\mathrm{rig}}$, and it preserves the set $(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$.

$(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$ has a natural structure of an admissible open subset of $\breve{\mathcal{F}}^{\mathrm{rig}}$. if $b'=gb\sigma(g)^{-1}$, then $\mu\mapsto g^{-1}\mu g$ induces an isomorphism from $(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$ to $(\breve{\mathcal{F}}_{b'}^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$. Moreover, if b is Kottwitz-decent w.r.t. $s\in\mathbb{Z}_+$, then this admissible open subset is defined over $E\mathbb{Q}_{p^s}$. ⌟

Proof: Cf.[Rapoport Zink, P26]. □

3 Groups of EL/PEL Types

Def. (17.7.3.1) [Algebraic Groups of EL/PEL Types]. Let F be a finite étale algebra over $\mathbb{Q}_p$, B a finite central algebra over F, and $V\in\mathcal{M}\mathrm{od}_B^{\mathrm{fg}}$.

An **algebraic group of EL type** over $\mathbb{Q}_p$ is an algebraic group of the form $GL_B(V)$. They are related to the classification of p-divisible groups with an endomorphism and level structures.

Let $(-,-)$ be a non-degenerate alternating $\mathbb{Q}_p$-bilinear form on V together with a formal involution $*$ on B that

$$(bv,w)=(v,b^*w).$$

Let F_0 be the field of elements of F fixed by $*$.

An **algebraic group of PEL type** over $\mathbb{Q}_p$ is an algebraic group over $\mathbb{Q}_p$ given by

$$G(R)=\{g\in GL_B(V\otimes_{\mathbb{Q}_p}R)|\exists c\in X(G),\quad (gv,gw)=c(g)(v,w),\quad \forall v,w\}$$

⌟

Prop. (17.7.3.2) [Setups]. If G is an algebraic group of EL/PEL type, $K_0=W(\overline{\mathbb{F}_p})[\frac{1}{p}]$, $b\in G(K_0)$, then we associate to b and the natural representation of G on V the isocrystal

$$(N(V),\Phi)=(V\otimes_{\mathbb{Q}_p}K_0,b(1\otimes\sigma)).$$

This isocrystal is equipped with an action of B, and in the PEL case an alternating bilinear form

$$\psi:N(V)\otimes N(V)\to 1(n).$$

where $n=v_p(c(b))$. In fact, we can find some unit u that $c(b)=p^n u\sigma(u)^{-1}$, then the pairing is defined as

$$\psi(v,v')=u^{-1}(v,v'),$$

any other choices of u multiplies ψ by an element in $\mathbb{Z}_p^*$.

We will fix in addition a conjugacy class of cocharacters $\mu:\mathbb{G}_m\to G$ defined over a field E, and the associated homogenous algebraic variety $\mathcal{F}$ defined over E of filtrations(17.7.2.1). $\mathcal{F}$ is equipped with a B-action, as $G\in GL_B(V)$.

Notice in the PEL case, these filtrations satisfy $\mathcal{F}^i=(\mathcal{F}^{m-i+1})^\perp$, where $m=c\circ\mu\in\mathrm{Hom}(\mathbb{G}_m,\mathbb{G}_m)\cong\mathbb{Z}$. This is due to the fact $(kv,kw)=k^m(v,w)$ and the fact the pairing is non-degenerate. ⌟

Prop. (17.7.3.3) [Shimura Field]. Fix a conjugacy class of cocharacters $\{\mu\}$ defined over E and $\mu_0 \in \{\mu\}$, its corresponding filtration $\mathcal{F}_0^\bullet$, The field E in(17.7.3.2) can be described as the field of definition of the isomorphism class of $\mathcal{F}_0^\bullet$ as a B-invariant filtration, or equivalently as the finite extension of $\mathbb{Q}_P$ generated by the traces

$$\mathrm{tr}(d; \mathrm{gr}^i_{\mathbb{F}_0}(V \otimes_{\mathbb{Q}_p} \overline{\mathbb{Q}_p})), d \in B, i \in \mathbb{Z}.$$

And the filtration $\mathcal{F}$ is described as the functor that for any E-algebra R, $\mathcal{F}(R)$ is the set of filtrations $\mathcal{F}^\bullet$ of $V \otimes_{\mathbb{Q}_p} R$ by R-modules that are direct summands that

$$\mathrm{tr}(d; \mathrm{gr}^i_{\mathcal{F}}(V \otimes_{\mathbb{Q}_p} R)) = \mathrm{tr}(d; \mathrm{gr}^i_{\mathbb{F}_0}(V \otimes_{\mathbb{Q}_p} \overline{\mathbb{Q}_p})).$$

and moreover in the PEL case satisfies $\mathcal{F}^i = (\mathcal{F}^{m-i+1})^\perp$. ⌟

Proof: 1: The field of definition E of the conjugacy class $\{\mu\}$ is determined by Tannakian duality, so it suffices to check over which field these two filtrations are isomorphic as G-filtrations, but G is just the group fixing the B-module structure, so it suffices to show they are equivalent as B-modules, which is then determined by the traces, by(3.6.1.27).

2: It suffices to show $\mathcal{F}$ is a homogenous space under G. We restrict to the PEL case, the EL case is simpler. After base change from $\mathbb{Q}_p$ to $\overline{\mathbb{Q}_p}$, the data decomposes to the following types:

- (A) : $B = \mathrm{End}(W) \times \mathrm{End}(W^\vee)$ where W is a f.d. $\overline{\mathbb{Q}_p}$-vector space and $(u, v)^* = (v^t, u^t)$. And $V = W \otimes V' \bigoplus W^\vee \otimes V'^\vee$ where the pairing is natural and makes the sum orthogonal.

$$G = \{(1 \otimes g, c \cdot (1 \otimes g^{-t})| g \in GL(V'), c \in X(G)\}$$

- (C) : $B = \mathrm{End}(W)$ where W is a f.d. $\overline{\mathbb{Q}_p}$-vector space equipped with a symmetric bilinear form $(-,-)_W$ and $*$ is the transposition w.r.t it.
  And $V = W \otimes V'$ where V' is equipped with an alternating form $(-,-)_{V'}$ that $(-,-)_V = (-,-)_W \otimes (-,-)_{V'}$.

$$G = \{cg | g \in \mathrm{Sp}(V'), c \in X(G)\}$$

- (BD): As in (C), except that $(-,-)_W$ is skew-symmetric and $(-,-)_{V'}$ is symmetric.

$$G = \{cg | g \in SO(V'), c \in C(G)\}$$

Under this decomposition, the functor $\mathcal{F}$ in the proposition is represented by products of partial flags of V:

- (A) : $\mathcal{F}^i = W \otimes (\mathcal{F}')^i \bigoplus W^\vee \otimes ((\mathcal{F}')^{m+1-i})^\perp$ and the correspondence $\mathcal{F}^\bullet \mapsto (\mathcal{F}')\bullet$ identifies $\mathcal{F}$ with the partial flag variety of V' with fixed dimensions $\dim((\mathcal{F}')^i)$.
- (B, CD) : $\mathcal{F}^\bullet = W \otimes (\mathcal{F}')^\bullet$ and $\mathcal{F}$ is identified with the partial flag variety of V' of fixed dimensions $\dim((\mathcal{F}')^i)$ and $(\mathcal{F}')^i = ((\mathcal{F}')^{m+1-i})^\perp$.
  The (A) case G clearly acts transitively on $\mathcal{F}$, and the (B, CD) case $(\mathcal{F}')^i$ is isotropic for $i \geq (m+1)/2$, and it determines all other components, so G acts transitively, by Witt's theorem(14.5.2.3).

The reason is(3.6.3.27) and the fact representations of B is semisimple, then contemplating on the pairing condition. □

Prop. (17.7.3.4) [Examples of PEL Type]. Let $B = D$ be the quaternion algebra over $\mathbb{Q}_p$ and $*$ be the involution, i.e.

$$D = \mathbb{Q}_{p^2}[\Pi], \quad \Pi^2 = p, \quad \Pi a = \sigma(a)\Pi$$

and

$$a^* = \sigma(a), a \in \mathbb{Q}_{p^2}, \quad , \Pi^* = \Pi.$$

Let (V, ι) be a free D-module of rank n with a non-degenerate bilinear form satisfying the conditions in(17.7.3.1). Then G is a non-trivial inner form of the group GSp_{2n} of symmetric similitudes:

Firstly $\mathbb{Q}_{p^2} \otimes K_0 \cong K_0 \oplus K_0$, then $\mathbb{Q}_{p^s}$ acts on $K_0 \oplus K_0$ by $a(x, y) = ax, \sigma(a)y)$. As V is a $\mathbb{Q}_{p^2}$-vector space, there is a decomposition

$$V = V_0 \oplus V_1$$

where $\mathbb{Q}_{p^2}$ acts on V_i by $a(v) = v.\sigma^i(a)$, then G_{K_0} is just GSp_{2n,K_0}, and $G \neq GSp_{2n}$ as the Galois action σ on $\mathbb{Q}_{p^2} \otimes K_0$ and $K_0 \cong K_0 \oplus K_0$ are different.

Take $b \in G(K_0)$ the element with $c(b) = p$ and the corresponding isocrystal (N, Φ) is isotypical of slope $1/2$. N decomposes as $N_0 \oplus N_1$. Notice now Π and $\Phi = b\sigma$ interchanges N_i, and $\Pi\Phi = \Phi\Pi$. Also N_i is isotropic: For $v, w \in N_i, a \in \mathbb{Q}_{p^2}$,

$$a(v, w) = (av, w) = (\iota(\sigma^i(a))v, w) = (v, \iota(\sigma^{i+1}(a))w) = (v, \sigma(a)w) = \sigma(a)(v, w)$$

so $(v, w) = 0$.

We can define a new non-degenerate alternating form

$$\langle -, - \rangle : N_0 \times N_0 \to K_0 : \langle v, v' \rangle = (v, \Pi v')$$

and also a σ-linear endomorphism of N_0: $\Phi_0 = \Pi^{-1} \circ \Phi|_{N_0}$. From the condition, $v_p(\det \Phi_0) = 0$, and Φ has all the slopes 0. Also $\langle \Phi_0 v, \Phi_0 w \rangle = \sigma(\langle v, w \rangle)$, as

$$\langle \Phi_0 v, \Phi_0 w \rangle = (\Pi^{-1}\Phi v, \Phi w) = (\Pi^{-1} b\sigma v, b\sigma w) = \sigma(v, \Pi w) = \sigma(\langle v, w \rangle).$$

so this alternating form is defined over $\mathbb{Q}_p$, denoted by $(V_0, \langle -, - \rangle)$, and Φ_0 corresponds to σ. Then $J_b = GSp(V_0, \langle -, - \rangle)$.

Next we consider

$$(0) = \mathcal{F}_0^2 \subset \mathcal{F}_0^1 \subset \mathcal{F}_0^0 = V \otimes \overline{\mathbb{Q}_p}$$

be a filtration where $\mathcal{F}_0^1$ be a D-invariant Lagrangian subspace. This corresponds to a cocharacter $\mu \to G$, and $\mathcal{F}$ is just the $\mathbb{Q}_{p^2}$ variety of D-invariant Lagrangian subspaces of $V_{\mathbb{Q}_{p^2}}$. By(17.7.3.3), the Shimura field is $\mathbb{Q}_p$.

Let $\mathcal{F} \subset \mathcal{F}(K)$ where K/K_0 is a field extension, then

$$\mathcal{F} = \mathcal{F}_0 \oplus \mathcal{F}_1$$

where $\mathcal{F}_i \in N_0 \otimes_{K_0} K$, as $\mathcal{F}$ is Π-invariant. Now $\mathcal{F}_0$ is also a Lagrangian subspace of $(V_0, \langle -, - \rangle)$. $\mathcal{F}(K)$ identifies the K-points of the Grassmannian of Lagrangian subspaces of $(V_0, \langle -, - \rangle)$. ⌟

Cor. (17.7.3.5). Under the above identification, the subset $\mathcal{F}^{wa}(K)$ of the Grassmannian of Lagrangian spaces $\mathcal{F}$ of $(V_0 \otimes K, \langle -, - \rangle)$ is characterized by $\mathcal{F}$ satisfying the the following conditions:

For all totally isotropic subspaces $W_0 \subset V_0$, we have $\dim_K \mathcal{F} \cap (W_0 \otimes K) \leq 1/2 \dim W_0$. ⌟

Proof: It's clear $\mu(N,\Phi,\mathcal{F})=0$, so weakly-admissibility is equivalent to semi-stability. The uniqueness of the HN-filtration of $\mathcal{F}$ implies its D-invariance, thus semi-stability is equivalent to the fact that for any subspace $P\subset N$ stable under Φ and D-action, we have

$$\dim_K(\mathcal{F}\cap(P\otimes_{K_0}K))\leq v_p(\det(\Phi;P)).$$

Now Φ is isotypical with slope $1/2$, $v_p(\det(\Phi;P))=\frac{1}{2}\dim P$, and the D-invariance of P is equivalent to $P=P_0\oplus P_1$ and the Φ-invariance of P is equivalent to the Φ_0-invariance of P_0, i.e. P_0 is a $\mathbb{Q}_p$-rational subspace $W_0\subset V_0$.

Finally we show it suffices to check for totally isotropic subspaces: Let W_0' be the radical of W_0, then there is a non-singular alternating form on W_0/W_0', then the image of $\mathcal{F}_0'\cap(P\otimes_{K_0}K)$ in this quotient is a totally isotropic space, thus has dimension$\leq\frac{1}{2}\dim(W_0/W_0')$. then it suffices to check the condition for W_0'. □

17.8 Adic Spaces and Perfectoid Spaces(Scholze)

References are [Hub93], [Hub96], [Mor19], [Bha17], [Wed14], [S-W20], [Sch12].

Notation (17.8.0.1).
- Use notations as in Topological Commutative Algebra.

⌟

1 (Continuous)Valuation Spectrums

Main references are [Mor19]. Notice this should be prior to the definition of adic spaces.

Def. (17.8.1.1) [Riemann-Zariski Space]. Let $K \in \mathtt{Field}$ and $A \subset K \in \mathcal{CR}\mathrm{ing}$, the Riemann-Zariski space $RZ(K,A)$ is defined to be the space of all valuation subrings of K containing A with the topology generated by

$$U(x_1,\ldots,x_n) = \{P \in RZ(K,A) | x_1,\ldots,x_n \in P\}.$$

$RZ(K,0)$ is also denoted by $RZ(K)$. $RZ(K,A)$ is just isomorphic to $\mathrm{Spa}(K,A^{itc})$, so it is spectral by(17.8.2.23). ⌟

Cor. (17.8.1.2). Clearly the specialization relations of $RZ(K,A)$ is identical to inclusion relations. ⌟

Def. (17.8.1.3) [Valuation Spectrum]. For $A \in \mathcal{CR}\mathrm{ing}$, the **valuation spectrum** $\mathrm{Spv}(A) \in \mathcal{T}\mathrm{op}$ is the set of equivalent classes of valuations on A, topologized by the open subsets

$$\mathrm{Spv}(A)(\frac{f}{g}) = \{x \in \mathrm{Spa}(A) | |f(x)| \le |g(x)| \ne 0\}.$$

$\mathrm{Spv}(A)$ is spectral, with sub-basis generated by $\mathrm{Spv}(\frac{f}{g})$

There is a kernel map $\ker : \mathrm{Spv}(A) \to \mathrm{Spec}\, A$ sending a valuation to its kernel(support). Then this map is continuous, and the fiber of this map over $\mathfrak{p}$ is just isomorphic to the Riemann-Zariski space $RZ(k(\mathfrak{p}))$.

Moreover, the map $\ker : \mathrm{Spv}(A) \to \mathrm{Spec}\, A$ is spectral, as the kernel of $D(f)$ is $U(\frac{f}{f})$. ⌟

Specialization Relations in $\mathrm{Spv}(A)$

Def. (17.8.1.4) [Vertical Specializations]. Let $x, y \in \mathrm{Spv}(A)$. We say that x is a vertical specialization of y if x is a specialization of y and $\mathfrak{p}_x = \mathfrak{p}_y$. ⌟

Valuations with Support Conditions

Def. (17.8.1.5) [$\mathrm{Spv}(A,J)$]. We define a space $\mathrm{Spv}(A,J) \subset \mathrm{Spv}(A)$ by

$$\mathrm{Spv}(A,J) = \{x \in \mathrm{Spv}(A) | r(x) = x\} = \{x \in \mathrm{Spv}(A) | c\Gamma_x(J) = \Gamma\}.$$

with the subset topology from $\mathrm{Spv}(A)$. ⌟

Prop. (17.8.1.6).
- $\mathrm{Spv}(A,J)$ is a spectral space.

- A basis of quasi-compact open subsets for the topology is given by the sets $U(\frac{f_1,\ldots,f_n}{g})$ where $J \subset \sqrt{(f_1,\ldots,f_n)}$.
- The retraction $r : \mathrm{Spv}(A) \to \mathrm{Spv}(A, J)$ is a spectral map.

⌟

Proof: Cf.[Mor19]P52. □

Continuous Valuation Spectrum

Def. (17.8.1.7) [Continuous Valuations]. For $A \in \mathcal{H}ub\,\mathcal{R}ing$, define $\mathrm{Cont}(A) \in \mathcal{T}op$ as the subspace of $\mathrm{Spv}(A)$(17.8.1.3) consisting of continuous valuations on A. Then

$$\mathrm{Cont}(A) = \{x \in \mathrm{Spv}(A, A^{00}A) | x(A^{00}) < 1\}$$

⌟

Proof: Cf.[Mor19]P64. □

Cor. (17.8.1.8) [Cont(A) is Spectral]. For any Huber ring A, $\mathrm{Cont}(A)$ is a spectral space, with a basis of quasi-compact open subsets given by $U(\frac{f_1,\ldots,f_n}{g})$, where $A^{00} \subset \sqrt{(f_1,\ldots,f_n)}$, or equivalently $(f_1,\ldots,f_n)$ is open**??**. ⌟

Proof: This is because

$$\mathrm{Cont}(A) = \mathrm{Spv}(A, A^{00}A) - \bigcup_{g\in A^{00}} U(\frac{1}{g}),$$

which is an open subset of $\mathrm{Spv}(A, A^{00}A)$, thus the assertion follows from(17.8.1.6) and(4.12.4.7). □

2 Adic Spectra

Def. (17.8.2.1)[Adic Spectra]. For any $(A, A^+) \in \mathcal{H}ub\mathrm{Pair}$(11.2.5.13), the **adic spectrum** of (A, A^+) is defined to be

$$\mathrm{Spa}(A, A^+) = \{x \in \mathrm{Cont}(A) | x(A^+) \le 1\}.$$

And for $A \in \mathcal{H}ub\,\mathcal{R}ing$, denote $\mathrm{Spa}\,A = \mathrm{Spa}(A, A^0)$, where A^0 is the ring of power-bounded elements(11.2.5.8).

The shape of these open sets is dictated by the desired properties that both $\{x|f(x) \ne 0\}$ and $\{x|f(x) \le 1\}$ be open. These desiderata combine features of classical algebraic geometry and rigid geometry, respectively.

This adic spectrum construction(17.8.2.1) defines a functor

$$\mathrm{Spa} : \mathcal{H}ub\mathrm{Pair}^{\mathrm{op}} \to \mathcal{T}op\,.$$

And for any ring of integers A^+ of A, $\mathrm{Spa}\,A = \mathrm{Spa}(A, A^0) \hookrightarrow \mathrm{Spa}(A, A^+)$ is an immersion of spaces, by(11.2.5.13). ⌟

Def. (17.8.2.2) [Kernel map]. Taking kernels of valuations gives a map $\ker : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}\,A$. This map is continuous, as the inverse image of $D(f)$ is $\mathrm{Spa}(A, A^+)(\frac{f}{f})$. We call a subset a **Zariski open subset** of $\mathrm{Spa}(A, A^+)$ iff it is open in the initial topology along ker. ⌟

Def. (17.8.2.3) [Rational Subsets]. A **rational subset** of $\mathrm{Spa}(A, A^+)$ is defined to be

$$\mathrm{Spa}(A, A^+)(\frac{f_1, \ldots, f_n}{g}) = \{x \in \mathrm{Spa}(A, A^+) | x(f_i) \le x(g)\},$$

where (f_i) is an open ideal. ⌟

Prop. (17.8.2.4) [Adic Spectrums are Spectral]. The adic spectrum $\mathrm{Spa}(A, A^+)$ is spectral, and a basis of quasi-compact open subsets are given by rational subsets. And the Spa functor is naturally a functor from the category of Huber rings to the category of spectral spaces. ⌟

Proof: Firstly $\mathrm{Spa}(A, A^+)$ is closed in the constructible topology of $\mathrm{Cont}(A)$: for any $a \in A$,

$$\{x \in \mathrm{Cont}(A) | |a|_x \le 1\} = U(\frac{1, a}{1})$$

is a quasi-compact open subset of $\mathrm{Cont}(A)$, so constructible, thus $\mathrm{Spa}(A, A^+) = \cap_{a \in A^+}\{x \in \mathrm{Cont}(A) | |a|_x \le 1\}$ is closed in the constructible topology.

So the assertions follow from(4.12.4.7) and(17.8.1.8). □

Remark (17.8.2.5). In spite of the proposition that adic spaces are spectral, it is very different from classical algebraic geometry. For example, the generalizations of a point y is totally ordered(localization of the valuation ring), but this nearly never happen for an affine variety. ⌟

Remark (17.8.2.6). The rational subsets forms a basis for the topology of $\mathrm{Spa}(A, A^+)$. But in general $\mathrm{Spa}(\frac{f}{g})$ is not quasi-compact, in particular, $\ker : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}\, A$ is not quasi-compact. ⌟

Def. (17.8.2.7) [Specialization Map]. The **specialization map**

$$\mathrm{Sp} : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}(A^+/A^{00})$$

that maps a point x to the inverse image of the maximal ideal of R_x along the valuation map $A^+ \to R_x$ it corresponds. It clearly lies in $\mathrm{Spec}(A^+/A^{00})$ as any pseudo-uniformizer is mapped to a pseudo-uniformizer in R_x thus in the maximal ideal.

This map is continuous and spectral, unlike that the kernel map(17.8.2.22): the inverse image of a $D(f)$ for $f \in A^+$ is the set of points $x \in \mathrm{Spa}(A, A^+)$ that $x(f)$ is a unit, i.e. $|x(f)| = 1$. As $|x(f)| \le 1$ for all $f \in A^+$, this set is just $\mathrm{Spa}(A, A^+)(\frac{1}{f})$, so specialization map sp is both continuous and spectral. ⌟

Completed Residue Fields

Def. (17.8.2.8) [Completed Residue Fields]. Let $x \in \mathrm{Spa}(A, A^+)$, then we denote by $k(x)$ the fraction field of $A/\mathfrak{p}_x$, with a valuation ring $k^+(x)$. If x is not analytic, we set $\kappa(x) = k(x), \kappa^+(x) = k^+(x)$. If x is analytic, we set $\kappa(x) = k(x)^\wedge, \kappa^+(x) = k^+(x)^\wedge$. $(\kappa(x), \kappa(x)^+)$ is called the **completed residue field** of x. ⌟

Prop. (17.8.2.9) [Vertical Generalizations]. The morphism

$$\mathrm{Spa}(\kappa(x), \kappa(x)^+) \to \mathrm{Spa}(A, A^+)$$

induces a homeomorphism onto the set of vertical generalizations of x.

x is analytic iff $\kappa(x)$ is microbial. ⌟

Proof: For the first assertion, if x is not analytic, then $\mathrm{Spa}(k(x), k(x)^+) \cong RZ(k(x), k(x)^+)$ is homeomorphic to the vertical generalizations of x.

If x is analytic, then by(17.8.2.16), $\mathrm{Spa}(\kappa(x), \kappa(x)^+) \to \mathrm{Spa}(k(x), k(x)^+)$ is a homeomorphism. And now we need to check more that if $R \in RZ(k(x), k(x)^+)$ corresponds to a vertical generalization y, then $|\cdot|_R$ is continuous iff $|\cdot|_y$ is continuous. For this, see[Mor19]107.

The second assertion follows from(11.2.6.7). □

Prop. (17.8.2.10) [Residue of Rational Subsets]. Let $f : (A, A^+) \to (A\langle \frac{T}{s} \rangle, A\langle \frac{T}{s} \rangle^+)$ be a rational subset, and $y \in \mathrm{Spa}(A\langle \frac{T}{s} \rangle, A\langle \frac{T}{s} \rangle^+)$ with $x = \mathrm{Spa}(f)(y)$, then the canonical map $(k(x), k(x)^+) \to (k(y), k(y)^+)$ induces an isomorphism of Huber pairs $(\kappa(x), \kappa(x)^+) \cong (\kappa(y), \kappa(y)^+)$ after completion. ⌟

Proof: Cf.Morel P108.**?** □

Def. (17.8.2.11) [Adic Points]. An **adic point** is $\mathrm{Spa}(K, K^+)$ where
- $(K, K^+) \in \mathcal{H}\mathrm{ubPair}$,
- $K \in \texttt{Field}$, and K is either complete non-Archimedean or discrete,
- K^+ is an open and bounded valuation subring(hence integrally closed).

An **analytic adic point** is an adic point s.t. K is complete non-Archimedean. ⌟

Remark (17.8.2.12). The adic point is not a point in general. In fact, if K is non-Archimedean, $\mathrm{Spa}(K, K^+)$ is totally ordered by inclusion**?**, with a unique closed point corresponding to K^+ and a unique generic point corresponding to $\mathcal{O}_K$. ⌟

Prop. (17.8.2.13) [Valuation Ring Characterization of Spa]. For a Huber pair (A, A^+), there is a natural bijection between $\mathrm{Spa}(A, A^+)$ and the set of maps $\varphi : (A, A^+) \to (K, K^+)$ that $\mathrm{Spa}(K, K^+)$ is an adic point where $K_x = \kappa(x)$ and x corresponds to the image of the closed point of $\mathrm{Spa}(K, K^+)$ under the map $\mathrm{Spa}(\varphi)$. And x is analytic iff the corresponding adic point $\mathrm{Spa}(K, K^+)$ is analytic. ⌟

Proof: Let $\varphi : (A, A^+) \to (K, K^+)$ be a map of Huber pairs, then correspond the maps gives a continuous valuation on A which is in $\mathrm{Spa}(A, A^+)$ and $\mathfrak{p}_x = \ker(\varphi)$. Notice x is the image of the closed point of $\mathrm{Spa}(K, K^+)$. And we get a map $k(x) \to K$ such that $k(x)^+ = k(x) \cap K^+$, and that has dense image by assumption, so after completion(when non-Archimedean) induces an isomorphism $(\kappa(x), \kappa(x)^+) \cong (K, K^+)$. Thus this is a bijection of sets. □

Prop. (17.8.2.14) [Uniformity]. If A is uniform, then the map

$$A \to \prod_{x \in \mathrm{Spa}(A, A^+)} \kappa(x)$$

is a homeomorphism of A onto its image, where $\kappa(x)$ is the completed residue field(17.8.2.8). ⌟

Proof: Berkovich, Étale cohomology for non-Archimedean analytic spaces.**?** □

Cor. (17.8.2.15). Let $\widetilde{\mathcal{O}}_X$ be the sheafification of $\mathcal{O}_X$, then if A is uniform, $A \to H^0(X, \widetilde{\mathcal{O}}_X)$ is injective. ⌟

Proof: In fact, $A \to H^0(X, \widetilde{\mathcal{O}}_X) \to \prod_x \kappa(x)$ is injective. □

Properties of Adic Spectrums

Prop. (17.8.2.16) [Properties of Adic Spectrums].

- The completion map $(A, A^+) \to (\widehat{A}, \widehat{A}^+)$ induces an homeomorphism on the adic spectrums that preserves rational subsets.
- $\mathrm{Spa}(A, A^+)$ vanishes iff its completion $\widehat{A}$ vanishes.
- (Adic Nullstellensatz)$A^+ = \{f \in A | x(f) \leq 1, \forall x \in \mathrm{Spa}(A, A^+)\}$.
- If A is complete, then $f \in A$ is a unit iff $|f|_x \neq 0$ for all $x \in \mathrm{Spa}(A, A^+)$.
- If A is Tate, then f is topologically nilpotent iff $|f|_x^n \to 0$ for any $x \in \mathrm{Spa}(A, A^+)$.

⌟

Proof: 1: Use the valuation ring characterization(17.8.2.13), a point of x determined a continuous map $(A, A^+) \to (K, K^+)$. Now this extends to a map under completion, thus determines a point of $\mathrm{Spa}(\widehat{A}, \widehat{A}^+)$, so the Spa map is surjective. And injectivity follows from the fact A is dense in $\widehat{A}$.

For the homeomorphism, just notice that if $f_i - f_i', g - g' \in t^{N+1}\widehat{A}$, then

$$\mathrm{Spa}(\frac{f_1, \ldots, f_n}{g}) = \mathrm{Spa}(\frac{f_1', \ldots, f_n'}{g'}).$$

where $f_n = t^N$. So now A is dense in $\widehat{A}$, if we choose $f_i, g \in A$, then this rational subset is clearly induced from A.

2: Cf.[Mor19]P104.

3: Cf.[Mor19]P91.

4: Cf.[Mor19]P106.

5: Cf.[Mor19]P106. □

Cor. (17.8.2.17) [Generalizations in Adic Spectrum]. The above proposition shows that the generalization relations of Spa are easily determined, for an element y, all generalizations of y are in bijection with $\mathrm{Spec}(R_y/(t))$ as a poset, thus totally ordered, and each y has a unique generic point as generalization, because it is microbial.

Moreover, $\mathrm{Spa}(A, A^0)$ is closed under generalization in $\mathrm{Spa}(A, A^+)$, and they have the same set of generic points. ⌟

Proof: The last assertion is because the generalizations of a point y is just valuation rings containing R_y, and R_y contains $A^0/\mathfrak{p}_y$, so does its generalizations. And for any generic point $x \in \mathrm{Spa}(A, A^+)$, A^0 is mapped to the valuation ring R_x, because it is a rank 1 valuation, so if $t^k f^{\mathbb{N}} \subset R_x$, then $f \in R_x$ because otherwise we have $|t| < |f^{-n}|$ for n large. □

Def. (17.8.2.18) [Specialization Map]. The **specialization map**

$$\mathrm{Sp} : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}(A^+/A^{00})$$

that maps a point x to the inverse image of the maximal ideal of R_x along the valuation map $A^+ \to R_x$ it corresponds. It clearly lies in $\mathrm{Spec}(A^+/A^{00})$ as any pseudo-uniformizer is mapped to a pseudo-uniformizer in R_x thus in the maximal ideal.

This map is continuous and spectral, unlike that the kernel map(17.8.2.22): the inverse image of a $D(f)$ for $f \in A^+$ is the set of points $x \in \mathrm{Spa}(A, A^+)$ that $x(f)$ is a unit, i.e. $|x(f)| = 1$. As $|x(f)| \leq 1$ for all $f \in A^+$, this set is just $\mathrm{Spa}(A, A^+)(\frac{1}{f})$, so specialization map sp is both continuous and spectral. ⌟

Prop. (17.8.2.19) [Maximal Hausdorff Quoteint]. Let $X = \mathrm{Spa}(A, A^+)$ be an affinoid Tate space, the if $\overline{X}$ is the quotient of X by the equivalence relation generated by specialization, then $\overline{X}$ is the Hausdorffization of X, i.e. $\overline{X}$ is Hausdorff. ⌟

Proof: To show $\overline{X}$ is Hausdorff, if $x, y \in X$ is not mapped to the same point in $\overline{X}$, then by(17.8.2.17), we may assume x, y is generic in X, and $\overline{\{x\}} \cap \overline{\{y\}} = \varnothing$. Now we must find two disjoint open subsets of x, y that is stable under specialization. Cf.[Bhatt Perfectoid Spaces P75]. □

Spectrality of Adic Spectrums

Def. (17.8.2.20) [Rational Subsets]. A **rational subset** of $\mathrm{Spa}(A, A^+)$ is defined to be

$$\mathrm{Spa}(A, A^+)(\frac{f_1, \ldots, f_n}{g}) = \{x \in \mathrm{Spa}(A, A^+) | x(f_i) \leq x(g)\},$$

where $(f_i) = (1)$. ⌟

Prop. (17.8.2.21). Rational subsets are stable under intersection(Easy). ⌟

Prop. (17.8.2.22). The rational subsets forms a subbasis for the topology of $\mathrm{Spa}(A, A^+)$.**?** But in generally $\mathrm{Spa}(\frac{f}{g})$ is not quasi-compact, in particular, $\mathrm{Spv}(A) \to \mathrm{Spa}(A, A^+)$ is not quasi-compact(proper). ⌟

Prop. (17.8.2.23) [Adic Spectrums are Spectral]. The adic spectrum $\mathrm{Spa}(A, A^+)$ is spectral, and a basis of quasi-compact open subsets are given by rational subsets. And the Spa functor is naturally a functor from the category of Huber rings to the category of spectral spaces. ⌟

Proof: Firstly $\mathrm{Spa}(A, A^+)$ is closed in the constructible topology of $\mathrm{Cont}(A)$: for any $a \in A$,

$$\{x \in \mathrm{Cont}(A) || a|_x \leq 1\} = U(\frac{1, a}{1})$$

is a quasi-compact open subset of $\mathrm{Cont}(A)$, so constructible, thus

$$\mathrm{Spa}(A, A^+) = \cap_{a \in A^+} \{x \in \mathrm{Cont}(A) || a|_x \leq 1\}$$

is closed in the constructible topology.

So the assertions follow from(4.12.4.7) and(17.8.1.8). □

Remark (17.8.2.24). In spite of the proposition that adic spaces are spectral, it is very different from classical algebraic geometry. For example, the generalizations of a point y is totally ordered(localization of the valuation ring), but this nearly never happen for an affine variety. ⌟

Cor. (17.8.2.25) [Detecting Nilpotence Locally]. If (A, A^+) is an affinoid Tate ring and $f \in A$, then $f \in A^{00}$ iff $|f(x)|^n \to 0$ for all x. ⌟

Proof: If f is topological nilpotent, then $f^N \in tA^+$ for some n, so $|f(x)|^{nN} \leq |t(x)|^n \to 0$ because x is continuous. Conversely, if $|f(x)|^n \to 0$ for all x, then $X = \cup_n X(\frac{f^n}{t})$. But X is quasi-compact, so $|f(x)|^n \leq |t(x)|$ for all x, for some n. So by(17.8.2.16) $f^n \in tA^+$. Now A^+ is a filtered colimits of rings of definitions(11.2.5.14), so $f^n \in tA_0$ for some tA_0, which shows that $f \in A^{00}$. □

Constructions of Adic Spectrums

Prop. (17.8.2.26) [Direct Limits of Uniform Affinoids]. The direct limits exists in the category of uniform affinoid Tate rings. and $A^+ = \operatorname{colim} A_i^+$.

Moreover,

$$|\operatorname{Spa}(A, A^+)| \cong \varprojlim_i |\operatorname{Spa}(A_i, A_i^+)|$$

as a homeomorphism of spectral spaces, and each rational subset of $\operatorname{Spa}(A, A^+)$ is pulled back from some rational subset of $\operatorname{Spa}(A_i, A_i^+)$.

The same conclusion also hold in the category of complete uniform affinoid Tate rings(For the homeomorphism, (17.8.2.16) is used). ⌟

Proof: Suppose the colimit index has a minimal element i_0, let t be a pseudo-uniformizer, then each A_i^+ is a ring of definition with pseudo-uniformizer t. Now we set $A = \operatorname{colim} A_i$ with ring of definitions $A^+ = \operatorname{colim} A_i^+$, then A^+ is integrally closed in A, thus (A, A^+) is truly a uniform affinoid Tate ring. Now we check it is the colimit: For any compatible map $(A_i, A_i^+) \to (B, B^+)$, there is a map $f : (A, A^+) \to (B, B^+)$ as abstract rings. We check it is continuous: we may assume B^+ is the ring of definition, then $t^n A^+ \subset f^{-1}(t^n B^+)$, thus it is continuous.

For the adic spectrum, now a point $x \in \operatorname{Spa}(A, A^+)$ is determined by the map of uniform affinoid Tate rings $(A, A^+) \to (k(\mathfrak{p}), R_x)$, and by the universal property, it is defined by a compatible set of maps $(A_i, A_i^+) \to (k(\mathfrak{p}), R_x)$. Now it is easy to see the desired bijection of topological spaces, as the elements defining rational subsets are pullbacks from some A_i. □

Prop. (17.8.2.27) [Perfection of Adic Spectrum]. Let (A, A^+) be an affinoid Tate ring of char$p$, then

- The Frobenius map induces a homeomorphism on the adic spectrum of (A, A^+).
- If (A, A^+) is uniform, then there is a perfection functor, which is left adjoint to the forgetful functor from the category of perfect uniform affinoid Tate rings to the category of affinoid Tate rings. And it is just $(A_{\text{perf}}, A_{\text{perf}}^+)$.
- The natural map $(A, A^+) \to (A_{\text{perf}}, A_{\text{perf}}^+)$ induces a homeomorphism on the adic spectrum.

⌟

Proof: 1: The Frobenius pulls a valuation a multiple of itself, thus equals itself.

2: Clearly A_{perf}^+ is integrally closed in A^+ and is in A_{perf}^0. It suffices to show $(A_{\text{perf}}, A_{\text{perf}}^+)$ is uniform, but this is because $A_{\text{perf}}^0 = (A_{\text{perf}})^0 \subset (t^{-n} A_0)_{\text{perf}} = t^{-n} (A_0)_{\text{perf}}$.

3: The Spa map is checked to be continuous and injective, for the converse, using the microbial valuation ring characterization, a point x of $\operatorname{Spa}(A, A^+)$ corresponds to a map A^+ to a complete field $k^+(x)$, thus a map $A_{\text{perf}}^+ \to k^+(x)_{\text{perf}}$, now $k^+(x) \to k^+(x)_{\text{perf}}$ is faithfully flat that preserves pseudo-uniformizers, thus it is a point y that maps to y. □

3 Structure Presheaf and Adic Spaces

Lemma (17.8.3.1) [Functions on Rational Subsets]. If $X = \operatorname{Spa}(A, A^+)$ is an affinoid adic space, and U is a rational subset, then there is a unique complete affinoid Tate ring $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ over (A, A^+) s.t. the the map of spectra

$$\operatorname{Spa}(\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \to \operatorname{Spa}(A, A^+)$$

is universal w.r.t. all the complete affinoid Tate space with a map to X that has image in U.

And in this case, this Spa map is a homeomorphism identifying the rational subsets contained in U to rational subsets of $\mathrm{Spa}(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$. In particular, U is quasi-compact. ⌟

Proof: **?** See Hub94 P1.3 for the proof in the Huber ring case.

Choose a ring of definition (A_0,t), and $U=\mathrm{Spa}(A,A^+)(\frac{f_1,\ldots,f_n}{g})$ for $f_i,g\in A_0$, and $f_n=t$**??**, and let $B=A[g^{-1}]$ and $B_0=A_0[\frac{f_i}{g}]$. Then $B=B_0[t^{-1}]$(notice that $A_0[t^{-1}]=A$). So B is a Tate A-algebra with ring of definition (B_0,t). Now if B^+ is the integral closure of the subring of B generated by $A^+[\frac{f_i}{g}]$, then (B,B^+) is an affinoid Tate ring. Set $(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ to be its completion.

By construction $\mathrm{Spa}(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ maps into U, because $x(g)\neq 0$ because g is a unit, and $|x(f_i)|\leq |x(g)|$ as $f_i/g\in B^+$.

Now check universal property: if $\mathrm{Spa}(C,C^+)$ maps into U, then g is a unit in C by(17.8.2.16), and then $f_i/g\in C^+$ by(17.8.2.16) again. Now C^0 is the filtered colimit of all rings of definition, so there is a ring of definition C_0 that contains A_0 and all f_i/g((11.2.5.17) is used). Then this gives a map of affinoid Tate rings that maps B_0 into C_0, and when passed to completion, induces a map $\mathcal{O}_X(U)\to C$ of Tate algebras. Now also B^+ is mapped into C^+ because C^+ is integrally closed, so we are done.

For the last assertion, by(17.8.2.16), we only have to prove $\mathrm{Spa}(B,B^+)\to U$ is a homeomorphism preserving rational subsets, for this, the injectivity is clear as B is a localization of A. And the surjectivity follows immediately from the valuation ring characterization and universal property. Continuity is also clear.

For the openness, for any rational subset $X(\frac{f_1,\ldots,f}{g})$ of $X=\mathrm{Spa}(B,B^+)$, because $B=A[g^{-1}]$, g is unit in B, we can assume that $f_i,g\in A_0$. Now we show $U\cap\mathrm{Spa}(A,A^+)(\frac{f_1,\ldots,f}{g})$ is rational, for this, it suffices to add a t^N to f_i, and this is possible, as $X(\frac{f_1,\ldots,f}{g})$ is quasi-compact by(17.8.2.23). (This is in fact similar to the proof that continuous bijection from compact to Hausdorff is homeomorphism). □

Remark (17.8.3.2). The proof goes through with complete replaced by Zariski or Henselian, because we only use item5 of(17.8.2.16), which is true for all Zariski pairs.

And by looking at the construction, if a rational subset U has a representation $X(\frac{f_1,\ldots,f_n}{g})$, then $f_i\in\mathcal{O}_X^+(U)$, and g is invertible in $\mathcal{O}_X(U)$. ⌟

Stalks

Def. (17.8.3.3) [Stalks]. The **stalks of an affinoid adic space** is defined as in the case of schemes, i.e. the colimit of the function ring of rational subsets containing x, without topology, and similarly for the **integral stalk**. notice that the function rings are defined by universal property w.r.t to complete Huber pairs, so the stalks only depend on the completion of (A,A^+). ⌟

Lemma (17.8.3.4). Let U be an open subset of $X=\mathrm{Spa}(A,A^+)$ and $f,g\in\mathcal{O}_X(U)$, then $V=\{x\in U||f|_x\leq |g|_x\neq 0\}$ is an open subset of X. ⌟

Proof: Cf. Morel P116.**?** □

Prop. (17.8.3.5) [Valuations on the Stalks]. Let $X=\mathrm{Spa}(A,A^+)$ be an affinoid adic space, and $x\in X$, then:

- There is a valuation x on $\mathcal{O}_{X,x}$ extending that on A, and $\mathcal{O}_{X,x}^+=\{f\in\mathcal{O}_{X,x}||f(x)|\leq 1\}$.

- $\mathcal{O}_{X,x}$ is local with maximal ideal $\mathfrak{m}_x = \ker x$, and $\mathcal{O}^+_{X,x}$ is local with maximal ideal $\{f \in \mathcal{O}_{X,x} | |f(x)| < 1\}$.
- If $\kappa(x)$ is the residue field of $\mathcal{O}_{X,x}$ and $\kappa(x)^+$ be the image of $\mathcal{O}^+_{X,x}$ in $\kappa(x)$, then $k^+(x)$ is naturally a valuation ring, and $(\kappa(x), \kappa^+(x))$ is an affinoid field over (A, A^+). In particular, there is an isomorphism between the residue fields of $\mathcal{O}^+_{X,x}$ and $k^+(x)$.
- If $\varphi : (A, A^+) \to (B, B^+)$ is a morphism of Huber pairs and $y \in \mathrm{Spa}(B, B^+)$ is a point that $\mathrm{Spa}(\varphi)(y) = x$, then the morphism of rings $\mathrm{Spa}(\varphi)^\flat_x : \mathcal{O}_{X,x} \to \mathcal{O}_{Y,y}$ induced by $\mathrm{Spa}(\varphi)$ is such that $|\cdot|_x \circ \mathrm{Spa}(\varphi)^\flat_x = |\cdot|_y$. In particular, $\mathrm{Spa}(\varphi)^\flat_x$ is a morphism of local rings. Also it sends $\mathcal{O}^+_{X,x}$ to $\mathcal{O}^+_{Y,y}$ and this is a morphism of local rings.

If moreover A is Tate, then we have:
- The ring $\mathcal{O}^+_{X,x}$ is t-adically Henselian, and $\mathcal{O}^+_{X,x} \to k^+(x)$ induces an isomorphism after t-adic completion.
- The pairs $(\mathcal{O}^+_{X,x}, \mathfrak{m}_x)$ and $(\mathcal{O}_{X,x}, \mathfrak{m}_x)$ are Henselian.

⌟

Proof: **?** Morel P115.

1: Consider the t-adic completion of the valuation ring R_x corresponding to x, then $(\widehat{k}(\mathfrak{p}_x), \widehat{R}_x)$ is an affinoid Tate ring over (A, A^+) that is mapped to x(and its generalizations), thus by universal property, there are unique maps from every rational subsets containing x to $(\widehat{k}_x, \widehat{R}_x)$, thus inducing a map $(\mathcal{O}_{X,x}, \mathcal{O}^+_{X,x}) \to (\widehat{k}_x, \widehat{R}_x)$, which induces the desired valuation. And also we have $\mathcal{O}^+_{X,x} \subset \{f \in \mathcal{O}_{X,x} | |f(x)| \le 1\}$, for the converse, if $|f(x)| \le 1$, then $U(\frac{f,1}{1})$ is rational subsets in U containing x, so by(17.8.3.2), $f \in \mathcal{O}_X(V)^+$, thus $f \in \mathcal{O}^+_{X,x}$.

2: for g not in $\mathfrak{m}_x$, $|g(x)| > |t(x)|^n$ for some n, so g is invertible in $U(\frac{t^n}{g})$ by(17.8.3.2), hence invertible in $\mathcal{O}_{X,x}$. Similarly for $\mathcal{O}^+_{X,x}$, as g is invertible in $U(\frac{1}{g})$.

3: This is clear from the construction of the valuation on $\mathcal{O}_{X,x}$ in item1.

4:

5: As filtered colimits of Henselian pair is Henselian(5.3.10.3) and the function ring is complete, the stalk is Henselian. As for the completion, notice $\mathfrak{m}_x \subset \mathcal{O}^+_{X,x}$ and is t-divisible, thus $\mathcal{O}^+_{X,x}$ has the same t-adic completion as $k^+(x)$.

6: We first prove $(\mathcal{O}^+_{X,x}, t)$ is Henselian, for this, it suffices to prove $(\mathcal{O}^+_X(U), t)$ is Henselian, by(5.3.10.3). And $\mathcal{O}^+_X(U)$ is a filtered colimits of rings of definitions(11.2.5.14) and they are t-adically complete hence Henselian, so we are done by(5.3.10.3) again. Then so does $(\mathcal{O}_{X,x}, \mathfrak{m}_x)$ because the property of being Henselian only depends on I(5.3.10.10). □

Cor. (17.8.3.6). By the construction of the valuation on the stalk, we have an inclusion of rings $k(\mathfrak{p}_x) \subset k(x) \subset \widehat{k}(x)$ that has the same completions, where the first is induced by the compatible map $A \to \mathcal{O}_X(X) \to \mathcal{O}_X(U)$. ⌟

Def. (17.8.3.7) [Huber's Presheaf]. Now by the universal property of function rings(17.8.3.1), we have a map between them induced by inclusion of rational subsets, so we can define the **structure presheaf** to be

$$\mathcal{O}_X(W) = \lim_{U \subset W \text{ rational}} \mathcal{O}_X(U),$$

and similarly for the **integral structure sheaf** $\mathcal{O}^+_X$.

Then there is a valuation of a point on $\mathcal{O}_X(W)$ by passing to the stalk, and

$$\mathcal{O}^+_X(W) = \{f \in \mathcal{O}_X(W) | |f(x)| \le 1, \forall x \in W\}.$$

because this is true for all rational subsets by adic nullstellensatz(17.8.2.16).

A Huber ring (A, A^+) is called **sheafy** iff the structure sheaf $\mathcal{O}_X$ on $X = \mathrm{Spa}(A, A^+)$ is a sheaf. In this case, $\mathcal{O}_X^+$ is also a sheaf by the above formula, so sheafyness is a property that only depends on A. ⌟

Criteria for Sheafyness

Def. (17.8.3.8) [Stably Uniform Huber Pair]. For $(A, A^+) \in \mathcal{H}\mathrm{ubPair}$ s.t. A is analytic and $X = \mathrm{Spa}(A, A^+)$, it is called **stably uniform** if $\mathcal{O}_X(U)$ is uniform for all rational subsets $U \subset X = \mathrm{Spa}(A, A^+)$. ⌟

Prop. (17.8.3.9). Let $A \to B$ be a continuous map of Huber rings which splits in the category of topological A-modules, then A is stably uniform. ⌟

Proof: The splitting means the map is strict(11.2.1.4), so A is also uniform. Also the splitting is preserved under completed tensor product with rational localization, so A is stably uniform. □

Prop. (17.8.3.10) [Examples of Sheafy Huber Rings]. Let (A, A^+) be a complete Huber pair,

1. (Schemes)If A is discrete, then A is sheafy.
2. (Formal Schemes)If A has a Noetherian ring of definition, then A is sheafy.
3. (Rigid Spaces, Fargues-Fontaine Curves)If A is Tate and strongly Noetherian(11.2.4.25), then A is sheafy.
4. (Perfectoid Spaces)If A is analytic and (A, A^+) is stably uniform(17.8.3.8), then A is sheafy and acyclic.

⌟

Proof: Cf. Hub94 T2.2, [Ked19]1.7.

We use the arguments following(17.8.4.30).

If A is analytic and (A, A^+) is stably uniform. Firstly the ideals $(f - gT), (g - fT)$ are closed in their rings, Cf.[Ked19]L1.5.26.

Then we have a diagram

$$\begin{array}{ccccccccc}
0 & \to & 0 & \to & B\langle T\rangle \oplus B\langle T^{-1}\rangle & \xrightarrow{(x,y)\mapsto x+T^{-1}y} & B\langle T,T^{-1}\rangle & \to & 0\\
 & & \downarrow & & \downarrow{\scriptstyle (f-gT,\,g-fT^{-1})} & & \downarrow{\scriptstyle \times(f-gT)} & & \\
0 & \to & B & \to & B\langle T\rangle\oplus B\langle T^{-1}\rangle & \xrightarrow{(x,y)\mapsto x-y} & B\langle T,T^{-1}\rangle & \to & 0\\
 & & \downarrow & & \downarrow & & \downarrow & & \\
0 & \to & B & \to & B\langle \frac{f}{g}\rangle \oplus B\langle\frac{g}{f}\rangle & \to & B\langle \frac{f}{g},\frac{g}{f}\rangle & \to & 0\\
 & & \downarrow & & \downarrow & & \downarrow & & \\
 & & 0 & & 0 & & 0 & &
\end{array}$$

where the columns and the first two rows are exact, thus the third row are exact in the middle and right by spectral sequence. Also it is exact at the left by(17.8.2.15). □

Remark (17.8.3.11). Notice that these contains nearly everything of interest, so Scholze comments that we can somehow pretend that non-sheafy Huber rings don't appear in nature. ⌟

Remark (17.8.3.12). Stably uniform is hard to check in practice, so a recent paper of Hansen-Kedlaya [Sheafyness Criterion for Huber Rings] studied another class of sousperfectoid rings which can be splitly embedded into a perfectoid ring, and another class of diamaintine rings, which involves a condition on the cohomology of pro-étale site of A, closely related to properties of diamonds. ⌟

Prop. (17.8.3.13) [Non-examples of Sheafy Huber Rings]. Cf. Hub94 end of section1.? ⌟

4 Adic Spaces

Def. (17.8.4.1) [Huber category]. The category $\mathcal{V}^{pre}$ is a category that the objects are triples $(X, \mathcal{O}_X, v_x)$ that X is a topological space, $\mathcal{O}_X$ is a , and $\mathcal{O}_X$ has the structure of sheaf of complete topological rings, and v_x are continuous valuations on the stalk $\mathcal{O}_{X,x}$ with support $\mathfrak{m}_x$.

And a morphism in V^{pre} is a pair $(f, f^\flat)$ where $f : X \to Y$ is a map of topological spaces and $f^\flat : \mathcal{O}_X \to f_*\mathcal{O}_Y$ is a morphism of presheaves of topological rings, and the induced morphism of $f^\flat$ on the stalks are compatible with the valuations.

The **Huber category** V is the full subcategory of V^{pre} whose objects are triples $(X, \mathcal{O}_X, v_x)$ in V^{pre} that $\mathcal{O}_X$ is a sheaf. ⌟

Def. (17.8.4.2)[Open Immersions]. An **open immersion** in V^{pre} is a homeomorphism onto an open subset that induces an isomorphism of presheaves. ⌟

Def. (17.8.4.3) [Adic Spaces]. The category of **affinoid adic spaces** is the full subcategory of the Huber category whose objects are isomorphic to $\mathrm{Spa}(A, A^+)$ for some Huber pair (A, A^+), and the category of **adic spaces** is the full subcategory of Huber category whose objects are locally isomorphic to an affinoid adic space. ⌟

Prop. (17.8.4.4) [Adic Spectrum Adjointness]. For any affinoid adic space $X = \mathrm{Spa}(R, R^+)$ and Y an arbitrary adic space, then there is a natural isomorphism

$$\mathrm{Hom}(Y, X) \cong \mathrm{Hom}((R, R^+), (\mathcal{O}_Y(Y), \mathcal{O}_Y^+(Y))).$$

⌟

Proof: It suffices to show for $Y = (S, S^+)$ affine, because an morphism from $Y \to X$ is glued from local morphisms, and $\mathcal{O}_Y$ is a sheaf.

For this, Cf.Huber94 Prop2.1(2).? □

Def. (17.8.4.5) [Uniform Adic Spaces]. An adic space X is called **uniform** if for all open affinoid $U = \mathrm{Spa}(R, R^+) \subset X$, the Huber ring R is uniform. ⌟

Cartier Divisors and Closed Immersions

Def. (17.8.4.6)[Cartier Divisors]. Let X be a uniform analytic adic space, then a (effective)**Cartier divisor** on X is an ideal sheaf $\mathcal{I} \subset \mathcal{O}_X$ that is locally free of rank 1. The support of a Cartier divisor is $\mathrm{Supp}(\mathcal{O}_X/\mathcal{I})$.

The support Z of a Cartier divisor is a nowhere dense closed subset of X, and the map $I \mapsto \mathcal{I} = i\mathcal{O}_X$ induces a bijection between invertible ideals $I \subset R$ that $V(I)$ is nowhere dense in X and Cartier divisors on X. ⌟

Proof: By(17.8.4.21), any Cartier divisor is of the form $I \otimes_R \mathcal{O}_X$ for some invertible ideal $I \subset R$. We need to show that $\varphi : I \otimes_R \mathcal{O}_X \to \mathcal{O}_X$ is injective iff $V(I) \subset X$ is nowhere dense.

By restriction, we can assume $I = (f)$ is principle, and if $V(f)$ contains an open subset, then on an open rational subset, $f = 0$ by uniformity(17.8.2.14), so φ is not injective. Conversely, if if $V(f)$ is nowhere dense, we show f is a nonzero-divisor: if $fg = 0$ and $g \neq 0$, then $U = U(\frac{g}{g})$ is contained in $V(f)$ and is open, so $U = 0$, which implies $g = 0$ by uniformity(17.8.2.14), contradiction. □

Prop. (17.8.4.7). Let X be a uniform analytic adic space and $\mathcal{I} \subset \mathcal{O}_X$ a Cartier divisor with support Z and $j : U = X \backslash Z \to X$. There are injective maps of sheaves

$$\mathcal{O}_X \hookrightarrow \varinjlim_n \mathcal{I}^{-n} \hookrightarrow j_* \mathcal{O}_U.$$

⌟

Proof: This is local, it suffices to check this is for any affine subscheme of X, so we can assume $X = \mathrm{Spa}(R, R^+)$ and $\mathcal{I} = f\mathcal{O}_X$ for some nonzero-divisor $f \in R$ whose vanishing locus Z is nowhere dense, and check the global sections:

$$R \to R[\frac{1}{f}] \to \Gamma(U, \mathcal{O}_U).$$

Then it suffices to show $R \to \Gamma(U, \mathcal{O}_U)$ is injective. But if g vanishes on U, then the vanishing locus of g is a closed subset containing U, which implies that it is all of X as Z is nowhere dense, so $g = 0$ by uniformity(17.8.2.14). □

Def. (17.8.4.8) [Meromorphic Along the Cartier Divisor]. A function $f \in H^0(U, \mathcal{O}_U)$ is **meromorphic along** the Cartier divisor $\mathcal{I} \subset \mathcal{O}_X$ if it lifts to $H^0(X, \varinjlim_n \mathcal{I}^{-n})$. ⌟

Def. (17.8.4.9) [Closed Cartier Divisors]. On a uniform analytic adic space X, a **closed Cartier divisor** is a Cartier divisor $\mathcal{I} \subset \mathcal{O}_X$ with support Z that $(Z, \mathcal{O}_X/\mathcal{I}, |\cdot|_x, x \in Z)$ is an adic space. ⌟

Prop. (17.8.4.10) [Closed Cartier Divisor and Closed Immersion]. On a uniform analytic adic space X, a Cartier divisor $\mathcal{I} \subset \mathcal{O}_X$ is closed iff the map $\mathcal{I}(U) \hookrightarrow \mathcal{O}_X(U)$ has closed image for all open affinoid $U \subset X$. In this case, for all open affinoid $U = \mathrm{Spa}(R, R^+) \subset X$, the intersection $U \cap Z = \mathrm{Spa}(S, S^+)$ is an affinoid adic space, where $S = R/I$ and S^+ is the integral closure of the image of R^+ in S. ⌟

Proof: The property of having closed image can be checked locally as affinoid subspace is quasi-compact. The fact $\mathcal{O}_X/\mathfrak{I}$ is a $(\mathcal{O}_X/\mathfrak{I})(U_i)$ is separated for an open covering $\{U_i\}$ of X, so at $\mathcal{I}(U_i)$ is closed in $\mathcal{O}_X(U_i)$.

Conversely, if $\mathcal{I}(U) \hookrightarrow \mathcal{O}_X(U)$ has closed image for all open affinoid $U \subset X$, we want to show $(Z, \mathcal{O}_X/\mathcal{I}, |\cdot|_x, x \in Z)$ is an adic space: We can construct this locally, so if $X = \mathrm{Spa}(R, R^+)$, $S = R/I$ is separated and complete, thus a complete Huber ring, and consider the quotient Huber ring(11.2.5.19) (S, S^+), then $\mathrm{Spa}(S, S^+) \to \mathrm{Spa}(R, R^+)$ is a closed immersion of topological spaces with image $V(I)$.

What's left to show is that the map of presheaves $\mathcal{O}_X/\mathcal{I} \to \mathcal{O}_Z$ is an isomorphism, and also $\mathcal{O}_X/\mathcal{I}(U) = \mathcal{O}_X(U)/\mathcal{I}(U)$. To show this, we first show the presheaf $\mathcal{O}_X/\mathcal{I}$ is a sheaf: this is by 3×3-lemma: $\mathcal{I}$ is locally (f), and for a rational covering $U_i \to X$,

$$\mathcal{O}_X(X)/f \to \prod_i \mathcal{O}_X(U_i)/f \rightrightarrows \prod_{ij} \mathcal{O}_X(U_{ij})/f$$

is exact.

And to show $\mathcal{O}_X/\mathcal{I} \to \mathcal{O}_Z$ is an isomorphism, it suffices to notice taking localization and taking quotient commutes, because they are both defined by universal properties.(11.2.5.19)(11.2.5.32). $\square$

Remark (17.8.4.11). Even if A is Tate and stably uniform, and $f \in A$ is a nonzero-divisor that $fA \subset A$ is closed, it may not be true that $\mathcal{O} = f\mathcal{O}_X \hookrightarrow \mathcal{O}_X$ is a closed Cartier divisor on $X = \mathrm{Spa}(A, A^+)$. This is because there may be rational localization $(A, A^+) \to (B, B^+)$ that fB is not closed in B. Cf. [Ked19]P16. ⌟

Examples of Adic Spaces

Prop. (17.8.4.12) [Examples of Adic Spaces].

- (Adic Closed Unit Disk) The space $\mathrm{Spa}(\mathbb{Z}[T]) = \mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z}[T])$ represents the functor $X \mapsto \mathcal{O}_X^+(X)$.
- (Adic Affine Line) The functor $X \mapsto \mathcal{O}_X(X)$ is also representable, by $\mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z})$. Notice for any non-Archimedean field K,
$$\mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z}) \times \mathrm{Spa}\, K = \cup_{n\geq 1} \mathrm{Spa}\, K\langle \varpi^n T\rangle = \varinjlim_{n, T\mapsto \varpi T} \mathrm{Spa}\, K\langle T\rangle.$$
This is because For any Huber pair (R, R^+) over $(K, \mathcal{O}_K)$, $R = \cup_n \varpi^{-n} R^+$ because ϖ is topologically nilpotent.
- (The Open Unit Disk) Let $D = \mathrm{Spa}\, \mathbb{Z}[[T]]$, then for any non-Archimedean field K, $D_K = D \times \mathrm{Spa}\, K$ represents the functor that maps a K-algebra R to all its elements of norm ≤ 1. Then this the open disk over K. And D_K is also represented by
$$\cup_{n\geq 1} \mathrm{Spa}\, K\langle T, \frac{T^n}{\varpi}\rangle.$$
- (The Punctured Open Unit Disk) Let $D^* = \mathrm{Spa}\, \mathbb{Z}((T))$, then
$$D_K^* = D^* \times \mathrm{Spa}\, K = D_K\langle \frac{T}{T}\rangle = D_K \backslash \{0\}$$

⌟

Prop. (17.8.4.13) [The Open Unit Disk over $\mathbb{Z}_p$]. Consider $X = \mathbb{Z}_p[[T]]$ with the (p, T)-adic topology, there is exactly one non-analytic point $x = x_{\mathbb{F}_p}$. Let $X = \mathrm{Spa}(\mathbb{Z}_p[[T]])$ and $\mathcal{Y} = X\backslash\{x_{\mathbb{F}_p}\}$, then for a point $x \in \mathcal{Y}$, $T(x)$ and $p(x)$ cannot both be 0 by(11.2.6.2).

Then there exists a unique continuous map
$$\kappa : |\mathcal{Y}| \to [0, \infty]$$
characterized by the following property: For any rational number $m/n < r, |T(x)|^n > |p(x)|^m$, and for any rational number $m/n > r, |T(x)|^n < |p(x)|^m$. This map κ is surjective. ⌟

Proof: Let $\widetilde{x}$ be a maximal vertical generalization of x, then it has rank 1 and we can assume $\widetilde{x}$ is real valued by(11.2.3.8). Now we define
$$\kappa(x) = \frac{\log |T(\widetilde{x})|}{\log |p(\widetilde{x})|},$$

This is definable as $T(\widetilde{x})$ and $p(\widetilde{x})$ cannot both be 0.

The uniqueness of $\kappa(x)$ follows from the fact $|T(x)|^n > |p(x)|^m$ implies to $|T(\widetilde{x})|^n \geq |p(\widetilde{x})|^m$ because $\widetilde{x}$ is a generalization of x.

To show κ satisfies the condition, if $m/n < r$, then $|T(\widetilde{x})|^n > |p(\widetilde{x})|^m$, so $|T(x)|^n > |p(x)|^m$ because $x, \widetilde{x}$ define the same topology. And it is continuous because

$$\kappa^{-1}((-\infty, r)) = \cup_{m/n<r} U(\frac{T^n}{p^m}).$$

To show the surjectivity, if $\kappa = [x_0 : x_1]$, define the valuation as

$$v(\sum a_{ij} p^i T^j) = \sup_{a_{ij}\neq 0} e^{-x_0 i - x_1 j}$$

where $(a_{ij})^p = 1$. □

Construction of Adic Spaces

Def. (17.8.4.14) [Fiber Products of Adic Spaces and Schemes]. Cf.[Wed14]P91. ⌟

Def. (17.8.4.15) [Adic Spaces attached to Schemes]. ⌟

Def. (17.8.4.16) [Adic Spaces attached to Formal Schemes]. Cf.[Wed14]. ⌟

Def. (17.8.4.17) [Adic Spaces attached to Rigid Analytic Spaces]. Cf.[Wed14]. ⌟

Sheaves and Vector Bundles

Def. (17.8.4.18). Let (A, A^+) be a Huber pair and $X = \mathrm{Spa}(A, A^+)$, let $\widetilde{M} = M \otimes_A \mathcal{O}_X$ be the presheaf on X. ⌟

Prop. (17.8.4.19). If A is sheafy, then for any finite projective A-module M, the presheaf $\widetilde{M}$ is a sheaf on $X = \mathrm{Spa}(A, A^+)$, and $H^i(U, \mathcal{F}) = 0$ for any rational subset of X and $i > 0$. ⌟

Proof: Because M is a direct sum of a finite free A-module, then we reduce to the case $\mathcal{O}_X$ is sheafy. □

Remark (17.8.4.20). This is a partial analogy with Tate's acyclicity theorem in rigid analytic geometry(17.5.1.40)(17.5.3.10), but it only holds for f.p. modules, not even f.g. modules. One impediment is that the rational localization map are generally not flat. To get around this, Kedlaya defined a category of pseudo-coherent modules, with the property that even when flatness fails, tensoring is also exact in this category. ⌟

Prop. (17.8.4.21) [Vector Bundles]. Let (A, A^+) be a sheafy analytic Huber pair and $X = \mathrm{Spa}(A, A^+)$, then the functor $M \to \widetilde{M}$ from the category of finite projective A-modules to the category Vect_X of locally finite free $\mathcal{O}_X$-modules is an equivalence of categories. In particular, Vect_X only depends on A. ⌟

Proof: Cf.[Ked19].P40**?** □

Pre-Adic Spaces

Main references are [S-W20]L3 and [Ked19].

Def. (17.8.4.22) [Pre-Adic Spaces]. ⌟

Remark (17.8.4.23). Pre-adic spaces is an approach to work around the failure of sheafyness of general Huber pair, with techniques from algebraic stacks. ⌟

Analytic Points

Prop. (17.8.4.24) [Analytic and Tate Rings]. Let (A, A^+) be a complete Huber pair, then

- The Huber ring A is analytic iff all points of $\mathrm{Spa}(A, A^+)$ are analytic.
- A point $x \in \mathrm{Spa}(A, A^+)$ is analytic iff there is a rational nbhd $U \subset \mathrm{Spa}(A, A^+)$ that $\mathcal{O}_X(U)$ is Tate.

⌟

Proof: 1: x is non-analytic iff $A^{00} \subset \mathfrak{p}_x$ by(11.2.6.5), so all points are analytic iff $A^{00}A = A$, which means A is analytic.

2: Let x be an analytic point, then there exists $f \in I$ where I is an ideal of definition that $|f|_x \neq 0$. Now $\{g \in A||g(x)| \leq |f(x)\}$ is open(because $|\cdot|_x$ is continuous), so contains some I^n. Now let $I^n = (g_1, \ldots, g_k)$, then $U(\frac{g_1,\ldots,g_k}{f})$ is a rational subset. Then in $\mathcal{O}_X(U)$, f is a unit, but also it is topologically nilpotent, because it is contained in I.

Conversely, if $x \in X$ has a rational nbhd $U = U\langle\frac{T}{s}\rangle$ such that $\mathcal{O}_X(U)$ is Tate, and x is not analytic, then $\mathfrak{p}_x$ contains an ideal of definition $I \subset A_0$. Now let $f \in \mathcal{O}_X(U)$ be a topologically nilpotent unit, then there exists $m \geq 1$ that f^m lies in the closure of $IA_0[t/s|t \in T]$ in $\mathcal{O}_X(U)$. Since $x \in U$, the valuation $|\cdot|_x$ extends to $\mathcal{O}_X(U)$, and since $|\cdot|_x$ is continuous, $|f^m(x)| = 0$, contradiction, as f is a unit in $\mathcal{O}_X(U)$. □

Def. (17.8.4.25) [Analytic Points]. Let X be a pre-adic space, then a point $x \in X$ is called an **analytic point** if there is some open affinoid nbhd $U = \mathrm{Spa}(A, A^+) \subset X$ of x that A is Tate. And X is called **analytic** if all of its points are analytic. ⌟

Prop. (17.8.4.26). Let $f : X \to Y$ be a map of analytic pre-adic spaces, then $|f| : |X| \to |Y|$ is generalizing. If f is quasi-compact and surjective, then $|f|$ is a quotient map. ⌟

Proof: Cf.[Hub96]1.1.10. and [Étale Cohomology of Diamonds, L2.5].**?** □

Def. (17.8.4.27). A map $f : Y \to X$ of pre-adic spaces is called **analytic** if it carries analytic points to analytic points. ⌟

Proof of Acyclicity and Sheafyness by Cech Reduction

Def. (17.8.4.28) [Standard Rational Coverings]. Let $X = \mathrm{Spa}(A, A^+)$ and $f_1, \ldots, f_n \in A$ which generates the unit ideal, then the sets $X(\frac{f_1,\ldots,f_n}{f_i})$ covers X, called the **standard rational covering** of X. And if $n = 2$, it is called a **standard binary rational covering** of X.

There are special types of standard binary rational coverings: if $f_1 = f, f_2 = 1$, then it is called a **simple Laurent covering**. If $f_1 = f, f_2 = 1 - f$, then it is called a **simple balanced covering**. ⌟

Lemma (17.8.4.29) [Reduction of Coverings]. Let A be an analytic Huber ring,

- (Huber) Every open covering of X can be refined by some standard rational covering.
- (Gabber-Ramero) Every open covering of a rational subspace of X can be refined by some compositions of simple Laurent coverings and simple balanced coverings.

⌟

Proof: 1: Cf.[Ked19]P28.
2: Cf.[Ked19]P29. □

Prop. (17.8.4.30)[Cech Reduction]. By a Cech cohomological argument the same as Tate's acyclicity theorem in rigid geometry(17.5.1.40), it suffices to prove any presheaf is a sheaf or any sheaf is acyclic on simple Laurent coverings and simple balanced coverings.

That is, for every rational localization (B, B^+) over (A, A^+), every pair $f, g \in B$ that $g = f$ or $1 - f$, if the sequence

$$0 \to B \to B\langle \frac{f}{g}\rangle \oplus B\langle \frac{g}{f}\rangle \to B\langle \frac{f}{g}, \frac{g}{f}\rangle \to 0,$$

- is exact at exact at left and middle, then $\mathcal{O}_X$ is sheafy.
- is exact, then $\mathcal{O}_X$ is acyclic.

Also remember the following equations:

$$B\langle \frac{f}{g}\rangle = B\langle T\rangle/\overline{(f - gT)}, \quad B\langle \frac{g}{f}\rangle = B\langle T\rangle/\overline{(g - fT)}, \quad B\langle \frac{f}{g}, \frac{g}{f}\rangle = B\langle T, T^{-1}\rangle/\overline{(f - gT)}$$

⌟

Prop. (17.8.4.31) [Properties of (Finite)Étale Maps].

- (Finite)Étale maps are invariant under compositions and pullbacks.
- If g and gf are (finite)étale, then so is f.
- f is (finite)étale iff $f^\flat$ is (finite)étale.

⌟

Proof: Cf.[S-W20]P65. □

5 Perfectoid Spaces

Affinoid Perfectoid Spaces

Def. (17.8.5.1) [Perfectoid Spaces]. For any perfectoid affinoid algebra R, we associated to it an affinoid adic space $\mathrm{Spa}(R, R^+)$, called an **affinoid perfectoid space**.

Tate's acyclicity(17.8.6.19) shows that the adic spectra of perfectoid affinoid algebras are sheafy, so we can defined the category of **perfectoid spaces** $\mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ to be the full subcategory of adic spaces that are locally isomorphic to affinoid perfectoid spaces. ⌟

Remark (17.8.5.2). Notice that it is not true that if $(A, A^+) \in \mathcal{H}\mathrm{ubPair}$ and $\mathrm{Spa}(A, A^+) \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$, then $A \in \mathcal{P}\mathrm{erfd}$. Thus there is ambiguity to the term affinoid perfectoid spaces. But we always use this to mean the affinoid adic space associated to a perfectoid Huber pair. ⌟

Proof: Cf.[Ked19]P62. □

Prop. (17.8.5.3). The absolute product of two perfectoid spaces of char p is also a perfectoid space. ⌟

Proof: Cf.[Sch17]P71. □

Prop. (17.8.5.4) [Fiber Products of Perfectoid Spaces]. $\mathcal{P}\mathrm{erfd}_K$ admits fiber products. ⌟

Proof: Perfectoid spaces are constructed by glueing, thus it suffices to show that the category of perfectoid $K^\flat$-algebras has fiber pushouts, by tilting equivalence. For this, if $X = (A, A^+), Y = (B, B^+), Z = (C, C^+)$, define $X \otimes_Y Z = (D, D^+)$, where D is the completion of $A \otimes_B C$, and D^+ is the completion of the integral closure of $A^+ \otimes_{B^+} C^+$ in D. Then D is a perfect $K^\flat$-algebra, and it is truly the filtered colimits, by(11.2.5.23).

Notice that we don't even need a base field K, Cf.[Ked19]P57. □

Tiltings

Prop. (17.8.5.5) [Tilting Rational Subsets]. For a perfectoid affinoid K-algebra (R, R^+) over a perfectoid field K,

- The $\sharp$ map induces an isomorphism $X = \mathrm{Spa}(R, R^+) \cong X^\flat = \mathrm{Spa}(R^\flat, R^{\flat 0})$ that identifies rational open subsets.
- For a rational subset U with tilting $U^\flat$, the complete affinoid Tate algebra $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is perfectoid over R with tilt $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$.

⌟

Proof: This follows from(17.8.5.9). □

Lemma (17.8.5.6) [Huber's Presheaf in Char p]. Assume char$K = p$ and $U = X(\frac{f_1,\ldots,f_n}{g})$ is a rational subset that $f_i, g \in R^+$ and $f_n = \varpi^N$, then:

- Consider the subring $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$, its ϖ-adic completion $(R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle)^a$ is a perfectoid K^{0a}-algebra.
- The map $R^+[X_i^{\frac{1}{p^\infty}}] \to R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ has kernel containing and almost equal to $I = (g^{\frac{1}{p^m}} X_i^{\frac{1}{p^m}} - f_i^{\frac{1}{p^m}})$.
- $\mathcal{O}_X(U)$ is a perfectoid K-algebra and $\mathcal{O}_X(U)^{0a} \cong (R^+\langle(\frac{f_i}{g})^{\frac{1}{p^m}}\rangle)^a$.

⌟

Proof: 1: The ring $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ is perfect and ϖ-torsion-free, and R^+ is semi-perfect, thus its completion is clearly a perfectoid K^{0a}-algebra by(11.2.9.1).

2: Clearly $I \subset \ker$ and notice $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}][\varpi^{-1}] = R[g^{-1}]$ as $f_n = \varpi^N$, so $I[\varpi^{-1}] = \ker[\varpi^{-1}]$. Now consider the mapping

$$P_0 = R^+[X_i^{\frac{1}{p^\infty}}]/I \to R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$$

Now this map is an isomorphism ofter inverting ϖ, so the kernel is ϖ^∞-torsion. But we have $I = I^{[p]}$ because R^+ is semi-perfect, so P_0 is perfect, so the kernel must be almost zero.

3: Consider the inclusion $R^+[\frac{f_i}{g}] \hookrightarrow R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$, we show the cokernel is killed by ϖ^{nN}: as $f_n = \varpi^N$,

$$\varpi^{nN} \prod_{i=1}^n (\frac{f_i}{g})^{\frac{1}{p^{a_i}}} = \prod_{i=1}^n (f_i^{\frac{1}{p^{a_i}}} g^{1-\frac{1}{p^{a_i}}}) \frac{f_n}{g} \in R^+[\frac{f_i}{g}].$$

So these two ring has the same ϖ-adic completion, the first one is just $\mathcal{O}_X(U)$ by the construction(17.8.3.1), so $\mathcal{O}_X(U)$ is perfectoid K-algebra, and the isomorphism is by tilting equivalence $\mathrm{perf}_K \cong \mathrm{perf}_{K^{0a}}$(11.2.9.5). □

Lemma (17.8.5.7) [Huber's Presheaf in Char 0]**.** Let $U = X(\frac{f_1,\dots,f_n}{g})$ is a rational subset that f_i, g are perfect elements in R^+, $f_i = a_i^\sharp, g = b^\sharp$, and $f_n = \varpi^N$, so f_i, g have compatible p^n-th roots, then let $U^\flat = X^\flat(\frac{f_1,\dots,f_n}{g})$ be the tilting of U, U is the inverse image of $U^\flat$ along the map $X \to X^\flat$. Then the conclusion of(17.8.5.6) is also true, and moreover, $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ tilts to $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$. ⌟

Proof: $1, 2$ of(17.8.5.6): Notation as before, there is a map $P_0 = R^+[X_i^{\frac{1}{p^\infty}}]/I \to R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$, and an inclusion $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}] \to \mathcal{O}_X^+(U)$. Now write (S, S^+) for the untilt of the perfectoid $(R^\flat, R^{\flat+})$-algebra $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$, then by the tilting process(11.2.9.13), $\mathrm{Spa}(S, S^+)$ maps into U, so by the universal property, there is a map

$$\mu : (\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \to (S, S^+).$$

Consider the composition

$$P_0 \xrightarrow{a_0} R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}] \xrightarrow{d_0} S^+,$$

we prove their completion gives the same K^{0a}-algebras(notice S^+ is already complete): a_0 is surjective, thus so does its completion, the map $d_0 \circ a_0$ is almost isomorphism modulo ϖ by(17.8.5.6) item2 and tilting equivalence, so does its completion. Now(5.7.3.2) tells us the completion of $d_0 \circ a_0$ is almost isomorphism, so does a and d as a is surjective.

By the way, we know that $R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle[\varpi^{-1}]$ is the untilt of $\mathcal{O}_{X^\flat}^+(U^\flat)$.

3 of(17.8.5.6) is proved as before.

For the tilting, by the above, we already know $R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}$ tilts to the perfectoid $K^{\flat 0a}$-algebra $\mathcal{O}_{X^\flat}(U^\flat)^{0a}$, and by item3 $\mathcal{O}_X(U)$ tilts to the perfectoid $K^\flat$-algebra $\mathcal{O}_{X^\flat}(U^\flat)$. Now the question is the tilt of $\mathcal{O}_X^+(U)$, notice as in the proof of item1, there is a natural map

$$(R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle[\varpi^{-1}], R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle) \to (\mathcal{O}_X(U), \mathcal{O}_X^+(U)),$$

whose tilting gives by university of Huber's presheaf a map

$$\xi : (\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat)) \to (\mathcal{O}_X(U), \mathcal{O}_X^+(U))^\flat.$$

These two map μ, ξ are inverse to each other, showing that the tilting of $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$. □

Lemma (17.8.5.8) [Approximation Lemma]. Assume $R = K\langle T_0^{\frac{1}{p^\infty}}, \dots, T_0^{\frac{1}{p^\infty}}\rangle$, $f \in R^0$ is homogenous of degree $d \in \mathbb{N}[p^{-1}]$, then for any $c > 0, \varepsilon > 0$, there exists some $g_{c,\varepsilon} \in R^{\flat 0}$ homogeneous of degree d that

$$|(f - g^\sharp)(x)| \le |\varpi|^{1-\varepsilon} \max\{|f(x)|, |\varpi|^c\}.$$

In particular, if $\varepsilon < 1$, then

$$\max\{|f(x)|, |\varpi|^c\} = \max\{|g_{c,\varepsilon}^\sharp(x)|, |\varpi|^c\}.$$

⌟

Proof: Cf.[Sholze Perfectoid Spaces, Lemma6.5]?. □

Prop. (17.8.5.9). For any $R \in \mathcal{P}\mathrm{erfd}_K$,

- The same conclusion of(17.8.5.8) holds.
- For $f, g \in R$, there exist $a, b \in R^\flat$ that $X(\frac{f,\varpi^c}{g}) = X(\frac{a^\sharp,\varpi^c}{b^\sharp})$. In particular, any rational subsets U of X comes from $X^\flat$, thus(17.8.5.7) applies for U.
- For any $x \in X$, the non-Archimedean field $\widehat{k(x)}$ is perfectoid.
- $X \to X^\flat$ is a homeomorphism preserving rational subsets.

⌟

Proof: 1: Using the tilting equivalence, we can write $f = g_0^\sharp + \varpi g_1^\sharp + \ldots + \varpi^c g_c^\sharp + f_{c+1}\varpi^{c+1}$, let $f_0 = g_0^\sharp + \varpi g_1^\sharp + \ldots + \varpi^c g_c^\sharp$. Then notice that the solution $g_{c,\varepsilon}$ for f_0 is suitable for f as well. So now if we consider the mapping

$$\mu : K\langle T_0^{\frac{1}{p^\infty}}, \ldots, T_n^{\frac{1}{p^\infty}}\rangle \to R : T_i \to g_i^\sharp,$$

together with its tilting

$$\mu^\flat : K^\flat\langle T_0^{\frac{1}{p^\infty}}, \ldots, T_n^{\frac{1}{p^\infty}}\rangle \to R^\flat.$$

Then for the approximation $g_{c,\varepsilon}^\sharp$ for $f' = \sum \varpi^i T_i$, $\mu^\flat(g)$ is what we are searching for.

2: Using 1, we find $a, b \in R^\flat$ that $|(g - b^\sharp)(x)| < \max\{|g(x)|, \varpi^c\}$ and $\max\{|f(x)|, |\varpi|^c\} = \max\{|a^\sharp(x)|, |\varpi|^c\}$ for all $x \in \mathrm{Spa}(R, R^+)$. Then it is routine to check that $X(\frac{f,\varpi^c}{g}) = X(\frac{a^\sharp,\varpi^c}{b^\sharp})$.

3: By(17.8.3.5), $\widehat{k^+(x)}$ equals the completion of the colimit $\mathrm{colim}\, \mathcal{O}_X^+(U)$ over rational subsets U containing x. As these are all perfectoid K^{0a}-algebras(11.2.9.14), and completion of the filtered limits of perfectoid K^{0a}-algebras is perfectoid(11.2.9.10), we know that $\widehat{k^+(x)}$ is perfectoid over K^{0a}, thus inverting ϖ shows $k(x)$ is also perfectoid over K.

4: this is injective because X is T_0 and a rational subset is the untilt of a ratinal subset of $X^\flat$ by item2. For surjectivity, a point of $X^\flat$ determines a continuous map $(R^\flat, R^{\flat+}) \to (\widehat{k(x)}, \widehat{k^+(x)})$, thus by untilting(11.2.9.13) corresponds to a map $(R, R^+) \to (L, L^+)$, then (L, L^+) is a perfectoid field, by(11.2.9.15), so it sorresponds to a point $y \in X$. Then it is clear that y maps to x, because the diagram $\begin{array}{ccc} R^\flat & \xrightarrow{\sharp} & R \\ \downarrow & & \downarrow \\ \widehat{k(x)} & \xrightarrow{\sharp} & L \end{array}$ is commutative. □

Prop. (17.8.5.10) [Tilting Equivalence for Perfectoid Spaces]. Fix a perfectoid field K, then for any perfectoid space X/K, there is a unique perfectoid space $X^\flat/K^\flat$ that satisfies: $X(R, R^+) \cong X^\flat(R^\flat, R^{\flat+})$ functorially, called the **tilt** of X. Moreover, this $X^\flat$ satisfies naturally $|X| \cong |X^\flat|$.

When X is an affinoid perfectoid space, this tilting coincides with that of(17.8.5.5).

And this tilting induces an equivalence between the category of perfectoid spaces over K and perfectoid spaces over $K^\flat$. ⌟

Proof: Firstly, the universal property truly determines the tilt $X^\flat$ uniquely: if there are two tilts X_1, X_2, as they are locally affinoid perfectoid like $\mathrm{Spa}(R^\flat, R^{\flat+})$ by(17.8.5.5), the immersion map $\mathrm{Spa}(R^\flat, R^{\flat+}) \to X_1$ determines via the functorial isomorphism a morphism $\mathrm{Spa}(R^\flat, R^{\flat+}) \to X_2$. Now X_1 has a sheaf structure, so these morphisms glue to give a morphism $X_1 \to X_2$. The same argument shows conversely there is a morphism $X_2 \to X_1$, and they are clearly converse to each other, so $X_1 \cong X_2$.

The construction of X is just the glueing of the tilting of the affinoid perfectoid spaces, as the tilting defined in(17.8.5.5) is a functor. The universal property is verified by just checking on the affinoid perfectoid spaces, as we can glue using the sheaf property. For the affinoid case, we should use(17.8.4.4). The last assertion is by(17.8.5.5). □

6 Properties of Perfectoid Spaces

Totally Disconnected Spaces

Def. (17.8.6.1) [Totally Disconnected Spaces]. A perfectoid space X is called **totally disconnected** if it is qcqs and any open covering $\{U_i \to X\}$ splits, i.e. $\coprod U_i \to X$ splits, or equivalently, there is a refinement covering $\{V_i \to X\}$ that $X \cong \coprod V_i$.

A perfectoid space X is called **strictly totally disconnected** if it is qcqs and every étale cover splits. ⌟

Prop. (17.8.6.2). Let X be a qcqs perfectoid spaces, then X is totally disconnected iff all its connected components are of the form $\mathrm{Spa}(K, K^+)$ where (K, K^+) are perfectoid affinoid fields. And it is strictly totally disconnected if moreover K are all alg.closed. ⌟

Proof: Cf.[Sch17].P29, P35. □

Prop. (17.8.6.3). if X is a totally disconnected perfectoid space, then X is affinoid. ⌟

Proof: Cf.[Sch17].P30.? □

Injections

Def. (17.8.6.4) [Injections]. A map $f : X \to Y$ of perfectoid spaces is called an injection if for any perfectoid space Z, $f_* : \mathrm{Hom}(Z, X) \to \mathrm{Hom}(Z, Y)$ is an injection. ⌟

Prop. (17.8.6.5) [Residue Field Map is Injection]. Let X be a perfectoid space and $x \in X$, giving rise to a map of residue fields

$$i_x : \mathrm{Spa}(\kappa(x), \kappa(x)^+) \to X,$$

then i_x is an injection of perfectoid spaces. ⌟

Proof: To show this, firstly we can replace X with an affinoid nbhd of X. Then notice that $\mathrm{Spa}(\kappa(x), \kappa(x)^+)$ is the filtered limit over all rational nbhds U of x in X, and for each U, $U \to X$ is an injection by definition(17.8.3.1), so i_x is also an injection. □

Prop. (17.8.6.6) [Characterizations of Injections]. Let $f : Y \to X$ be a map of perfectoid spaces, then the following conditions are equivalent:

- f is an injection.
- For any perfectoid adic field (K, K^+), the map of sets $f_* : Y(K, K^+) \to X(K, K^+)$ is an injection.
- The map $|f| : |Y| \to |X|$ is injective, and for all rank 1 point $y \in Y$ with image $f(y) = x \in X$, the map of completed residue fields $\kappa(x) \to \kappa(y)$ is an isomorphism.

- The map $|f|:|Y|\to|X|$ is injective, and f is final in the category of maps $Z\to X$ that $|Z|\to|X|$ factors through the map $|Y|\to|X|$.

In particular, by item4, an injection of perfectoid spaces is determined by its topological map. ⌟

Proof: $4\to1\to2$ is trivial. For the rest, Cf.[Sch17]P21. □

Prop. (17.8.6.7) [Injection and Base Change].

- Let $f:Y\to X$ be an injection of perfectoid spaces, and $X'\to X$ any map of perfectoid spaces, then the pullback $f':Y'=Y\times_X X'\to X'$ is also an injection, and the induced map

$$|Y'|\to|Y|\times_{|X|}|X'|$$

is a homeomorphism.

A map of perfectoids spaces is an injection iff it is universally injective. ⌟

Proof: Cf.[Sch17]P24. □

Immersions

Def. (17.8.6.8) [Immersions]. $f:Y\to X\in\mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ is called an **immersion of perfectoid spaces** if f is an injection and $|f|:|Y|\to|X|$ is a locally closed immersion. If $|f|$ is moreover closed or open, then it is called closed/open immersion. ⌟

Def. (17.8.6.9) [Zariski-Closed Immersion]. For $f:Z\to X\in\mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ where $X=\mathrm{Spa}(R,R^+)$ is affinoid,

- f is called a **Zariski-closed immersion of perfectoid spaces** if f is a closed immersion and $|Z|=V(I)\subset|X|$, where $I\subset R$ is an ideal.
- f is called a **strongly Zariski-closed immersion of perfectoid spaces** if $Z=\mathrm{Spa}(S,S^+)$ is affinoid, $R\to S$ is surjective, and S^+ is the closure of R^+ in S.

⌟

Prop. (17.8.6.10).

- If f is strongly Zariski-closed, then f is Zariski-closed, in particular a closed immersion.
- If f is Zariski-closed, then Z is affinoid.
- If X is of characteristic p, and f is Zariski-closed, then f is strongly Zariski-closed.

⌟

Proof: Cf.[Sch12] Section2.5. □

Prop. (17.8.6.11). For any map of perfectoid spaces $Y\to X$, the diagonal map $\Delta_f:Y\to Y\times_X Y$ is an immersion. ⌟

Proof: Clearly Δ_f is an injection, thus it suffices to show that $|\Delta_f|$ identifies Y with a locally closed subset of $|Y\times_X Y|$. This can be checked locally on the target, so we can assume $X=\mathrm{Spa}(R,R^+)$ and $Y=\mathrm{Spa}(S,S^+)$, then the diagonal map is strongly Zariski closed, as $S\widehat{\otimes}_R S\to S$ is surjective and maps the integral closure of $S^+\widehat{\otimes}_{R^+}S^+\to S^+$ onto S^+. Thus by(17.9.1.11), Δ_f is a closed immersion in this case. □

Def. (17.8.6.12) [Separated Map]. A map $f:Y\to X\in\mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ is called separated if Δ_f is a closed immersion. ⌟

Prop. (17.8.6.13)[Valuation Criterion]. Let $f : Y \to X$ be a map of perfectoid spaces. The following are equivalent:

- f is separated.
- $|\Delta_f| : |Y| \to |Y \times_X Y|$ is a closed immersion.
- $|f|$ is quasi-separated, and for any perfectoid adic field (K, K^+) and any diagram

$$\begin{array}{ccc} \mathrm{Spa}(K, \mathcal{O}_K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow f \\ \mathrm{Spa}(K, K^+) & \longrightarrow & X \end{array},$$

⌟

Almost Acyclicity

Def. (17.8.6.14) [p-Finite Tate Ring]. Denote $L = \widehat{\mathbb{F}_p[[t]]_{\mathrm{perf}}}[t^{-1}]$, an $\mathbb{F}_p[t]$ algebra A^+ is called **algebraically admissible** if it is f.p., reduced, t-torsion-free, and integrally closed in $A^+[t^{-1}]$. A perfectoid affinoid L-algebra (R, R^+) is called p**-finite** if it is the completion of the perfection(17.8.2.27) of a uniform Tate ring of the form $(A^+[t^{-1}], A^+)$, where A^+ is algebraically admissible. ⌟

Lemma (17.8.6.15) [Tate's Acyclicity for Classical Affinoid Algebra]. If A^+ is an algebraically admissible $\mathbb{F}_p[t]$-algebra, then $(A^+[t^{-1}], A^+)$ is a uniform affinoid Tate algebra(because it is finite), and:

- For any rational subset $U \subset X$, the structure presheaf $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is also uniform, and it is a perfection of an algebraically admissible $\mathbb{F}_p[t]$-algebra, so $\mathcal{O}_X^+(U) = \mathcal{O}_X(U)^0$.
- For any covering $\mathfrak{U} : U_i \to X$ of rational subsets, the Čech cohomology groups $H^i(\mathfrak{U}, \mathcal{O}_X^+)$ are all killed by t^N for N large.
- (A, A^+) is sheafy, with $H^i(X, \mathcal{O}_X^+)$ being t^∞-torsion for all i.

⌟

Proof: ? □

Lemma (17.8.6.16) [Tate's Acyclicity for p-Finite Perfectoid Algebras]. Let (R, R^+) be a p-finite perfectoid L-algebra that comes from the completion of perfection of (A, A^+), then:

- The map $X = \mathrm{Spa}(R, R^+) \to Y = \mathrm{Spa}(R, R^+)$ is a homeomorphism.
- For rational subset $V \subset Y$ with preimage $U \subset X$, $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is the completion of the perfection of $(\mathcal{O}_Y(V), \mathcal{O}_Y^+(V))$.
- For any covering $\mathfrak{U} : U_i \to X$ of rational subsets, the Čech cohomology groups $H^i(\mathfrak{U}, \mathcal{O}_X^0)$ are all almost zero.
- (R, R^+) is sheafy, with $H^i(X, \mathcal{O}_X^+)$ almost zero for all $i > 0$.

⌟

Proof: 1: This is because the adic spectrum is insensitive for perfection(17.8.2.27) and completion(17.8.2.16).

2: This is by the universal property, as these two are both the universal elements for the complete and affinoid adic spaces mapping to X that factors through U.

3: The complex calculating $H^i(\mathfrak{U},\mathcal{O}_X^0)$ is just the complex calculating $H^i(\mathfrak{U},\mathcal{O}_Y^+)$ under completion of perfection((17.8.2.26) used). So(17.8.6.15) and(17.8.6.17)(applied to every element) shows that the perfection makes the complex almost acyclic, and this is preserved under completion as $(-)^a$ is exact.

4: The complex calculating $H^i(\mathfrak{U},\mathcal{O}_X)$ is just the complex calculating $H^i(\mathfrak{U},\mathcal{O}_X^+)$ inverting t, thus they are all 0 as localization is exact. For the second, it is because of item3 and the fact $\mathcal{O}_X^+$ is almost isomorphic to $\mathcal{O}_X^0$(11.2.9.14). □

Lemma (17.8.6.17). Let A be a ring with an element t that admits compatible p^n-th roots, then for an A-module M that $t^N M=0$, consider the Frobenius pushforward $M\to F_*M$, then the colimit $\operatorname{colim}_{F_*} F_*^n M$ is naturally a module over A_{perf}, and it is annihilated by $t^{\frac{1}{p^n}}$ for all n. ⌟

Proof: The A_{perf} structure is natural, and notice $F_*^k M$ is annihilated by $t^{\frac{N}{p^k}}$, thus naturally the colimit is annihilated by $t^{\frac{1}{p^n}}$ for all n. □

Prop. (17.8.6.18) [Noetherian Approximation in Char p]. If K is a perfectoid field of char$p$ with pseudo-uniformizer t, then K is an extension of $L=\widehat{\mathbb{F}_p[[t]]_{\mathrm{perf}}}[t^{-1}]$, and If A is an K^0-perfectoid algebra that is integrally closed in $A[t^{-1}]$, then:

- A is a completion of a filtered colimit $(\operatorname{colim}_i B_i)^\wedge$ that B_i are p-finite, that induces an homeomorphism
$$\mathrm{Spa}(A[t^{-1}],A)\cong\varprojlim_i \mathrm{Spa}(B_i[t^{-1}],B_i)$$
that each rational subset of $\mathrm{Spa}(A[t^{-1}],A)$ comes from a rational subset of some $\mathrm{Spa}(B_i[t^{-1}],B_i)$.
- If $U_i\subset\mathrm{Spa}(B_i[t^{-1}],B_i)$ is a compatible system of rational subsets that corresponds to $U\subset\mathrm{Spa}(A,A^+)=X$, then
$$(\mathcal{O}_X(U),\mathcal{O}_X^+(U))\cong\varinjlim_j(\mathcal{O}_j(U_j),\mathcal{O}_j^+(U_j))^\wedge.$$

⌟

Proof: 1: $A=\operatorname{colim}_i A_i$, where A_i are all the f.p. $\mathbb{F}_p[t]$-algebras in A. Then each A_i is reduced(as A is complete and integrally closed in $A[t^{-1}]$) and t-torsion-free, and we can assume they are integrally closed in $A_i[t^{-1}]$ because A does, by passing to their integral closure.

Then applying the $(-)_{\mathrm{perf}}$ functor gives $\operatorname{colim}_i(A_i)_{\mathrm{perf}}=A$, as A is perfect, and applying the completion gives
$$(\operatorname{colim}_i\widehat{A_i})^\wedge=A,$$
as A is already complete, so we are done.

2: This is immediate from 1 and(17.8.2.26).

3: This is because by universal property for Huber presheaves, there are pushouts diagrams

$$\begin{array}{ccccccc}(B_i[t^{-1}],B_i) & \longrightarrow & (B_j[t^{-1}],B_j) & \longrightarrow & \ldots & \longrightarrow & (A[t^{-1}],A)\\ \downarrow & & \downarrow & & & & \downarrow\\ (\mathcal{O}_{X_i}(U_i),\mathcal{O}_{X_i}^+(U_i)) & \longrightarrow & (\mathcal{O}_{X_j}(U_j),\mathcal{O}_{X_j}^+(U_j)) & \longrightarrow & \ldots & \longrightarrow & (\mathcal{O}_X(U),\mathcal{O}_X^+(U))\end{array}$$

So the conclusion follows as colimits commutes with colimits. □

Prop. (17.8.6.19) [Almost Acyclicity for Perfectoids]. Fix a perfectoid field K and a perfectoid affinoid K-algebra (R, R^+) with adic spectrum $X = \mathrm{Spa}(R, R^+)$, then

- (R, R^+) is sheafy, i.e. $\mathcal{O}_X$ and $\mathcal{O}_X^+$ are sheaves.
- $\mathcal{O}_X^+(X) = R^+$, and $H^i(X, \mathcal{O}_X^+)$ is almost zero for $i > 0$.
- $\mathcal{O}_X(X) = R$, and $H^i(X, \mathcal{O}_X) = 0$ all $i > 0$.

⌟

Proof: As in the proof of(17.8.6.16), it suffices to prove $\mathcal{O}_X^0$ is almost exact w.r.t any covering $\mathfrak{U}$. For this, notice each term is ϖ-adically complete and flat by(17.8.5.5), so it suffices to prove it is almost exact modulo ϖ(5.7.3.2). Then by the tilting equivalence, it suffices to prove for $X^\flat$. So we may assume at first that K is of char$p$. Then we may replace K by $L = \widehat{\mathbb{F}_p[[t]]_{\mathrm{perf}}}[t^{-1}]$.

But then Noetherian approximation(17.8.6.18) shows that the rational subrings are completion of filtered colimits of p-finite K-algebras((17.8.2.26) used), and then we reduced to the p-finite case, as in the proof of(17.8.6.16). □

7 Étale Sites of Perfectoid Spaces

Def. (17.8.7.1) [Finite Étale Maps of Adic Spaces]. A map of Huber pairs $(A, A^+) \to (B, B^+)$ is called **finite étale** if $A \to B$ is finite étale, and B^+ is the integral closure of A^+ in B.

A map $f : X \to Y$ of adic spaces is called a **finite étalemorphism of adic spaces** if there is a cover of Y by affinoids $V \subset Y$ that $U = f^{-1}(V)$ are all affinoids, and the map $(\mathcal{O}_Y(V), \mathcal{O}_Y^+(V)) \to (\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is finite étale. Write $Y_{\text{fét}}$ for the category of all such maps. ⌟

Def. (17.8.7.2) [Étale Maps]. A map $X = \mathrm{Spa}(A, A^+) \to Y = \mathrm{Spa}(B, B^+)$ of adic spaces is called **étale** iff for any $x \in X$, there exists an open $x \in U$ and open $f(U) \subset V$ together with an adic space W that $f : U \to V$ factors through an open immersion $U \to W$ and a finite étale map $W \to V$.

Cf.[S-W20]P65. ⌟

Def. (17.8.7.3) [Strongly Finite Étale]. For convenience, in case of perfectoid affinoid K-algebras, we call a map of Huber pairs $(A, A^+) \to (B, B^+)$ **strongly finite étale** if it is finite étale and B^{+a} is almost finite étale over A^{+a}.

A map $f : X \to Y$ of adic spaces is called **strongly finite étale** if there is a cover of Y by affinoids $V \subset Y$ that $U = f^{-1}(V)$ are all affinoids, and the map $(\mathcal{O}_Y(V), \mathcal{O}_Y^+(V)) \to (\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is strongly finite étale. Write $Y_{s\,\text{fét}}$ for the category of all such maps.

Finally we will prove that if (A, A^+) is perfectoid, then any finite étale map $(A, A^+) \to (B, B^+)$ is strongly finite étale. ⌟

Prop. (17.8.7.4) [Strongly Finite Étale Maps Form a Stack]. If $f : X \to Y$ is a strongly finite étale map that $Y = \mathrm{Spa}(A, A^+)$ is an affinoid perfectoid, then X is also affinoid perfectoid, and the structure map $(\mathcal{O}_X(X), \mathcal{O}_X^+(X)) \to (\mathcal{O}_Y(Y), \mathcal{O}_Y^+(Y))$ is strongly finite étale. ⌟

Proof: By(17.8.7.9), it suffices to prove in char$p$. Then we can replace K by $L = \widehat{\mathbb{F}_p[[t]]_{\mathrm{perf}}}[t^{-1}]$. Then by Noetherian approximation(17.8.6.18), we can assume that Y is a limit of p-finite affinoids $\mathrm{Spa}(B_i, B_i^+)$. As both rational subsets and finite étale algebras pass through filtered colimit, and adic spectrum is quasi-compact(17.8.2.23), we can assume that a finite étale cover of Y arises through base change of some $\mathrm{Spa}(B_i, B_i^+)$. So it suffices to prove the proposition in case of Y p-finite. Then Y is a completion of perfection of some algebraically admissible ring over $\mathbb{F}_p[t]$. Then by the above argument again, we can assume that Y is algebraically admissible.

Now a classical theorem(Cf.[Étale cohomology of rigid analytic varieties and adic spaces, Huber 1.6.6(2)]) shows that the finite étale cover of Y is global finite étale $\mathrm{Spa}(S,S^+)\to\mathrm{Spa}(R,R^+)$ in this case. Notice the strongness is not needed because we are working in char p, where almost purity theorem is already proven. □

Cor. (17.8.7.5). For an affinoid perfectoid space $Y=\mathrm{Spa}(R,R^+)$, the functor $X\mapsto\mathcal{O}_X^+(X)$ defined an equivalence of categories $Y_{s\,\text{fét}}\cong R^{+a}_{a\,\text{fét}}$, and the functor $X\mapsto\mathcal{O}_X(X)$ gives a fully faithful functor $Y_{s\,\text{fét}}\to R_{\text{fét}}$. ⌟

Def. (17.8.7.6) [Étale Sites of Perfectoid Spaces]. Let X be a perfectoid space, then the étale site of X is the category $X_{\text{ét}}$ of perfectoid spaces that is étale over X, and coverings are given by topological coverings. We also consider the following subcategories:

- $X_{\text{ét}}^{aff}$, the category of affinoid perfectoid spaces étale over X.
- $X_{\text{ét},qcqs}$, the full subcategory of qcqs perfectoid spaces étale over X.
- $X_{\text{ét},qc,sep}$, the full subcategory of qc separated perfectoid spaces étale over X.

⌟

Prop. (17.8.7.7) [Gabber-Ramero]. If A is a finite K^0-algebra that is ϖ-adically Henselian, then

$$A[\varpi^{-1}]_{\text{fét}}\cong\widehat{A}[\varpi^{-1}]_{\text{fét}}.$$

⌟

Proof: Cf.[Almost Ring Theory P5.4.53]. □

Cor. (17.8.7.8) [Finite Étale Covers and Direct Limits of Complete Uniform Rings]. Let (A_i,A_i^+) be a filtered system of complete uniform affinoid K-algebras, and (A,A^+) be their colimit in the category of complete uniform affinoid Tate rings, then

$$2-\mathrm{colim}_i\,A_{i,\text{fét}}\cong A_{\text{fét}}$$

as categories. ⌟

Proof: By(17.8.2.26), A^+ is the ϖ-adic completion of the algebraic colimit B^+ of A_i^+, and $A=A^+[\varpi^{-1}]$. Each A_i is complete and ϖ-torsion-free, thus the colimit is Henselian and ϖ-torsion-free(5.3.10.3)(5.3.10.6). Then the proposition(17.8.7.7) shows that $B^+[\varpi^{-1}]_{\text{fét}}\cong A_{\text{fét}}$. Now it remains to show that

$$2-\mathrm{colim}_i\,A_{i,\text{fét}}\cong B^+[\frac{1}{\varpi}]_{\text{fét}},$$

which is because étale sites commutes with taking filtered colimits □

Final Proof of Almost Purity Theorem

Prop. (17.8.7.9). There is an equivalence of categories $X_{s\,\text{fét}}\cong X^\flat_{s\,\text{fét}}$. ⌟

Proof: For this, use(17.8.7.5),(17.8.5.10) and the proven part of(11.2.10.1) and notice that

$$A^{+a}_{a\,\text{fét}}=A^{0a}_{a\,\text{fét}}\cong A^{\flat 0a}_{a\,\text{fét}}=A^{\flat+a}_{a\,\text{fét}},$$

and the integral closure clearly corresponds.(It get around the problem that $R^{0a}_{\text{fét}}\to R_{\text{fét}}$ hasn't been proven essentially surjective). □

Prop. (17.8.7.10)[Proof of Almost Purity Theorem]. Fix a perfectoid affinoid K-algebra (R, R^+), if $S \in R_{\text{fét}}$, then the integral closure of S^+ in R^+ lies in $R^{+a}_{a\,\text{fét}}$, and this gives an inverse to the morphism d in(11.2.10.1), thus finishing the proof of almost purity theorem. ⌟

Proof: Continuing the proof of(11.2.10.1), it suffices to show that $d : R^{+a}_{a\,\text{fét}} \to R_{\text{fét}}$ is essentially surjective, because $S^+ \to \overline{S} \subset R^+$ is the only possible inverse, by the almost purity theorem in char$p$ and tracing the tilting equivalence(11.2.9.6). Given(17.8.7.5), it suffices to prove that for $X = \mathrm{Spa}(R, R^+)$, the prestacks $X_{s\,\text{fét}} \cong X_{\text{fét}}$, where $X_{s\,\text{fét}}(U) = \mathcal{O}_X^{+a}(U)_{s\,\text{fét}}$, and $X_{\text{fét}}(U) = \mathcal{O}_X(U)_{\text{fét}}$.

We use(6.1.3.22), firstly $X_{s\,\text{fét}}$ is a stack, by(17.8.7.4), and for each U, $X_{s\,\text{fét}}(U) \to X_{\text{fét}}(U)$ is fully faithful by almost purity theorem(11.2.10.1). $X_{\text{fét}}$ is separated by(17.8.4.21), because the structure section of an element $S \in X_{\text{fét}}$ is determined its value on the stalk.

Its left to prove that their stalks are equal, for this, use the formula

$$\mathrm{colim}_{x\in U}(\mathcal{O}_X(U), \mathcal{O}_X^+(U)) = (\widehat{k(x)}, \widehat{k^+(x)})$$

in the category of complete uniform affinoid K-algebras(they are all perfectoids(17.8.5.5) thus uniform), by definition. So we get by(17.8.7.8):

$$\mathrm{colim}_{x\in U}\,\mathcal{O}_X(U)_{\text{fét}} \cong \widehat{k(x)}_{\text{fét}},$$

and by(17.8.7.8) together with the proven part of almost purity theorem(11.2.10.1):

$$\mathrm{colim}_{x\in U}\,\mathcal{O}_X^+(U)_{a\,\text{fét}} \cong \mathrm{colim}_{x^\flat\in U^\flat}\,\mathcal{O}_X^{\flat+}(U^\flat)_{a\,\text{fét}} \cong \kappa^+(x^\flat)_{a\,\text{fét}} \cong \kappa^+(x)_{a\,\text{fét}}.$$

Now we have already proved the almost purity over fields(11.2.10.1) which says $\kappa(x^\flat)_{a\,\text{fét}} \cong \kappa^+(x)_{a\,\text{fét}}$, so their stalks are the same. □

Cor. (17.8.7.11) [Invariance of Étale Site under Tilting]. There is a natural isomorphism of categories $X_{\text{ét}} \cong X^\flat_{\text{ét}}$, by almost purity theorem(11.2.10.1) and the localness of étale maps. ⌟

Prop. (17.8.7.12) [Almost Acyclicity]. For any $X \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$, the functor $U \mapsto \mathcal{O}_X(U)$ is a sheaf on $X_{\text{ét}}$, and $H^i(X_{\text{ét}}, \mathcal{O}_X^+)$ is almost zero if X is affinoid perfectoid. ⌟

Proof: □

17.9 Pro-Étale Sites on $\mathcal{P}\mathrm{erfd}$ and Diamonds

References are [Sch17] and [Notes on Diamonds, David Hansen].

1 Properties of Perfectoid Spaces

Totally Disconnected Spaces

Def. (17.9.1.1) [Totally Disconnected Spaces]. $X \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ is called **totally disconnected** if it is qcqs and any open covering $\{U_i \to X\}$ splits, i.e. $\coprod U_i \to X$ splits, or equivalently, there is a refinement covering $\{V_i \to X\}$ that $X \cong \coprod V_i$.

A perfectoid space X is called **strictly totally disconnected** if it is qcqs and every étale cover splits. ⌟

Prop. (17.9.1.2). Let X be a qcqs perfectoid spaces, then X is totally disconnected iff all its connected components are of the form $\mathrm{Spa}(K, K^+)$ where (K, K^+) are perfectoid affinoid fields. And it is strictly totally disconnected if moreover K are all alg.closed. ⌟

Proof: Cf.[Sch17].P29, P35. □

Prop. (17.9.1.3). if X is a totally disconnected perfectoid space, then X is affinoid. ⌟

Proof: Cf.[Sch17].P30. □

Injections

Def. (17.9.1.4) [Injections]. $f : X \to Y \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ is called an injection if for any perfectoid space Z, $f_* : \mathrm{Hom}(Z, X) \to \mathrm{Hom}(Z, Y)$ is an injection. ⌟

Prop. (17.9.1.5) [Residue Field Map is Injection]. Let X be a perfectoid space and $x \in X$, giving rise to a map of residue fields

$$i_x : \mathrm{Spa}(\kappa(x), \kappa(x)^+) \to X,$$

then i_x is an injection of perfectoid spaces. ⌟

Proof: To show this, firstly we can replace X with an affinoid nbhd of X. Then notice that $\mathrm{Spa}(\kappa(x), \kappa(x)^+)$ is the filtered limit over all rational nbhds U of x in X, and for each U, $U \to X$ is an injection by definition(17.8.3.1), so i_x is also an injection. □

Cor. (17.9.1.6). In particular, if X is qcqs and has a unique closed point $x \in X$, then $X = \mathrm{Spa}(\kappa(x), \kappa(x)^+)$, as in this case X is the only quasi-compact open subset containing x. ⌟

Prop. (17.9.1.7) [Characterizations of Injections]. For $f : X \to Y \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$, the following are equivalent:

- f is an injection.
- For any perfectoid adic field (K, K^+), the map of sets $f_* : Y(K, K^+) \to X(K, K^+)$ is an injection.
- The map $|f| : |Y| \to |X|$ is injective, and for all rank 1 point $y \in Y$ with image $f(y) = x \in X$, the map of completed residue fields $\kappa(x) \to \kappa(y)$ is an isomorphism.
- The map $|f| : |Y| \to |X|$ is injective, and f is final in the category of maps $Z \to X$ that $|Z| \to |X|$ factors through the map $|Y| \to |X|$.

In particular, by item4, an injection of perfectoid spaces is determined by its topological map. ⌟

Proof: Cf.[Sch17]P21. $4 \to 1 \to 2$ is trivial. □

Prop. (17.9.1.8) [Injection and Base Change].

- Let $f : Y \to X$ be an injection of perfectoid spaces, and $X' \to X$ any map of perfectoid spaces, then the pullback $f' : Y' = Y \times_X X' \to X'$ is also an injection, and the induced map
$$|Y'| \to |Y| \times_{|X|} |X'|$$
is a homeomorphism.
- A map of perfectoids spaces is an injection iff it is universally injective.

⌟

Proof: Cf.[Sch17]P24. □

Immersions

Def. (17.9.1.9) [Immersions]. $f : Y \to X \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ is called an immersion if f is an injection and $|f| : |Y| \to |X|$ is a locally closed immersion. If $|f|$ is moreover closed or open, then it is called closed/open immersion. ⌟

Def. (17.9.1.10) [Zariski-Closed Immersions]. Let $f : Z \to X = \mathrm{Spa}(R, R^+) \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$, then

- f is called a Zariski-closed immersion if f is a closed immersion and $|Z| = V(I) \subset |X|$, where $I \subset R$ is an ideal.
- f is called a strongly Zariski-closed immersion if $Z = \mathrm{Spa}(S, S^+)$ is affinoid perfectoid, $R \to S$ is surjective, and S^+ is the closure of R^+ in S.

⌟

Prop. (17.9.1.11).

- If f is strongly Zariski closed, then f is Zariski closed, in particular a closed immersion.
- If f is Zariski closed, then Z is affinoid.
- If X is of characteristic p, and f is Zariski closed, then f is strongly Zariski closed.

⌟

Proof: Cf.[Sch17] Section2.5. □

Prop. (17.9.1.12). For any map of perfectoid spaces $Y \to X$, the diagonal map $\Delta_f : Y \to Y \times_X Y$ is an immersion. ⌟

Proof: Clearly Δ_f is an injection, thus it suffices to show that $|\Delta_f|$ identifies Y with a locally closed subset of $|Y \times_X Y|$. This can be checked locally on the target, so we can assume $X = \mathrm{Spa}(R, R^+)$ and $Y = \mathrm{Spa}(S, S^+)$, then the diagonal map is strongly Zariski closed, as $S\widehat{\otimes}_R S \to S$ is surjective and maps the integral closure of $S^+\widehat{\otimes}_{R^+} S^+ \to S^+$ onto S^+. Thus by(17.9.1.11), Δ_f is a closed immersion in this case. □

Def. (17.9.1.13) [Separated Map]. $f : Y \to X \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$ is called separated if Δ_f is a closed immersion. ⌟

Prop. (17.9.1.14) [Valuation Criterion]. For $f : Y \to X \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$, the following are equivalent:

- f is separated.
- $|\Delta_f| : |Y| \to |Y \times_X Y|$ is a closed immersion.
- $|f|$ is quasi-separated, and for any perfectoid adic field (K, K^+) and any diagram

$$\begin{array}{ccc} \mathrm{Spa}(K, \mathcal{O}_K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow f \\ \mathrm{Spa}(K, K^+) & \longrightarrow & X \end{array},$$

there exists at most one dotted arrow making the diagram commutative.

⌟

Proof: The equivalence of 1 and 2 is by(17.9.1.12).

2 $\to$ 3: If $|\Delta_f|$ is a closed immersion, then it is in particular quasi-compact, thus f is quasi-separated. Now if there are two dotted-arrow making this diagram commutative, they define a point $z \in (Y \times_X Y)(K, K^+)$ s.t. $z|_{\mathrm{Spa}(K,\mathcal{O}_K)} \in \Delta_f(Y)(K, \mathcal{O}_K)$. But $|\Delta_f|(|Y|)$ is closed in $|Y \times_X Y|$, so z maps $\mathrm{Spa}(K, K^+)$ into $|\Delta_f|(|Y|)$ iff it maps $\mathrm{Spa}(K, \mathcal{O}_K)$ into $|\Delta_f|(|Y|)$, as $\mathrm{Spa}(K, \mathcal{O}_K) \subset \mathrm{Spa}(K, K^+)$ is dense**??**. Now Δ_f is an injection, so by(17.9.1.7), z factors through Δ_f thus the two maps are equal.

3 $\to$ 2: The condition implies that $|\Delta_f| : |Y| \to |Y \times_X Y|$ is a quasi-compact locally closed immersion of locally spectral spaces which is moreover specializing. But because $|\Delta_f|$ is quasi-compact, the image of $|\Delta_f|$ is pro-constructible, and it is also closed under specialization, thus it is closed, Cf.[Sch17]P25. □

2 Pro-Étale Site and v-Site

Prop. (17.9.2.1). if (R, R^+) is the completed filtered colimit of perfectoid Huber pairs (R_i, R_i^+), $X_i = \mathrm{Spa}(R_i, R_i^+)$, $X = \mathrm{Spa}(R, R^+)$, then base change induce equivalences of categories:

- $2 - \lim_i X_{i,\text{fét}} \cong X_{\text{fét}}$.
- $2 - \lim_i X_{i,\text{ét}}^{\text{aff}} \cong X_{\text{ét}}^{\text{aff}}$.
- $2 - \lim_i X_{i,\text{ét},qcqs} \cong X_{\text{ét},qcqs}$.
- $2 - \lim_i X_{i,\text{ét},qc,sep} \cong X_{\text{ét},qc,sep}$.

⌟

Proof: Cf.[Sch17]P27.

1 follows from almost purity theorem. □

Def. (17.9.2.2)[Pro-étale Morphism]. A map of perfectoid Huber pairs $(A, A^+) \to (B, B^+)$ is called **pro-étale** iff it is the completed filtered colimit of étale ring maps $(A, A^+) \to (A_i, A_i^+)$.

A morphism of perfectoid spaces is **pro-étale** if there is an affinoid covering $V_i = \mathrm{Spa}(R_i, R_i^+)$ of X that $f^{-1}(V_i)$ have coverings $U_{ij} = \mathrm{Spa}(R_{ij}, R_{ij}^+)$ that $(R_i, R_i^+) \to (R_{ij}, R_{ij}^+)$ are all pro-étale.

In fact, by(17.9.2.7), if this is true for one affinoid covering V_i of X, then this is true for any affinoid covering of X. ⌟

Prop. (17.9.2.3). If S is a profinite set and X is a perfectoid space, then we can define a new perfectoid space $X \times \underline{S}$ as the inverse limit of $X \times \underline{S_i}$, where $S = \varprojlim S_i$. Then $X \times \underline{S}$ is pro-étale over X. ⌟

Prop. (17.9.2.4) [Immersion are Pro-Étale]. If $f : Z \hookrightarrow X$ be a Zariski closed immersion with image $V(I)$, then f is affinoid pro-étale. Then $f(Z)$ can be written as the intersection of rational subsets

$$U_{f_1,\ldots,f_n} = \{|f_1|, \ldots, |f_n| \le |\varpi|\}$$

for various n and $f_1, \ldots, f_n \in I$. Then $Z = \varprojlim U_{f_1,\ldots,f_n} \to X$, as it is a closed immersion thus an injection(17.9.1.11), which shows $Z \to X$ is pro-étale.

In particular, an immersion is also pro-étale because pro-étale can be checked analytically locally. ⌟

Cor. (17.9.2.5) [Diagonal Map is Pro-Étale]. If $f : Y \to X$ is a map of perfectoid spaces, then $\Delta_f : Y \to Y \times_X Y$ is pro-étale, by(17.9.1.12). ⌟

Prop. (17.9.2.6). If X is an affinoid perfectoid space, then the functor

$$\mathrm{Pro}(X^{\mathrm{aff}}_{\text{ét}}) \to X^{\mathrm{aff}}_{pro\,\text{ét}} : \varprojlim_i (X_i) \mapsto \varprojlim_i X_i$$

is an equivalence of categories. ⌟

Proof: This map is essentially surjective by definition, To show it is fully faithful, it suffices to show that for $Y = \varprojlim_i \mathrm{Spa}(Y_i, Y_i^+), Z = \varprojlim_j \mathrm{Spa}(Z_j, Z_j^+)$,

$$\mathrm{Hom}_X(Y, Z) = \varprojlim_j \varinjlim_i \mathrm{Hom}(Y_i, Z_j).$$

We need to show for any $Z \to X$,

$$\mathrm{Hom}_X(Y, Z) = \varinjlim_i \mathrm{Hom}(Y_i, Z).$$

Because $2 - \lim_i X_{i,\text{ét},qcqs} \cong X_{\text{ét},qcqs}$(17.9.2.1), we have

$$\mathrm{Hom}_X(Y, Z) = \mathrm{Hom}_Y(Y, Y \times_X Z) = \varinjlim_i \mathrm{Hom}_{Y_i}(Y_i, Y_i \times_X Z) = \varinjlim_i \mathrm{Hom}_X(Y_i, Z).$$

□

Prop. (17.9.2.7) [Properties of Pro-Étale Morphisms].

- (Affinoid)Pro-Étale maps are stable under composition and pullbacks.
- Let $f : Y \to X, f' : Y' \to X$ be (affinoid)pro-étale, then any map $g : Y \to Y'$ over X is also (affinoid)pro-étale.
- For any affinoid perfectoid space X, the category $X^{\mathrm{aff}}_{pro-\text{ét}}$ has all finite limits.

⌟

Proof: 1: Composition is obvious. pro-étale maps are stable under pullbacks because étale maps do.

2: We can factor g as a section of the map $Y \times_X Y' \to Y$ and the projection map $Y \times_X Y' \to Y'$. Thus it suffices to show a section of a pro-étale map is pro-étale. But if $Y = \varprojlim_i Y_i \to X$ is pro-étale, then a section is given by compatible sections $s_i : X \to Y_i$. Then $X = \varprojlim_i (X \times_{Y_i} Y) \to X$ is pro-étale.

3: This is because $X^{\mathrm{aff}}_{\text{ét}}$ has finite limits, because it has a final object and fiber products(11.2.9.17). □

Def. (17.9.2.8) [Big Pro-Étale Sites]. Consider the following categories:

- $\mathcal{P}$erfd$\mathcal{S}$pa, the category of perfectoid spaces.
- $\mathcal{P}$erf, the category of perfectoid spaces of characteristic p.
- $X_{pro\,\text{ét}}$, the category of perfectoid spaces pro-étale over X, where X is a perfectoid space.
- $X^{\text{aff}}_{pro\,\text{ét}}$, the category of affinoid perfectoid spaces pro-étale over X.

The **big pro-étale site** is the category Perfd endowed with the topology that a family of maps $\{f_i : Y_i \to X\}$ is a covering if all f_i are pro-étale and for any quasi-compact open subset $U \subset X$, there is a finite set $J \subset I$ and quasi-compact opens $V_j \subset Y_j$ that $U = \cup_{j\in J} f_j(V_j)$.

These truly form sites by(17.9.2.7). ⌟

Cor. (17.9.2.9). The presheaf $\mathcal{O} : X \mapsto \mathcal{O}_X(X), \mathcal{O}^+ : X \mapsto \mathcal{O}^+_X(X)$ on the big étale site are sheaves. If X is affinoid perfectoid, then $H^i(X_{pro\,\text{ét}}, \mathcal{O}) = 0$ for $i > 0$, and $H^i(X_{pro\,\text{ét}}, \mathcal{O}^+)$ is almost zero for $i > 0$. Moreover, the big pro-étale site is subcanonical. ⌟

Proof: Firstly we can assume X is affinoid because we already know $\mathcal{O}, \mathcal{O}^+$ are sheaves w.r.t. the analytic topology. Let $Y \to X$ be an affinoid pro-étale covering of X, where $Y = \text{Spa}(R_\infty, R^+_\infty)$, $(R_\infty, R^+_\infty) = (\varinjlim_i (R_i, R^+_i))^\wedge$. Then fixing a pseudo-uniformizer ϖ of R, the complexes

$$0 \to R^+/\varpi \to R^+_j/\varpi \to \cdots$$

is almost exact, because $H^i(X_{\text{ét}}, \mathcal{O}^+_X/\varpi)$ is almost zero for $i > 0$. Now take a direct limit over i, then

$$0 \to R^+/\varpi \to R^+_\infty/\varpi \to \cdots$$

is almost exact. Now by induction on n, we can prove

$$0 \to R^+/\varpi^n \to R^+_\infty/\varpi^n \to \cdots$$

is almost exact. Then by passing to the direct limit ,

$$0 \to R^+ \to R^\infty_\infty \to \cdots$$

is almost exact. Then by inverting ϖ,

$$0 \to R \to R_\infty \to \cdots$$

is exact. These give us the desired results. Notice $\mathcal{O}^+$ is a sheaf because it is the elements of valuations≤ 1 everywhere by(17.8.3.7).

For the final assertion, if $\{Y_i \to Y\}$ is a pro-étale covering of Y, and $g_i : Y_i \to X$ are maps that agree on $Y_i \times_X Y_j$, then firstly we can glue these maps together topologically to a map $|Y| \to |X|$. So this problem can be considered locally on X, so we may assume $X = \text{Spa}(R, R^+)$ is affinoid, and maps $(R, R^+) \to (\mathcal{O}(Y_i), \mathcal{O}^+(Y_i))$ that agree on the overlap(17.8.4.4), then they glue to a map $(R, R^+) \to (\mathcal{O}(Y), \mathcal{O}^+(Y))$, as $\mathcal{O}, \mathcal{O}^+$ are all sheaves, and this gives a morphism $Y \to X$. □

Prop. (17.9.2.10) [Strictly Totally Disconnected Pro-Étale Cover]. Let X be an affinoid perfectoid space, then there is an affinoid perfectoid space $\widetilde{X}$ with an affinoid pro-étale surjective and universally open map $\widetilde{X} \to X$ that $\widetilde{X}$ is strictly totally disconnected. ⌟

Proof: Cf.[Sch17]P35. □

Prop. (17.9.2.11). The presheaf $\mathcal{O}, \mathcal{O}^+$ are sheaves w.r.t. the v-topology. Moreover, the v-site is subcanonical. ⌟

Proof: Cf.[Sch17]P40. □

Prop. (17.9.2.12). Let X be an affinoid perfectoid space, then $H^i_v(X, \mathcal{O}) = 0$ for $i > 0$, and $H^i_v(X, \mathcal{O}^+)$ is almost zero for $i > 0$. ⌟

Proof: Cf.[Sch17]P41. □

Descent on Pro-Étale Site

Prop. (17.9.2.13) [Descent May Fail]. The question is whether the fibered category over Perfd:

$$X \mapsto \{\text{Perfectoid Spaces } Y \to X\}$$

is a stack for the pro-étale toplogy. This fails in general. An evidence is that the fibered category

$$X \mapsto \{\text{Affinoid Perfectoid Spaces } Y \to X\}$$

is not a stack on the category of affinoid Perfectoid spaces with the analytic topology, let along the pro-étale topology:

Let $X = \operatorname{Spa} K\langle x, y\rangle$, and $V \subset X$ be $\{(x, y) \mid |x| = 1 \text{ or } |y| = 1\}$, then V is covered by two affinoids, but is not an affinoid itself: $H^1(V, \mathcal{O}_V) = \widehat{\bigoplus}_{m,n>0} K x^{-m} y^{-n} \neq 0$. But there is a standard rational covering $X = \cup_i X(\frac{f_1, f_2, f_3}{f_i})$, where $f_1 = \varpi$, $f_2 = x$, $f_3 = y$, and

$$U_0 \cap V = \varnothing, \quad U_1 \cap V = \{|x| = 1\} \subset U_1, \quad U_2 \cap V = \{|y| = 1\} \subset U_2$$

are all affinoid. There is a similar example in the perfectoid case, thus

$$X \mapsto \{\text{Affinoid Perfectoid Spaces } Y \to X\}$$

is not a stack. ⌟

Prop. (17.9.2.14) [Pro-étale is not Pro-étale Local]. There is an example of a non-pro-étale map that is pro-étale locally pro-étale. ⌟

Proof: Cf.[S-W20]P66. □

Prop. (17.9.2.15) [Characterization of Locally pro-étale Maps]. For $f : X \to Y \in \mathcal{A}\text{ff}\,\mathcal{P}\text{erfd}\mathcal{S}\text{pa}$, the following are equivalent:

- There exists an affinoid pro-étale cover $Y' \to Y$ s.t. the base change $X' = X \times_Y Y' \to Y'$ is pro-étale.
- For all geometric points $\operatorname{Spa} C \to Y$, $X \times_Y \operatorname{Spa} C = \operatorname{Spa} C \times \underline{S}$ for some profinite set S.

⌟

Proof: Cf.[S-W20]P66. □

Prop. (17.9.2.16) [Descent]. Descent data of the the fibered category

$$X \mapsto \{\text{Perfectoid Spaces } Y \to X\}$$

of a perfectoid space $Y' \to X'$ along a pro-étale cover $X' \to X$ is effective in the following cases:

- If X, X', Y' are affinoids and X is totally disconnected.
- if f is separated and pro-étale and X is strictly totally disconnected.
- If f is separated and étale. In particular, the fibered category

$$X \mapsto \{\text{separated étale } X \to Y\}$$

is a stack over the category of perfectoid spaces with the pro-étale topology.
- If f is finite étale. In particular, the fibered category

$$X \mapsto \{\text{finite étale } X \to Y\}$$

is a stack over the category of perfectoid spaces with the pro-étale topology.

⌟

Proof: Cf.[Sch17]P9.3, 9.6, 9.7. □

3 Morphisms of v-Stacks

Def. (17.9.3.1)[Étale Morphisms of Stacks]. Let $f: Y' \to Y$ be a map of pro-étale stacks on $\mathcal{P}$erfd,

- Assume f is locally separated(i.e. there is an open cover of Y' over which f becomes separated), then f is called **quasi-pro-étale** if for any strictly totally disconnected perfectoid space X and a map $X \to Y$, the pullback $Y' \times_Y X$ is representable and $Y' \times_Y X \to X$ is pro-étale.
- Assume f is locally separated, then f is called **étale** if for any perfectoid space X and a map $X \to Y$, the pullback $Y' \times_Y X$ is representable and $Y' \times_Y X \to X$ is étale.
- f is called **finite étale** if for any perfectoid space X and a map $X \to Y$, the pullback $Y' \times_Y X$ is representable and $Y' \times_Y X \to X$ is finite étale.

⌟

4 Diamonds

Remark (17.9.4.1) [Motivation of Diamonds]. The idea of diamonds is that there should be a functor

$$\diamond : \{\text{analytic adic spaces over } \mathbb{Z}_p\} \to \{\text{diamonds}\}$$

that forgets the structure morphism to $\mathbb{Z}_p$. For a perfectoid space X, $X \mapsto X^f lat$ has this property, so this functor should coincides on these objects. Now any analytic adic space X over $\mathbb{Z}_p$ is pro-étale locally perfectoid:

$$X = \mathrm{Coeq}(\widetilde{X} \times_X \widetilde{X} \rightrightarrows X),$$

where $\widetilde{X} \to X$ is a pro-étale perfectoid cover. The equivalence relations $R = \widetilde{X} \times_X \widetilde{X}$ is also perfectoid, so this functor should send X to $\mathrm{Coeq}(R^\flat \rightrightarrows \widetilde{X}^\flat)$.

For example, if $X = \mathrm{Spa}(\mathbb{Q}_p)$, then a pro-étale cover of X is $\mathrm{Spa}((\mathbb{Q}_p^{\mathrm{cycl}})^\wedge)$, and then $R = \widetilde{X} \times_X \widetilde{X} = \widetilde{X} \times \underline{\mathbb{Z}_p^*}$ by Galois theory, and then $\mathbb{Q}_p^\diamond$ should be defined as the coequalizer of $\mathrm{Spa}((\mathbb{Q}_p^{\mathrm{cycl}})^\flat)/\underline{\mathbb{Z}_p^*}$, whose meaning is explained in(17.9.4.11). ⌟

Def. (17.9.4.2) [Diamonds]. A **diamond** is a pro-étale sheaf $\mathcal{D}$ on $\mathcal{P}$erfd that can be written as $\mathcal{D} = X/R$, where

- $X \in \mathcal{P}$erfd,

- R is a pro-étale equivalence relation in $X \times X$(i.e. an equivalence relation that the maps $s, t : R \to X$ are pro-étale),
- R is representable.

⌟

Prop. (17.9.4.3). Let $X \in \mathcal{P}\mathrm{erfd}$ and $R \subset X \times X$ a representable pro-étale equivalence relation, then

- The quotient sheaf $Y = X/R$ is a diamond.
- The natural map of sheaves $R \to X \times_Y X$ is an isomorphism.
- Let $\widetilde{X} \to X$ be a pro-étale cover by a perfectoid space $\widetilde{X}$, and $\widetilde{R} = R \times_{X \times X} (\widetilde{X} \times \widetilde{X})$ the induced equivalence relation, then $\widetilde{R}$ is a representable pro-étale equivalence relation of $\widetilde{X}$, and the natural map $\widetilde{Y} = \widetilde{X}/\widetilde{R} \to Y = X/R$ is an isomorphism.
- The map $X \to Y$ is quasi-pro-étale(17.9.3.1).

⌟

Proof: 1 is by definition.

For 2, firstly $R \to X \times_Y X$ is injective as subsheaves of $X \times X$. Next, if $Z \to X \times_Y X$ is any map from a perfectoid space Z, then we have two maps $a, b : Z \to X$ that their composition with $X \to Y$ agree. This means after passing to a pro-étale covering $\widetilde{Z} \to Z$, the composition map $\widetilde{Z} \to Z \to X \times X$ factors through R. Now this map $\widetilde{Z} \to R$ descends to a map $Z \to R$, because pro-étale site is subcanonical and the two projection maps $\widetilde{Z} \times_Z \widetilde{Z} \to R$ coincides because they do after compositing with $R \hookrightarrow X \times X$.

3: Firstly $\widetilde{R}$ is representable as fiber products of representable objects(17.8.5.4), and the two projections are pro-étale, as they are compositions of base changes of pro-étale morphisms. Also the mop $\widetilde{Y} \to Y$ of pro-étale sheaves is surjective, as the composition $\widetilde{X} \to X \to Y$ is.

To show $\widetilde{Y} \to Y$ is injective, let Z be a perfectoid space with two maps $Z \to \widetilde{Y}$ that coincide after compositing with $\widetilde{Y} \to Y$, we need to show $a = b$. Now because pro-étale site is subcanonical, it suffices to show this after replacing Z with a pro-étale cover $\widetilde{Z}$, such that a, b factors over $\widetilde{a}, \widetilde{b} : Z \to \widetilde{X}$. The associated map $Z \to \widetilde{X} \times \widetilde{X} \to X \times X$ factors through R by item2, so we get a map $Z \to R \times_{X \times X} (\widetilde{X} \times \widetilde{X}) = \widetilde{R}$, which means $\widetilde{a}, \widetilde{b}$ induces the same map $Z \to \widetilde{Y}$. So we are done.

4: By 3, we can replace X by $\widetilde{X} = \coprod_i U_i \to X$, where U_i is an affinoid cover of $\widetilde{X}$, and R by the the induced equivalence relation in $\widetilde{X} \times \widetilde{X}$, and to pro-étale is analytically local. In this way, we may assume $R \subset X \times X$ and $X \times X \to X$ are separated.

Let X' be a strictly totally disconnected perfectoid space and $X' \to X$ be a map. Because $X \to Y$ is surjective as sheaves on Perf, there is a pro-étale cover $\widetilde{X'} \to X'$ and a map $\widetilde{X'} \to X$ lying over $X' \to Y$. We can assume $\widetilde{X'}$ is affinoid. Let $W = X' \times_Y X \to X'$ be the fiber product, then

$$\widetilde{X'} \times_{X'} W = \widetilde{X'} \times_X (X \times_Y X) = \widetilde{X'} \times_X R$$

is representable and pro-étale over $\widetilde{X'}$, and also separated. So by(17.9.2.16), W is also representable, pro-étale and separated over X. □

Cor. (17.9.4.4) [Equivalent Characterization of Diamonds]. Let Y be a pro-étale sheaf on Perf, then Y is a diamond iff there is a surjective quasi-pro-étale morphism $X \to Y$ from a perfectoid space X. If X is a disjoint union of strictly totally disconnected spaces, then $R \subset X \times_Y X \subset X \times X$ is a representable pro-étale equivalence relation with $Y = X/R$. ⌟

Proof: If Y is a diamond, then $X \to Y$ is quasi-pro-étale by(17.9.4.3). Conversely, if there is a quasi-pro-étale morphism $X \to Y$, by(17.9.2.10), we can assume that X is a disjoint union of strictly disconnected spaces. In this case, by the definition of auasi-pro-étale, R is representable and the projections $R = X \times_Y X \to X$ is pro-étale, and $X/R \cong Y$: it suffices to show this map is injective: if $a, b : Z \to X$ are two maps that coincide after composing with $X \to Y$, then after replacing to a pro-étale covering $\widetilde{Z} \to Z$, we can lift to maps $(\widetilde{a}, \widetilde{b}) : \widetilde{Z} \to R$. And this map descend to a map $Z \to R$, because the pullback to $\widetilde{Z} \times_Z \widetilde{Z} \to R$ coincides as they do after composing with $R \hookrightarrow X \times X$. So $X/R \to Y$ is injective. □

Cor. (17.9.4.5).

- Let Y be a pro-étale sheaf on $\mathcal{P}$erfd and there is a quasi-pro-étale map $Y' \to Y$, where Y' is a diamond, then Y is also a diamond.
- Let $f : Y' \to Y$ be a quasi-pro-étale map of pro-étale sheaves on $\mathcal{P}$erfd and Y is a diamond, then Y' is also a diamond.

⌟

Proof: 1: By(17.9.4.4), we can choose a quasi-pro-étale map $X \to Y'$ where X is a perfectoid space, then $X \to Y' \to Y$ is also quasi-pro-étale, so Y is a diamond by(17.9.4.4) again.

2: Choose a surjective quasi-pro-étale map $X \to Y$ where X is a perfectoid space, then $X' \times_X Y$ is representable and $X' \to Y'$ is quasi-pro-étale and surjective, thus Y' is a diamond by(17.9.4.4). □

Lemma (17.9.4.6) [Product of Perfectoid Spaces]. The product of two perfectoid spaces of char p is also a perfectoid space. ⌟

Proof: Cf.[Sch17]P71. □

Prop. (17.9.4.7) [Absolute Product of Diamonds]. Let $\mathcal{D}, \mathcal{D}'$ be diamonds, then the product sheaf $\mathcal{D} \times \mathcal{D}'$ is also a diamond. ⌟

Proof: Let $\mathcal{D} = X/R$ and $\mathcal{D}' = X'/R'$, then $R \times R', X \times X'$ are also representable by(17.9.4.6), $R \times R' \to (X \times X') \times (X \times X')$ is also an injection, and the projections are pro-étale. Thus $\mathcal{D} \times D' = (X \times X')/(R \times R')$ is a diamond, by(17.9.4.3). □

Prop. (17.9.4.8) [Fiber Products]. Fiber products exist in the category of diamonds. ⌟

Proof: Let $Y_1 \to Y_2 \leftarrow Y_3$ be a diagram of diamonds. Choose representations $Y_i = X_i/R_i$, and after replacing X_1, X_2 with a pro-étale covering using(17.9.4.3), we can assume there are maps $X_i \to X_3$ lying over $Y_i \to Y_3$. Moreover, we can replace X_i by $X_i \times_{Y_3} X_3$ to assume that $X_i \to Y_1 \times_{Y_3} X_3$ is surjective in the pro-étale topology.

In this case, the map $X_1 \times_{X_3} X_2 \to Y_1 \times_{Y_3} Y_2$ is surjective in the pro-étale topology, and the equivalence relation $R_4 = X_4 \times_{Y_4} X_4$ can be calculated to be $R_4 = R_1 \times_{R_3} R_2$, which is representable. It remains to see that $R_4 \to X_4$ is pro-étale. But $R_1 \times R_2 \to X_1 \times X_2$ is pro-étale, so does its base change $R_1 \times_{X_3} R_2 \to X_1 \times_{X_3} X_2 = X_4$, and also $R_4 = R_1 \times_{R_3} R_2 \to R_1 \times_{X_3} R_2$ is pro-étale because it is the base change of $R_3 \to R_3 \times_{X_3} R_3$, which is pro-étale by(17.9.2.5). □

Prop. (17.9.4.9). Let Y be a diamond, then Y is a sheaf for the v-topology. ⌟

Proof: Cf.[Sch17]P54. □

Def. (17.9.4.10) [Underlying Spaces of Diamonds]. Any diamond has an underlying space $|\mathcal{D}| = |X|/|R|$. ⌟

Proof: ? □

Spd($\mathbb{Q}_p$)

Prop. (17.9.4.11). Let Spd($\mathbb{Q}_p$) be defined as

$$\mathrm{Spa}((\mathbb{Q}_p^{\mathrm{cycl}})^\flat)/\mathbb{Z}_p^* = \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty})))/\mathbb{Z}_p^*,$$

where $\mathbb{Z}_p^*$ acts on $\mathbb{F}_p((t^{1/p^\infty}))$ via $\gamma(t) = (1+t)^\gamma - 1$(11.2.8.17), i.e. it is the coequalizer of

$$\underline{\mathbb{Z}_p}^* \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \rightrightarrows \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))),$$

where one map is projection and the other map is the group action. To show this is diamond, we first need to verify this is an injection thus an equivalence relation, which follows from(17.9.4.12). ⌟

Lemma (17.9.4.12). Consider the map

$$g : \underline{\mathbb{Z}_p}^* \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \rightrightarrows \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty})))$$

where the first map is group action and the second map is projection, then this is an injection map. ⌟

Proof: For any adic point (K, K^+), $\mathbb{Z}_p^*$ acts freely on K^{00}, thus the map is an injection, by(17.9.1.7). □

Prop. (17.9.4.13) [Torsor over Affinoid Perfectoid Space]. Let G be a profinite group and $f : \mathcal{F}' \to \mathcal{F}$ be a $\underline{G}$-torsor, with G profinite, then for any affinoid $X = \mathrm{Spa}(B, B^+)$ and any morphism $X \to \mathcal{F}$, the pullback $\mathcal{F}' \times_{\mathcal{F}} X$ is representable by a perfectoid affinoid $X' = \mathrm{Spa}(A, A^+)$, where (A, A^+) is the completed filtered colimit of (A_H, A_H^+), where for each open normal subgroup H of G, A_H/B is a finite étale G/H-torsor. ⌟

Proof: If H is an open normal subgroup of G, then $\mathcal{F}'/\underline{H} \to \mathcal{F}$ is a G/H-torsor, and $\mathcal{F}' = \varprojlim_H \mathcal{F}'/\underline{H}$, thus we reduce to the case G is finite. But for this case, we use the fact {perfectoid spaces finite étale over X} is a stack(17.9.2.16), and the definition of G-torsor. □

Prop. (17.9.4.14) [Description of Spd($\mathbb{Q}_p$)]. If $X = \mathrm{Spa}(R, R^+)$ is an affinoid perfectoid space of characteristic p, then $(\mathrm{Spd}\,\mathbb{Q}_p)(X)$ is the set of isomorphism classes of data of the following shape.

- A $\mathbb{Z}_p^*$-torsor $R \to \widetilde{R}$, i.e. $\widetilde{R} = (\varinjlim_i R_i)^\wedge$, where R_n/R is finite étale with Galois group $(\mathbb{Z}/p^n\mathbb{Z})^*$.
- A topological nilpotent unit $t \in \widetilde{R}$ s.t. for all $\gamma \in \mathbb{Z}_p^*$, $\gamma(t) = (1+t)^\gamma - 1$.

⌟

Proof: Notice $\mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^\flat \to \mathrm{Spd}(\mathbb{Q}_p)$ is a $\mathbb{Z}_p^*$-torsor by definition, so for any morphism $X \to \mathrm{Spd}(\mathbb{Q}_p)$, the pullback $\mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^\flat \times_{\mathrm{Spd}(\mathbb{Q}_p)} X \to X$ is also a $\mathbb{Z}_p^*$-torsor, so it is isomorphic to a torsor $\mathrm{Spa}(\widetilde{R}, \widetilde{R}^+) \to \mathrm{Spa}(R, R^+)$ by(17.9.4.13), and the map $\mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^\flat \times_{\mathrm{Spd}(\mathbb{Q}_p)} X \to X \to \mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^\flat$ is an $\mathbb{Z}_p^*$-equivariant map, which is equivalent to a topologically nilpotent element $t \in \widetilde{R}$ that is equivariant, i.e. $\gamma(t) = (1+t)^\gamma - 1$.

Conversely, for any such a $\mathbb{Z}_p^*$-torsor $R \to \widetilde{R}$, an equivariant element $t \in \widetilde{R}$ descends to a map $X \to \mathrm{Spd}(\mathbb{Q}_p)$. □

Prop. (17.9.4.15). $\mathcal{P}$erf$\mathrm{d}\mathcal{S}$pa $/\mathbb{Q}_p$ is equivalent to the category of perfectoid spaces $X \in \mathcal{P}\mathrm{erf}_p$ together with a map $X \to \mathrm{Spd}(\mathbb{Q}_p)$. ⌟

Proof: Consider the category of triples $(X^\sharp, X, \iota)$, where $X^\sharp$ is a perfectoid space over $\mathbb{Q}_p$, X is a perfectoid space of characteristic p, $\iota : X^{\sharp\flat} \cong X$ is an isomorphism. A map of triples is a tuple $(f^\sharp, f) : (X^\sharp, X, \iota) \to (Y^\sharp, Y, \iota')$ that $\iota' \circ f^{\sharp\flat} = f \circ \iota$.

This category is equivalent to the category of perfectoid spaces over $\mathbb{Q}_p$ by the forgetful functor, where the quasi-inverse is given by $X^\sharp \mapsto (X^\sharp, X^{\sharp\flat}, \mathrm{id}_{X^{\sharp\flat}})$. And this category is also fibered in equivalent relations over Perf. So it is equivalent to a presheaf $\mathrm{Untilt}_{\mathbb{Q}_p}$ which maps X to the isomorphism classes of untilts $(X^\sharp, \iota)$ over $\mathbb{Q}_p$, where $\iota : X^{\sharp\flat} \cong X$ is an isomorphism, by(4.2.3.31).

Similarly we can show define a functor Untilt which maps X to the isomorphism classes of untilts $(X^\sharp, \iota)$(of whatever characteristic), where $\iota : X^{\sharp\flat} \cong X$ is an isomorphism.

Let $X = \mathrm{Spa}(R, R^+)$ be an affinoid perfectoid space of characteristic p. If $X^\sharp = \mathrm{Spa}(R^\sharp, R^{\sharp+})$ is an untilt. Let $\widetilde{X}^\sharp = X^\sharp \widetilde{\otimes}_{\mathbb{Q}_p} \mathbb{Q}_p^{\mathrm{cycl}}$, then $\widetilde{X}^\sharp \to X^\sharp$ is a pro-étale $\underline{\mathbb{Z}_p^*}$-torsor, whose tilt $\widetilde{X} \to X$ is a pro-étale $\underline{\mathbb{Z}_p^*}$-torsor equipped with a $\underline{\mathbb{Z}_p^*}$-equivariant map $\widetilde{X} \to \mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^\flat$ this is a morphism $X \to \mathrm{Spd}(\mathbb{Q}_p)$ by(17.9.4.14).

Conversely, let $\widetilde{X} \to X$ be a pro-étale $\underline{\mathbb{Z}_p^*}$-torsor and $\widetilde{X} \to \mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^\flat$ a $\underline{\mathbb{Z}_p^*}$-equivariant map, then by tilting equivalence there exists a morphism $\widetilde{X}^\sharp \to \mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})$ which is also $\underline{\mathbb{Z}_p^*}$-equivariant. The equivariance means that it is a descent datum along $\widetilde{X} \to X$, so it descends to an untilt $X^\sharp$ of X over $\mathbb{Q}_p$.

Finally, for general affinoid perfectoid space X, as $\mathrm{Untilt}_{\mathbb{Q}_p}$ and $\mathrm{Spd}(\mathbb{Q}_p)$ are all sheaves on Perf, the above construction can be glued to give an isomorphism between them. □

Prop. (17.9.4.16) [Untilts is a Sheaf]. Untilt is a v-sheaf on $\mathcal{P}\mathrm{erfd}$. So does $\mathrm{Untilt}_{\mathbb{Q}_p}$, because the invertibility of p can be verified locally as $\mathcal{O}$ is sheaf. ⌟

Proof: Firstly Untilt is clearly an analytic sheaf, so it suffices to show that if $X = \mathrm{Spa}(R, R^+)$ is a perfectoid space of characteristic p with a v-cover $Y = \mathrm{Spa}(S, S^+) \to X$ and $Y^\sharp = \mathrm{Spa}(S^\sharp, S^{\sharp+})$ is an untilt of Y that the corresponding two untilts of $Z = Y \times_X Y$ agree, then there is a unique untilt $X^\sharp = \mathrm{Spa}(R^\sharp, R^{\sharp+})$ whose pullback to Y is $Y^\sharp$.

Cf.[Sch17]P86. □

Spatial Diamonds

Def. (17.9.4.17) [Spatial Diamonds]. A **spatial diamond** is a qcqs diamond D s.t. $|D|$ has a basis of opens $|U|$ s.t. $U \subset D$ is a qc open immersion. ⌟

Proof: □

Diamonds associated to Perfectoid Spaces

Def. (17.9.4.18). For $Y \in \mathcal{P}\mathrm{erfd}\mathcal{S}\mathrm{pa}$, $Y^\diamond$: is the map $X \mapsto$ untilts of X with a map to Y.

It is a locally spatial diamond, s.t. $|Y^\diamond| = |Y|$. ⌟

Example (17.9.4.19). $\mathrm{Spa}(R, R^+)^\diamond = \mathrm{Spa}(R^\sharp, R^{+\sharp})$. ⌟

17.10 Untilts and Fargues-Fontaine Curves

References are [FF curves, Lurie], [FF Curve, Johannes], [The Fargues-Fontaine Curve and Diamonds Mathew Morrow], [Laurent Fargues and Jean-Marc Fontaine. Courbes et fibrés vectoriels en théorie de Hodge p-adique].

1 Schematic F-F Curve

Def. (17.10.1.1) [Fargues-Fontaine Curve]. The sum $\oplus_n B^{\varphi=p^n}$ is a graded ring. In fact, it is non-negatively graded(17.10.1.33), and we define the **Fargues-Fontaine curve** as the scheme

$$\mathrm{Proj}(\oplus_{n\geq 0}B^{\varphi=p^n}).$$

⌟

Def. (17.10.1.2)[Formal Logarithm]. For $x\in 1+\mathfrak{m}_{C^\flat}$, $[x]-1=[x-1]+\sum_{n>0}[c_n]p^n$, thus $|[x]-1|_\rho\geq |x-1|>0$, thus the formal logarithm

$$\log([x])=\sum_{k>0}\frac{(-1)^{k+1}}{k}([x]-1)^k$$

converges for every Gauss norm $|\cdot|_\rho$, thus converges to some element in B. And clearly $\varphi(\log([x]))=p\log([x])$, thus $\log([x])\in B^{\varphi=p}$. And $\log([xy])=\log([x])\log([y])$. ⌟

Prop. (17.10.1.3) [Artin-Hasse Exponential]. There is another way of constructing elements in $B^{\varphi=p}$, which is

$$T:a\in\mathfrak{m}_{C^\flat}\mapsto\sum_n\frac{[a^{p^n}]}{p^n}.$$

We want to relate this one to the formal logarithm:

There is a bijection of sets $\mathfrak{m}_{C^\flat}\cong 1+\mathfrak{m}^b_{C^\flat}$ that $\log([E(a)])=T(a)$, which is defined by the **Artin-Hasse exponential**

$$E(x)=\prod_{(d,p)=1}(\frac{1}{1-x^d})^{\frac{\mu(d)}{d}}.$$

⌟

Proof: Firstly, it has coefficients in $\mathbb{Z}_{(p)}$, because $(1-x^d)^{\frac{1}{d}}=\sum(-1)^kC^k_{\frac{1}{n}}x^{kd}$ has coefficient in $\mathbb{Z}_{(p)}$. And $[1-x]=\lim_k(1-[x^{p^{-k}}])^{p^k}$, so

$$\log([\prod_{(d,p)=1}(\frac{1}{1-x^d})^{\frac{\mu(d)}{d}}])=\sum_{(d,p)=1}\frac{\mu(d)}{d}\log(\frac{1}{[1-d]})=\sum_{(d,p)=1}\mu(d)\sum_{\alpha\in p^{-n}\mathbb{Z}}\frac{[x^{d\alpha}]}{d\alpha}$$

Notice the right hand side stablizes for any term $[x^\beta]$, and if $\beta\neq\frac{1}{p^k}$, it will vanish, thus for $x\in\mathfrak{m}_{C^\flat}$, it converges, and the sum equals $\sum_n\frac{[x^{p^n}]}{p^n}$. □

Cor. (17.10.1.4). The set of elements of the form $\sum_n\frac{[a^{p^n}]}{p^n}$ is closed under addition. ⌟

Valuation Function

Def. (17.10.1.5) [Exponential Valuation]. For any positive real number s, define a valuation on $A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$ by the formula $v_s(f) = -\log|f|_{\exp(-s)}$, then it is a valuation by(17.11.1.8).

If f has a Teichmuller expansion $\sum_{n>>-\infty}[c_n]p^n$, then

$$|f|_\rho = \sup\{|c_n|_{C^\flat}\rho^n\}, \quad v_s(f) = \inf\{v(c_n) + ns\}.$$

⌟

Prop. (17.10.1.6). For any $f \neq 0 \in A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$, $s \mapsto v_s(f)$ is a concave function in s which is piecewise linear with integral slopes. ⌟

Proof: Consider the Newton Polygon. □

Lemma (17.10.1.7). If $s > 0$ and f_n is a Cauchy sequence in $A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$ for the norm $|\cdot|_{\exp(-s)}$ and doesn't converge to 0, then the sequences

$$v_s(f_n), \quad \partial_- v_s(f_n), \quad \partial_+ v_s(f_n)$$

stablize. ⌟

Proof: Easy, Cf.[ff Curve Lurie P44]. □

Prop. (17.10.1.8). If $0 < a \leq b < 1$, and f_n is a Cauchy sequence in $A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$ and doesn't converge to 0 for either the norm $|\cdot|_a$ or $|\cdot|_b$, then the sequence of functions $s \mapsto v_s(f)$ stablizes on $[-\log(b), -\log(a)]$. ⌟

Proof: Assume f_n doesn't converge to 0 for the form $|\cdot|_b$, then by(17.10.1.7), the sequences $v_s(f_n), \partial_+ v_s(f_n)$ converges, thus $v_s(f_n)$ is bounded uniformly, thus $v_s(f)$ is bounded.

Then choose N large that $|f - f_m|_\rho$ very small for any $m > N$ and $a \leq \rho \leq b$, then $v_s(f) = v_s(f_m)$ for any $a \leq s \leq b$, thus it stablizes. □

Cor. (17.10.1.9). Let f be a non-zero element in B, then the construction $s \mapsto v_s(f)$ is a concave function in s with piecewise linear function with integral slopes. This is analogous to the Hadamard three circle theorem(11.5.2.13). ⌟

Proof: This is true for $f \in B_{[a,b]}$, because any f is a limit of a sequence f_n in both the norm $|\cdot|_a$ and $|\cdot|_b$, so by the proposition, there for n large, $v_s(f) = v_s(f_n)$ on $[-\log(b), -\log(a)]$, thus the conclusion is true by(17.10.1.6). And for $f \in B$, for any interval $[a,b]$ we can do the same, thus the conclusion is true on each interval, thus it is true. □

Metric Structures on Y

Def. (17.10.1.10) [Metric on $\overline{Y}$]. Let $\overline{Y} = Y \cup \{0\}$ be the isomorphism classes of untilts of $C^\flat$, where 0 corresponds to $C^\flat$ itself.

(17.11.1.5) show $\overline{Y}$ corresponds to distinguished elements in $A_{\inf}$ up to units. So for any $x, y \in \overline{Y}$, we let $d(x,y) = |\xi_x(y)|_{K_y} \leq 1$. Then this is a metric, and it is non-Archimedean. ⌟

Proof: Firstly, if $d(x,y)=0$, then ξ_x divides ξ_y, which is equivalent to $(\xi_x)=(\xi_y)$, by(5.5.4.21).

Secondly, for any x,y, since $C^\flat$ is alg.closed, we can assume $\xi_x(y)=c^\sharp$ for some $c\in C^\flat$. Notice $\xi(y)=t^\sharp+pu(y)$ is in $\mathfrak{m}_K$, thus $c\in\mathfrak{m}_{C^\flat}$. So $\xi_x-[c]$ is also a distinguished element and vanishes at y, so we may assume that $\xi_y=\xi_x-[c]$ by(5.5.4.21) again. Then

$$d(y,x)=|\xi_y(x)|_{K_x}=|c^\sharp|_{K_x}=|c|_{C^\flat}=|c^\sharp|_{K^y}=d(x,y).$$

Finally it is non-Archimedean because any valuation field K is non-Archimedean. □

Prop. (17.10.1.11) [$\overline{Y}$ is Complete]. $\overline{Y}$ is complete w.r.t this metric. ⌟

Proof: Given a Cauchy sequence of points y_n in $\overline{Y}$, as in the proof of(17.10.1.10), we can assume that $\xi_{y_n}=\xi_{y_{n-1}}+[c_n]$ for some $c_n\in\mathfrak{m}_{C^\flat}$, and $|c_n|_{C^\flat}=d(y_{n-1},y_n)$. Now A_{inf} is $[t]$-adically complete for a uniformizer $t\in C^\flat$, thus $\sum[c_n]$ is definable in A_{inf}, and $\xi=\xi_0+\sum[c_n]$ is also distinguished, and corresponds to a point y which y_n clearly converges to. □

Divisors

Lemma (17.10.1.12). $B_{[a,b]}$ is an integral domain. ⌟

Proof: By(17.10.1.9), the valuation function $v_s(f)$ and $v_s(g)$ are bounded, thus it is clear that $v_s(fg)$ is also finite, so $fg\neq 0$. □

Prop. (17.10.1.13) [Divisors]. Assume $C^\flat$ is alg.closed, then for any $f\in B_{[a,b]}$ and $y=(K,\iota)\in Y_{[a,b]}$, we define the **order of vanishing** $\mathrm{ord}_K(f)\in\mathbb{Z}\cup\{\infty\}$ as the valuation of $e_K(f)\in B^+_{\mathrm{dR}}(K)$. Then

- if $f\neq 0\in B_{[a,b]}$, then $\mathrm{ord}_K(f)<\infty$ for each $K\in Y_{[a,b]}$, and there are only f.m. K that $\mathrm{ord}_K(f)\neq 0$. In particular, $B_{[a,b]}$ is an integral domain.
- if $x,y\neq 0\in B_{[a,b]}$, then x divides y iff $\mathrm{ord}_K(x)\geq\mathrm{ord}_K(y)$ for each $K\in Y_{[a,b]}$.

Thus for each $f\in B_{[a,b]}$, we can define the **divisor** of K as the formal sum $\sum_{K\in Y_{[a,b]}}\mathrm{ord}_K(f)K$, and this is also definable for $f\in B$, but it may be an infinite but locally finite sum. ⌟

Proof: Firstly, by(17.10.1.17) and(17.10.1.18), if $\mathrm{div}(f)\cap Y_{[a,b]}\neq 0$, then there is a distinguished element ξ that $f=\xi f_1$. And we can iterate this, and eventually end up with $f=\xi_1\ldots\xi_n f_n$ that $\mathrm{div}(f_n)\cap Y_{[a,b]}=0$, by(17.10.1.19), so by(17.10.1.20), f_n is invertible in f, so $\mathrm{div}(f)$ is finite. And if $\mathrm{div}(g)\geq\mathrm{div}(f)$, then g also divides $\xi_1\ldots\xi_n$, so g divides f. □

Remark (17.10.1.14). Notice by(17.11.1.22), for a $f\in B_{[a,b]}$, $\mathrm{ord}_K(f)>0$ iff $f(y)=0\in K$. ⌟

Cor. (17.10.1.15) [B is Integral Domain]. B is an integral domain, and if $C^\flat$ is alg.closed, then x is divisible by y if and only if $\mathrm{div}(x)\geq\mathrm{div}(y)$. ⌟

Cor. (17.10.1.16). B is integrally closed. ⌟

Proof: B is an integral domain by(17.10.1.15), it is integrally closed because if f/g is integral over B, then there image in $B^+_{\mathrm{dR}}(y)$ is integral over $B^+_{\mathrm{dR}}(y)$ for all $y\in Y$, thus in $B^+_{\mathrm{dR}}(y)$ because it is a valuation ring, and then f is divisible by g by(17.10.1.15). □

Prop. (17.10.1.17) [Examples of Divisors].

- For a distinguished element ξ, if $\xi=up$, then ξ is invertible in B, thus $\mathrm{div}(\xi)=0$. Otherwise ξ defines a char0 untilts K of $C^\flat$, and ξ is a uniformizer of $B^+_{\mathrm{dR}}(K)$, and it doesn't divides other distinguished elements(5.5.4.21), thus $\mathrm{div}(\xi)=K$.

- $\mathrm{div}(\log([x])) = \sum_{n\in Z} \varphi^n(K)$.

⌟

Proof: 2: $\log([x])$ vanishes at a single φ-orbits of Y, and one of them is given by the distinguished element $\xi = 1 + [x^{1/p}] + \ldots + [x^{p-1/p}] = \frac{[x]-1}{[x^{1/p}]-1}$. Notice $[x^{1/p}] - 1$ is mapped to an invertible element in K, thus it is invertible in $B^+_{\mathrm{dR}}(K)$, so $[x] - 1$ is associated to ξ, and notice

$$\log([x]) = \sum_{k>0} \frac{(-1)^{k+1}}{k}([x]-1)^k \equiv [x] - 1 \mod ([x]-1)^2,$$

so $\mathrm{ord}_K(\log([x])) = 1$, and because $\varphi(\log([x])) = p\log([x])$, $\mathrm{ord}_{\varphi^n(K)}(\log([x])) = 1$ for any n, so we are done. □

Lemma (17.10.1.18). Let $C^\flat$ be alg.closed. If ξ is a distinguished element of A_{inf} vanishes at a point $y \in Y_{[a,b]}$ and $g \in B_{[a,b]}$ also vanishes at y, then g is divisible by ξ in $B_{[a,b]}$. ⌟

Proof: If $g \in A_{\mathrm{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$, then this is easy by(17.10.1.14) and $A_{\mathrm{inf}}/(\xi) = \mathcal{O}_K$(17.11.1.4).

Now generally g is a limit of $g_n \in A_{\mathrm{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$, so $g(y)$ is the limit of $g_n(y) \in K$. Now $g(y) = 0$, so $\lim_n g_n(y) = 0$. Now K is alg.closed by(11.2.8.16), so we can let $g_n(y) = c_n^\sharp$, so c_i converges to 0 in $C^\flat$. So $\{[c_n]\}$ converges to 0 in norm $|\cdot|_a$ and $|\cdot|_b$, so we can replace g_n by $g_n - [c_n]$ and assume $g_n(y) = 0$.

Now the first part shows $g_n = \xi h_i$, and now h_i is a Cauchy sequence for both $|\cdot|_a$ and $|\cdot|_b$, so converges to some h, and then $g = \xi h$. □

Lemma (17.10.1.19). Given this lemma(17.10.1.18), we have a strategy of proving(17.10.1.13), that is, decomposing f, g into distinguished elements, but we need to show this decomposition is finite. And this is true:

If $f \neq 0 \in B_{[a,b]}$, denote $\beta = -\log(b), \alpha = -\log(a)$ and let $N = \partial_- v_\beta(f) - \partial_+ v_\alpha(f) \geq 0$, then f cannot be divisible by a product of $\xi_1, \ldots, \xi_{N+1}$ of $N+1$ distinguished elements. ⌟

Proof: By(5.5.4.20), if ξ is distinguished, then $v_s(\xi) = \max\{s, v(v_0)\}$. Now $v(v_0) = v(t^\sharp) = v(|p|_K)$ in $\mathcal{O}_K = A_{\mathrm{inf}}/([t] - up)$, so if K corresponding to ξ belongs to $Y_{[a,b]}$, then $v(v_0) \in [\beta, \alpha]$, so $\partial_- v_\beta(\xi) = 1, \partial_+ v_\alpha(\xi) = 0$.

So if $f = \xi_1, \ldots, \xi_{N+1} u$, then $N(f) \geq \sum N(\xi_i) \geq N+1$. □

Lemma (17.10.1.20) [Valuation Funtion And Invertibility]. Let $C^\flat$ be alg.closed and $f \neq 0 \in B_{[a.b]}$, then the following are equivalent:

- f is invertible.
- $\partial_- v_\beta(f) = \partial_+ v_\alpha(f)$.
- $\mathrm{div}(f) \cap Y_{[a,b]} = \varnothing$.

⌟

Proof: 2 → 3: by(17.10.1.19).

1 → 2: Because $N(f) + N(f^{-1}) = 0$, and $N(f) \geq 0, N(f^{-1}) \geq 0$, so $N(f) = 0$.

2 → 1: Assume first that $f = \sum_{n>>-\infty} [c_n] p^n \in A_{\mathrm{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$, then the hypothesis just says that $s \to v_s(f)$ is linear in a small nbhd of $[\beta, \alpha]$, that is, there is a n_0 that $v(c_n) + ns > v(c_{n_0}) + n_0 s$ for all $n \neq n_0$ and $s \in [\beta, \alpha]$.

Now we can normalize f that $n_0 = 0$ and $c_0 = 1$, so $|f-1|_\rho < 1$ for all $\rho \in [\beta, \alpha]$, so $f-1$ is topologically nilpotent in $B_{[a,b]}$, and thus f is invertible.

Generally, f is a limit of a sequence $f_n \in A_{\inf}[\frac{1}{p}, \frac{1}{[\pi]}]$, and by(17.10.1.8) we can assume the hypothesis holds for all f_n. Then f_n is invertible, and it is easily shown that f_n^{-1} is a Cauchy sequence in $B_{[a,b]}$, so converges to some f^{-1}.

$3 \to 2$: Firstly, if $\partial_- v_\beta(f) > \partial_+ v_\alpha(f)$, then we must have $\partial_- v_\rho(f) > \partial_+ v_\rho(f)$ for some s, so wlog, we can assume $a = b = s$, and we need to show f vanishes at some point in $Y_{\exp(s)}$. Now combining with(17.10.1.18) and(17.10.1.19), this is equivalent to another statement that any element $y \in B_{[\rho,\rho]}$ has a decomposition $y = g\xi_1 \ldots \xi_n$ where ξ_k corresponds to points in Y_ρ and g is invertible in B_ρ. The proof is finished at(17.10.1.30). □

Primitive Elements and the Proof of $3 \to 2$ of The Lemma on Valuation Function and Invertibility

Def. (17.10.1.21). Let $C^\flat$ be alg.closed, an element in $B_{[\rho,\rho]}$ is called **good** iff it has a decomposition as in the proof of $3 \to 2$ of(17.10.1.20). ⌟

Prop. (17.10.1.22) [Approximating Zero]. If f is a good element having n-zeros on Y_ρ, and $g \in B_\rho$ that $|f-g|_\rho < |f|_\rho$, then for any zero y of g on Y_ρ, there exists a zero y' of f on Y_ρ that $d(y', y) < \rho(\frac{|f-g|_\rho}{|g|_\rho})^{1/n}$. ⌟

Proof: $|f-g|_\rho \geq |(f-g)(y)|_K = |f(y)|_K$. Now $f = g\xi_1 \ldots \xi_n$, and ξ corresponds to y_i, then

$$|f(y)|_K = |g(y)|_K |\xi_1(y)|_K \ldots |\xi_n(y)|_K = \frac{|f|_\rho}{\prod_i |\xi_i|_\rho} \prod_i d(y_i, y) = |f| \prod_i \frac{d(y_i, y)}{\rho}.$$

(Notice $|g|_\rho = |g(y)|_K$ because g is invertible(17.11.1.10)) and $d(y_i, y) \leq \rho$. So at least one ξ satisfies the desired inequality. □

Cor. (17.10.1.23). If $f \in B_\rho$ is given by a Cauchy sequence of good elements, and $\partial_- v_\rho(f) > \partial_+ v_\rho(f)$, then f has a root on Y_ρ. ⌟

Proof: By(17.10.1.7), passing to a subsequence, we may assume

$$v_s(f) = v_s(f_n), \quad \partial_- v_s(f) = \partial_- v_s(f_n), \quad \partial_+ v_s(f) = \partial_+ v_s(f_n), \quad |f_{n+1} - f_n|_\rho < |f|_\rho.$$

Let $n = \partial_- v_s(f) - \partial_+ v_s(f) > 0$, then each f_i has exactly n roots on Y_ρ, and applying(17.10.1.22), we can find successively roots y_n of f_n that $d(y_{n+1}, y_n) \leq \rho(\frac{|f_{n+1}-f_n|_\rho}{|f|_\rho})^{1/n}$, so the sequence $\{y_n\}$ is Cauchy and converges to some point $y \in \overline{Y}$, so

$$|f_i(y)|_K \leq |f_i|_\rho \frac{d(y_i, y)}{\rho} = |f|_\rho \frac{d(y_i, y)}{\rho} \to 0.$$

so $f(y) = 0$. □

Def. (17.10.1.24) [Primitive Elements]. An element $f = \sum_{n \geq 0} [c_n] p^n \in A_{\inf}$ is called **primitive of degree** d if $c_0 \neq 0, |c_d| = 1$ for some smallest element d.

Clearly an element is distinguished of degree 1 iff it is distinguished and corresponds to an untilts of $X^\flat$ of char0. ⌟

Prop. (17.10.1.25).

- Any element $f \in A_{\inf}$ of finite Teichmuller expansion can be written uniquely as a $f = p^m[c]g$, where $c \in C^\flat$ and g is primitive.
- For an element $f \in A_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$, f can be written as $p^m[c]g$ iff $v_s(f)$ consists of f.m. line segments iff $\sup\{|c_n|\}$ is achieved by some n.
- If $f = gh$ in $A_{\inf}$ is primitive, then g, h are also primitive, and $\deg(f) = \deg(g) + \deg(h)$.

⌟

Prop. (17.10.1.26). Let $f = \sum [c_n]p^n \in A_{\inf}$ be primitive of degree $d > 0$, and let $\lambda \in (0, 1)$ be the number that $s = -\log(\lambda)$ is the minimal number that $v_s(f)$ is non-differentiable at, i.e. s is -1 times the slope of the line segment on the left of $v(c_d)$. Then f has a zero on Y_λ. ⌟

Proof: By(17.10.1.27) there is a $y \in Y_\lambda$ that $|f(y_1)| \le \lambda^{d+1}$, and then(17.10.1.28) shows we can find successively y_n that

$$d(y_n, y_{n+1}) \le \lambda^{1+\frac{d}{n}}, \quad |f(\lambda_n)| \le \lambda^{d+m}.$$

So y_n is a Cauchy sequence thus converges to some y, and then $f(y) = 0$. □

Lemma (17.10.1.27) [Lemma for Approaching a Zero]. If $C^\flat$ is alg.closed and $f \in A_{\inf}$ is primitive of degree $d > 0$, and let λ as in(17.10.1.26), then there is a point $y \in Y_\lambda$ that $|f(y)|_{K_y} \le \lambda^{d+1}$. ⌟

Proof: Let $f = \sum [c_n]p^n$, we may assume $c_d = 1$, and let $F = x^d + c_{d-1}x^{d-1} + \ldots + c_0$, then the largest valuation of the roots of F on $C^\flat$ is λ, by Newton polygon. Let r be such a root, then c_i is divisible by r^{d-i}, and let $\xi = p - [r]$ be a distinguished element of $A_{\inf}$ and corresponds to an untilt K, then $|p|_K = \lambda$, and

$$p^{-d}f(y) = \sum_{n \ge 0} c_n^\sharp p^{n-d} \equiv \sum_{i=0}^{d} (\frac{c_i}{r^{d-i}})^\sharp \mod p = (r^{-d}F(r)) \mod p = 0$$

thus $f(y)$ is divisible by p^{d+1}, which is equivalent to $|f(y)|_K \le \lambda^{d+1}$. □

Lemma (17.10.1.28) [Lemma for Approaching a Zero]. Situation as in(17.10.1.27), if $y \in Y_\lambda$ and $|f(y)| = \lambda^d \cdot \alpha$, then there is a y' that $d(y, y') \le \lambda \cdot \alpha^{1/d}$ that $|f(y')| \le \lambda^{d+1}\alpha$. ⌟

Proof: Since $A_{\inf}$ is ξ-complete and every element of $A_{\inf}/\xi \cong \mathcal{O}_K$ belongs to the image of $\sharp : \mathcal{O}_C^\flat \to \mathcal{O}_K$, thus by induction, we can write $f = \sum_{n \ge 0} [c_n]\xi^n$. Because f is primitive of degree d, we may assume $c_d = 1$, and $|c_0|_{C^\flat} = |f(y)|_K = \lambda^d\alpha$.

Let $F(x) = c_0 + c_1x + \ldots + c_{d-1}x^{d-1} + x^d$, because $C^\flat$ is alg.closed, let r be a root of minimal absolute value, then $|r|^m_{C^\flat}|c_m|_{C^\flat} \le \lambda^n\alpha$, in particular $|r|_{C^\flat} \le \lambda\alpha^{1/n}$. So let $\xi' = \xi - [r]$, then ξ is also distinguished, and $d(y', y) = |r|_{C^\flat} \le \lambda\alpha^{1/n}$(17.10.1.10), and $d(0, y') = \lambda$, and $\xi(y') = r^\sharp$.

Now

$$\frac{(f(y'))^\sharp}{c_0^\sharp} = \sum_{n \ge 0} \frac{c_n^\sharp}{c_0^\sharp}\xi(y')^n = \sum_{n \ge 0} (\frac{c_n r^n}{c_0})^\sharp \equiv \sum_{i=0}^{n} (\frac{c_n r^n}{c_0})^\sharp \mod p = (\frac{F(r)}{c_0})^\sharp = 0,$$

So $|f(y')|_{K'} \le |c_0^\sharp|_{K'}|p|_{K'} = |c_0|_{C^\flat}\lambda = \lambda^{d+1}\alpha$. □

Cor. (17.10.1.29) [Primitive Elements Decompose as Distinguished Elements]. If $f \in A_{\inf}$ is a primitive element of degree $d > 0$, then f admits a factorization as products of distinguished elements ξ corresponding to points in Y. ⌟

Proof: Use induction on d. If $d = 1$, then f is distinguished by(17.10.1.24), and if $d > 1$, then by(17.10.1.26), $f = \xi g$, so g is primitive of degree $d-1$ by(17.10.1.25), so induction is finished. □

Prop. (17.10.1.30) [Finite Teichmuller Expansion is Good]. Any element of finite Teichmuller expansion is good.

In particular, because any element of B_ρ can be approximated by elements in $A_{\mathrm{inf}}[\frac{1}{p}, \frac{1}{[t]}]$, and such element can be approximated by elements of finite Teichmuller expansion, by(17.10.1.23), we finishes the proof of $3 \to 2$ of(17.10.1.20). ⌟

Proof: If f has finite Teichmuller expansion, then $f = p^m[c]g$, where g is primitive of degree d. If $d = 0$, then g is invertible in A_{inf}, thus f is invertible in B_ρ. Otherwise, we can use(17.10.1.29) to factorize g into distinguished elements, and the elements that corresponds to points outside Y_ρ is invertible in B_ρ because $v_s(\xi) = \max\{s, v(v_0)\}$ and $2 \to 1$ of(17.10.1.20), so f is good. □

Bounded Meromorphic Functions

Prop. (17.10.1.31). If $f \in B$, then $f \in A_{\mathrm{inf}}$ iff $|f|_\rho \le 1$ for any $0 < \rho < 1$.

Easily we can get characterization of f being in $A_{\mathrm{inf}}[\frac{1}{p}], A_{\mathrm{inf}}[\frac{1}{[t]}]$ or $A_{\mathrm{inf}}[\frac{1}{p}, \frac{1}{[t]}]$. ⌟

Proof: One direction is trivial, for the other, by(17.10.1.32), we can find successively f_n that $f = \sum_{i<n}[c_i]p^i + f_n$, and $|f_n|_\rho \le \rho^n$ for all $0 < \rho < 1$. So f_n converges to 0 in any norm ρ, thus it converges to 0 in B, and $f = \sum_{n\ge 0}[c_n]p^n \in A_{\mathrm{inf}}$. □

Lemma (17.10.1.32). If $f \in B$ satisfies $|f|_\rho \le \rho^m$ for all $0 < \rho < 1$, then there is a $c \in \mathcal{O}_{C^\flat}$ that $f = [c]p^m + g$ that $|g|_\rho \le \rho^{m+1}$ for all $0 < \rho < 1$. ⌟

Proof: Replace f by $\frac{f}{p^m}$, we may assume $m = 0$. Choose a sequence f_i in $A_{\mathrm{inf}}[\frac{1}{p}, \frac{1}{[t]}]$ converging to f in B, where $f_i = \sum_{n>>-\infty}[c_{n,i}]p^n$.

Firstly we want to truncate f_i with the positive part f_i^+. Notice for each ρ and any $0 < \varepsilon < 1$, because $\lim |f_i - f|_{\varepsilon\rho} = 0$, thus for i large, $|f_i|_{\varepsilon\rho} = |f|_{\varepsilon\rho} \le 1$, thus $|c_{-n,i}|_{C^\flat}\rho^{-n} \le \varepsilon^n < \varepsilon \le \varepsilon$, so $|f_i - f_i^+|_\rho < \varepsilon$ for i large, so $\lim f_i^+ = f$ also in B.

Secondly, $|c_{0,i} - c_{0,j}|_{C^\flat} \le |f_i - f_j|_\rho$ for each ρ, thus $c_{0,i}$ is Cauchy in $C^\flat$ thus converges to some $c \in C^\flat$, and when i is large, $|c_{0,i}|_{C^\flat} \le |f_i|_\rho = |f|_\rho \le 1$, so $c \in \mathcal{O}_{C^\flat}$. Now let $g_i = \sum_{n>0}[c_{n,i}]p^n$, then g_i is also Cauchy in B for any norm $|\rho|$ and converges to some g, and $f = g + [c]$.

It's left to check $|g|_\rho \le \rho$: each $v_s(g_i)$ has positive slopes, then so does $v_s(g)$ because by(17.10.1.7), $v_s(g_i)$ stablizes to $v_s(g)$ uniformly on compact intervals. So if $v_s(g) < s - \varepsilon$ for some s, then $v_\varepsilon(g) \le v_s(g) - (s - \varepsilon) < 0$, but this cannot happen because $v_\varepsilon(g) \le \max\{v_\varepsilon(f), -\log |c|_{C^\flat}\} \ge 0$. □

Eigenspaces of Frobenius

Prop. (17.10.1.33).

- The vector space $B^{\varphi=p^n}$ vanish for $n < 0$.
- The canonical map $\mathbb{Q}_p \to B^{\varphi=\mathrm{id}}$ is an isomorphism.

⌟

Proof: 1: Consider $v_{ps}(\varphi(f)) = pv_s(f)$(17.11.1.14), $v_s(p^n f) = ns + v_s(f)$, so if $\varphi(f) = p^n f$, then

$$pv_{s/p}(f) = v_s(\varphi(f)) = v_s(p^n f) = ns + v_s(f).$$

Let $h(s) = \partial_+ v_s(f)$, then $h(s/p) = n + h(s)$, but h must by non-increasing(17.10.1.6), so $n \ge 0$.

2: Firstly we prove $B^{\varphi=\mathrm{id}}$ is a field: by(17.10.1.15), it suffices to show that $\mathrm{div}(f) = 0$ for $f \neq 0 \in B^{\varphi=\mathrm{id}}$. If $\mathrm{div}(f) \neq 0$, because f is fixed by φ, so $\mathrm{div}(f) \geq \sum_{n\in\mathbb{Z}} \varphi^n(y)$ for some y, and $\sum_{n\in\mathbb{Z}} \varphi^n(y) = \mathrm{div}(\log([\varepsilon])$ for some $\varepsilon \in 1 + \mathfrak{m}_{C^\flat}$ because K is alg.closed and by (17.11.1.16). So by(17.10.1.15) again $f = g\log([\varepsilon])$, and $g \in B^{\varphi=p^{-1}}$ by(17.10.1.2), then $g = 0$ by item1.

3: From(17.10.1.34) and(17.10.1.31), $f \in A_{\mathrm{inf}}[\frac{1}{p}]$, thus $f = \sum_{n>>\infty}[c_n]p^n$, so $\varphi(f) = f$ shows $c_n^p = c_n$, which is equivalent to $c_n \in \mathbb{F}_p$. So $f \in W(\mathbb{F}_p)[\frac{1}{p}] = \mathbb{Q}_p$. □

Lemma (17.10.1.34). If $f \neq 0 \in B^{\varphi=\mathrm{id}}$, then there is an integer n that $|f|_\rho = \rho^n$. ⌟

Proof: Notice $|f|_\rho^p = |\varphi(f)|_{\rho^p} = |f|_{\rho^p}$, so $v_{ps}(f) = pv_s(f)$, differentiation shows that $\partial_- v_{ps}(f) = \partial_- v_s(f)$. This is for all $s < 0$, and $\partial_- v_s(f)$ is non-decreasing, thus it is constant, and $v_{ps}(f) = pv_s(f)$ shows $v_s(f) = ns$ for some integer n. □

Cor. (17.10.1.35). For $n \geq 0$, any element $f \in B^{\varphi=p^n}$ factors uniquely up to action of $\mathbb{Q}_p^*$ as $\lambda\log([\varepsilon_1])\ldots\log([\varepsilon_n])$ where $\lambda \in B^{\varphi=\mathrm{id}}$, $0 < |\varepsilon_i - 1| < 1$. ⌟

Proof: The existence is by(17.10.1.30)

For the uniqueness: it suffices to prove $\log([\varepsilon])$ is a prime element in $\oplus_{n\geq 0}B^{\varphi=p^n}$. For this, notice for any $f \in B^{\varphi=p^n}$, $\mathrm{div}(f)$ is fixed by φ, and $\mathrm{div}(\log([\varepsilon]))$ is a single orbit of φ, thus by(17.10.1.15), if $\log([\varepsilon])$ divides fg, then $\log([\varepsilon])$ divides f or g. □

Applications

Cor. (17.10.1.36). If $C^\flat$ is alg.closed, then every untilts K of $C^\flat$ belongs to the vanishing locus of $\log([x])$ for some $x \in C^\flat$ that $0 < |x - 1| < 1$, and the map

$$\psi : 1 + \mathfrak{m}_{C^\flat} \to K : y \mapsto \log(y^\sharp)$$

is surjective with kernel generated by x (as a $\mathbb{Q}_p$-subspace of $1 + \mathfrak{m}_{C^\flat}$). ⌟

Proof: By(11.2.8.16), any untilts of $C^\flat$ is alg.closed, thus it has a compatible p^n-th roots of unity. So it belongs to some locus of $\log([x])$ by(17.11.1.16). Now if $|z| < |p|_K^{1/(p-1)}$, then $z = \log(\exp(z))$, and $\exp = y^\sharp$ for some y because K is alg.closed. So ψ contains sufficiently small elements, but it is a map of $\mathbb{Q}_p$-vector spaces, thus it is surjective. For the kernel, if $\log(y^\sharp) = 0$, then $\log([y])$ vanish on K, thus by(17.11.1.16), y, x is in the same $\mathbb{Q}_p$-vector space. □

Cor. (17.10.1.37). If $C^\flat$ is alg.closed, then the map

$$1 + \mathfrak{m}_{C^\flat} \xrightarrow{\log([x])} B^{\varphi=p}$$

is an isomorphism. ⌟

Proof: Firstly any untilts of $C^\flat$ is alg.closed by(11.2.8.16). It is injective because of the correspondence(17.11.1.16), and for the surjectivity, for each $f \in B^{\varphi=\mathrm{id}}$, if $f = 0$, then $f = \log([1])$, and if $f \neq 0$, then notice $\mathrm{div}(f) \neq \varnothing$, because in this case f is invertible in B by(17.10.1.15), thus $f^{-1} \in B^{\varphi=p^{-1}}$, so $f^{-1} = 0$ by(17.10.1.33), contradiction.

Now if $\mathrm{ord}_K(f) \geq 1$, then $\mathrm{ord}_{\varphi^n(K)}(f) \geq 1$ for any $n \in \mathbb{Z}$ since $\varphi(f) = pf$. Consider $\mathrm{div}(\log([x])) = \sum_{n\in\mathbb{Z}} \varphi^n(K)$(17.10.1.17), then f is divisible by $\log([x])$ by(17.10.1.15), $f = \log([x])g$, then $g \in B^{\varphi=\mathrm{id}}$, then $g \in \mathbb{Q}_p^*$ by(17.10.1.33), thus $f = \log([x^g])$. □

Cor. (17.10.1.38) [Filtration on B_{dR}]. By(17.10.1.17) and(17.10.1.36), we see that for any untilt K of $C^\flat$, there is a unique up to $\mathbb{Q}_p$-constant ε that $t = \log([\varepsilon])$ is the uniformizer of $B_{\mathrm{dR}}(y)$. In fact, this ε can be to be $\varepsilon = (1, \xi_p, \ldots, x_{p^n}, \ldots)$, where ξ_{p^n} is a compatible roots of unity in the alg.closed field K.

Now we prefer to use the filtration $Fil^n = t^{-n} B^+_{\mathrm{dR}}$ on B_{dR} because it is $G_{\mathbb{Q}_p}$ invariant, as ε does. ⌟

Prop. (17.10.1.39). Let $C^\flat$ be alg.closed, then any point x of the Fargues-Fontaine curve X_{FF} that is not the generic point corresponds to the prime $x_K = (\log([\varepsilon]))$(17.10.1.35) where $K \in \mathrm{div}(\log([\varepsilon]))$(17.10.1.36). And the residue field of x_K can be identified to K. ⌟

Proof: By(17.10.1.35), we can cover X_{FF} by affine schemes of the form $\mathrm{Spec}(R_f = B[f^{-1}]^{\varphi=\mathrm{id}})$ for $f \in B^{\varphi=p}$, now for any prime $\mathfrak{p} \subset R_f$, let $\frac{g}{f^n} \in \mathfrak{p}$, then $g = \lambda \log([\varepsilon_1]) \ldots \log([\varepsilon_n])$, thus some $\frac{\log([\varepsilon])}{f} \in \mathfrak{p}$. Let K be a point that $\log([\varepsilon])$ vanish(17.11.1.16), then we claim $(\log([\varepsilon])/f)$ is maximal.

In fact, we may assume f doesn't vanish on K, otherwise $\log([\varepsilon])/f$ is a unit, then there is a map $\rho : B[f^{-1}]^{\varphi=1} \subset B[f^{-1}] \to K$, and this map is surjective with kernel $(\log([\varepsilon])/f)$: it is surjective even on $f^{-1}B^{\varphi=p}$ by(17.10.1.36), and if $\log([\varepsilon_1])/f$ is mapped to 0, then $\log([\varepsilon_1])$ differs from $\log([\varepsilon])$ by some Q_p^* by(17.11.1.16). □

Cor. (17.10.1.40). If $C^\flat$ is alg.closed, there is a bijection of sets:

$$Y/\varphi_{C^\flat}^{\mathbb{Z}} \cong \{\text{Closed points of } X_{FF}\}.$$

by(17.11.1.16). ⌟

Cor. (17.10.1.41). X_{FF} is a Dedekind scheme(6.4.2.14). ⌟

Proof: Let $\mathrm{Spec}(R_f = B[f^{-1}]^{\varphi=\mathrm{id}})$, two elements $f = \log([\varepsilon]), g = \log([\mu])$ can cover it. The proof of(17.10.1.39) shows that every prime ideals of R_f is maximal principal, in particular f.g, thus by(5.1.1.48), it is Noetherian. And it has Krull dimension 1 and it is regular because all of its maximal ideals are principal, hence normal(5.3.5.32). So X_{FF} is a Dedekind scheme. □

2 Line Bundles and Filtrations

Def. (17.10.2.1). By(17.10.1.35), the graded algebra $\oplus_{n\geq 0} B^{\varphi=p^n}$ is generated over $\mathbb{Q}_p$ by $B^{\varphi=p}$, so we can define the Serre twisting sheaf $\mathcal{O}(1)$ on X_{FF}, which is a line bundle, and on an open affine scheme $U = X - \{x\}$, where x corresponds to $\log([\varepsilon])$, $\mathcal{O}(1)(U) = (B[\frac{1}{\log([\varepsilon])}])^{\varphi=p}$. Similarly we can define $\mathcal{O}(m)$, and $\mathcal{O}(m) = \mathcal{O}(1)^m$. ⌟

Lemma (17.10.2.2). There is an isomorphism $\mathrm{Div}(X) \to \mathrm{Pic}(X)$ that maps each x to the inverse of its ideal sheaf(6.5.3.15)(5.3.5.20). And there is also a degree map $\mathrm{Div}(X) \to \mathbb{Z}$. Then:

$$\begin{array}{ccc} \mathrm{Div}(X) & \xrightarrow{\deg} & \mathbb{Z} \\ & \searrow & \downarrow \rho \\ & & \mathrm{Pic}(X) \end{array}$$

commutes. ⌟

Proof: It suffices to show that any $\mathcal{O}(x)$ is isomorphic to $\mathcal{O}(1)$. As $\log([\varepsilon])$ is a global section of $\mathcal{O}(1)$ that vanishes of order 1 at x, it induces an isomorphism $\mathcal{O}(1) \cong \mathcal{O}(x)$ by(6.5.3.15). □

Lemma (17.10.2.3) [Cohomology of Line Bundles]. For any integer m, $B^{\varphi=p^m} \to H^0(X, \mathcal{O}(m))$ is an isomorphism and $H^i(X, \mathcal{O}(m)) = 0$ for $i > 0, m > 0$. ⌟

Proof: This is trivial using Cech cohomology, as $\oplus_{n\geq 0} B^{\varphi=p^n}$ is PID, so X is separated. □

Prop. (17.10.2.4). The construction induces an isomorphism $\rho : \mathbb{Z} \cong \mathrm{Pic}(X) : m \mapsto \mathcal{O}(m)$. ⌟

Proof: By lemma(17.10.2.2), ρ is surjective because $\mathrm{Div}(X) \to \mathrm{Pic}(X)$ does, and it is injection because if $\mathcal{O}(m) \cong \mathcal{O}(n)$, then tensoring $\mathcal{O}(-m)$, we can assume $\mathcal{O} \cong \mathcal{O}(-k)$, but they have different global sections by lemma(17.10.2.3) and(17.10.1.33)(17.10.1.35). □

Harder-Narasimhan Filtration of Vector Bundles

Prop. (17.10.2.5) [Harder Narasimhan Formalism for Bun_X]. For a vector bundle L on X, we can define $\deg(L) = n$ iff $L \cong \mathcal{O}(n)$(17.10.2.2), and for a vector bundle E, define $\deg(E) = \deg(\wedge(E))$. And define the generic rank on the category of coherent sheaves on X. Then this is a Harder-Narasimhan formalism on $\mathcal{C} = \mathrm{Bun}_X$ with $\mathcal{A} = \mathcal{V}\mathrm{ect}_{K(X)}$. ⌟

Proof: Only the last axiom needs proof, but if $\mathcal{E}' \subsetneq \mathcal{E}$, notice $\wedge\mathcal{E}' \subsetneq \wedge\mathcal{E}$(The stalks are PID), so by taking their top exterior power product, we reduce to the case of line bundles.

But $\mathcal{O}(m)$ cannot map into $\mathcal{O}(n)$ if $m > n$ and must by isomorphism if $m = n$, by tensoring $\mathcal{O}(-m)$ and looking at global sections(17.10.2.3), so the assertion is true. □

Cor. (17.10.2.6). Every vector bundle $\mathcal{E}$ on X has a unique functorial Harder-Narasimhan filtration, by(4.3.4.22). ⌟

3 Base Change of Fields

Prop. (17.10.3.1) [Base Change]. Let $C^\flat$ be alg.closed. For any finite extension E of $\mathbb{Q}_p$ of degree n, $\mathrm{Spec}\, E \to \mathrm{Spec}\, \mathbb{Q}_p$ is finite étale, and finite locally free of degree n, so does $X_E = X \otimes_{\mathbb{Q}_p} E \to X$(6.6.2.24).

In particular, X_E is also a Dedekind scheme**?**. For any closed point x of X corresponding to an untilt K of $C^\flat$, which is alg.closed, the fiber of X_E over x is identical to the spectrum of $E \otimes_{\mathbb{Q}_p} K \cong K^n$ as K is alg.closed.

In this situation and use(17.10.1.40), we see that the closed points of X_E are in bijection with isomorphism classes of (K, ι, u) module φ-actions, where (K, ι) is an untilt of $C^\flat$, and $u : E \to K$ is an embedding of E into K over $\mathbb{Q}_p$, isomorphism classes of these triples are denoted by Y_E. ⌟

Prop. (17.10.3.2). By(17.10.3.1) and flat base change(6.7.5.1), we know $H^0(X_E, \mathcal{O}_{X_E}) = E$, in particular X_E is connected. ⌟

Lemma (17.10.3.3). If E is unramified of degree n over $\mathbb{Q}_p$, then $E \cong W(\mathbb{F}_{p^n})[\frac{1}{p}]$. In particular,

$$\mathrm{Hom}_{\mathbb{Q}_p}(E, K) \cong \mathrm{Hom}_{\mathbb{Z}_p}(W(\mathbb{F}_{p^n}), \mathcal{O}_K) \cong \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, \mathcal{O}_K/p) \cong \mathcal{O}_{C^\flat}/[t]) \cong \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)$$

where the last isomorphism is by Henselian lemma.

Therefore, $Y_E \cong Y \otimes \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)$, and

$$\text{Closed points of } Y_E \cong Y_E/\varphi^{\mathbb{Z}} \cong (Y \otimes \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C))/\varphi^{\mathbb{Z}} \cong Y/\varphi^{n\mathbb{Z}}.$$

⌟

Prop. (17.10.3.4). If E is unramified of degree n over $\mathbb{Q}_p$ and $U \neq X$ is an affine open defined by a homogenous element t, then

$$U_E = \mathrm{Spec}((B[t^{-1}] \otimes_{\mathbb{Q}_p} E)^{\varphi=\mathrm{id}}) = \mathrm{Spec}(B[t^{-1}]^{\varphi^n=1}).$$

where φ acts trivially on E. ⌟

Proof: Each $u \in \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C^\flat)$ induces a map $W(\mathbb{F}_p) \to W(\mathcal{O}_{C^\flat}) = A_{\mathrm{inf}} \to B$, which extends to a map $\overline{u} : E \to B[t^{-1}]$. and induces a map $q_u : B[t^{-1}] \otimes_{\mathbb{Q}_p} E \to B[t^{-1}]$. Now

$$B[t^{-1}] \otimes_{\mathbb{Q}_p} E \to \prod_{\mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)} B[t^{-1}]$$

is an isomorphism, which is just because $x^{p^n} - x$ splits in $B[t^{-1}]$.

And under this isomorphism, the action of φ is

$$\varphi((f_0, \ldots, f_{n-1}) = (\varphi(f_{n-1}), \varphi(f_0), \ldots, \varphi(f_{n-2})),$$

so proposition is clear. □

Cor. (17.10.3.5). Fix now a finite extension $E/\mathbb{Q}_p$ with uniformizer π that has ramification degree e and inertia degree d, and E_0 is the maximal unramified subextension, then there are maps $E_0 \to B$ by(17.10.3.4), fix forever one of them p_u, this induces a map

$$B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E \to B[\frac{1}{t}] \otimes_{E_0} E$$

and this induces an isomorphism

$$(B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E)^{\varphi=\mathrm{id}} = (B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E_0)^{\varphi=\mathrm{id}} \otimes_{E_0} E = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=\mathrm{id}}$$

⌟

Def. (17.10.3.6)[Y_E^0]. Define $Y_E^0 \subset Y_E =$ triples (K, ι, u), where (K, ι) is an untilt of $C^\flat$, and $u : E \to K$ is an embedding that $u|_{E_0}$ is identical to $e_K \circ p_u : E_0 \to B \to K$. Notice Y_E^0 is not stable under the Frobenius, but it is stable under φ^d, and induces an isomorphism

$$Y_E^0/\varphi^{d\mathbb{Z}} \cong Y_E/\varphi^{\mathbb{Z}}.$$

⌟

Prop. (17.10.3.7). Notice for an element y of Y_E^0, the map $u : E \to K_y = B_{dR}^+(y)/\xi$ extends uniquely to a map $E \to B_{dR}^+(y)$ that is compatible with $e_K \circ p_u : E_0 \to B_{\mathrm{dR}}^+(y)$, because E is separable over E_0. i.e.

$$\begin{array}{ccc} E_0 & \xrightarrow{e_K \circ p_u} & B_{\mathrm{dR}}^+(y) \\ \downarrow & \overset{\widetilde{u}}{\nearrow} & \downarrow \\ E & \xrightarrow{u} & K \end{array}$$

Then this defines a map $B \otimes_{E_0} E \to B_{\mathrm{dR}}^+(y)$, also called the stalk map. ⌟

Prop. (17.10.3.8). For any finite extension $E/\mathbb{Q}_p$, the degree map $\deg : \mathrm{Pic}(X_E) \cong \mathbb{Z}$ is an isomorphism. ⌟

Proof: It suffices to show that $\mathcal{O}_{X_E}(x) \cong \mathcal{O}_{X_E}(x')$ for each pair of closed points x, x' of X_E.

We attempt to construct a line bundle $\mathcal{O}_{X_E}(1)$ on X_E that $\mathcal{O}_{X_E}(1)(U_E) = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=\pi}$, because $\mathcal{O}_{X_E}(U_E) = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=1}$.

We show simultaneously that $\mathcal{O}_{X_E}(1)$ is a line bundle and it is isomorphic to $\mathcal{O}_{X_E}(x)$ for any closed point $x \in X_E$: For any $x \in X_E$ corresponding to a φ^d-orbit of Y_E^0, let f be the element constructed by lemma(17.10.3.9) below, we show that for any affine open $U = D(t)$, multiplying by $f : \mathcal{O}_{X_E}(x)(U_E) \to \mathcal{O}_{X_E}(1)(U_E)(\star)$ is an isomorphism:

Notice $B \otimes_{E_0} E$ is free over B, let $N(f) \in B$ be its norm, the norm is local, so for each $y \in Y$, $N(f)_y = \prod_{\overline{y}} f_{\overline{y}}$, where $\overline{y} \in Y_E$ are over y, so it vanishes with order 1 in a φ^d-orbit of Y(order 1 because f only vanishes at $\overline{y}$ in the orbit corresponding to x), and then $N(f)\varphi(N(f))\dots\varphi^{d-1}(N(f))$ vanishes at a single φ-orbit of Y with order 1, thus equals $u\log([\varepsilon])$ for some $\varepsilon \in \mathfrak{m}_{C^\flat}$, by(17.10.1.17)(17.10.1.13). In particular, y divides $\log([\varepsilon])$.

Now if $x \notin U_E$, then $\log([\varepsilon])$ divides t, so f divides t, thus f is invertible in $B[\frac{1}{t}] \otimes_{E_0} E$, thus $(\star)$ is an isomorphism.

Otherwise if $x \in U_E$, then choose some x' not in U_E, then the same argument shows that f' is invertible in $B[\frac{1}{t}] \otimes_{E_0} E$, so $f/f' \in (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi=\mathrm{id}}$ that vanishes with a single zero at x, so multiplying by f'/f defines an isomorphism $\mathcal{O}_{X_E}(U_E) \cong \mathcal{O}_{X_E}(x)(U_E)$, so it suffices to show the composition

$$\mathcal{O}_{X_E}(U_E) \xrightarrow{f'/f} \mathcal{O}_{X_E}(x)(U_E) \xrightarrow{f} \mathcal{O}_{X_E}(1)(U_E)$$

is an isomorphism, but this reduces to the first case. □

Lemma (17.10.3.9)[Uniformizer Existence]. If x be a closed point of X_E corresponding to an orbit of φ in Y_E thus an orbit S of φ^d in Y_E^0, then there is an element $f \in (B \otimes_{E_0} E)^{\varphi^d=\pi}$ that $\mathrm{ord}_{\overline{y}}(f) = 1$ if $\overline{y} \in S$, and 0 otherwise. ⌟

Proof: The map defined (17.10.3.18) composed with the Teichmuller section(17.10.3.16) in fact has image in $(B \otimes_{E_0} E)^{\varphi^n=\pi}$ because $[\pi] = \pi t + t^{p^n} = \varphi^n$ on $\mathcal{O}_{C^\flat}$, and it is an isomorphism of $\mathcal{O}_E$ modules. Now there are commutative diagrams:

$$\begin{array}{ccccc} G_{LT}(\mathcal{O}_{C^\flat}) & \xrightarrow{\sigma} & G_{LT}(A_{\mathrm{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\log_G} & B \otimes_{E_0} E \\ & & \downarrow & & \downarrow \\ & & G_{LT}(\mathcal{O}_K) & \xrightarrow{\log_G} & K \end{array}$$

The map $G_{LT}(\mathcal{O}_{C^\flat}) \to G_{LT}(\mathcal{O}_K)$ has kernel $\mathcal{O}_E u$ for some u, thus we can let $f = \log_G(\sigma(u))$, then the image of $f \in K$ is 0, which means f has a zero at the point $y \in Y_E^0$. And(17.10.3.13) shows the the zeros of f is just the φ^d-orbit containing y. □

Lubin-Tate Formal Groups and the Proof of the Lemma of Uniformizer

Prop. (17.10.3.10). The ring $B \otimes_{E_0} E$ is an integral domain. ⌟

Proof: Cf.[Lurie P95]. In fact this is the ramified Witt vector, which is by the same reason as before an integral domain, Cf.[FF Curve Johannes]. □

Cor. (17.10.3.11). If $f \neq 0 \in B \otimes_{E_0} E$, then $N_{E/E_0}(f) \neq 0 \in B$, in particular, the vanishing locus of f is finite. ⌟

Cor. (17.10.3.12). If $f, g \in B \otimes_{E_0} E$, then f is divisible by g iff for each $\overline{y} \in Y_E^0$, $\mathrm{ord}_{\overline{y}}(f) \geq \mathrm{ord}_{\overline{y}}(g)$. ⌟

Proof: If $\mathrm{ord}_{\overline{y}}(f) \geq \mathrm{ord}_{\overline{y}}(g)$, suppose $N_{E/E_0}(g) = gh$, then multiplying by h, we can assume $g \in B$. Now f is written uniquely as $f_0 + f_1\pi + \ldots + f_{e-1}\pi^{e-1}$ where $f_k \in B$, thus it suffices to show f_i is divisible by g, which is equivalent to $\mathrm{ord}_y(f) \geq \mathrm{ord}_y(g)$ for each $y \in Y$, by(17.10.1.15). Now if $\mathrm{ord}_y(g) = n$, the hypothesis shows f vanishes in

$$\prod_{\overline{y}\to y} B_{\mathrm{dR}}^+(y)/\xi^n = (B_{\mathrm{dR}}^+(y)/\xi^n) \otimes_{E_0} E = B_{\mathrm{dR}}^+(y)/\xi^n + \pi B_{\mathrm{dR}}^+(y)/\xi^n + \ldots + \pi^{e-1} B_{\mathrm{dR}}^+(y)/\xi^n$$

thus $\mathrm{ord}_y(f) \geq n = \mathrm{ord}_y(g)$. □

Cor. (17.10.3.13). If $f \in (B \otimes_{E_0} E)^{\varphi^n = \pi}$, then the vanishing locus of f is a single φ^d-orbit, and all zeros are simple. ⌟

Proof: Set $N_{E/E_0}(f) = f'$ and $N_{E/E_0}(\pi) = \pi'$, then f belongs to $B^{\varphi^d = \pi'}$, and its divisor is just the image of divisor of f in Y_E^0. So it suffices to show that f' vanishes on a single $\varphi^{d\mathbb{Z}}$-orbit.

Now for $0 < \rho < 1$,

$$\rho^{p^d} |f'|_{\rho^{p^d}} = |\pi' f'|_{\rho^{p^d}} = |f'^{\varphi^d}|_{\rho^{p^d}} = |f'|_\rho^{p^d},$$

thus

$$p^d s + v_{p^d s}(f') = p^d v_s(f')$$

for each $s > 0$, differentiating, we get

$$1 + \partial_- v_s(f') = \partial_- v_s(f')$$

Now the divisor of f' is $\varphi^{d\mathbb{Z}}$-invariant, and it has exactly one zero on any annulus $(\rho^n, \rho]$(17.10.1.19), thus its divisor is a single φ^d-orbit. □

Def. (17.10.3.14) [Universal Lubin-Tate Formal Group]. Recall that if E is a finite extension of Q_p with uniformizer π, for a $\mathcal{O}_E$-algebra A complete w.r.t π, $G_{LT}(A)$ is the Lubin-Tate formal group, with elements the topological nilpotent elements of A3.

Now we define the **universal cover of Lubin-Tate formal group** $\widetilde{GT}$ as the functor

$$A \mapsto \lim\{\cdots \xrightarrow{[\pi]} G_{LT}(A) \xrightarrow{[\pi]} G_{LT}(A)\}.$$

⌟

Prop. (17.10.3.15).

- Notice for K an alg.closed extension of E, $G_{LT}(\mathcal{O}_K)$ is in bijection with $\mathfrak{m}_K$, and the kernel of $[\pi^n]$ on $G_{LT}(\mathcal{O}_K)$ has order $\mathcal{O}_E/\pi^n$, thus the kernel of $\widetilde{G}_{LT}(\mathcal{O}_K) \to G_{LT}(\mathcal{O}_K)$ is a 1-dimensional $\mathcal{O}_E$-module.
- If π vanishes on A and A is perfect, then $[\pi] = \pi t + t^q = t^q$ on A, so it is just the Frobenius, and $\widetilde{G}_{LT}(A) \to G_{LT}(A)$ is a bijection.
- $\widetilde{G}_{LT}(A) \to \widetilde{G}_{LT}(A/I)$ is an isomorphism for $\pi \in I$ and A is I-adic.
- $\widetilde{G}_{LT}(A) \to \widetilde{G}_{LT}(A/I)$ is an isomorphism for any ideal I that $I + (\pi) \neq (1)$, because both of them is isomorphic to $\widetilde{G}_{LT}(A/(I + (\pi))$.

⌟

Proof: For 3, it suffices to prove that $\widetilde{G}_{LT}(A/I^{n+1}) \to \widetilde{G}_{LT}(A/I^n)$ for $n \geq 1$. Notice $F(u,v) \equiv u+v \mod I^{2n}$, so we have an exact sequence

$$0 \to I^n/I^{n+1} \to G_{LT}(A/I^{n+1}) \to G_{LT}(A/I^n) \to 0.$$

In particular the kernel is annihilated by π, so there is a commutative diagram

$$\begin{array}{ccccc} \cdots & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) \\ & \nearrow & \downarrow & \nearrow & \downarrow \\ \cdots & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) \end{array}$$

which show that $\widetilde{G}_{LT}(A/I^{n+1}) \cong \widetilde{G}_{LT}(A/I^n)$. □

Cor. (17.10.3.16) [Teichmuller Section]. Consider the $\mathcal{O}_E$-algebra $A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E$. Because there are isomorphism $\mathcal{O}_{E_0}/p \cong \mathcal{O}_E/\pi$, we have an isomorphism

$$C^\flat \cong A_{\inf}/p \cong (A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)/\pi$$

Now(17.10.3.15) shows the diagram

$$\begin{array}{ccc} \widetilde{G}_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\cong} & \widetilde{G}_{LT}(\mathcal{O}_{C^\flat}) \\ \downarrow & & \downarrow \cong \\ G_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \longrightarrow & G_{LT}(\mathcal{O}_{C^\flat}) \end{array}$$

So the lower horizontal map is surjective, and it even has a canonical section σ, called the **Teichmuller section**. ⌟

Cor. (17.10.3.17). Given a point of Y_E^0 which corresponds to an untilt of $C^\flat$ together with a E_0-map $E \to K$, then this gives a commutative diagram

$$\begin{array}{ccc} \widetilde{G}_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\cong} & \widetilde{G}_{LT}(\mathcal{O}_K) \\ \downarrow & & \downarrow \\ G_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \longrightarrow & G_{LT}(\mathcal{O}_K) \end{array}$$

where the right vertical arrow is surjective with kernel free of rank 1 over $\mathcal{O}_E$. So this together with(17.10.3.16) shows there is a surjection $G_{LT}(\mathcal{O}_{\mathcal{O}_{C^\flat}}) \to G_{LT}(\mathcal{O}_K)$ with kernel a rank-1 $\mathcal{O}_E$-module. ⌟

Prop. (17.10.3.18). There is a canonical $\mathcal{O}_E$-module map

$$G_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) \xrightarrow{\log_G} B \otimes_{E_0} E.$$

and it is equivariant w.r.t φ. ⌟

Proof: $G_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)$ are in bijection with the maximal ideal of $A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E$, and $\log_G(x)$ is of the form $x + \frac{c_2}{2}x^2 + \ldots + \frac{c_n}{n}x^n + \ldots$, with $c_n \in \mathcal{O}_E$.

Now for $x \in G_{LT}(A_{\inf} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)$, we show that $\log_G(x)$ converges in $B \otimes_{E_0} E = B + \pi B + \ldots + \pi^{e-1}B$: Let $c_n x^n = \sum a_{n,i}\pi^i$, then we need to show $a_{n,i}/n$ converges to 0 for each of the norm $|\cdot|_\rho$. And this is because if $x = x_0 + \pi y_0$, then for $n \geq em$, $|x|_\rho \leq \max\{|x_0|_\rho^{em}, \rho^m$, which decays exponential in n, and $|\frac{1}{n}|_\rho$ decays linearly in n. □

Prop. (17.10.3.19). The map $\log_G(\sigma(\cdot)) : G_{LT}(\mathcal{O}_{C^\flat}) \to (B \otimes_{E_0} E)^{\varphi^n=\pi}$ as in(17.10.3.9) is an isomorphism. ⌟

Proof: For surjectivity, as any $f \in (B \otimes_{E_0} E)^{\varphi^n=\pi}$ vanishes at a single $\varphi^{d\mathbb{Z}}$-orbit, then by(17.10.3.9) we can find a $\log_G(u)$ that vanishes at the same locus, so $f = \log(u)\lambda$ where λ is a unit in $B \otimes_{E_0} E$(17.10.3.12), so

$$\lambda \in (B \otimes_{E_0} E)^{\varphi^n=\mathrm{id}} = (B \otimes_{\mathbb{Q}_p} E)^{\varphi=\mathrm{id}}(17.10.3.5) = B^{\varphi=\mathrm{id}} \otimes_{\mathbb{Q}_p} E = E.$$

For injectivity, we proved in(17.10.3.9) that each $\log_G(\sigma(u))$ only vanishes at a single φ^d-orbit in Y_E^0, so it cannot by 0, which vanishes at all points. □

Cor. (17.10.3.20). There are canonical bijections

$$\{\text{Closed Points of } X_E\} \cong \{\varphi^{d\mathbb{Z}}\text{orbits of } Y_E^0\} \cong ((B \otimes_{E_0} E)^{\varphi^n=\pi} - \{0\})/E^* \cong (G_{LT}(\mathcal{O}_{C^\flat}) - \{0\}/E^*$$

by(17.10.3.9)(17.10.3.19),(17.10.3.12). ⌟

Vector Bundles and Base Change

Prop. (17.10.3.21) [Vector Bundles on the Cover]. Let $\pi : X_E \to X$ be the covering map, for any vector bundle $\mathcal{E}$ on X_E, $\pi_*(\mathcal{E})$ is a vector bundle on X, and this induces an isomorphism

$$\{X_E\text{-Bundles}\} \cong \{X - \text{Bundles with an } E\text{-action}\}.$$

Now define $\deg(\mathcal{E}) = \deg(\pi_*\mathcal{E})$, and $\mathrm{slope}(\mathcal{E}) = \frac{\deg(\mathcal{E})}{\mathrm{rank}(\mathcal{E})} = \frac{1}{n}\mathrm{slope}(\pi_*\mathcal{E})$.

Then $\mathcal{E}$ is semistable of slope λ iff $\pi_*\mathcal{E}$ is semistable of slope λ/n. ⌟

Proof: One direction is clear, for the other, if $\mathcal{F} = \pi_*\mathcal{E}$ is not semistable, choose its HN-filtration, then $\lambda_1 > \lambda/n$. Now the action of E on $\mathcal{F}$ preserves the HN-filtration, thus $\mathcal{F}_1$ is an E-vector bundle, thus by the correspondence above, $\mathcal{F}_1 = \pi_*\mathcal{E}'$ for some subbundle $\mathcal{E}' \subset \mathcal{E}$, and clearly this contradicts the semistablity of $\mathcal{E}$. □

Cor. (17.10.3.22). For any integral number d, n with $n > 0$, there exists a semistable vector bundle on X with rank n and degree d. ⌟

Proof: Let E be an extension of $\mathbb{Q}_p$ of degree n, then $\pi_*(\mathcal{O}_{X_E}(d))$ is semistable of rank n and degree d, by(17.10.3.1)(6.6.2.23), because $\mathcal{O}_{X_E}(d)$ is a line bundle(17.10.3.8) so clearly semistable, and it is of degree d because **?**. □

Isocrystals and Classification of Semistable Vector Bundle over X

Remark (17.10.3.23). Recall the Dieudonné-Manin Classification(8.8.4.10)(8.8.4.13): Any isocrystal over k is a finite sum of modules pure of slopes λ_i. And if k is alg.closed, then any isocrystal over k has a unique decomposition as sums of E_{λ_i}. ⌟

Prop. (17.10.3.24). Let $k = \overline{\mathbb{F}}_p \in C^\flat$, then there is an inclusion $W(k) \to A_{\mathrm{inf}}$, which extends to a map $K \to B$. Now given an isocrystal V over k, denote $\mathcal{E}_V$ the coherent sheaf on X defined by the graded module $\oplus_{n\geq 0} \mathrm{Hom}_K(V, B)^{\varphi=p^n}$. In other words, on an affine open subscheme $U = D(t)$, $\mathcal{E}_V(U) = \{\varphi - \text{equivariant } K\text{-linear maps } V \to B[\frac{1}{t}]\}$.

And when $V = E_{m/n}$ is the simple isocrystal, then $\mathcal{E}_V$ is denoted by $\mathcal{O}(\frac{m}{n})$. ⌟

Prop. (17.10.3.25). In fact we have $\mathcal{O}(\frac{m}{n})(U) \cong (B[t^{-1}])^{\varphi^n = p^m} = (\rho_* \mathcal{O}(m))(U)$, where $\rho : X_E \to X$, and E is an unramified extension of $\mathbb{Q}_p$. ⌟

Prop. (17.10.3.26) [Classification of Semistable Vector Bundles over X]. For every vector bundle on X, the HN-filtration splits non-canonically, and the construction $V \to \mathcal{E}_V$ induces an equivalence of categories between

$$\{\text{Isoclinic Isocrystals of slope } \mu\}^{\text{op}} \to \{\text{Semistable vector bundles on } X \text{ of slope } \mu\}$$

⌟

Proof: Cf.[FF Curve Johannes].**?** □

Cor. (17.10.3.27). Any two semistable vector bundles of slope λ over X is isomorphic, and a semistable vector bundle of slope 0 is trivial. ⌟

Prop. (17.10.3.28). If $\mathcal{E}, \mathcal{E}'$ be semistable vector bundles on X of slopes μ, μ', then $\mathcal{E} \otimes \mathcal{E}'$ is semistable of slope $\mu + \mu'$. ⌟

Proof: We can assume $\mathcal{E} = \rho_* \mathcal{O}_{X_E}(d)$ for an unramified extension $E/\mathbb{Q}_p$ by(17.10.3.27), and then $\mathcal{E} \otimes \mathcal{E}' = \rho_*(\mathcal{O}_X(d) \otimes \rho^* \mathcal{E}')$. Since ρ_*, ρ^* preserves semistability(by(17.10.3.21) and**?**). So it suffices to prove $\mathcal{O}(d) \otimes -$ preserves semistablity, but this is clear, as $\mathcal{O}(d)$ shifts degree. □

Diamonds Definitions

Def. (17.10.3.29) [Diamond]. Let Perf denote the site of perfectoid spaces of characteristic p equipped with the pro-étale topology. A **diamond** X is a sheaf (of sets) on Perf of the form $X = Hom_{Perf}(,Z)/R$, where $Z \in Perf$ and $R \in Z \times Z$ is a reasonable representable equivalence relation. ⌟

Prop. (17.10.3.30) [Scholze]. Let $\underline{R} = (R, R^+)$ be a Huber pair, then

$$\text{Spd}(\underline{R}) = \mathcal{Z} \mapsto \{\text{untilts of}\text{Spa}(\underline{R}) \text{ over } Z\}$$

is a diamond.

And this construction can be glued to give diamond $X^\diamond$ of any adic space X, which is a sheaf. ⌟

Def. (17.10.3.31) [Adic Fargues-Fontaine Curve]. Let $\mathcal{Y}$ be the adic space $\text{Spa}(A_{\text{inf}})$ removing the vanishing locus of p and $[t]$, then by what we proved, the Frobenius act totally discontinuous on $\mathcal{Y}$, thus the quotient $\mathcal{X}^{FF}$ is an adic space, the FF-curve. ⌟

Prop. (17.10.3.32). There is an isomorphism of diamonds:

$$\mathcal{Y}^\diamond \cong \text{Spd}(C^\flat) \times \text{Spd}(\mathbb{Q}_p), \quad \mathcal{X}^{FF,\diamond} \cong \text{Spd}(C^\flat)/\varphi^{\mathbb{Z}} \times \text{Spd}(\mathbb{Q}_p)$$

More generally, over any Huber pair $\underline{R}$, there is a relative FF-curve which is defined by

$$\text{Spd}(\underline{R}) \times \text{Spd}(\mathbb{Q}_p)/\varphi^{\mathbb{Z}}$$

⌟

Proof: $C^\flat$ is a perfectoid of char$p$, so for a perfect Huber pair, $\underline{S}$ point of $C^\flat$ is just a morphism $u:(C^\flat,\mathcal{O}_{C^\flat}\to(S,S^+)$. And a $\mathbb{Q}_p$ point is just a char0 untilts $\underline{T}$ of $\underline{S}$.

So for each pairs (T,u), we need to find a morphism $A_{\inf}[\frac{1}{p},\frac{1}{[t]}\to T$. For this, consider

$$A_{\inf}=W(\mathcal{O}_{C^\flat})\to W(S^+)\cong W(T^\flat)\xrightarrow{\theta_T}T$$

This is a bijection, as we proved in the beginning(17.11.1.2). □

Prop. (17.10.3.33). There is a morphism of ringed spaces $\mathcal{X}^{FF}\to X^{FF}$ that regard $\mathcal{X}^{FF}$ as the rigid analytification of $\mathcal{X}$, so they have the same category of vector bundles and cohomology, prove by Kedlaya-Liu. ⌟

4 Applications

Prop. (17.10.4.1). The FF curve X is geometrically simply connected, i.e. the projection defines an isomorphism of étale groups $\pi_1(X)\to\pi_1(\operatorname{Spec}\mathbb{Q}_p)=\mathrm{Gal}_{Q_p}$.

Equivalently, the pullback defines an equivalence of étale sites. ⌟

Proof: Let $\widetilde{X}\to X$ be an finite étale morphism, we want to prove that $\widetilde{X}=X\otimes_{\operatorname{Spec}\mathbb{Q}_p}\operatorname{Spec}(E)$ for some étale $\mathbb{Q}_p$-algebra. Let $\mathcal{A}=\rho_*\mathcal{O}_{\widetilde{X}}$, and $E=H^0(X,\mathcal{A})=H^0(\widetilde{X},\mathcal{O}_{\widetilde{X}})$. Now it suffices to show $\mathcal{A}=E\otimes_{\mathbb{Q}_p}\mathcal{O}_X$, which shows $\widetilde{X}=X\otimes_{\operatorname{Spec}\mathbb{Q}_p}\operatorname{Spec}(E)$, and forces E be an étale $\mathbb{Q}_p$-algebra by fpqc descent**?**. Equivalently, $\mathcal{A}$ is trivial, and this is equivalent to $\mathcal{A}$ being semistable of slope 0 by(17.10.3.27).

Because ρ is finite étale, the trace pairing $\mathcal{A}\times\mathcal{A}\to\mathcal{A}\xrightarrow{tr}\mathcal{O}_X$ is non-degenerate(check on stalks), which induces an isomorphism $\mathcal{A}\cong\mathcal{A}^\vee$, so $\deg(\mathcal{A})=0$, and if $\mathcal{A}$ is not semistable, let $\mathcal{A}'$ be the first term of the HN-filtration of $\mathcal{A}$, then it is of slope $\lambda>0$, So $\mathcal{A}'\otimes\mathcal{A}'$ is of slope 2λ by(17.10.3.28), so the composite $\mathcal{A}'\otimes\mathcal{A}'\hookrightarrow\mathcal{A}\otimes\mathcal{A}\to\mathcal{A}$ must by 0(4.3.4.32), which is impossible, because if U is an affine open that $\mathcal{A}$ has a section, then this says $U\otimes_X\widetilde{X}$ has a section s that $s^2=0$. But $U\otimes_X\widetilde{X}$ is reduced(check on stalks). □

Cor. (17.10.4.2).

- The projection map induces equivalence of categories between Finite Abelian groups with $Gal(Q_p)$-action and étale Local system on X.
- If M is a finite Abelian group with a $Gal(\mathbb{Q}_p)$-action, then

  $$H^*(Gal(\mathbb{Q}_p),M)\to H^*_{ét}(X,u^*M)$$

  is an isomorphism for $*=0,1$.

⌟

Proof: 1 is trivial, and 2 Cf. [Lurie P102]. □

5 Weakly Admissible⇒Admissible

Def. (17.10.5.1) [Notations]. Let K be a finite extension of $\mathbb{Q}_p$, and $K_0=W(k)[\frac{1}{p}]$ be the maximal unramified subextension in K, let $C=\widehat{\overline{K}}$ and $F=C^\flat$. Denote by $\infty\in X$ the closed point determined by C, which is just the vanishing locus of the Galois stable line $\mathbb{Q}_pt$, where $t=\log([\varepsilon])$ and $\varepsilon=(1,\xi_p,\xi_{p^2},\dots)\in C^\flat$(17.10.1.36).

Notice G_K acts on $\mathbb{Q}_p\log([\varepsilon])$ by the cyclotomic character χ_{cycl}. Recall

$$B_{\mathrm{dR}}^+=\widehat{\mathcal{O}}_X(\infty),\quad B_{\mathrm{crys}}^+,\quad B_{\mathrm{crys}}=B_{\mathrm{crys}}^+[t^{-1}],\quad B_e=H^0(X-\{\infty\},\mathcal{O}_X)=(B_{crys})^{\varphi=\mathrm{id}}$$

⌟

Def. (17.10.5.2) [Equivariant Action of G_K on Vector Bundles]. Recall an equivariant action of G_K on a bundle $\mathcal{E}$ on X is a data of isomorphisms $\sigma^*(\mathcal{E})\cong E$ that $c_{\sigma\tau}=c_\tau\circ\tau^*(c_\sigma)$. Notice any equivariant action of G_K on $\mathcal{E}$ induces a semilinear G_K action on $\mathcal{E}_\infty^\wedge=\mathcal{E}\otimes_{\mathcal{O}_X}B_{\mathrm{dR}}^+$, and here we require this action is continuous. The category of equivariant G_K-bundles are denoted by $Bun_X^{G_K}$. ⌟

Cor. (17.10.5.3). By the slope 0 case of the classification of vector bundles on X(17.10.3.26) and(18.4.5.1), we see that the functor:

$$\mathrm{Rep}_{\mathbb{Q}_p}G_K\to\mathrm{Bun}_X^{G_K}:V\mapsto V\otimes_{\mathbb{Q}_p}\mathcal{O}_X$$

is fully faithful with essential image the category $\mathrm{Bun}_X^{G_K,sst,0}$ of all G_K vector bundles on X that the underlying bundle is semistable of slope 0, i.e. trivial(17.10.3.27). ⌟

Prop. (17.10.5.4). There is a pullback diagram of categories:

$$\begin{array}{ccc}\varphi-FilMod_{K/K_0} & \longrightarrow & \varphi-Mod_{K_0}\\ \downarrow{\scriptstyle\mathcal{E}(-)} & & \downarrow{\scriptstyle\mathcal{V}}\\ \mathrm{Bun}_X^{G_K} & \longrightarrow & \mathrm{Rep}_{B_e}G_K\end{array}$$

Where $\mathcal{E}(-)$ maps a φ-filtered module (D,φ_D,Fil) to the bundle that is the bundle $\widetilde{(D,\varphi_D)}$ modified so that the fiber at ∞ is $Fil^0(D_K\otimes_K B_{\mathrm{dR}})$. ⌟

Proof: 1: By lemma(18.4.4.9), $\varphi-FilMod_{K/K_0}$ is equivalent to a φ-module V with a G_K-stable B_{dR}^+-lattice in $(V\otimes_{K_0}K)\otimes_K B_{\mathrm{dR}}^+=V\otimes_{K_0}B_{\mathrm{dR}}^+$.

2: By(18.4.6.5), φ-Mod is a full subcategory of $\mathrm{Rep}_{B_e}G_K$, where the G_K-stable B_{dR}^+-lattice is choose to be $V\otimes_{K_0}B_{\mathrm{dR}}^+$.

3: Clearly there is a functor

$$Bun_X^{G_K}\to\mathrm{Rep}_{B_e}G_K:\mathcal{E}\to H^0(X-\{\infty\},\mathcal{E}).$$

, and(6.4.2.15) says in this case $Bun_X^{G_K}$ is equivalent to a B_e-module with continuous G_K-actions and and a B_{dR}^+-module with continuous G_K-actions that they corresponds as a B_{dR}-module with continuous G_K-actions.

4: The compatibility in 3 just says that the B_{dR}^+-lattice choosen in the definition of(18.4.4.11) just comes from that of 2, so this diagram is clearly a pullback. □

Lemma (17.10.5.5). Let $FilV\in VectFil_K$ and $W=Fil(V\otimes_K B_{\mathrm{dR}})$, if $V\otimes B_{\mathrm{dR}}^+=\{e_1,\ldots,e_n\}$ and $Fil^0(V\otimes_K B_{\mathrm{dR}})=\{t^{-a_1}e_1,\ldots,t^{-a_n}e_n\}$, then the Hodge polygon of $FilV$ has slopes $(a_1,\ldots,a_n)$. ⌟

Proof: Use(18.4.4.9), notice $(t^aB_{\mathrm{dR}}^+)^{G_K}=0$ for $a>0$, as in the proof of(18.4.4.8). □

Lemma (17.10.5.6). The functor

$$\mathcal{E}(-) : \varphi - FilMod_{K/K_0} \to Bun_X^{G_K}$$

defined in(17.10.5.4) preserves degree and HN-filtration, where the HN-filtration on the RHS is induces by the HN-filtration on Bun_X by canonicity. ⌟

Proof: $\deg(\mathcal{E}((D,\varphi_D,Fil)) = \deg(\mathcal{E}(D,\varphi_D)) - \dim_K[D\otimes_{K_0} B_{\mathrm{dR}}^+ : Fil^0(D_K \otimes_K B_{\mathrm{dR}})]$ $= \deg(D_K, Fil) - \deg(D,\varphi_D)$.

Now the degree correspond, for the invariance of HN-filtration, it suffices to prove the subobjects are in bijection: Given a subobjects of $\mathcal{E}(V)$, we want to show it is a $\mathcal{E}(V')$, but this is because on the affine open $\mathrm{Spec}(B_e)$, by(18.4.6.5) any subbundle is also crysatalline, i.e. comes from $\varphi - Mod_{K_0}$. □

Prop. (17.10.5.7) [Weakly Admissible implies Admissible]. The category of crystalline Galois representations of G_K is equivalent to the category $\varphi - FilMod_{K/K_0}^{wa}$ of weakly admissible filtered φ-modules for K. ⌟

Proof: By definition of weakly admissible and(17.10.5.6), there is a pullback diagram

$$\begin{array}{ccc} \varphi - FilMod_{K/K_0}^{wa} & \longrightarrow & \varphi - FilMod_{K/K_0} \\ \downarrow & & \downarrow \mathcal{E}(-) \\ \mathrm{Rep}_{\mathbb{Q}_p} G_K \cong Bun_X^{G_K,sst,0} & \longrightarrow & Bun_X^{G_K} \end{array}$$

Adjunction with(17.10.5.4), we get another pullback diagram

$$\begin{array}{ccccc} \varphi - FilMod_{K/K_0}^{wa} & \longrightarrow & \varphi - FilMod_{K/K_0} & \longrightarrow & \varphi - Mod_{K_0} \\ \downarrow & & \downarrow \mathcal{E}(-) & & \downarrow \mathcal{V} \\ \mathrm{Rep}_{\mathbb{Q}_p} G_K \cong Bun_X^{G_K,sst,0} & \longrightarrow & Bun_X^{G_K} & \longrightarrow & \mathrm{Rep}_{B_e} G_K \end{array}$$

But this pullback is just the category of crystalline representations: by(17.10.5.3), for $V \in \mathrm{Rep}_{\mathbb{Q}_p} G_K$, the condition $\mathcal{V}(\mathcal{D})(M) \cong M$ in(18.4.6.5) is just saying that V is in the image of $\mathcal{V}$ iff

$$(V \otimes_{\mathbb{Q}_p} B_{crys})^{\varphi=\mathrm{id}} \otimes_{B_e} B_{crys} \cong V \otimes_{\mathbb{Q}_p} B_{crys}$$

which is equivalent to V being crystalline. □

⌟

1 Fontaine's Period Rings

Fontaine's Ring A_{inf}

Def. (17.11.1.1) [Fontaine's Ring A_{inf}]. Let $C^\flat$ be a perfectoid field of characteristic p, for any untilt K of $C^\flat$, the Fontaine's ring $A_{\text{inf}} = A_{\text{inf}}(\mathcal{O}_K)$ is defined to be the ring of Witt vectors $W(\mathcal{O}_{C^\flat})$(5.5.1.15). Also denote $B_{\text{inf}} = A_{\text{inf}}[\frac{1}{p}]$.

the set of all the char0 untilts K of $C^\flat$ is denoted by Y. and $Y_{[a,b]}$ denotes those untilts that $a \le |p|_K \le b$. ⌟

Prop. (17.11.1.2). By(11.2.9.7), if $K \in \mathcal{P}\text{erfd}^0 \cap \texttt{Field}^0$, with tilt $C^\flat$, then there is a diagram

$$\begin{array}{ccc} A_{\text{inf}} & \xrightarrow{\theta} & \mathcal{O}_K \\ \downarrow & & \downarrow \\ \mathcal{O}_{C^\flat} & \xrightarrow{\bar{\sharp}} & \mathcal{O}_K/(p) \end{array}.$$

Then θ is surjective, and $\ker\theta$ is generated by some distinguished element $\xi = [t] - pu$ where $u \in A_{\text{inf}}$ is invertible. Moreover, any distinguished element in the kernel is a generator. ⌟

Proof: θ is surjective by(5.5.1.16). By(11.2.8.11), there exists $t \in A_{\text{inf}}$ s.t. $t^\sharp = pu'$ for some u' invertible in $\mathcal{O}_K$. Thus $u' = \theta(u)$ for some invertible $u \in A_{\text{inf}}$, then $\theta([t] - pu) = 0$. And ξ generates the kernel because it generates after modulo ϖ, and and use the fact $\mathcal{O}_K$ is p-complete.

For the last assertion, use(17.11.1.4), which shows that if ξ' is another distinguished element in $\ker\theta$, $A_{\text{inf}}/(\xi')$ is an integral domain of dimension 1. So $(\xi) = (\xi')$ as $\mathcal{O}_K$ is not a field. □

Lemma (17.11.1.3). If $R \in \mathcal{CR}\text{ing}$, $x, y \in R$, and $x \in R^\times$ and R is x-adically complete Hausdorff, and y is not a zero-divisor in R/x and R/x is y-adically complete Hausdorff, then the same is true with x, y interchanged. ⌟

Proof: ? □

Prop. (17.11.1.4) [Untilts and Distinguished Elements]. (17.11.1.2) shows that for any untilt K of $C^\flat$, the kernel is generated by a distinguished element. Conversely, for any distinguished element ξ, $A_{\text{inf}}/(\xi)$ can be identified with the valuation ring $\mathcal{O}_K$ of a perfectoid field K. and

$$\mathcal{O}_C^\flat = A_{\text{inf}}/p \to A_{\text{inf}}/(\xi, p) \cong \mathcal{O}_K/p$$

exhibits K as an untilt of $C^\flat$. ⌟

Proof: May assume $\xi = [t] - up$ and $t \neq 0$. Consider the mapping $\theta : A_{\text{inf}} \to A_{\text{inf}}/(\xi) = \mathcal{O}_K$, and denote $\theta([x])$ by $x^\sharp$.

Firstly, we can apply lemma(17.11.1.3) to ξ and p to conclude that A_{inf} is ξ-complete and ξ-torsion-free, and $\mathcal{O}_K$ is p-adically complete and p-torsion-free.

Now for any $y \in \mathcal{O}_K$ is p-adically complete, there is a $x \in \mathcal{O}_C^\flat$ that $(y) = (x^\sharp)$: multiplying p-power, we can assume y is not divisible by p, and there is a x that $y \equiv x^\sharp \mod p$, thus x is not divisible by t. Now $t = xx'$ for some $x' \in \mathfrak{m}_C^\flat$, thus $y = x^\sharp + t^\sharp w = x^\sharp(1 + x'w)$, and $1 + x'w$ is invertible in $\mathcal{O}_K$.

Next we prove $\mathcal{O}_K$ is an integral domain: It suffices to show any $y \neq 0 \in \mathcal{O}_K$ is not a zero-divisor. We can assume $y = x^\sharp$, by what just proved, and then x divides t^n for some n, so it suffices to consider $y = t^{n\sharp} = p^n$, and p^n is not a zero-divisor by what just proved.

Now we can endow $\mathcal{O}_K$ with the valuation $|y| = |x|_{C^\flat}$ for $y = x^\sharp u$, and extend it to the quotient field K. Then this is a Non-Archimedean valuation and the residue field has char p because $|p| < 1$, and K has char0, because $p \neq 0$ in K. And it is p-adically complete.

Finally, $\mathcal{O}_K/p\mathcal{O}_K \cong A_{\text{inf}}/(\xi, p) = \mathcal{O}_{C^\flat}/\pi$, so the Frobenius is surjective, thus $K = K(\mathcal{O}_K)$ is a perfectoid field. □

Cor. (17.11.1.5). The correspondence $\xi \mapsto \text{Frac}(A_{\text{inf}}/(\xi))$ induces a bijection

$$\{\text{Distinguished elements}\}/\text{units} \cong \{\text{Untilts of } C^\flat\}/\text{isomorphisms}.$$

⌟

Prop. (17.11.1.6)[A_{inf} as Holomorphic Function in p]. Any element in A_{inf} can be written uniquely as a unique Teichmuller representation $[c_0] + [c_1]p + [c_2]p^2 + \ldots +$. Now we can regard these elements as holomorphic functions on $B(0,1)$, and any untilts K of $\mathcal{O}_{C^\flat}$ can be regarded as points in $B(0,1)$, where A_{inf} take value $c_0^\sharp + c_1^\sharp p + \ldots \in \mathcal{O}_K$ at the point K.

This map can in fact be extended to $A_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$ s.t.

$$A_{\text{inf}} \hookrightarrow A_{\text{inf}}[\frac{1}{[t]}] \hookrightarrow A_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}] \to K.$$

called the **evaluation map**. ⌟

Fontain's Ring B

Def. (17.11.1.7) [Fontaine's Ring B]. If compared to the complex case, the elements of A_{inf} are just elements $\sum a_n z^n$ that $|a_n| \leq 1$, this are not all the holomorphic functions on $B(0,1)$, which is

$$\{\sum_{n\in\mathbb{Z}} a_n z^n | \limsup_{n>0} |a_n| \leq 1, \quad \lim_{n\to\infty} |a_{-n}|^{1/n} = 0\}.$$

This leads to a enlargement of A_{inf}:

For $0 < a \leq b < 1$ in the value group of $C^\flat$, $\pi_a, \pi_b \in C^\flat$ with $|\pi_a| = a, |\pi_b| = b$, define

$$B_{[a,b]} = A_{\text{inf}}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}]^\wedge[p^{-1}],$$

this is definable at any untilts K that $a \leq |p|_K \leq b$.

Then $B_{[a,b]}$ is an algebra over $A_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$, and define $B = \varprojlim B_{[a,b]}$. ⌟

Prop. (17.11.1.8) [Gauss Norm]. Any element f in $A_{\inf}[\frac{1}{[t]}, \frac{1}{p}]$ is of the form $\sum_{n>>-\infty}[c_n]p^n$, where $\{|c_n|\}$ is bounded. So we can define the valuation $|f|_\rho = \sup\{|c_n|\rho^n\}$, it is realizable by some term $|a_n|\rho^n$. Notice that for an until $y = (K, \iota)$, if $\rho = |p|_K$, then $|f(y)| \leq |f|_\rho$.

Then this is a non-Archimedean valuation on $A_{\inf}[\frac{1}{[t]}, \frac{1}{p}]$. ⌟

Proof: Firstly $|f+g|_\rho \leq \max\{|f|_\rho, |g|_\rho\}$ for every ρ that is generic for $f+g$ and in the value group of $C^\flat$: In this case,

$$|f+g|_\rho = |(f+g)(y)| \leq \max\{|f(y)|, |g(y)|\} \leq \max\{|f|_\rho, |g|_\rho\}$$

for some point y by(17.11.1.8), then by continuity and(17.11.1.9), this is true for any ρ.

The same method shows that $|f|_\rho|g|_\rho = |fg|_\rho$. □

Lemma (17.11.1.9) [Generic Norms]. ρ is called **generic** for f iff the valuation is realized exactly once. Notice if ρ is generic for f and in the value group of $C^\flat$, then $|f|_\rho = |f(y)|$ for some y(Choose $K = A_{\inf}/([c]-p)$ where $|c|_{C^\flat} = \rho$).

For any f, the numbers ρ that ρ is not generic for f is discrete in ρ. ⌟

Proof: Consider the Newton polygon of f, then only the slopes of the Newton polygon are not generic. □

Lemma (17.11.1.10). If $y = (K, \iota) \in Y$ and $|p|_K = \rho$, then $|f(y)| \leq |f|_\rho$, and equality holds if either ρ is generic or f is invertible. ⌟

Prop. (17.11.1.11) [Valuation Map]. For $0 < a \leq b < 1$ in the value group of $C^\flat$, $|\pi_a| = a, |\pi_b| = b$,

$$A_{\inf}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}] = \{f \in A_{\inf}[\frac{1}{[t]}, \frac{1}{p}] | |f|_a \leq 1, |f|_b \leq 1\} = V_0,$$

Thus the ring $B_{[a,b]}$ is identified with the completion of $A_{\inf}[\frac{1}{[t]}, \frac{1}{p}]$ w.r.t the valuation $|\cdot|_a + |\cdot|_b$(14.2.4.4). In particular, for any point y that $a \leq |p|_K \leq b$, the valuation map(17.11.1.6) can be extended to a map

$$B_{[a,b]} \to K.$$

⌟

Proof: Notice V_0 is a subring by(17.11.1.8), so clearly $A_{\inf}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}] \subset V_0$.

For the reverse containment, notice that $\{|c_n|\}$ is bounded, so there is an m that $\pi_b^m c_n \in C^\flat$ for any n. Now

$$f = \sum_{n<m}[c_n]p^n + (\sum_{n\geq 0}[c_{n+m}\pi_b^m]p^n)(\frac{p}{[\pi_b]})^m,$$

so it suffices to prove the case f has finite presentation. Now $c_n\pi_a^n, c_n\pi_b^n \in \mathcal{O}_C^\flat$, thus $[c_n]p^n = [c_n\pi_a^n](\frac{\pi_n}{p})^{-n} = [c_n\pi_b^n](\frac{p}{\pi_b})^n \in A_{\inf}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}]$, where $n \geq 0$ or $n \leq 0$. Thus the inverse containment is true. □

Prop. (17.11.1.12) [Topology of B]. For $0 < a \leq c \leq b < 1$, $|f|_c \leq \max\{|f|_a, |f|_b\}$(trivial), thus the Fontaine's ring B can be realized as the completion of $A_{\inf}$ w.r.t. all these norms, and endowed with the topology of p-adic Fréchet space. ⌟

Proof: Cf.[Conrad, P65].? □

Prop. (17.11.1.13) [Teichmuller Expansion]. An infinite sum $f = \sum [a_n]p^n$ converges in B iff it converges in any norm $|\cdot|_\rho$ for $0 < \rho < 1$, which is equivalent to

$$\limsup_{n>0} |c_n|_{C^\flat}^{1/n} \le 1, \quad \lim_{n\to\infty} |c_{-n}|_{C^\flat}^{1/n} = 0.$$

This is analogous to the complex case(11.4.3.4). However, for now, we don't know iff every element of B is of this form, and whether the representation is unique?. ⌟

Prop. (17.11.1.14) [Frobenius Action]. Notice the Frobenius action of $C^\flat$ extends to a Frobenius action on the Witt victor $A_{\inf}$, and it satisfies

$$|\varphi(f)|_{\rho^p} = (|f|_\rho)^p,$$

Thus induces an isomorphism $B_{[a,b]} \cong B_{[a^p,b^p]}$. Passing to the limit, we get an automorphism of B, denoted also by φ. ⌟

the Field B_{dR}

Prop. (17.11.1.15)[Untilts with Roots of Unity]. Let $\mathbb{Q}_p^{\mathrm{cycl}} = \mathbb{Q}_p(\mu_{p^\infty})^\wedge$, and $\varepsilon = (1, \mu_p, \mu_{p^2}, \ldots)$ be a compatible p^n-th roots of unity that is an element of $(\mathbb{Q}_p^{\mathrm{cycl}})^\flat$. Then $\varepsilon - 1$ is a pseudo-uniformizer of $(\mathbb{Q}_p^{cyc})^\flat$, For any untilts K of $\mathbb{C}^\flat$ and an embedding of $\mathbb{Q}_p^{\mathrm{cycl}}$ in K, the tilting maps $\varepsilon - 1$ to a pseudo-uniformizer of $\mathbb{C}^\flat$. This induces a bijection:

$$\{\text{Untilts } (K,\iota) \text{ of } C^\flat \text{ with an embedding } \mathbb{Q}_p^{\mathrm{cycl}} \hookrightarrow K\} \cong \{x \in \mathbb{C}^\flat | 0 < |x-1| < 1\}.$$

⌟

Proof: In fact, the left hand side is equivalent to K has a compatible p^n-th roots of unity, and we want to prove that for any x in the right hand side, there is a unique untilts K that $(x^{\frac{1}{p^k}})^\sharp$ is a compatible primitive roots of unity, and this is equivalent to $(x^{\frac{1}{p}})^\sharp$ satisfies $1 + x + \ldots + x^{p-1} = 0$, and further equivalent to $\theta : A_{\inf} \to \mathcal{O}_K$ annhilalates $1 + [x^{\frac{1}{p}}] + \ldots + [x^{\frac{p-1}{p}}]$.

It suffices to show $\xi = 1 + [x^{\frac{1}{p}}] + \ldots + [x^{\frac{p-1}{p}}]$ is distinguished(17.11.1.5). Let $\xi = \sum [c_n]p^n$, consider reducing to the residue field: $W(\mathcal{O}_{C^\flat}) \to W(\mathcal{O}_{C^\flat}/\mathfrak{m}_{C^\flat})$, then $\overline{x} = 1$, and $\overline{\xi} = p$, thus $|c_0| < 1, |c_1 - 1| < 1$, so it is distinguished(5.5.4.20). □

Cor. (17.11.1.16). Considering different p^n-th roots of unities, there is a correspondence:

$$\{\text{Char 0 Untilts } (K,\iota) \text{ of } C^\flat \text{ with a compatible } p^n\text{-th roots of unity}\} \cong \{x \in \mathbb{C}^\flat | 0 < |x-1| < 1\}/\mathbb{Z}_p^*.$$

where $\mathbb{Z}_p^*$ acts by exponentiation(11.2.8.8).

Furthermore, there is a correspondence:

$$\{\text{Char 0 Untilts } (K,\iota) \text{ of } C^\flat \text{ with a compatible } p^n\text{-th roots of unity}\}/\varphi_{C^\flat}^{\mathbb{Z}} \cong \{x \in \mathbb{C}^\flat | 0 < |x-1| < 1\}/\mathbb{Q}_p^*.$$

where the inverse is given by $x \mapsto$ the vanishing locus of $\log([x]) \in B$. ⌟

Proof: The only thing needed to be proven is the inverse is given by $N(\log([x]))$. Notice for any untilts K, $|(x^{p^n})\sharp - 1| < |p|_K^{1/(p-1)}$ for n large, then $\log((x^{p^n})\sharp) = 0$ iff $(x^{p^n})\sharp = 1$ by Newton polygon. Now $x^\sharp \ne 1$ because $x \ne 1$ and $\sharp$ is injective. Hence composing φ^n for some unique n, we can assume $x^\sharp = 1, x^{\frac{1}{p}} \ne 1$, thus it corresponds an untilt as in(17.11.1.15). □

Def. (17.11.1.17) [B_{dR}^+]**.** p is not a zero-divisor in $A_{\inf}/(\xi^n)$, as in the proof pf(17.11.1.4), so we can define
$$B_{\mathrm{dR}}^+ = \varprojlim_n A_{\inf}/(\xi^n)[\frac{1}{p}]$$
⌟

Prop. (17.11.1.18)[Fontaine's Ring B_{dR}]. B_{dR}^+ is a CDVR with ξ a uniformizer and the residue field K. Hence we can define $B_{\mathrm{dR}} = \mathrm{Frac}(B_{\mathrm{dR}}^+)$. ⌟

Proof: Firstly ξ is not a zero divisor in B_{dR}^+, because if $\xi x = 0, x = (x_n)$, then for any $n > 0$, and some k that $p^k x_n \in A_{\inf}/(\xi^n)$, so $p^k x_n$ is annihilated by ξ in $A_{\inf}/(\xi^n)$, thus $p^k x_n = \xi^{n-1} y_n$ for some y_n, because ξ is a non-zero-divisor in $A_{\inf}$(17.11.1.4). So $p^{n-1} x_{n-1} = 0 \in A_{\inf}/(\xi^n)$, thus $x_{n-1} = 0$, because p is non-zero-divisor in $A_{\inf}/(\xi^n)$(17.11.1.4).

Next there is a map $B_{\mathrm{dR}}^+/(\xi^m) \to A_{\inf}/(\xi^m)[p^{-1}]$. This is an isomorphism: it is clearly a surjection, and if $x = (x_n)$ is mapped to 0, then for each $n \geq m$, we choose $p^{k(n)} x_n = 0 \in A_{\inf}/(\xi^n)$, then $p^{k(n)} x_n = \xi^m y_n$ for a unique $y_n \in A_{\inf}/(\xi^{n-m})$. So $x = \xi^m \cdot (\frac{y_n}{p^{k(n)}}) \in \xi^m B_{\mathrm{dR}}$.(Notice the uniqueness of y_n shows $(\frac{y_n}{p^{k(n)}})$ is an element in B_{dR}^+).

Then it follows $B_{\mathrm{dR}}^+ \cong \varprojlim_m B_{\mathrm{dR}}^+/(\xi^m)$, which shows that B_{dR}^+ is ξ-adically complete, and $m = 1$ shows the residue field is equal to K. □

Remark (17.11.1.19). $A_{\inf}/(\xi^n)[\frac{1}{p}] = A_{\inf}/(\xi^n)[\frac{1}{[t]}]$, so if $\mathrm{char}\, k = p$, then B_{dR}^+ is just $W(C^\flat)$.

Thus B_{dR}^+ should be thought as the completed local ring at the point $y = (K, \iota)$. ⌟

Prop. (17.11.1.20)[Topology on B_{dR}]. The Gauss norms give $A_{\inf}$ a topology, giving B_{dR} a topology. Then B_{dR} is complete in this topology, and $B_{\mathrm{dR}} \to K$ is continuous.

With this topology, B_{dR} is abstractly isomorphic to $\mathbb{C}_p((T))$, but not topological isomorphic to it. ⌟

Proof: Cf.[Conrad, P65] or [p-adic Period Rings]P42.?

B_{dR} is abstractly isomorphic to $\mathbb{C}_p((T))$ by Cohn structure theorem?, but [Colmez, Une construction de BdR] proved that $\overline{K}$ is dense in B_{dR}, so it cannot by topological isomorphic to $\mathbb{C}_p((T))$. □

Prop. (17.11.1.21) [The Stalk Map]. Notice $A_{\inf} = \varprojlim_n A_{\inf}/(\xi^n)$ as ξ is distinguished, thus there is a natural injection $A_{\inf} \to B_{\mathrm{dR}}^+$, whose composition with $B_{\mathrm{dR}}^+ \to B_{\mathrm{dR}}^+/\xi \cong K$ maps $p, [t]$ to $p, t^\sharp$, which shows $p, [t]$ are invertible in B_{dR}^+, so there is a map
$$e : A_{\inf}[\frac{1}{p}, \frac{1}{[t]}] \to B_{\mathrm{dR}}^+.$$
In case $a \leq |p|_K \leq b$, this can be further extended to a map $e : B_{[a,b]} \to B_{\mathrm{dR}}^+$(The stalk map). ⌟

Proof: It suffices to prove for $a = |p|_K = b$ because the topology is stronger. In this case, choose $t = p^\flat \in C^\flat$, then $|t|_{C^\flat} = |p|_K$, thus $\overline{e}_n$ determined a map
$$A_{\inf}[\frac{[t]}{p}, \frac{p}{[t]}] \to B_{\mathrm{dR}}^+/(\xi^n) \cong (A_{\inf}/\xi^n)[p^{-1}],$$
It suffices to prove the image is contained in $p^{-k}(A_{\inf}/\xi^n)$ for some $k = k(n)$, because then $\overline{e}_n$ is p-adically continuous, and extends to map of $B_{[a]} = (A_{\inf}[\frac{[t]}{p}, \frac{p}{[t]}])\widehat{\ }_p \to (A_{\inf}/(\xi^n))[p^{-1}]$, which is compatible w.r.t n, thus gives a map $B_{[a]} \to B_{\mathrm{dR}}^+$.

For this, consider $f=\overline{e}_n(\frac{[t]}{p}), g=\overline{e}_n(\frac{p}{[t]})$, then their reduction under $B_{\mathrm{dR}}^+/(\xi^n)\to B_{\mathrm{dR}}^+/\xi\cong K$ is in $\mathcal{O}_K\cong A_{\mathrm{inf}}/(\xi)$, thus

$$f=f_1+\frac{\xi}{p^c}f_2,\quad g=g_1+\frac{\xi}{p^c}g_2$$

for $f_1,f_2,g_1,g_2\in A_{\mathrm{inf}}/(\xi^n)$ for some c. Then any

$$f^m=(f_1+\frac{\xi}{p^c}f_2)^m=\sum_{i=0}^{n-1}C_m^i f_1^{m-i}(\frac{\xi}{p^c}f_2)^i\in p^{-nc}(A_{\mathrm{inf}}/(\xi^n)).$$

Thus $\overline{e}_n(A_{\mathrm{inf}}[\frac{[t]}{p},\frac{p}{[t]}])\in p^{-nc}(A_{\mathrm{inf}}/(\xi^n))$. □

Cor. (17.11.1.22). The stalk map $e:B_{[a,b]}\to B_{\mathrm{dR}}^+$ composed with the map $B_{\mathrm{dR}}^+/(\xi)\cong K$ are in fact equivalent to the valuation map(17.11.1.11). ⌟

$\underline{B_{\mathrm{crys}}}$

Cf.[Notes on p-adic Hodge, Serin Hong].

Def. (17.11.1.23) [B_{crys}]. ⌟

$\underline{B_{\mathrm{st}}, B_e}$

2 C_{dR}-Theorem

Thm. (17.11.2.1) [C_{dR}, Faltings/Tsuji]. If $X\in\mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}/K$, then for any $r\in\mathbb{N}$, there exists a canonical isomorphism

$$\gamma_{\mathrm{dR}}(X):B_{\mathrm{dR}}\otimes_K H_{\mathrm{dR}}^r(X/K)\cong B_{\mathrm{dR}}\otimes_{\mathbb{Q}_p}\mathrm{H}_{\text{ét}}^r(X_{\overline{K}},\mathbb{Q}_p).$$

which identifies filtrations and Gal_K-actions on both sides. Moreover γ_{dR} is functorial in X. ⌟

Proof: Cf.[Faltings, p-adic Hodge Theory]. or [p-adic Hodge for Rigid Analytic Varieties, Scholze], [BMS18]P104. □

Cor. (17.11.2.2) [deRham Comparison for Étale Cohomologies]. $\mathrm{H}_{\text{ét}}^r(X_{\overline{K}},\mathbb{Q}_p)\in\mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$, and

$$H_{\mathrm{dR}}^r(X)\cong D_{B_{\mathrm{dR}}}(\mathrm{H}_{\text{ét}}^r(X_{\overline{K}};\mathbb{Q}_p)),\quad H^{n-p}(X;\Omega_X^p)\cong\mathrm{gr}^p H_{\mathrm{dR}}^r(X).$$

Also by taking the gradation of(17.11.2.1), by(18.4.5.5), there is a Hodge-like decomposition

$$\mathbb{C}_K\otimes_{\mathbb{Q}_p}\mathrm{H}_{\text{ét}}^r(X_{\overline{K}},\mathbb{Q}_p)\cong\bigoplus_{a+b=r}\mathbb{C}_K(-a)\otimes_K H^b(X,\Omega_X^a).$$

This shows we can recover the de Rham cohomology of X from the étale cohomology, and the Hodge-Tate weights of $\mathrm{H}_{\text{ét}}^r(X_{\overline{K}},\mathbb{Q}_p)$ lies in in $[-r,0]$. ⌟

Remark (17.11.2.3). Is this true for non-proper varieties with logarithmic poles? ⌟

Example (17.11.2.4) [Elliptic Curve Case, Tensoring $\mathbb{C}_K$ Lost Informations]. For $E \in \mathcal{E}\mathrm{ll}/K$ with multiplicative reduction and $j(E) > 1$, by(15.11.5.13) and(15.11.5.10),

$$E(\overline{K}) \cong \overline{K}^{\times}/q^{\mathbb{Z}}$$

as Gal_K-representations for some $q \in K^{\times}$. Thus $T_p(E) \cong q^{\mathbb{Q}_p/\mathbb{Z}_p}$ and there exists an exact sequence

$$0 \to \mathbb{Z}_p(1) \to T_p(E) \to \mathbb{Z}_p \to 0.$$

Then this sequence doesn't split when tensoring $\overline{K}$, but split when tensoring $\mathbb{C}_K$, by(17.11.3.3). ⌟

Proof: Suppose it splits ofter tensoring $\overline{K}$, then it splits after tensoring some finite extension K'. Then by projection of K' onto $\mathbb{Q}$, we see

$$0 \to \mathbb{Q}_p(1) \to V_p(E) \to \mathbb{Q}_p \to 0$$

is splitting as a $\mathrm{Gal}_{K'}$-representations. But this is not true, as any system of roots of p □

C_{dR}-theorem(17.11.2.1) implies any representation of Gal_K of the form $\mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p)$ is deRham, thus it is natural to consider the converse:

3 C_{crys}-Theorem

Thm. (17.11.3.1) [Hyodo-Kato Isomorphism]. If $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$ has good reduction $\mathcal{X}/\mathcal{O}_K$, let $\overline{\mathcal{X}} = \mathcal{X}_k$, then for any $r \in \mathbb{N}$, $H^r_{\mathrm{crys}}(\overline{\mathcal{X}}) \in \varphi\text{-}\mathcal{M}\mathrm{od}_{W(k)}$, and there is an isomorphism

$$K \otimes_{W(k)} H_{\mathrm{crys}}(\overline{\mathcal{X}}) \cong H^r_{\mathrm{dR}}(X).$$

Then this isomorphism descends $H^r_{\mathrm{dR}}(X)$ to K_0, and this K_0-structure is independent of the smooth model $\mathcal{X}/\mathcal{O}_K$. ⌟

Proof: □

Thm. (17.11.3.2) [C_{crys}, Faltings]. If $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$ has good reduction $\mathcal{X}/\mathcal{O}_K$, let $\overline{\mathcal{X}} = \mathcal{X}_k$, then for any $r \in \mathbb{N}$, there exists a canonical isomorphism

$$\gamma_{\mathrm{dR}}(X) : B_{\mathrm{dR}} \otimes_K H^r_{\mathrm{dR}}(X/K) \cong B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} \mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p).$$

which respect Gal_K-actions and Frobenius-actions on both sides. Moreover γ_{crys} is functorial in X, and $B_{\mathrm{dR}} \otimes \gamma_{\mathrm{crys}} = \gamma_{\mathrm{dR}}$(17.11.2.1). ⌟

Proof: Cf.[Faltings, Crystalline Representations and *p*-adic Galois Representations].**?** □

Cor. (17.11.3.3) [Crystalline Comparison for Étale Cohomologies]. If $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$ has good reduction $\mathcal{X}/\mathcal{O}_K$, let $\overline{\mathcal{X}} = \mathcal{X}_k$, then for any $r \in \mathbb{N}$, $\mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p) \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, and

$$H^r_{\mathrm{crys}}(\overline{\mathcal{X}}) \cong D_{\mathrm{crys}}(\mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p)).$$

? ⌟

18 Representation Theory

18.1 Classical Representation Theory

In this section the representation theory over field $\mathbb{C}$ are studied(at least over a topological field of characteristic0). Modular representations are studied in Modular Representations.

For classical representations, the theory of semisimple algebras should be kept in mind.

1 Topological Representations

Def. (18.1.1.1) [Representations]. Let G be a topological group, R be a topological ring with a G-action, then an R-**representation** of G is a topological R-module V with an R-covariant action of G on M s.t. $G \times M \to M$ is continuous. The category of such representations is denoted by $\mathrm{Rep}_R(G)$.

An **irreducible representation** is a representation that has no non-trivial invariant closed subspaces. An **indecomposable representation** is a representation that is not a direct sum of two subrepresentations. ⌟

Def. (18.1.1.2) [Free Representations]. Situation as in(18.1.1.1), $V \in \mathrm{Rep}_R(G)$ is called a **free** R**-representation** if V is free over B. And it is trivial iff $V \cong B^n \in \mathrm{Rep}_B(G)$. ⌟

Def. (18.1.1.3) [Constructing Representations]. Dual representations, tensor product, and symmetric and exterior tensors. ⌟

Def. (18.1.1.4)[Projective Representations]. A **projective representation** of a topological group G on a TVS V is a continuous map $G \times P(V) \to P(V)$, where the topology on $P(V)$ is induced from $V \backslash \{0\} \subset V$. ⌟

Prop. (18.1.1.5)[F.D. Schur's Lemma]. Let $(\pi_1, V_1), (\pi_2, V_2)$ be an irreducible f.d. $\mathbb{C}$-representation of a topological group G, then $C(\pi_1, \pi_2) = \mathbb{C}$ if $\pi_1 \cong \pi_2$, and 0 otherwise. ⌟

Proof: This is because π_i are irreducible as representations with discrete topology of G: Any subspace of V_i is closed. So we reduce to(18.1.1.10). □

Def. (18.1.1.6) [Types of Representations]. Let V be an irreducible f.d. $\mathbb{C}$-representation of a topological group G, then there are three possibilities:

- $V \ncong V^*$, called a **representation of complex type**.
- There is an invariant symmetric form on V inducing an isomorphism $V \cong V^*$, called a **representation of real type**.
- There is an invariant alternating form on V inducing an isomorphism $V \cong V^*$, called a **representation of quaternion type**.

The category of representation of $\mathbb{K}$-type is denoted by $\mathrm{Rep}(G)_{\mathbb{K}}$. ⌟

Proof: By Schur's lemma(18.1.1.5), either $V \not\cong V^*$ or there is a unique isomorphism $V \cong V^*$ up to scalar, which is equivalent to an invariant form B on V. The two coordinate of this invariant form induces two isomorphisms $V \cong V^*$, which must be proportional, so $B(x,x) = cB(x,x)$, so $c = 0$ or $B(x,x) = 0$ for all x, which means B is symmetric or alternating. □

Def. (18.1.1.7)[Unitary Representations]. Usually we consider unitary representations on a Hilbert space. A **unitary representation** of a topological group G on a Hilbert space $\mathcal{H}$ is defined to be a homomorphism from G to the group $U(\mathcal{H})$ of unitary operators of $\mathcal{H}$ continuous in the strong operator topology(11.7.4.7). Notice by(11.7.4.8), this is equivalent to the unitary and continuous in the weak operator topology.

The category of unitary representations of G is denoted by $\mathrm{Rep}\,\mathrm{uni}(G)$. ⌟

Def. (18.1.1.8) [Projective Unitary Representation]. A **projective unitary representation** of a topological group G on a Hilbert space $\mathcal{H}$ is defined to be a continuous homomorphism from G to the group $PU(\mathcal{H})$ of unitary operatoes of $\mathcal{H}$, where the topology of $PU(\mathcal{H})$ is induced from the strong operator topology of $U(\mathcal{H})$(11.7.4.7). Notice by(11.7.4.8), this is equivalent to the unitary and continuous in the weak operator topology. ⌟

Def. (18.1.1.9) [Character]. Let $\rho : G \to GL(n, V)$ be a linear representation of f.d of a group G. Then the **character** of χ_ρ is defined to be $\chi_\rho(g) = \mathrm{tr}(\rho(g))$. ⌟

Prop. (18.1.1.10) [Schur's lemma]. If (π, V) is an at most countable dimensional irreducible $\mathbb{C}$-representation of a topological $\mathbb{C}$-algebra, then $\mathrm{End}_A(V) \cong \mathbb{C}$. In particular this holds for $\dim A$ countable. ⌟

Proof: First the dimension of $\dim_{\mathbb{C}} \mathrm{End}(V)$ is at most countable, because V is acyclic by irreducibly, so $\dim_{\mathbb{C}} \mathrm{End}(V) \leq \dim_{\mathbb{C}} V$. And $\mathrm{End}(V)$ is a skew field, by irreducibility. So the result follows from(3.2.1.10). □

Cor. (18.1.1.11). Any irreducible representation of a commutative group has dimension 1. ⌟

Cor. (18.1.1.12)[Index 2 Subgroup]. Let G be a topological group and H an open (normal)subgroup of index 2, $G = H \rtimes \{\sigma\}$. Let (π, V) be an irreducible representation of H of at most countable dimensional, then

- $\mathrm{res}_H^G \mathrm{ind}_H^G \pi \cong \pi \oplus \pi^\sigma$.
- $\pi \cong \pi^\sigma$ iff π is the restriction of an irreducible representation of G, called **type I**. And there are exactly two such extensions to G.
- $\pi \not\cong \pi^\sigma$ iff $\mathrm{ind}_H^G \pi$ is an irreducible representation of G, called **type II**.

All these are true for unitarizable representations. ⌟

Proof: 1: This is clear.

2: If π is a restriction of an irreducible smooth representation of G, then σ intertwines π and π^σ. Conversely, if $\pi \cong \pi^\sigma$, then there is an operator A on V that intertwines π and π^σ, and then $A^2 = \mathrm{id}$ by Schur's lemma(18.1.1.10). Let σ acts by A, then this representation extends to G.

3: If π extends to G, then clearly π appear in $\mathrm{ind}_H^G \pi$ but not surjective, so $\mathrm{ind}_H^G \pi$ is not irreducible. Conversely, if $\mathrm{ind}_H^G \pi$ is not irreducible, notice $\mathrm{res}_H^G \mathrm{ind}_H^G \pi \cong \pi \oplus \pi^\sigma$, thus $\pi \cong \pi^\sigma$, otherwise any G-invariant subspace can only be π or π^σ, so π or π^σ extends to representations of G, contradicting 2. □

Prop. (18.1.1.13). For any topological G a topological ring B with a G-action, $d \in \mathbb{N}$, there is a bijection between the set of equivalence classes of trivial B-representations V of G of rank d and the category of $H^1(G, \mathrm{GL}(d, B))$. Moreover, V is trivial iff it is mapped to the distinguished point of $H^1(G, \mathrm{GL}(d, B))$. ⌟

Proof: This follows by taking the matrix of $g \in G$ w.r.t. a B-basis of V. □

Cor. (18.1.1.14). Let L/K be a Galois extension of fields, then any f.d. L-representation of $\mathrm{Gal}(L/K)$ is trivial. ⌟

Proof: This follows from Hilbert's theorem90(8.7.3.16). □

Admissible Representations

Def. (18.1.1.15) [Admissible Representations]. Let $G \in \mathcal{G}\mathrm{rp}^{\mathrm{top}}$ and E a topological field that G acts trivially and B a topological E-algebra s.t. $B \in \mathrm{Rep}_E(G)$. Then $V \in \mathrm{Rep}_E^{\mathrm{fd}}(G)$ is called a **B-admissible** representation if $B \otimes_E V \in \mathrm{Rep}_B(G)$ is trivial.

The category $\mathrm{Rep}_E^{B\text{-adm}}(G)$ is the full subcategory of $\mathrm{Rep}_E(G)$ consisting of f.d. B-admissible E-representations of G. ⌟

Prop. (18.1.1.16) [Inclusions and Admissibility]. Let $G \in \mathcal{G}\mathrm{rp}^{\mathrm{top}}$ and E a topological field that G acts trivially and B_1, B_2, B a topological E-algebra s.t. $B_1, B_2, B \in \mathrm{Rep}_E(G)$, and $B_1 \subset B, B_2 \subset B$, $B_1 \cap B_2 = B_0$, and $B^G \subset B_0$, then

$$\mathrm{Rep}_E^{B_1\text{-adm}}(G) \cap \mathrm{Rep}_E^{B_2\text{-adm}}(G) = \mathrm{Rep}_E^{B_0\text{-adm}}(G).$$

⌟

Proof: The RHS is contained in LHS trivially. For the converse inclusion, if $V \in \mathrm{Rep}_E^{B_1\text{-adm}}(G) \cap \mathrm{Rep}_E^{B_2\text{-adm}}(G)$, there exists elements $\{u_i\} \subset (B_1 \otimes_E V)^G$ and $\{v_i\} \subset (B_2 \otimes_E V)^G$ s.t.

$$B \otimes_E V = Bu_1 \oplus \ldots Bu_n = Bv_1 \oplus \ldots Bv_n.$$

Then the transformation matrix from $\{u_i\}$ to $\{v_i\}$ is an element in $GL(n; B)$ that is invariant under G, so contained in $GL(n; B^G)$. Thus it is clear that

$$\{v_i\} \subset (B_2 \otimes_E V)^G \cap (B_1 \otimes_E V)^G = (B_0 \otimes_E V)^G,$$

and then $B_0 \otimes_E V = B_0 v_1 \oplus \ldots B_0 v_n$, and V is B_0-admissible. □

Gal_K-Regularity

Def. (18.1.1.17) [G-Regularity]. Situation as in(18.1.1.15), we want to establish a numerical criterion for recognizing B-admissible representations. B is called **G-regular** if it satisfies the following three conditions:

H1 : B is a domain.

H2 :$(\mathrm{Frac}(B))^G = B^G$, in particular, B^G is a field.

H3 : if $b \neq 0 \in B$ and Eb is stable under G-action, then $b \in B^*$.

Notice a field is clearly G-regular. ⌟

Cor. (18.1.1.18). Notice that (H3) implies $B^G \in \texttt{Field}$, because for $b \in B^{\mathrm{Gal}_K}$, Eb is clearly stable under G-action, thus b is invertible.

Also the morphism
$$\alpha_B(W) : B \otimes_{B^G} W^G \to W$$
is injective for all finite free $W \in \mathrm{Rep}_B(G)$. In particular, this is true for $W = B \otimes_E V, V \in \mathrm{Rep}_E^{\mathrm{fd}}(G)$, and we get a functor
$$D_B : \mathcal{V}\mathrm{ect}_E \to \mathcal{V}\mathrm{ect}_{B^G}$$
such that
$$\dim_{B^G} D_B(V) \leq \dim_E V.$$
⌟

Proof: To show α_W is injective, it suffices to show a linear basis $\{e_i\}$ of W^G over B^G is linearly independent over B: Suppose $\sum a_i e_i = 0$, where $a_i \in B$, with the number of nonzero coefficients minimal, and $a_1 \neq 0$, then dividing $a_1 \in \mathrm{Frac}(B)$, we assume $a_1 = 1$, and then acting by $g - \mathrm{id}$, we get
$$\sum (g(a_i) - a_i)e_i = 0$$
and this has smaller non-zero elements, unless a_i is fixed by g for any $g \in G$, so $a_i \in \mathrm{Frac}(B)^G = B^G$ by (H2), contradiction. □

Prop. (18.1.1.19)[B-Admissible Representations]. If B is G-regular(18.1.1.17), $V \in \mathrm{Rep}_E^{\mathrm{fd}}(G)$ and $W = B \otimes_E V$, then the following are equivalent:

- W is trivial, i.e. V is B-admissible.
- $\alpha_B(W)$(18.1.1.18) is an isomorphism.
- $\dim_{B^G} D_B(V) = \dim_E V$.

⌟

Proof: $1, 2$ are equivalent by(18.1.1.18), as B^{Gal_K} is a field. Also $2 \to 3$ is clear.

$3 \to 2$: $\alpha_W : B \otimes_{B^G} W^G \to B \otimes_E V$ is a B-linear morphism of two finite free B-modules, then it suffices to show the determinant map is an isomorphism. Let $v_1, \ldots, v_d$ be a E-basis of V and $w_1, \ldots, w_d$ a B^G-basis of W^G. Let b be the unique element of B that
$$\alpha_W(v_1) \wedge \ldots \wedge \alpha_W(v_d) = bw_1 \wedge \ldots \wedge w_d$$
then $gb = \eta b$ for $g \in G$ where η is determined by the identity $\alpha_W(gv_1) \wedge \ldots \wedge \alpha_W(gv_d) = \eta\alpha_W(v_1) \wedge \ldots \wedge \alpha_W(v_d)$. Now the E-space of $v_1, \ldots, v_d$ is V, which is stable under G action, thus $\eta \in E$, and then by (H3) $b \in B^*$, so we are done. □

Cor. (18.1.1.20)[$\mathrm{Rep}_E^{B-\mathrm{adm}}(G)$]. If B is Gal_K-regular, then

- $\mathrm{Rep}_E^{B-\mathrm{adm}}(G) \subset \mathrm{Rep}_E(G)$ is stable under subobjects and quotients.
- $D_B : \mathrm{Rep}_E^B(G) \to \mathcal{V}\mathrm{ect}_{B^G}$ is exact and faithful.
- $\mathrm{Rep}_E^{B-\mathrm{adm}}(G) \subset \mathrm{Rep}_E(G)$ is stable under taking dual and tensor products. And if $V, V_1, V_2 \in \mathrm{Rep}_E^{B-\mathrm{adm}}(G)$, then there is a natural isomorphism
$$D_B(V_1) \otimes D_B(V_2) \cong D_B(V_1 \otimes V_2)$$
and
$$D_B(V) \otimes D_B(V^\vee) \cong D_B(V \otimes V^\vee) \to D_B(E) = B^G$$
is a perfect pairing between $D_B(V)$ and $D_B(V^\vee)$.

⌟

Proof: 1: Given an exact sequence $0 \to V_1 \to V \to V_2 \to 0 \in \mathrm{Rep}_E(G)$, tensoring B and taking G-fixed points, we get an exact sequence

$$0 \to D_B(V_1) \to D_B(V) \to D_B(V_2)$$

from which we derive the inequality $\dim_{B^G} D_B(V) \le \dim_{B^G} D_B(V_1) + \dim_{B^G} D_B(V_2)$. Now we have $\dim_{B^G} D_B(V_i) \le \dim_E V_i$ by(18.1.1.18), so

$$\dim_{B^G} D_B(V) \le \dim_{B^G} D_B(V_1) + \dim_{B^G} D_B(V_2) \le \dim_E V_1 + \dim_E V_2 = \dim_E V.$$

But this is an equality because V is B-admissible, thus V_1, V_2 are all B-admissible, and the exact sequence is in fact an isomorphism by dimension reason.

2: D_B is faithful because $B \otimes_{B^G} D_B(V) \cong B \otimes_E V$.

3: There is a natural map

$$D_B(V_1) \otimes_{B^G} D_B(V_2) = (B \otimes_E V_1)^G \otimes (B \otimes_E V_2)^G \to (B \otimes_E (V_1 \otimes_E V_2))^G = D_B(V_1 \otimes_E V_2),$$

and $\dim_{B^G} D_B(V_1 \otimes_E V_2) \le \dim_E(V_1) \cdot \dim_E(V_2)$, so it suffices to show that this map is injective. For this, notice that $D_B(V_1 \otimes_E V_2) \subset B \otimes_E (V_1 \otimes_E V_2)$, and after tensoring B,

$$D_B(V_1) \otimes_{B^G} D_B(V_2) \subset B \otimes_{B^G} (D_B(V_1) \otimes_{B^G} D_B(V_2)) \cong (B \otimes_E V_1) \otimes_B (B \otimes_E V_2) \to B \otimes_E (V_1 \otimes_E V_2)$$

is an isomorphism.

To show for the dual preserves B-admissibility, notice that $\mathrm{Rep}_E^{B-\mathrm{adm}}(G)$ is also stable under exterior products, as exterior products are quotient of tensor products. Notice there is an isomorphism

$$\wedge(V^\vee) \otimes \wedge^{\dim V - 1} V \cong V^\vee,$$

so it suffices to show for $\dim V = 1$. Let v_0 be an E-basis of V, $g(v_0) = \eta(g) v_0$, then $D_B(V) = B^G(b \otimes v_0)$ for some $b \neq 0 \in B$. Thus $b/g(b) = \eta(g)$. And it is easy to show that $D_B(V^\vee) = B^G(b^{-1} \otimes v_0)$, and the natural pairing is perfect. In general, the pairing is also perfect because perfectness of a pairing can be checked after passing to the determinant space. □

Unitary Representations of Locally Compact Groups

For unitary representations of locally compact groups, see11.10.

2 Smooth Representations

Prop. (18.1.2.1)[Smooth Representations]. A **smooth representation** of a locally compact group G on a complex vector space is a continuous representation w.r.t the discrete topology.

The category $\mathrm{Rep}^{\mathrm{alg}}(G)$ of smooth representations is a full Abelian subcategory of the category of continuous representations, and there is a right adjoint to the forgetful functor:

$$\mathrm{Rep}(G) \to \mathrm{Rep}^{\mathrm{alg}}(G) : V \mapsto V^\infty = \bigcup_{K \subset G \text{ compact open}} V^K$$

So it preserves injectives and $\mathcal{M}(G)$ has enough injectives. ⌟

Def. (18.1.2.2) [Equivariant Sheaves]. Let G be a locally compact group acting on a space X, let $p : G \otimes X \to X$ be the projection and $a : G \times X \to X$ be the action, then a **equivariant sheaf** on X is a pair $(\mathcal{F}, \rho)$, where $\mathcal{F}$ is a locally constant complex sheaf on X and ρ is an isomorphism of sheaves $p^*(\mathcal{F}) \cong a^*(\mathcal{F})$ that:

- ρ is identity on $e \otimes X$.
- $p_{23}^* \rho \circ (\mathrm{id}_G \times a)^* \rho = (m \times \mathrm{id}_X)^* \rho$ on $G \times G \times X$.

⌟

Prop. (18.1.2.3). If X is a pt with the trivial G-action, then a equivariant sheaf on X is equivalent to a representation of G. ⌟

Proof: For any equivariant sheaf on X, the pullback are just locally constant functions of G with value in V. Then ρ on each stalk g defines an action of g on V. Compatibility with the G-action shows that this is a group action. And consider the stalk at e, because ρ is id at e, for each v, there is an open nbhd U that $\rho(u)v = v$ on for $u \in U$, thus it is smooth. The converse is obvious. □

Def. (18.1.2.4) [Coinvariants]. The **Jacquet functor** $J_G : \mathrm{Rep}(G) \to \mathcal{V}\mathrm{ect}_{\mathbb{C}}$ is the functor mapping a representation V of G to $V/V(G)$, where $V(G)$ is spanned by $\pi(g)v - v$. It is equivalent to the functor $V \mapsto V \otimes_G \mathbb{C}$.

Let ψ be a character of G, then we can more generally define $J_{G,\psi} : \mathrm{Rep}(G) \to \mathcal{V}\mathrm{ect}_{\mathbb{C}}$ is the functor mapping a representation V of G to $V/V_{G,\psi}$, where $V_{G,\psi}$ is spanned by $\pi(g)v - \psi v$. It is equivalent to the functor $V \mapsto V \otimes_G \mathbb{C}_\psi$, or equivalently $J_{G,\psi} = J_G \circ (\psi^{-1} \otimes)$. ⌟

Prop. (18.1.2.5). If G is compact, then $e_G V = V^G = V/V(G)$.

And if G is a union of increasing family of compact groups, then J_G is exact, so is $J_{G,\psi}$. ⌟

Proof: J_G is clearly right exact. And if G is compact, $e_G V = V^G = V/V(G)$: if $\pi(G)v = v$, then $v = e_G v$, and if $e_G v = 0$, then because v is smooth, $\sum_{h_i \in G/K} h_i v = 0$, thus $v = \frac{1}{[G:K]}(v - h_i v)$ is in $V(G)$.

If G is a union of compact groups K_i, then $V/V(G) = \mathrm{colim}\, V/V(K_i)$ is exact. □

Prop. (18.1.2.6). If G is a union of increasing family of compact open subgroups $\{K_\alpha\}$, then $v \in V(G,\psi)$(ψ can be trivial) iff for some K_α, $\int_{K_\alpha} \psi^{-1}(h)\pi(h)v dh = 0$. ⌟

Proof: We can assume ψ is trivial. If $v = \pi(h)w - w$ and $h \in K_\alpha$, then $\int_{K_\alpha} \psi^{-1}(h)\pi(h)v dh = 0$. Conversely, by the proof of(18.1.2.5), $V(G) = \cup V(K_\alpha) = \cup \ker(e_{K_\alpha})$, which is equivalent to $\int_{K_\alpha} \pi(h)v dh = 0$. □

Def. (18.1.2.7) [Contragradient Representation]. For a smooth representation V of G, the **contragradient smooth representation** $V^\wedge = (V^*)^\infty$ is the smooth part of V^*. ⌟

Prop. (18.1.2.8). Let E be a smooth or f.d. representation of a topological group G, then

- E has an irreducible subquotient.
- If E is f.g., then it has an irreducible quotient.

⌟

Proof: 2: Use Zorn's lemma for the set of proper G-subspaces of U, the union of a chain of proper G-subspaces is proper, because it is f.g.. So it has a maximal proper G-space, thus the quotient is irreducible.

1 follows from 2 by choosing a f.g. submodule. □

Prop. (18.1.2.9) [Induced Representation]. The induced and compactly induced representations have the following equivalent forms:

$$\mathrm{Ind}_H^G(V) = \mathrm{Hom}_{\mathbb{Z}[H]}(\mathbb{Z}[G], V), \quad \mathrm{ind}_H^G(V) = \mathbb{Z}[G] \otimes_{\mathbb{Z}[H]} V.$$

I.e., if H acts on V by ρ, then $\mathrm{ind}_H^G(\rho)$ is the space $\oplus_{\gamma\in G/H} V_\gamma$ where $V_\gamma \cong V \in \mathcal{M}\mathrm{od}_H$, and that for $v_\gamma \in V_\gamma$, $(\mathrm{Ind}(\rho)g)v_\gamma = \rho(h)v_{\gamma'} \in V_{\gamma'}$ where $g\gamma = \gamma' h$ that $\gamma' \in G/H, h \in H$. ⌟

Proof: Choose a set of left coset representatives Γ of G/H, then Γ^{-1} is a set of right coset representatives for $H\backslash G$. Now $\mathbb{Z}[G] = \oplus_{\gamma\in\Gamma}\mathbb{Z}[H]\gamma^{-1}$, and we define the space $V_\gamma \cong V$ of maps from $\mathbb{Z}[G]$ to V determined by: $v_\gamma(g) = \rho(g\gamma)v \in V$ if $g \in H\gamma^{-1}$ and 0 otherwise.

Then $\mathrm{Ind}(\rho)(V) = \oplus_{\gamma\in\Gamma} V_\gamma$ that for $v_\gamma \in V_\gamma$, $(\mathrm{Ind}(\rho)g)v_\gamma$ is the map $\mathbb{Z}[G]$ to V determined by: $((\mathrm{Ind}(\rho)g)v_\gamma)(g') = \rho(g'\gamma' h)v \in V$ if $g' \in H(\gamma')^{-1}$, and 0 otherwise, where $g\gamma = \gamma' h$. Then $(\mathrm{Ind}(\rho)g)v_\gamma = \rho(h)v_{\gamma'}$, which is the same as the formula for $\mathrm{Ind}(\rho)$ as in(18.1.2.9). So the map $v_\gamma \to v_\gamma : \mathrm{Ind}(\rho) \to \mathrm{Ind}(\rho)$ is an isomorphism in $\mathbb{Z}[G] - \mathcal{M}\mathrm{od}$. □

Prop. (18.1.2.10) [Clifford's Theorem]. If $\rho : G \to GL(V)$ is a semisimple smooth or f.d. representation and H is a normal subgroup of G, then $\rho|_H$ is also semisimple.

In particular, a normal Abelian subgroup acts by scalars on any irreducible $\mathbb{C}$-representation of G, by(18.1.1.11). ⌟

Proof: Use definition(3.6.1.4), we reduce to the case ρ is simple. Now an H-subrepresentation is simple iff it has no proper H-subrepresentations, so clearly G maps a simple H-subrepresentation to another simple H-subrepresentation. So if W is the sum of all simple H-subrepresentations, then G preserves W, which shows $W = V$, and V is H-semisimple by(3.6.1.4). □

Prop. (18.1.2.11) [Restriction]. If G is a group and H is an open normal subgroup of G of finite index n. Let (π, V) be a smooth representation of G of f.d. over a field of characteristic $p \nmid n$, then

- If $\pi|_H$ is completely reducible, then π is also completely reducible.
- If (π, V) is irreducible, then $\pi|_H = \pi_1 \oplus \ldots \oplus \pi_k$ where π are irreducible representations of H and $k \leq [G : H]$.
- If (π, V) is irreducible, the isotopy parts of H are all of the same dimension, and if there are more than 1 isotropy classes, then G is an induced representation.

Moreover, item2, 3 are also true for H open normal in G s.t. $HZ(G)$ is of finite index n. ⌟

Proof: Let $g_1, \ldots, g_n$ be a coset representation of G/H.

1: If V_1 is a G-submodule of V, then V_1 has a complementary H-submodule $V_1^\perp$. Let P_0 be the projection of V onto V_1 along $V_1^\perp$, then $P = \frac{1}{p}\sum \pi(g_i)P_0\pi(g_i)^{-1}$ is a projection of V onto V_1 that commutes with G-action. Therefore the kernel of P is a G-submodule of V that is complementary to V_1.

2: Let $v \in V$, then $\{\pi(g_i)v\}$ generates V as a H-representation, thus by(18.1.2.8) there is an H-submodule $V' \subset V$ that V/V' is irreducible. Let $V_i = \pi(g_i)V'$, then V/V_i are also irreducible representations of H. Consider the H-invariant map $V \mapsto \oplus V/V_i$, its kernel is G-invariant, thus trivial, thus V is a submodule of $\oplus V/V_i$, and the assertion follows.

3: The G-action permutes with isotopy classes. And if there are more than 1 classes, choose the stabilizer G_ρ of one V^ρ, then $V = \mathrm{Ind}_{G_\rho}^G V^\rho$ by(18.1.2.9). □

Prop. (18.1.2.12) [Kolchin]. Let G be a discrete group acting on a f.d. vector space V s.t. each $g \in G$ acts via a unipotent endomorphism, then there is a basis s.t. G is mapped into $U(n, T)$. ⌟

Proof: Cf.[Mil17]P279. □

3 Linear Representation of Finite Groups

Basic references are [Ser77], [A-B95]. [群表示论 notes 薛航].

Remark (18.1.3.1). The representations in this subsection is assumed to be of f.d. over a field of char0, in particular, over a subfield of $\mathbb{C}$. In particular, there is no need to consider topologies.

Because a finite group is compact, all results of compact groups apply to a finite group, see4.

Because a finite group is locally profinite, all results of locally profinite groups apply to finite groups2. ⌟

Prop. (18.1.3.2) [Orthogonality of Characters]. The characters χ_i of irreducible representations of G form a basis of $ZL^2(G)$ by(11.10.4.30). Also, for $s \in G$, let $c(s)$ be the number of elements in the conjugacy class of s, then:

- $\int_i |\chi_i(s)|^2 = g/c(s)$.
- If t is not conjugate to s, then $\sum_i \chi_i(s)^* \chi_i(t) = 0$.

⌟

Proof: The last assertion follows from the first one, if you consider a matrix with conjugacy classes as column and characters as rows, and place $\sqrt{c(s)/g}\chi_i(s)$ in the entries, then it is an orthogonal matrix. □

Cor. (18.1.3.3) [Representations Determined by Characters]. A representation of G over $\mathbb{C}$ is determined by its character, by(3.6.1.13). ⌟

Cor. (18.1.3.4) [Number of Representations]. If G is a finite group, then the cardinality of $\widehat{G}$ is equal to the number of conjugates of G, and $\sum_{\pi \in \widehat{G}} d_\pi^2 = |G|$. ⌟

Proof: Both $\{\chi_\pi\}$ and the characteristic functions of the conjugate classes of G are basis for $L^2(G)$. And the second assertion follows from the Peter-Weyl theorem(11.10.4.15) as $\sum_{\pi \in \widehat{G}} d_\pi^2$ is the dimension of $L^2(G)$. □

Cor. (18.1.3.5). G is Abelian iff every irreducible representation of G is of dimension 1. ⌟

Proof: This follows immediately from the equation $\sum_{\pi \in \widehat{G}} d_\pi^2 = |G|$(18.1.3.4), as G is Abelian iff it has $|G|$ conjugacy classes iff $|\widehat{G}| = |G|$ iff $d_\pi = 1$ for any π. □

Prop. (18.1.3.6). If G is a finite p-group and A is a nonzero p-torsion G-module, then $A^G \neq 0$. ⌟

Proof: We may consider A generated by a single element. Because A is p-torsion, $|A| = p^n$ for some n. Now consider the orbit, then if the orbit is not a single element, then its order is divisible by p, so $|A^G|$ is divisible by p. But 0 is fixed, so $A^G \neq 0$. □

Group Algebra $\mathbb{C}[G]$

Prop. (18.1.3.7) [Maschke's Theorem]. If F is a field of char p and G is a finite group of order prime to p, then for any representation U of $F[G]$ and a submodule V, there exists a complement of V in U. ⌟

Proof: Choose an arbitrary projection π of U to V, and let $\rho(v) = 1/|G| \sum g^{-1}\pi(g(v))$, then it can be checked ρ commutes with G-actions, thus its kernel is also a G-modules, and it is identity on V, so $U = V \oplus k \ker \rho$. □

Cor. (18.1.3.8) [Totally Decomposable]. Any such representation of G is a direct sum of irreducible representations. ⌟

Prop. (18.1.3.9) [Brauer-Nesbitt]. For a finite group G, if two finite dimensional semisimple representations over a field has the same char poly for every element g of G, then they are isomorphic. ⌟

Proof: Just use the irreducible representations are orthogonal and that they have the same and for char p, we can use divide by p and the char poly becomes p-th power and we can do this forever, contradiction. □

Prop. (18.1.3.10). Integral properties of characters. ⌟

Prop. (18.1.3.11) [Dimensions Divisor Order]. The dimension of the irreducible representations of G divides the order of G. ⌟

Proof: □

Cor. (18.1.3.12). The dimension of the irreducible representations of a p-group G is a p-power. ⌟

Prop. (18.1.3.13) [Burnside's Theorem]. Any group of order n that n has only two prime divisors are solvable. ⌟

Proof: □

Induced Representations and Mackey Theory

Remark (18.1.3.14). When G is a finite group, the induced representation Ind_H^G(18.1.2.9) is the same as the (compact)induction in(18.1.5.34). In particular, all the results there holds in the finite group case. ⌟

Prop. (18.1.3.15) [Character of Induced Representations]. Character of induced representations, Cf.[Serre, P30]. ⌟

Rationality Problems

Def. (18.1.3.16) [Ring $R_K(G)$]. We want to consider the representations over a subfield K of $\mathbb{C}$.

Let $R_K(G)$ be the $\mathbb{Z}$-module generated by the characters of the representations of G over K, then it is a subring of $R(G) = R_{\mathbb{C}}(G)$. And define the $\mathbb{Z}$-module $\overline{R}_K(G)$ to be the elements of $R(G)$ with values in K. Clearly $R_K(G) \subset \overline{R}_K(G)$. ⌟

Prop. (18.1.3.17) [Induction and Restriction Morphism]. Let H be a subgroup of G, then the induction induces a Abelian group homomorphism $R(H) \to R(G)$, and restriction induces a ring homomorphism $R(G) \to R(H)$. The formula $\mathrm{Ind}(\varphi \cdot \mathrm{res}(\psi)) = \mathrm{Ind}(\varphi) \cdot \psi$ shows the image of Ind is an ideal of $R(G)$. Also by Frobenius reciprocity(18.1.5.37), Ind and Res are dual to each other:

$$(\varphi, \mathrm{res}\,\psi)_H = (\mathrm{Ind}\,\varphi, \psi)_G.$$

⌟

Prop. (18.1.3.18). Let ρ_i be the isomorphism classes of all irreducible linear representations of G over K and χ_i there characters. Then

- χ_i form a basis of $R_K(G)$.
- χ_i are mutually orthogonal.

┘

Proof: □

Cor. (18.1.3.19). A representation of G over $\mathbb{C}$ is realizable over K iff its character belongs to $R_K(G)$. ┘

Proof: One direction is trivial, for the other, if $\chi \in R_K(G)$, then $\chi = \sum n_i\chi_i$, and $(\chi, \chi_i) = n_i(\chi_i, \chi_i)$. As $(\chi, \chi_i) \geq 0$ as they are representations of G, we have $n_i \geq 0$, thus $\rho = \sum n_i\rho_i$ is realizable over K, by(18.1.3.3). □

Def. (18.1.3.20) [Schur Indices]. $K[G]$ is called **quasisplit** if the D_i are all commutative, or equivalently, all $m_i = 1$. ┘

Prop. (18.1.3.21). If L/K is finite and $L[G]$ is quasisplit, then $[L : K]$ is divisible by each of the Schur indices m_i. ┘

Proof: □

Prop. (18.1.3.22). The characters $\psi = \chi_i/m_i$ form a basis of $\overline{R}_K(G)$. ┘

Proof:

□

Cor. (18.1.3.23). $R_K(G) = \overline{R}_K(G)$ iff $K[G]$ is quasisplit. ┘

Cor. (18.1.3.24) [Brauer]. If m is the least common multiples of the orders of the elements of G and K contains the m-th roots of unity, then $R_K(G) = R(G)$. ┘

Proof:

□

Cor. (18.1.3.25). If m is the least common multiples of the orders of the elements of G, then all the Schur indices of G over any field K divides the Euler function $\varphi(m)$. ┘

Proof: This follows from(18.1.3.24) and(18.1.3.21) by considering the field $K[\mu_m]$ over K. □

Def. (18.1.3.26) [Galois-Action on G]. Let $L = K(\mu_m)$, where m divides the order of any element in G, then L/K is Galois and $G(L/K) = \Gamma_K$ is a subgroup of $(\mathbb{Z}/m\mathbb{Z})^*$. Then this group can act on G by $\sigma_t(x) = x^n$ as a set, and we call two elements $s, s' \in G$ Γ_K**-conjugate** iff they are in the same Γ_K orbits of G. ┘

Prop. (18.1.3.27). A class function f on G with values in L belongs to $K \otimes_{\mathbb{Z}} R(G)$ iff

$$\sigma_t(f(s)) = f(s^t)$$

for $\sigma_t \in \Gamma_K$ and $s \in G$. ┘

Proof: Cf.[Serre, P95]. □

Cor. (18.1.3.28). A class function f on G with values in K belongs to $K \otimes_{\mathbb{Z}} R_K(G)$ iff it is constant on the Γ_K-orbits of G. ┘

Proof: Because the □

Prop. (18.1.3.29). For a finite group G, all representations of G has characters in $\mathbb{Q}$ iff it all representations have characters in G, iff every two element generating the same subgroup of G is conjugate. ⌟

Proof: Cf.[Serre P103]. □

Cor. (18.1.3.30). representations of S_n all has characteristic in $\mathbb{Z}$. ⌟

Artin's Theorem & Brauer's Theorem

Prop. (18.1.3.31) [Generalized Artin Theorem]. Let X be a family of subgroups of a finite group G. Let $\mathrm{Ind} : \oplus_{H\in X} R_K(H) \to R_K(G)$ be the ring homomorphism induced by induction, then the following properties are equivalent:

- G is the union of conjugates of the subgroups in X.
- the cokernel of Ind is finite.

⌟

Proof: $2 \to 1$: By the character of induced representations(18.1.3.15), any function in the image of Ind vanishes outside the union of conjugates of the subgroups in X, so if this is not G, then the cokernel cannot by finite.

$1 \to 2$: Notice the duality of Ind and Res(18.1.3.17), it suffices to show that Res is injective, but this is clear. □

Cor. (18.1.3.32) [Artin Theorem]. Choose X as the family of cyclic subgroups of G, then every character of G is a rational combination of characters induced from cyclic subgroups of G. ⌟

Proof:

□

Prop. (18.1.3.33) [Brauer's Theorem]. Let $G \in \mathcal{A}\mathrm{b}^{\mathrm{fin}}$, then $K_0(\mathrm{Rep}(G))$ is generated by $\mathrm{Ind}_{H_i}^G(\chi_i)$, where $H_i \leq G, \chi_i \in \widehat{H}_i$. ⌟

Proof: □

Prop. (18.1.3.34) [Generalized Brauer's Theorem]. ⌟

Proof: □

Important representations

Prop. (18.1.3.35) [Q_8]. There is a 2-dimensional representation of the quadratic group $Q_8 = \{\pm 1, \pm i, \pm j, \pm k\}$:

$$i \mapsto \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad j \mapsto \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}, \quad k \mapsto \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

⌟

Prop. (18.1.3.36). There is a representation of S_n on the $n-1$-dimensional hypersurface $\sum x_i = 0$. ⌟

4 Symmetric Groups

⌟

Structure Sheaf and Distributions

Cf.[Representations of the Group GL(n,F) over Local Fields Bernstein/Zelevinsky] and [Bernstein, Representation of p-adic Groups, Bernstein].

Prop. (18.1.5.2). For $G \in \mathrm{loc}\mathcal{P}\mathrm{rof}$, any $\varphi \in C_c^\infty(G)$ is K-bi-invariant under some compact open subgroup K. ⌟

Proof: φ must be of the form $\sum a_i\chi_{U_i}$, where each U_i is open compact. Then for each element $x \in U_i$, there is an open compact group U_x that $U_x x \cup xU_x \subset U_i$, by(11.10.1.50). Now because $\mathrm{Supp}\, f$ is compact, f.m. of the $U_x x \cap xU_x$ covers $\mathrm{Supp}\,\varphi$, thus we consider their intersection $\cap U_{x_i}$, which is a compact open subgroup K_0 that φ is K_0-bi-invariant. □

Lemma (18.1.5.3). Let G be a locally profinite group and H a closed subgroup, then G/H is locally profinite space by(11.10.1.51). Then the projection $P : C_c(G) \to C_c(G/H)$ defined in(11.10.1.36) restricts to a projection $P^\infty : C_c^\infty(G) \to C_c^\infty(G/H)$, and it is surjective. ⌟

Proof: Firstly P maps $C_c^\infty(G)$ into $C_c^\infty(G/H)$ because if φ is left invariant under K, then $P\varphi$ is also left invariant under K. For the surjectivity, let $\varphi \in C_c^\infty(G/H)$, then $V = \mathrm{Supp}\,\varphi$ is open compact, then by(11.10.1.52) there is an open compact subspace V that $p(V) = U$, Then we can define

$$\psi(x) = \chi_V(x)\varphi(p(x))/P(\chi_V)(p(x)),$$

then it is supported on V, and $P(\psi) = \varphi$. Also, it is locally constant, as is easily verified. □

Prop. (18.1.5.4) [Left Invariant Distribution]. Let G be a locally profinite group and T is a left invariant distribution on G, then it is the restriction of a unique Haar measure. ⌟

Proof: Any element $f \in C_c^\infty(G)$ is of the form $\sum a_i\lambda(h_i)e_K$ for some K, by(18.1.5.2), where $e_K = \mu(K)^{-1}\chi_K$. Because T is left-invariant, $T(f) = \sum a_i T(e_K)$, and $\int f d\mu = \sum a_i$. Thus to show T is a multiple of $d\mu$, it suffices to show $T(e_K)$ is independent of K.

If $K_1 \le K_2$, then $K_2 = \coprod_{i=1}^n a_i K_1$, where $n = [K_2 : K_1]$, so $e_{K_2} = \mu(K_1)/\mu(K_2)\sum_{i=1}^n \lambda(a_i)e_{K_1}$. Also $\mu(K_2) = n\mu(K_1)$ by left invariance. Now it is clear $T(e_{K_1}) = T(e_{K_2})$ by left invariance of T. Then for any two K, K', we can find an open compact group K'' in their intersection, thus $T(e_K) = T(e_{K'})$. □

Cor. (18.1.5.5). If T is a distribution on G that satisfies $\lambda(g)T = \xi(g)^{-1}T$ for $g \in G$, then there is a unique Haar measure $d\mu$ that $T(f) = \int_G \xi(g)f(g)d\mu(g)$. ⌟

Proof: Consider the distribution $T'(f) = T(\xi^{-1}f)$, then it is left invariant. □

Cor. (18.1.5.6) [Invariant Quotient Distribution]. Let G be a locally profinite group and H a closed subgroup. then left H-invariant measures on G are identified with measures on G/H.

And if there exists a left G-invariant distribution D on G/H, then G/H admits a G-invariant measure(11.10.1.38), whose restriction to $C_c^\infty(G/H)$ is D. ⌟

Proof: Consider the distribution $D \circ P^\infty$, which is a left invariant linear functional on $C_c^\infty(G)$, (18.1.5.4) shows that it's the restriction of a Haar measure on G.

Then we can use the same method as in(11.10.1.38) to show $\Delta_G|_H = \Delta_H$, and the surjectivity of P^∞(18.1.5.3) shows D is a quotient measure on G/H. □

Prop. (18.1.5.7) [Gelfand Pairs]. Let G be a locally profinite group and H a closed subgroup s.t. $\Delta(G)|_H = \Delta_H$. Suppose ι is an involution on G that leaves H invariant and acts trivially on those distributions on G with are H-bi-invariant, then for any smooth irreducible representation V of G, $\dim(V^*)^H \cdot \dim((V^\vee)^*)^H \leq 1$. ⌟

Proof: Given two H-invariant maps $l : C \to \mathbb{C}, m : V^\vee \to \mathbb{C}$, by Frobenius reciprocity, we get two maps $l' : C_c^\infty(H\backslash G) \to V, m' : C_c^\infty(H\backslash G) \to V^\vee$ that are surjective, and give rise to $B : C_c^\infty(\mathcal{H} \times \mathcal{H}\backslash G \times G) \to V \times V^\vee \to \mathbb{C}$.

Then B satisfies $B(f, g) = B(i(g), i(f))$, where $i(f)(x) = f(\overline{x}^{-1})$: There is a commutative diagram

$$\begin{array}{ccc} G \times G & \xrightarrow{(x,y)\mapsto xy^{-1}} & G \\ \downarrow{\scriptstyle (x,y)\mapsto(\iota(y)^{-1},\iota(x)^{-1})} & & \downarrow{\scriptstyle \iota} \\ G \times G & \xrightarrow{(x,y)\mapsto xy^{-1}} & G \end{array}$$

and the horizontal arrows identify left H-invariant right G-invariant distributions on G with left $H \times H$-invariant distributions on $G \times G$.

By the surjectivity of l', m', $\ker(l'), \ker(m')$ are left and right radicals of B resp., and the above formula shows they determine each other, and l', m' are determined by their kernels, thus we are done. □

Prop. (18.1.5.8) [Bernstein-Zelevinsky?]. If $p : X \to Y$ is a continuous map of locally profinite groups, $\mathcal{F}$ be a cosmooth C^∞-sheaf on X**??**. Let G be a group acting on X and the sheaf $\mathcal{F}$ that $p(gx) = p(x)$, and χ a character of G. Then

- Let $\Gamma_c(X, \mathcal{F})(\chi)$ be the $C_c^\infty(X)$-submodule of $\Gamma_c(X, \mathcal{F})$ generated by $gf - \chi(g)^{-1}f, g \in G, f \in \Gamma_c(X, \mathcal{F})$. Then $\Gamma_c(X, \mathcal{F})/\Gamma_c(X, \mathcal{F})(\chi)$ is a non-degenerate $C_c^\infty(Y)$-module by composing p, so we can define $\mathcal{G}$ the sheaf on Y corresponding to this submodule by(4.4.4.14). Then if $y \in Y$ and $Z = p^{-1}(y)$, the stalk
$$\mathcal{G}_y \cong \Gamma_c(Z, \mathcal{F})/\Gamma_c(Z, \mathcal{F})(\chi).$$
- Assume there are no non-zero distributions $D \in \mathcal{D}(p^{-1}(y), \mathcal{F}|_{p^{-1}(y)})$ that satisfies $gD = \chi(g)D$ for any $y \in Y$, then no such D exists in $\mathcal{D}(X, \mathcal{F})$.

⌟

Proof: 1: Firstly $\Gamma_c(X, \mathcal{F})/\Gamma_c(X, \mathcal{F})(\chi)$ is a $C_c^\infty(Y)$-module because $\varphi \circ p$ fixes $\Gamma_c(X, \mathcal{F})(\chi)$:

$$(\varphi \circ p)(gf - \chi(g)^{-1}f) = g((\varphi \circ p)f) - \chi(g)^{-1}((\varphi \circ p)f),$$

which uses the condition $p(gx) = p(x)$. The non-degeneracy is also clear, by(4.4.4.14).

Secondly $\Gamma_c(Z,\mathcal{F})\cong\Gamma_c(X,\mathcal{F})/\Gamma_c(U,\mathcal{F})$ by(4.4.4.11), so $\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi)$ is isomorphic the quotient of $\Gamma_c(X,\mathcal{F})$ by $\Gamma_c(U,\mathcal{F})$ and $\Gamma_c(X,\mathcal{F})(\chi)$, because $\Gamma_c(U,\mathcal{F})$ is stable under action of $f\mapsto gf-\chi(g)^{-1}f$(this uses the condition $p(gx)=p(x)$).

We claim the space $\Gamma_c(U,\mathcal{F})$ is the space L generated by elements of the form $(\varphi\circ p)f$, where $\varphi\in C_c^\infty(Y),\varphi(y)=0,f\in\Gamma_c(X,\mathcal{F})$: L is clearly contained in $\Gamma_c(U,\mathcal{F})$, and if $f\in\Gamma_c(U,\mathcal{F})$, then $\operatorname{Supp} f$ is compact and disjoint from Z, so there is an open compact subset $U\subset Y$ containing $p(\operatorname{Supp} f)$ but not y. Let $\varphi=\chi_U$, then $f=(\chi_U\circ p)f\in L$.

Then by(4.4.4.14), the stalk $\mathcal{G}_y$ is isomorphic to $M/M(y)$, where $M=\Gamma_c(X,\mathcal{F})/\Gamma_c(X,\mathcal{F})(\chi)$. So $M(y)$ is just the image of the space L in M by(4.4.4.15), hence $\mathcal{G}_y$ is exactly $\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi)$.

2: this follows from 1, as $gD=\chi(g)D$ is just saying $D(g^{-1}f-\chi(g)f)=0$, or that D annihilates $\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi)=\mathcal{G}_y$ by item1. So this is equivalent to $\mathcal{G}_y$=0 for any y, which is equivalent to $\mathcal{G}=0$, as $\mathcal{G}$ is a sheaf. □

Cor. (18.1.5.9) [Invariant Distribution On Orbits]. Let γ be an action of a locally profinite group G on a locally profinite space X and a $C^\infty(X)$-sheaf. Assume the action is constructible(4.12.1.21) and there are no G-invariant distribution on any G-orbit in X, then there are no non-zero G-invariant distribution on X. ⌟

Proof: Firstly, by(4.12.1.22) and(4.4.4.6) any orbit is locally profinite. If there is a G-invariant distribution on X, we may change X to $\operatorname{Supp} T$, which is G-invariant, thus by(4.12.1.22) there is an open subset $U\subset X$ that G acts regularly, thus we reduce to the regular action case.

Then we can consider $X\to X/G$, X/G is locally profinite by(4.12.1.10), so Bernstein-Zelevinsky(18.1.5.8) can be used. □

Prop. (18.1.5.10) [Gelfand-Kazhdan]. If G is a locally profinite group, and γ is an action of G on a locally profinite space X, σ is a homeomorphism $X\cong X$, $\mathcal{F}$ is a C^∞-sheaf on X, and we assume:

- γ is constructible,
- for each $g\in G$, there is a $g^\sigma\in G$ that $\gamma(g)\sigma=\sigma\gamma(g^\sigma)$.
- For some $n\geq 0$ and $g_0\in G$, $\gamma^n=\gamma(g_0)$.
- If there is a non-zero G-invariant $\mathcal{F}$-distribution T on a G-orbit S, then $\sigma(S)=S$ and $\sigma(T)=T$.

Then any G-invariant distribution on X is invariant under σ. ⌟

Proof: Let T be a G-invariant $\mathcal{F}$-distribution that $\sigma T\neq T$, then $n>1$, and for any n-th root of unity ξ, consider $T_\xi=\sum\xi^{-i}\sigma^i(T)$. Then

$$\sigma T_\xi=\xi T_\xi,\quad \sum_\xi T_\xi=nT,\quad \sum\xi T_\xi=n\sigma(T).$$

so $\sum_\xi(\xi-1)T_\xi=n(\sigma(T)-T)\neq 0$, which shows there is a root $\xi\neq 1$ that $T_\xi\neq 0$. Notice T_ξ is G-invariant by condition2. Consider the action $\sigma_x i=\xi\cdot\sigma$, then T_ξ is invariant under σ_ξ.

Let G' be the semi-direct product of G with σ_ξ, under the action of $\sigma_\xi^{-1}g\sigma_\xi=g^\sigma$, then G' is locally profinite and acts on $X,\mathcal{F}$. Clearly this action is also constructible.

Now for any G'-orbit S', we prove there are no G'-invariant distribution on S', because it is in priori G-invariant, so some distribution exists on some G-orbit $S\subset S'$, but then condition4 shows σ fixes S, then $S=S'$ and $\sigma(T)=T$. But $\sigma_\xi(T)=T$, contradiction. Finally,(18.1.5.9) shows there are no G'-invariant distribution on X, contradicting T_ξ. □

Cor. (18.1.5.11) [Gelfand-Kazhdan]. If G is a locally profinite group that is σ-compact, and γ is an action of G on a locally profinite space X, $\sigma:X\cong X$ is a homeomorphism, and we assume:

- γ is constructible,
- for each $g \in G$, there is a $g^\sigma \in G$ that $\gamma(g)\sigma = \sigma\gamma(g^\sigma)$.
- For some $n \geq 0$ and $g_0 \in G$, $\sigma^n = \gamma(g_0)$.
- For any x, x and $\sigma(x)$ are in the same G-orbit.

Then any G-invariant distribution on X is invariant under σ. ⌟

Proof: We use(18.1.5.11) and take $\mathcal{F}$ to be just $C^\infty(X)$. Then we need to check condition4: for any G-orbit S of X let $s \in S$ and $\mathrm{Stab}(s) = H$, $S \cong G/H$ by(4.12.1.22) and(11.10.1.53). Then(18.1.5.6) shows T is just the G-invariant measure on $G/H : T\varphi = \int_{G/H} \varphi(\gamma(g)s)$. Now condition4 and2 shows σT is also G-invariant, thus $\sigma T = cT$. Clearly $c \geq 0$, and condition3 shows $c^n = 1$, thus $c = 1$. □

Hecke Algebra

This is a continuation of Hecke Algebras.

Def. (18.1.5.12) [Hecke Algebras of Locally Profinite Groups]. The algebra $\mathcal{H}(G)$ of test functions(4.4.4.10) on a locally profinite group G under convolution is an algebra, called the **Hecke algebra** of G. And for a compact open subgroup K of G, $\mathcal{H}_K$ is the subspace of K-bi-invariant functions in $\mathcal{H}(G)$.

Notice $\mathcal{H} = \cup_K \mathcal{H}_K$ by(18.1.5.2). Also $\mathcal{H}_K$ has a unit $e_K = \mu(K)^{-1}\chi_K$. This is easily verified.

Then $\mathcal{H}_G$ is an idempotented algebra(3.6.4.2). ⌟

Proof: Define the set $\mathcal{E}$ of idempotents in $\mathcal{H}(G)$ as e_K, where K is compact open in G. The fact that $\mathcal{H}$ is an idempotented algebra follows from(18.1.5.13) and(18.1.5.15). □

Prop. (18.1.5.13) [Point Measure]. Consider the point measure δ_g for $g \in G$, it is not an element in $\mathcal{H}(G)$, but it can convolute on $\mathcal{H}(G)$: $(\delta_g * \varphi)(x) = \varphi(g^{-1}x), (\varphi * \delta_g)(x) = \varphi(xg)$. Then

- If $g \in K$, then $\delta_g * e_K = e_K * \delta_g = e_K$.
- $\delta_g * e_K * \delta_{g^{-1}} = e_{gKg^{-1}}$.
- If $K = K_1K_2$ is an open subgroup, then $e_{K_1} * e_{K_2} = e_K$. In particular, $e_K * e_K = e_K$.

⌟

Remark (18.1.5.14). In fact we should define the Hecke algebra as locally constant distributions on G, then there equations are more natural. This algebra is equivalent to Hecke algebra by $f \mapsto f\mu_G$. ⌟

Prop. (18.1.5.15). $\mathcal{H}_K = e_K * \mathcal{H} * e_K = \mathcal{H}[e_K]$. ⌟

Proof: Notice by(18.1.5.13), functions in $e_K * \mathcal{H} * e_K$ is clearly K-bi-invariant. For the other direction, notice if φ is left and right K-invariant, then $\varphi = e_K * \varphi = \varphi * e_K = e_K * \varphi * e_K$. □

Prop. (18.1.5.16) [Smooth Representations and $\mathcal{H}$-Modules]. For a smooth representation (π, V) of G, for any v, $g \mapsto \pi(g)v$ can be regarded as a locally constant function with value in V, thus for any $\varphi \in \mathcal{H}_G$, $g \mapsto \varphi(g)\pi(g)v$ is locally constant with compact support, thus we can define a representation of the Hecke algebra $\mathcal{H}_G$ by

$$\pi(\varphi)v = \int_G \varphi(g)\pi(g)v dg$$

which just has nothing to do with integration, and this is compatible with convolution by formal reason. Then this is a smooth $\mathcal{H}_G$-module, and this gives an equivalence between the category of smooth(admissible) representations of $\mathcal{H}(G)$(3.6.4.4) and the category of smooth(admissible) representations of G. ⌟

Proof: For any $v \in V$, there is an open compact subgroup K that $v \in V[e_K]$, thus $e_K v = v$, so V is smooth. For the equivalence of categories, for any $\mathcal{H}(G)$-module V, we can define a G-action by linearly extending the action $\pi(g)e_K v = (\delta_g * e_K)v$. Notice by associativity of representation and smoothness, this is well-defined on all of V, and is a representation of G. Also it is continuous because $v = e_K v$ for some K thus $\pi(g)v = (\delta_g * e_K)v = e_K v = v$ for any $g \in K$. Finally these two functors are inverse to each other is also easily checked. □

Cor. (18.1.5.17). $(-)^K, (-)^\infty$(18.1.2.1) are both exact, by(3.6.4.3). ⌟

Cor. (18.1.5.18). Let (π, V) be a non-zero smooth representation of a locally profinite group G, then the following are equivalent by(3.6.4.6) and(18.1.5.16):

- π is irreducible.
- V is simple as $\mathcal{H}$-module.
- V^{K_0} is either zero or simple as a $\mathcal{H}_{K_0}$-module for all open compact subgroups K_0 of G.

⌟

Prop. (18.1.5.19) [Fourier Transform]. If G is a locally profinite Abelian group, then the Fourier transform induces an isomorphism

$$\mathcal{H}(\widehat{G}) \cong C_c^\infty(G) : \varphi \mapsto \widehat{\varphi}(\xi) = \int_G \varphi(y)\overline{\langle \xi, y\rangle} dy.$$

⌟

Proof: By(11.10.3.8) this is an algebra homomorphism. It remains to show that the image are all locally compact, and this is clear from the fact $\widehat{G}$ is given the compact-open topology(11.10.3.6). □

Admissible Smooth Representations

Prop. (18.1.5.20).

- For any compact open subset K of G, $V^K = ((V^\wedge)^K)^*$.
- $\mathrm{Hom}_G(V, W^\wedge) = \mathrm{Hom}(W, V^\wedge)$.
- $V \hookrightarrow (V^\wedge)^\wedge$ is an injection.

⌟

Proof: 1: Using(18.1.5.16), because $(\widetilde{V})^K = V^{*K}$. There is a homomorphism $V^{*K} \to V^{K*}$, it is injective, because if $f(v) = 0$ for each $v \in V^K$, then $f(w) = f(e_K v) = 0$. It is also injective, because for each $f \in V^{K*}$, the inverse image is $g(w) = g(e_K w)$.

2: $\mathrm{Hom}(V, \widetilde{W}) = \mathrm{Hom}(V, W^*) = \mathrm{Hom}(V \otimes W, \mathbb{C})$.

3: by the proof of item1,

$$\widetilde{\widetilde{V}} = \cup_K((\cup_K V^{*K})^{*K}) = \cup_K((\cup_K V^{*K})^{K*}) = \cup_K(V^{*K*}) = \cup_K(V^{K**}).$$

So the filtered colimits of the injections $V^K \to (V^K)^{**}$ gives an injection $\cup_K(V^{K**})$. □

Cor. (18.1.5.21) [Contragradient Functor is Exact]. The contragradient functor $V \mapsto \widehat{V}$ is exact. Because $(-)^*$, $(-)^\infty$ are all exact(18.1.5.17). ⌟

Cor. (18.1.5.22). If P is projective in $\mathcal{M}(G)$, then $\widetilde{P}$ is injective in $M(G)$. ⌟

Proof: $\mathrm{Hom}(X,\widetilde{P})=\mathrm{Hom}(P,\widetilde{X})$, and notice that the contragradient functor is exact(18.1.5.21). □

Def. (18.1.5.23) [Admissible Representations]. An **admissible smooth representation** of a locally profinite group G is a smooth representation that for any compact open subgroup K of G, V^K is of f.d.. The category of admissible smooth representation of G is denoted by $\mathrm{Rep}^{\mathrm{adm}}(G)$.

Then a smooth representation is admissible iff $V\cong (V^\wedge)^\wedge$. In particular, the contragradient of an admissible representation is admissible. ⌟

Proof: If V^K is of f.d. for each K, then by the proof of item3 of(18.1.5.20), $V\cong\widetilde{\widetilde{V}}$. Conversely, if $V\cong\widetilde{\widetilde{V}}$, then $V^K\cong V^{K**}$, thus V must be finite, by(3.5.3.9). □

Cor. (18.1.5.24). For an irreducible admissible representation, the contragradient is also irreducible admissible.

Extensions of admissible representations are admissible, by(18.1.5.17). ⌟

Prop. (18.1.5.25) [Decomposition of Admissible Representations]. Let K be a compact open subgroup of G, then any smooth representation of G decomposes as

$$V=\bigoplus_{\rho\in\mathrm{Rep}(K)}V^\rho,$$

and V is admissible iff each V^ρ are all of f.d. In particular, this shows the two notations of admissible(locally compact group and locally profinite groups) are compatible for smooth representations. ⌟

Remark (18.1.5.26). WARNING: The decomposition theorem of compact groups cannot be directly used, as representation may not be of f.d. so may not be unitarizable. ⌟

Proof: Firstly $V\subset\sum_{\rho\in\widehat{K}}V(\rho)$, because any $v\in V$ is fixed by some compact open subgroup K_0 of K, and we can choose K_0 to be normal in K by(4.12.1.6), so for $\Gamma=K/K_0$,

$$v\in V^{K_0}=\oplus_{\rho\in\widehat{\Gamma}}V(\rho)\subset\sum_{\rho\in\widehat{K}}V(\rho).$$

Also this sum is direct, because otherwise $\sum_{\rho\in S}c_\rho v_\rho=0$, but let K_0 be the intersection of kernels of ρ, then this is an equation of elements in representations of $\Gamma=K/K_0$ finite, so contradicting(18.1.3.8).

If π is admissible, then $V(\rho)\subset V^{\ker\rho}$ is of f.d.. Conversely, if V is not admissible, then V^{K_0} is of infinite dimensional for some K_0 compact compact normal, so V^{K_0} decomposes as direct sums of $V(\rho)$ for $\rho\in\widehat{K/K_0}$, thus one of these space must be of infinite dimensional. □

Def. (18.1.5.27) [Character of Admissible Representations]. Let (π,V) be an admissible representation of G, then for any $\varphi\in\mathcal{H}$, $\varphi\in\mathcal{H}_K$ for some compact open subset of G, by(18.1.5.12), so $\mathrm{Im}(\pi(\varphi))\subset V^K$, which is of f.d., so we can define the trace of φ as $\mathrm{tr}(\pi(\varphi)|V^K)$. Notice this is independent of K chosen by linear algebra reasons. And this defines a distribution on $\mathcal{H}:\varphi\mapsto\mathrm{tr}(\varphi)$, called the **character** of V. ⌟

Cor. (18.1.5.28). $\mathcal{M}(G)$ has enough injectives. ⌟

Proof: As $\mathcal{M}(G)$ has enough projectives(3.6.4.9)(18.1.5.16), there is a surjection $P\to\widetilde{X}$, thus an injection $\widetilde{\widetilde{X}}\hookrightarrow\widetilde{P}$(18.1.5.21). Now $X\hookrightarrow\widetilde{\widetilde{X}}$ by(18.1.5.20). □

Irreducible Admissible Representations

Prop. (18.1.5.29) [Separation Lemma]. If G is a σ-compact locally profinite group, then for any $0 \neq h \in \mathcal{H}(G)$, there is an irreducible representation ρ that $\rho(h) \neq 0$. ⌟

Proof: Cf.[Bernstein, P20], [Bernstein-Zelevinsky, P19].? □

Prop. (18.1.5.30) [Shur's Lemma].

- If G is a σ-compact locally profinite group, then any irreducible smooth representation V is of at most countable dimension, thus $\mathrm{End}_G(V) = \mathbb{C}$ by(3.2.1.10).
- If G is a locally profinite group, then any irreducible admissible representation V of G satisfies $\mathrm{End}_G(V) = \mathbb{C}$.

⌟

Proof: 1: If it is of at most finite dimension because if ξ generate V, then notice its stablizer is compact open, and G is σ-compact, so V is at mots countable.

2: Let K_0 be a small open compact subgroup that $V^{K_0} \neq 0$, then V^{K_0} is of f.d. and preserved under $T \in \mathrm{End}_G(V)$, thus T has an eigenvalue c, thus $T = cI$ on V. □

Prop. (18.1.5.31). Let $(\pi_1, V_1), (\pi_2, V_2)$ are two irreducible representations of a locally profinite group G. If $V_1^K \cong V_2^K \neq 0$ as $\mathcal{H}_K$-module for some compact open subgroup K of G, then $\pi_1 \cong \pi_2$. This follows immediately from(3.6.4.7). ⌟

Prop. (18.1.5.32) [Characters Determine Irreducible Admissible Representations]. Let $\pi_1, \ldots, \pi_n$ be inequivalent irreducible admissible representations of a locally profinite group G, then their characters $\mathrm{tr}(\pi_i)$ are linearly independent. In particular, an irreducible admissible representation is determined by its character. ⌟

Proof: Choose K that $V_i^K \neq 0$ for any i, the hypothesis together with(18.1.5.31) shows $V_i^K \not\cong V_j^K$. Then we finish by(11.10.4.22). □

Prop. (18.1.5.33) [Representations of Product Group]. If G_1, G_2 are all locally profinite groups and (π_i, M_i) are irreducible admissible representations of G_i, then $M_1 \otimes M_2$ is an irreducible admissible representation of $G_1 \times G_2$, and any irreducible admissible representations of $G_1 \times G_2$ comes like this. ⌟

Proof: By(18.1.5.16) and(3.6.4.15), this follows if we have $\mathcal{H}_{G_1 \otimes G_2} \cong \mathcal{H}_{G_1} \otimes \mathcal{H}_{G_2}$. And this fact is easily deduced from(4.4.4.12). □

Induced Representations and Mackey Theory

Def. (18.1.5.34) [Smooth Induced Representations]. Let G be a locally profinite group and H is a closed subgroup, (π, V) be a smooth representation of H, we can define the **smooth induced representation** $\mathrm{Ind}_H^G \pi$ as the space of locally constant f on G with values in V

$$f(hg) = \sqrt{\frac{\Delta_G(h)}{\Delta_H(h)}} \pi(h) f(g).$$

with the natural right G-representation. Notice this is similar to that of unitary representations of locally compact groups, in(11.10.5.3).

the induced representation $\mathrm{Ind}_H^G \pi$ has a subrepresentation ind_H^G consisting of functions that is compactly supported in $H \backslash G$, called the **compactly induced representation**. ⌟

Remark (18.1.5.35). The normalized factor here is used to make the induction of a unitarizable representation unitarizable(18.1.5.45). ⌟

Prop. (18.1.5.36) [Description of the Induced Representations]. Situation as in(18.1.5.34). Let $K\subset G$ be an open compact subgroup, and $\Omega\subset G$ be a system of coset representations of $H\backslash G/K$. For each $g\in G$, denote $N_g=H\cap gKg^{-1}$ the compact open subgroup of H, then the restriction of functions from G to Ω induces an isomorphism of $(\mathrm{Ind}_H^G(V))^K$ with the $\prod_{g\in\Omega}V^{N_g}$. And in this way, $(\mathrm{ind}_H^G(V))^K$ is mapped to $\bigoplus_{g\in\Omega}V^{N_g}$. ⌟

Prop. (18.1.5.37). Let G be a locally profinite group, H a closed subgroup of G, and B a closed subgroup of H, then

- Ind_H^G and ind_H^G are both exact functors $\mathrm{Rep}^{\mathrm{alg}}(H)\to\mathrm{Rep}^{\mathrm{alg}}(G)$.
- $\mathrm{Ind}_H^G\circ\mathrm{Ind}_B^H=\mathrm{Ind}_B^G$ and $\mathrm{ind}_H^G\circ\mathrm{ind}_B^H=\mathrm{ind}_B^G$.
- $\mathrm{Ind}_H^G(\sigma)^\vee=\mathrm{ind}_H^G(\sigma^\vee)$.
- (Smooth Frobenius Reciprocity)If $(\pi,W)\in\mathrm{Rep}^{\mathrm{alg}}(G)$, $(\rho,V)\in\mathrm{Rep}^{\mathrm{alg}}(H)$, then there are functorial isomorphisms

$$\mathrm{Hom}_G(\pi,\mathrm{Ind}_H^G(\rho))=\mathrm{Hom}_H(\pi|_H,\rho\otimes\sqrt{\frac{\Delta_G}{\Delta_H}}),\quad \mathrm{Hom}_G(\mathrm{ind}_H^G(\sigma),\pi)=\mathrm{Hom}_H(\rho\otimes\sqrt{\frac{\Delta_H}{\Delta_G}},(\pi^\vee|_H)^\vee)$$

⌟

Proof: 1: This follows from the description in(3.6.4.3) and(3.6.4.3) by taking colimits.

2: For simplicity we prove for G,H,B unimodular. An element in $\mathrm{Ind}_H^G\circ\mathrm{Ind}_B^H(V)$ is an element $\varphi:G\mapsto\mathrm{Hom}(H,V)$ that satisfies $\varphi(hg)(h')=(\pi(h)\varphi(g))(h')=\varphi(g)(hh')$, thus $\varphi(g)(h)=\varphi(hg)(1)$. Let $\Phi(g)=\varphi(g)(1)$, then Φ satisfies $\Phi(bg)=\pi(b)\Phi(g)$. So $\varphi\mapsto\Phi$ is an isomorphism. ind case follows from item3.

3: For $f:G\to V\in\mathrm{Ind}_H^G(\sigma),f'\in G\to V^\vee\in\mathrm{ind}_H^G(\sigma^\vee)$, $\langle f,f'\rangle$ is compactly supported in $H\backslash G$, and $\langle\pi(h)f,\pi(h)f'\rangle=\frac{\Delta_G(h)}{\Delta_H(h)}\langle f,f'\rangle$, thus we can define a G-invariant pairing

$$\langle f,f'\rangle=\int_{H\backslash G}\langle f(g),f'(g)\rangle d\mu_{H\backslash G}(g)(11.10.1.44).$$

This map is a perfect pairing on the K-fixed part for any compact open K using description in(18.1.5.36), thus we are done.

4: Given a $\Phi:W\to\mathrm{Ind}_H^G V$, we have a map $\varphi:W\to V:\varphi(w)=\Phi(w)(1)$, then it is verified that $\varphi\in C(\pi|_H,\rho\otimes\sqrt{\frac{\Delta_G}{\Delta_H}})$. Conversely, if $(\varphi:W\to V)\in C(\pi|_H,\rho\otimes\sqrt{\frac{\Delta_G}{\Delta_H}})$ is given, we can define $\Phi;W\to\mathrm{Ind}_H^G V:\Phi(w)(g)=\varphi(\pi(g)w)$, then $\Phi(w)\in\mathrm{Ind}_H^G V$ and this is linear in w(remember to check smoothness). Finally, it is easily verified these maps are inverse to each other. The second assertion follows from item3 and(18.1.5.20). □

Cor. (18.1.5.38). If $H\backslash G$ is compact, then $\mathrm{Ind}_H^G=\mathrm{ind}_H^G$, and they map admissible representations to admissible representations, by the description in(3.6.4.3), as $H\backslash G/K$ is both compact and discrete thus finite. ⌟

Prop. (18.1.5.39). If H is normal in G and for any $\rho\in\mathrm{Rep}(H)$, let ρ^g be ρ twisted by conjugation of $g\in G$, then $\mathrm{Ind}_H^G(\rho)\cong\mathrm{Ind}_H^G(\rho^g)$, and $\mathrm{ind}_H^G(\rho)\cong\mathrm{ind}_H^G(\rho^g)$ ⌟

Proof: □

Prop. (18.1.5.40). Let $H \leq G, K \trianglelefteq G, \rho \in \mathrm{Rep}(H)$, then

$$(\mathrm{Ind}_H^G(\rho))^K \cong \mathrm{Ind}_{H/H\cap K}^{G/K}(\rho^{H\cap K}) \in \mathrm{Rep}^{\mathrm{alg}}(G/K)$$

⌟

Proof: □

Prop. (18.1.5.41). Let G be a locally profinite group and H is a closed subgroup, (π, V) be a smooth representation of H, then there is a G-invariant map $P_\pi : C_c^\infty(G) \otimes V \to \mathrm{ind}_H^G(\pi)$:

$$P_\pi(\varphi, v)(g) = \int_H \varphi(b^{-1}g)\sqrt{\frac{\Delta_G(b)}{\Delta_H(b)}}\pi(b)vdb.$$

And if $\dim \pi < \infty$ and there is an open compact subgroup K of G that $G = HK$, then this map is surjective.

Moreover,

$$P(\lambda(b)^{-1}\varphi, v) = \sqrt{\Delta_G(b)\Delta_H(b)}P(\varphi, \pi(b)v), \quad b \in H$$

⌟

Proof: It can be verified that $P_\pi(\varphi, v)(bg) = \sqrt{\frac{\Delta_G(b)}{\Delta_H(b)}}\pi(b)P_\pi(\varphi, v)$.

If $H\backslash G$ is compact, by(11.10.1.52), there is a compact open subset K of G that $G = HK$, then for any $f \in \mathrm{Ind}_H^G(\pi) = \sum v_i \otimes f_i$, consider $\varphi_i = \chi_{K^{-1}} f_i$, then $\sum P(\varphi_i, v_i) = \sum V(H\cap K) f_i v_i = V(H \cap K)f$. □

Prop. (18.1.5.42) [Mackey's Decomposition]. Let H, K be closed subgroups of a locally profinite group G, ρ is a smooth representation of H. If $s \in G$, then we can define a new representation of $H_s = K \cap sHs^{-1}$ as $\rho^s(g) \mapsto \rho(s^{-1}gs)$. Then if we use unnormalized induction,

- If either H or K is open in G, then
$$\mathrm{res}_K^G \mathrm{ind}_H^G \rho \cong \bigoplus_{s\in H\backslash G/K} \mathrm{ind}_{H_s}^K \rho^s$$
- If K is open in G, then
$$\mathrm{res}_K^G \mathrm{Ind}_H^G \tau \cong (\prod_{s\in H\backslash G/K} \mathrm{Ind}_{H_s}^K \tau^s)^\infty$$

⌟

Proof: Cf.[Yam22]. □

Cor. (18.1.5.43) [Mackey's Intertwining Theorem]. Let H be a closed subgroup of a locally profinite group G, K an open subgroup of G, σ(resp. τ) be a smooth representation of K(resp. H), define τ^s as in(18.1.5.42), then if we use unnormalized induction,

- $$\mathrm{Hom}_G(\mathrm{ind}_K^G \sigma, \mathrm{Ind}_H^G \tau) \cong \prod_{s\in H\backslash G/K} \mathrm{Hom}_{H_s}(\sigma, \tau^s).$$
- If moreover $H\backslash HgK \cong H_s\backslash K$ is compact for any $g \in G$(e.g. K is compact) and σ is f.g. over K, then
$$\mathrm{Hom}_G(\mathrm{ind}_K^G \sigma, \mathrm{ind}_H^G \tau) \cong \bigoplus_{s\in H\backslash G/K} \mathrm{Hom}_{H_s}(\sigma, \tau^s).$$

⌟

Proof: 1: This is a direct consequence of Mackey's decomposition(18.1.5.42) and Frobenius reciprocity(18.1.5.37):

$$\begin{aligned}\mathrm{Hom}_G(\mathrm{ind}_K^G\sigma,\mathrm{Ind}_H^G\tau)&\cong\mathrm{Hom}_K(\sigma,\mathrm{res}_K^G\mathrm{Ind}_H^G\tau)\cong\mathrm{Hom}_K(\sigma,(\prod_{s\in H\backslash G/K}\mathrm{Ind}_{H_s}^K\tau^s)^\infty)\\&\cong\mathrm{Hom}_K(\sigma,\prod_{s\in H\backslash G/K}\mathrm{Ind}_{H_s}^K\tau^s)\cong\prod_{s\in H\backslash G/K}\mathrm{Hom}_K(\sigma,\mathrm{Ind}_{H_s}^K\tau^s)\\&\cong\prod_{s\in H\backslash G/K}\mathrm{Hom}_{H_s}(\sigma,\tau^s).\end{aligned}$$

2 is similar. □

Cor. (18.1.5.44) [Compact Induction Admissible]. If H is a subgroup of G that $H\backslash G$ is compact, then Ind_H^G takes admissible representations to admissible representations. ⌟

Proof: For any compact open subgroup $K\subset G$, $H\backslash G/K$ is finite, as $H\backslash G$ is compact and K is open, then by Mackey's decomposition(18.1.5.42), $(\mathrm{Ind}_H^G\rho)^K=\oplus_{s\in H\backslash G/K}\rho^{s^{-1}Ks\cap H}$ is of f.d. if ρ is admissible. □

Unitarizable Admissible Representations

Prop. (18.1.5.45). The induction of a unitarizable representation is unitarizable, by(11.10.5.3). ⌟

Prop. (18.1.5.46)[Converse of Schur's Lemma]. If (π,V) is a unitarizable admissible representation of a locally profinite group G that $\mathrm{Hom}_G(V,V)=\mathbb{C}$, then π is irreducible. ⌟

Proof: Cf.[Bump, P523].? □

Compact Representations

Def. (18.1.5.47) [Compact Representations]. For a locally profinite group G, a **compact representation** is a smooth representation of G s.t. for every $\xi\in V$ and every compact open subgroup $K\subset G$, the function $D_{\xi,K}:G\to V:g\mapsto\pi(e_K)\pi(g^{-1})\xi$ has compact support. ⌟

Prop. (18.1.5.48). $V\in\mathrm{Rep}^{\mathrm{alg}}(G)$ is compact iff every matrix coefficient of V is compactly supported. And every f.g. compact representation is admissible. ⌟

Proof: If V is compact, for any $\xi\in V,\xi^\wedge\in V^\wedge$, $\xi^\wedge\in(V^\wedge)^K$, then $\mathrm{Supp}\,\varphi_{\xi,\xi^\wedge}\in\mathrm{Supp}\,D_{\xi,K}$ is compact.

For the converse, Cf.[Bernstein Zelevinsky, P26]. □

18.2 Modular Representations

Main references are [Ser77] and [Bon11].

1 Block Theory

See [Bon11].

2 Mixed Characteristic

3 Equal Characteristic

Prop. (18.2.3.1). The only irreducible representation of a p-group over a a field of char p is the trivial representation. ⌟

Proof: For any $v \in V$, consider the additive subgroup generated by $g(s)v$, then it is a finite group of prime power order. Then(3.1.6.4) shows it has a element other than 0 fixed by all G, thus it is not irreducible unless trivial representation. □

18.3 Galois Representations(Basics)

Main references are [Theories of p-adic Galois Representations, Fontaine/Yi Ouyan], [Local Langlands for GL(n), Zijian Yao]. [Con06], [R. Taylor, Galois representations, long version of the talk given at the iCM 2002].

Notation (18.3.0.1).

- Use notations defined in Classical Representation Theory.
- Use notations defined in Cohomology of Arithmetic Fields.

⌟

Remark (18.3.0.2). For $K \in \texttt{Field}$, $E \in \texttt{Field}^{\text{top}}$, the theory of Galois representations study the category $\text{Rep}_E(\text{Gal}_K)$. ⌟

1 Basics

Def. (18.3.1.1) [Galois Representations]. For any $K \in \texttt{Field}, p \in \mathbf{P}$,

- an **Artin representation** of K is a f.d. smooth $\mathbb{C}$-representation of Gal_K.
- a **p-adic Galois representation** of K is a f.d. continuous $\mathbb{Q}_p$-representation of Gal_K. If $K \in p\text{-}\texttt{LField}$, this is called a **$p$-adic local Galois representation**(of K).
- a **p-adic integral Galois representation** of K is a f.d. continuous $\mathbb{Q}_p$-representation of Gal_K. If $K \in p\text{-}\texttt{LField}$, this is called a **$p$-adic local integral Galois representation**(of K).
- if $K \in p\text{-}\texttt{LField}, \ell \in \mathbf{P}\backslash\{p\}$, then an **$\ell$-adic Galois representation** of K is a f.d. continuous $\mathbb{Q}_\ell$-representation of Gal_K.

⌟

Cor. (18.3.1.2) [Artin Representations as ℓ-adic(or p-adic) Representations]. A choice of isomorphism(14.2.1.27) $\overline{\mathbb{Q}}_p \cong \overline{\mathbb{Q}}_\ell \cong \mathbb{C}$ induces a bijection between Artin representations and ℓ-adic(or p-adic) representations with open kernels. ⌟

Prop. (18.3.1.3) [Compact Groups Stabilize a Lattice]. Let Γ be a compact group and let $\rho : \Gamma \to GL(n, \overline{\mathbb{Q}}_p)$ be a continuous homomorphism, then there exists a finite extension $L/\mathbb{Q}_p$ that $\rho(\Gamma) \subset GL(n, L)$, and up to conjugation, $\rho(\Gamma) \subset GL(n, \mathcal{O}_L)$, or equivalently, Γ fixes a $\mathcal{O}_L$-lattice. ⌟

Proof: Notice $\rho(\Gamma)$ is compact and Hausdorff, so by Baire category theorem, now that $GL(n, L)$ is closed in $GL(n, \overline{\mathbb{Q}}_p)$ for all $L/\mathbb{Q}_p$ finite, and all this extensions are countable by primitive element theorem, so there is an L that $\rho(\Gamma) \cap GL(n, L)$ contains an open subset of $\rho(\Gamma)$, so it is an open subgroup, thus of finite index, hence by adding all the coset representations into L, we get an L' finite.

For the second assertion, notice $\rho(\Gamma)$ is compact in $GL(n, L)$, thus by(15.4.1.5), it is conjugate to $GL(n, \mathcal{O}_L)$. □

Prop. (18.3.1.4) [Brauer-Nesbitt]. If two n-dimensional representations have the same char polynomial and char $k = 0$, or char $k > n$ and they have the same character, then their semisimplification are the same. ⌟

Proof: The proof is not hard, use the Artin-Wedderburn theorem, and the fact the representation may not by semisimple. □

Def. (18.3.1.5)[Restricted Galois Representations]. By(14.4.1.18), if $F \in \texttt{GField}$, for any $v \in \Sigma_F$, a Galois representation ρ of F can be restricted to a Galois representations ρ_v of Gal_{F_v}, called the **restricted Galois representation**. ⌟

Def. (18.3.1.6) [Cyclotomic Characters and Tate Twists]. For $K \in \texttt{Field}, p \in \mathbf{P}$, the p-adic **cyclotomic character** χ_p of Gal_K is the character corresponding to the 1-dimensional p-adic Tate module of $\mathbb{G}_{a,K}$.

For any $(\rho, V) \in \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_K)$ or $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ and $n \in \mathbb{Z}$, we can define the **Tate twist** $\rho(n)$ as the representation twisted by n-th power of the cyclotomic character χ_p^n. ⌟

Def. (18.3.1.7)[Tate Duals]. For a p-adic representation V of the Galois group of a field K, the **Tate dual** V^D of V is defined to be $V^D = V^\vee(1)$. Similarly for p-adic integral representations. ⌟

Def. (18.3.1.8)[Properties of Galois Representations]. Let ρ be a representation of $\mathrm{Gal}_\mathbb{Q}$ on some topological ring A, then

- ρ is called an **odd representation** if $\rho(\mathtt{c}) = -1$, and an **even representation** otherwise.
- For $p \in \mathbf{P}$, ρ is said to be **unramified at** p if $I_p \subset \ker(\rho|_{\mathrm{Gal}_{\mathbb{Q}_p}})$.
- For $p \in \mathbf{P}$, ρ is said to be **flat at** p if for any Artinian quotient A/I of A, the quotient representation $\overline{\rho}|_{\mathrm{Gal}_{\mathbb{Q}_p}}$ is isomorphic to the representation of $\mathrm{Gal}_{\mathbb{Q}_p}$ on the geometric points of a finite flat group scheme over $\mathbb{Z}_p$.

⌟

2 ℓ-adic (Local)Galois Representations

Def. (18.3.2.1) [Notations].

- Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, $K \in p\text{-}\texttt{NField}$ with residue field $\mathbb{F}_q$.
- Let $\ell \in \mathbf{P} \setminus \{p\}$.
- $t_\ell : I_K/R_K \to \mathbb{Z}_\ell$ be the ℓ-adic tame character(14.2.3.20).
- Let σ be a fixed lift of $\mathrm{Frob} \in \mathrm{Gal}_{\mathbb{F}_q}$.
- Let $\chi = \chi_\ell$ be the unramified cyclotomic character(18.3.1.6) $\widehat{\mathbb{Z}} \cong \mathrm{Gal}_K / I_K \to \mathbb{Z}_\ell : \sigma \mapsto q$.

⌟

Prop. (18.3.2.2). If $\rho : \Gamma \to GL(n,k) = GL(V)$ is a representation, then it has a filtration $0 = V_0 \subset V_1 \subset \ldots \subset V_n = V$ where V_{i+1}/V_i is irreducible, then there is a semisimplification of ρ, which is $\rho^{ss} = \oplus V_{i+1}/V_i$. ⌟

Def. (18.3.2.3) [Residential Representation]. If $L/\mathbb{Q}_p$ finite, we may take a Γ-stable $\mathcal{O}_L$-lattice Γ, then the **residual representation** $\overline{\rho}_L$ is defined by $\Gamma \to GL(\Lambda/\pi\Lambda)$. Then the semisimplification of $\overline{\rho}_L$ is independent of Λ chosen.**?** ⌟

Prop. (18.3.2.4) [Induced Galois Representations]. Let F be a local field with residue characteristic p. Let $(n, q) = 1$, then any irreducible representation (ρ, V) of Gal_F of dimension n is induced from a character χ of K^* for a field extension K/F of degree n. ⌟

Proof: Suppose χ factors through a normal subgroup $G(L/F)$. It suffices to show ρ is an induced representation from a subgroup, then use induction. Suppose it is not, then consider the filtration of Galois groups $R_v \subset I_v \subset G_F$. R_v is a pro-p-group, thus all irreducible f.d. representations are p-powers, by(18.1.3.12), thus it is 1-dimensional. Now R_v is a normal subgroup, by(18.1.2.10), R_v acts by scalars on V. Now the exact sequence $1 \to R_v \to I_v \to I_v/R_v \to 0$ is a split exact sequence(14.2.2.17), and I_v/R_v is cyclic, thus $\rho|_{I_v}$ also contains a character, and the same argument as above shows I_v acts by characters. Then a twist of ρ factors through G/I_v, which is a cyclic group, contradiction. □

Thm. (18.3.2.5). Let K be a p-adic field with residue field k and $k = \overline{k}$, then any $\rho \in \mathrm{Rep}_{\mathbb{Q}_\ell}^{\mathrm{pot.\,st}}(\mathrm{Gal}_K)$ comes from geometry. ⌟

Proof: Cf.[Fontaine, Galois Rep]P12.**?** □

Weil Representations

References are [Yao17].

Prop. (18.3.2.6)[Primitive Weil Representation]. $\pi \in \mathrm{Rep}^{\mathrm{alg}}(W_K)$ is called primitive if it is not induced from a representation of a proper subgroup. Then for any primitive representation of W_F, it factors through $C_{E/F}$ for some finite extension E/F by continuity, and by Clifford's theorem(18.1.2.10), the normal subgroup C_E acts by scalars, so the image of $W_{E/F}$ in $GL(V)$ is a finite group. ⌟

Def. (18.3.2.7) [Twisting Character of W_K]. For $s \in \mathbb{C}$, define the quasi-character $\omega_s : W_F \to \mathbb{C}^\times : x \mapsto ||x||^s$. ⌟

Prop. (18.3.2.8) [Twisting of Weil Representation]. For any $\rho \in \mathrm{Irr}^{\mathrm{alg}}(W_F)$, there exists some $s \in \mathbb{C}$ that $\omega_s \otimes \rho$ factors through $W_F \to G_F$. And for this s, $(\omega_s \otimes \rho)(W_F)$ is a finite subgroup of $GL(V)$. ⌟

Proof: $\ker(\rho|_{I_F})$ is an open subgroup of I_F. Conjugation by σ induces a permutation on the finite subgroup $\rho(I_F)$, so there is some n that $\rho^n = \mathrm{id}$ on $\rho(I_F)$, which means $\rho(\sigma^n)$ commutes with each elements of W_F, thus it is a scalar by Schur's lemma. Thus we can chose s that $(\omega_s \otimes \rho)(\sigma^n) = 0$, then $\omega_s \otimes \rho$ is trivial on $U = \langle \sigma^n, \ker(\rho|_{I_F}) \rangle$, which is a subgroup of W_F of finite index. Thus the image is finite.

Also the closed subgroup $\overline{U} = \overline{\langle \sigma^n, \ker(\rho|_{I_F}) \rangle} \subset \mathrm{Gal}_K$ if of finite index, and $\overline{U} \cap W_F = U$, thus $W_F/U \cong \mathrm{Gal}_F/\overline{U}$, and this representation extends to Gal_K. □

Cor. (18.3.2.9) [Galois-Type Representations]. As W_K is dense in Gal_K, $\mathrm{Rep}^{\mathrm{alg}}(\mathrm{Gal}_K) \subset \mathrm{Rep}^{\mathrm{alg}}(W_K)$ is a subcategory. The representations in this subcategory are called **representations of Galois-type**.

(18.3.2.8) shows $\mathrm{Rep}^{\mathrm{alg}}(\mathrm{Gal}_K)$ are almost the same as $\mathrm{Rep}^{\mathrm{alg}}(W_K)$. $\rho \in \mathrm{Rep}^{\mathrm{alg}}(W_K)$ is of Galois-type iff it has a finite image. ⌟

Prop. (18.3.2.10). Let ρ be a representation of W_K that $\rho(I_K)$ is finite, the following are equivalent:

- $\rho(\sigma)$ is semisimple for any $\sigma \in W_K$.
- $\rho(\varphi)$ is semisimple.
- ρ is a semisimple representation.

⌟

Proof: Cf.[Yao17]P4. □

Def. (18.3.2.11) [ℓ-Integral Representations]. For $\rho \in \mathrm{Rep}_{\overline{\mathbb{Q}}_\ell}(W_K)$, by(18.3.2.8), the eigenvalues of r are ℓ-adic units iff the eigenvalues of $\rho(\sigma) \in \mathcal{O}^*_{\overline{\mathbb{Q}}_\ell}$, iff the characteristic polynomial of $\rho(\sigma)$ are in $\mathcal{O}_{\overline{\mathbb{Q}}_\ell}[T]$ and $|\det(\rho(\sigma))| = 1$. Such a representation is called an **ℓ-integral representation**. ⌟

Def. (18.3.2.12) [Types of 2-Dimensional Representations]. By(18.3.2.6), any 2-dimensional representation of W_F has finite image in $\mathrm{PGL}(2,\mathbb{C}) \cong \mathrm{SO}(3,\mathbb{R})$(12.12.0.14). Thus by conjugacy into $\mathrm{SO}(3,\mathbb{R})$, the image is isomorphic to a cyclic, dihedral, tetrahedral, octahedral or icosahedral group by(12.12.3.1), called the **type of this Weil representation**. ⌟

Def. (18.3.2.13) [Dihedral Representation]. A **dihedral Weil representation** is a representation $W_F \to GL(2,\mathbb{C})$ that is induced from a quasi-character of W_E for some quadratic extension E/F. (What's the relation with(18.3.2.12)**?**) ⌟

Prop. (18.3.2.14) [Induced Weil Representations]. If $(p,n) = 1$ and $K \in p$-`NField`, then any irreducible representation $W_K \to GL(n,\mathbb{C})$ is induced from a quasi-character of W_E(equivalently $E^\times$) where E is a n-dimensional field extension E/F. ⌟

Proof: By(11.10.5.4), the class of such induced extensions are stable under twisting by ω_s, thus using(18.3.2.8), we can assume that the representation factors through $G(\overline{F}/F)$, thus through $G(K/F)$ for some finite extension K/F, thus the assertion follows from(18.3.2.4). □

Def. (18.3.2.15) [Artin Conductor]. For $(\rho, V) \in \mathrm{Rep}^{\mathrm{alg}}(W_K)$, define the **Artin conductor**

$$f(\rho) = f(\chi_\rho) = \sum_{i>0} \frac{1}{[G_0 : G_i]} \dim(V/V^{G_i})$$

where G_i are the higher ramification groups of G. ⌟

Def. (18.3.2.16) [Artin Conductors]. Let L/F be a Galois extension of global fields and $(\rho, V) \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, for $v \in \Sigma_F^{\mathrm{fin}}$, let $G_v = G_{v,0} \supset G_{v,1} \supset \ldots \supset G_{v,m} = 0$ be higher ramification groups at v, then the **Artin conductor** of ρ is defined to be the ideal in $\mathcal{O}_F$:

$$\mathfrak{f}(\rho) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} \mathfrak{p}_v^{a_v}, \quad a_v = \sum_{i \geq 0} \dim(V/V^{G_{v,i}}) \frac{\# G_{v,i}}{\# G_{v,0}}.$$

And we also define the **Swan conductor**

$$\mathfrak{b}(\rho) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} \mathfrak{p}_v^{b_v}, \quad b_v = \sum_{i \geq 1} \dim(V/V^{G_{v,i}}) \frac{\# G_{v,i}}{\# G_{v,0}}.$$

⌟

Prop. (18.3.2.17) [Conductor-Discriminant-Formula]. For any Galois extension of global fields L/F,

$$\mathfrak{d}_{L/F} = \prod_{\rho \in \mathrm{Irr}(\mathrm{Gal}(L/F))} \mathfrak{f}(F, \rho)^{\chi_\rho(1)}$$

⌟

Proof: Cf.[Neu99]P534. □

Weil-Deligne Representations

Def. (18.3.2.18)[Weil-Deligne Groups]. The **Weil-Deligne group** WD_K is the group scheme $W_K \ltimes \mathbb{G}_a \in \mathcal{G}\mathrm{rp}/\mathbb{Q}$ given by the action

$$wxw^{-1} = |w|x.$$

⌟

Def. (18.3.2.19) [Deligne-Weil Representations]. For $L \in \mathtt{Field}^0$, the category $\mathfrak{wd}_L(W_K)$ of **Deligne-Weil representations** of W_K over L consists of triples (ρ, V, N), where $(\rho, V) \in \mathrm{Rep}_L^{\mathrm{alg}}(W_K)$ and $N \in \mathrm{End}(V)$ s.t.

$$\rho(x)N\rho(x)^{-1} = |x|\cdot N, \quad x \in W_K.$$

Equivalently, a Deligne-Weil representation is a smooth representation (ρ, V) of W_K together with a W_K-map $V \mapsto V(1)$(18.3.1.6).

Equivalenly, a Deligne-Weil representation is a representation of the group scheme WD_K(18.3.2.18) over L, by**??**.

N is necessarily nilpotent, and for an irreducible Weil-Deligne representation, $N = 0$.

$\mathfrak{wd}_{\mathbb{C}}(W_K)$ is also denoted by $\mathfrak{wd}(W_K)$. ⌟

Proof: Because $\sigma N\sigma^{-1} = q^{-1}\cdot N$, N has no non-zero eigenvalues, so N is nilpotent. □

Remark (18.3.2.20). Deligne-Weil representations are exactly the continuous representations of W_K, as will be illustrated in(18.3.2.26). ⌟

Def. (18.3.2.21). Define tensor product and inner Homs: $(\rho_1, V_1, N_1)\otimes(\rho_2, V_2, N_2) = (\rho_3, V_3, N_3)$ where

$$V_3 = V_1 \otimes V_2, \quad \rho_3(x)(v_1 \otimes v_2) = \rho_1(x)v_1 \otimes \rho_2(x)v_2, \quad N_3(v_1 \otimes v_2) = N_1(v_1) \otimes v_2 + v_1 \otimes N_2(v_2).$$

and also $\mathrm{Hom}((\rho_1, V_1, N_1), (\rho_2, V_2, N_2)) = (\rho_3, V_3, N_3)$ where

$$V_3 = \mathrm{Hom}(V_1, V_2), \quad (\rho_3(x)\varphi)(v_1) = \rho_2(x)(\varphi(\rho_1(x)^{-1}(v_1))), \quad (N_3\varphi)(v_1) = N_2(\varphi(v_1)) - \varphi(N_1(v_1)).$$

And also the dual $\rho^\vee = \mathrm{Hom}(\rho, \mathbb{1})$. ⌟

Def. (18.3.2.22) [F-Semisimple Representations]. $\rho = (\rho_0, V, N) \in \mathfrak{wd}_L(W_K)$ is called **F-semisimple** if (ρ_0, V) is semisimple. ⌟

Prop. (18.3.2.23)[$\mathrm{Sp}_m(\rho)$]. If $(\rho, V) \in \mathrm{Rep}^{\mathrm{alg}}(W_K)$ and $m \geq 0$, we can define $\mathrm{Sp}_m(\rho) \in \mathfrak{wd}(W_K)$ given by $\mathrm{Sp}_m(\rho) = V \oplus V(1) \ldots \oplus V(m-1)$ and N maps $V(i)$ isomorphically to $V(i+1)$ for $i < m-1$, and trivial on $V(m-1)$.

Then any representation that ⌟

Thm. (18.3.2.24) [Grothendieck's ℓ-adic Monodromy Theorem]. For $\ell \in \mathbf{P} \setminus \{p\}$ and $\rho \in \mathrm{Rep}_{\mathbb{Q}_\ell}(W_K)$,

- There exists an open subgroup $I_K' \subset I_K$ and a uniquely determined nilpotent operator $N \subset \mathrm{End}(V)$ s.t. for all $\sigma \in I_K'$, $\rho(\sigma) = \exp(t_\ell(\sigma)N)$.
- For any element $x \in W_K$,

$$\rho(x)N\rho(x^{-1}) = |\cdot|N.$$

⌟

Proof: Cf.[Fontaine, P12].**?** □

Cor. (18.3.2.25) [Potentially Unramified]. If ρ is a semisimple ℓ-adic continuous representation of W_K, then $\#\rho(I_K) < \infty$. ⌟

Proof: Choose a finite extension K'/K s.t. $I_{K'} \subset I'_K$, then $\rho|_{I_{K'}}$ is both unipotent and semisimple(18.1.2.10). □

Thm. (18.3.2.26) [ℓ-adic Deligne-Weil Representations, Deligne]. There is an equivalence of categories

$$\mathrm{WD} = \mathrm{WD}_p : \mathrm{Rep}^{\mathrm{fd}}(W_K) \cong \mathfrak{wd}(W_K)$$

$$(\rho, V) \mapsto (\rho_\sigma, V, N), \quad \rho_\sigma(\sigma^n x) = \rho(\sigma^n x)\exp(-t_\ell(x)N),$$

where N is given in(18.3.2.24).

Moreover, by(18.3.2.9) and (18.3.2.11), this map identifies

$$\mathrm{WD} : \mathrm{Rep}^{\mathrm{fd}}(\mathrm{Gal}_K) \cong \mathfrak{wd}^{\ell\text{-int}}(W_K),$$

and ρ is unramified iff $\mathrm{WD}(\rho)$ is unramified. ⌟

Proof: **?** This is a Weil-Deligne representation by(18.3.2.24). WD is a functor and is an equivalence by the uniqueness of N(18.3.2.24). □

Cor. (18.3.2.27). In the above situation, for $\rho \in \mathrm{Rep}_L(\mathrm{Gal}_K)$, the following are equivalent:

- ρ is semisimple.
- ρ is F-semisimple and $\rho(I_K)$ is finite.
- ρ' is F-semisimple and $N = 0$.

⌟

3 Mod ℓ Local Galois Representations

Notation (18.3.3.1). Use notation as in(18.3.2.1). ⌟

Def. (18.3.3.2) [Decomposed Generically]. Let $K \in p$-`LField` with residue field $\mathbb{F}_q$ and $\ell \in \mathbf{P}\backslash p$, an unramified representation

$$\overline{\rho} : \mathrm{Gal}_K \to \mathrm{GL}(n, \overline{\mathbb{F}_\ell})$$

is called **decomposed generically** if the eigenvalues $\{\lambda_1, \ldots, \lambda_n\}$ of $\overline{\rho}(\varphi)$ satisfies $\lambda_i/\lambda_j \notin \{1, q\}$ for any $1 \leq i \neq j \leq n$. ⌟

4 Representations from Geometry

Prop. (18.3.4.1). Let $k \in$ `Field` and $E \in \mathcal{E}\mathrm{ll}/k$, then for any $N \in \mathbb{Z} \cap k^\times$, there is an action of Gal_k on $E[N] \cong (\mathbb{Z}/(N))^2$, giving a representation

$$\rho_{E,N} : \mathrm{Gal}_k \mapsto \mathrm{GL}(2, \mathbb{Z}/(N)).$$

Let $\overline{\rho}_{E,N}$ denote the representation $\mathrm{Gal}_k \mapsto GL(2, \mathbb{Z}/(N))/\{\pm 1\}$. Then $\rho_{E,N}$ is surjective iff $\overline{\rho}_{E,N}$ is surjective. ⌟

Proof: Notice if $\overline{\rho}_{E,N}$ is surjective, then either $\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}$ or $\begin{bmatrix} & 1 \\ -1 & \end{bmatrix}$ is in the image, thus -1 is in the image. □

Def. (18.3.4.2) [Tate modules representations]. For $\ell \in \mathbf{P}$, the action of Gal_k on the Tate module $T_\ell(E)$(15.7.6.15) is denoted by ρ_{E,ℓ^∞}. Equivalently,

$$\rho_{E,\ell^\infty} = \varprojlim_{n\in\mathbb{Z}_+} \rho_{E,\ell^n}.$$

If $\mathrm{char}\, k = 0$, we can assemble all the $T_\ell(E), \ell \in \mathbf{P}$ together to get a representation

$$\rho_E : \mathrm{Gal}_k \to \mathrm{End}(E(k^s)_{\mathrm{tor}}) \cong \mathrm{GL}(2, \widehat{\mathbb{Z}}).$$

⌟

Prop. (18.3.4.3) [Determinant of Tate Modules]. If (K, k) be a CDVR and $E \in \mathcal{E}\mathrm{ll}/K, \ell \in \mathbf{P} \setminus \{\mathrm{char}\, k\}$, then $\det(\rho_{E,\ell^\infty}) \cong \chi_\ell$(18.3.1.6), by Weil pairing(15.7.7.10). ⌟

Prop. (18.3.4.4) [Serre]. If $p \in \mathbf{P}$ and $\mathbb{Q}_p \subset_{\mathrm{fin}} K$ is a local field with ramification index e. Let $E \in \mathcal{E}\mathrm{ll}/K$ with semistable reduction, then if $2e < p - 1$, then the image of I_K under the projective representation associated to $\rho_{E,p}$ contains an element of order$\geq (p-1)/e$. ⌟

Proof: ? □

Thm. (18.3.4.5) [Serre]. Assume $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is non-CM, then $\mathrm{Im}(\rho_E) \subset \mathrm{GL}(2, \widehat{\mathbb{Z}})$ has finite index. In particular, there exists $N \in \mathbb{Z}_+$ s.t. $\rho_{E,p}$ is surjective for any $p \geq N$. ⌟

Proof: Cf.[Abelian l-adic representations and elliptic curves, Serre].? □

Conj. (18.3.4.6) [Serre's Uniformity Problem]. There exists a number $N \in \mathbb{Z}_+$ s.t. for any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ non-CM, $\rho_{E,p}$ is surjective for any $p \in \mathbf{P}_{\geq N}$. ⌟

Proof: □

5 Deformation of Galois Representations(Mazur)

Prop. (18.3.5.1). Let (A, k) be a Noetherian complete local ring and Π a profinite group. Then for any continuous representation $\rho : \Pi \to \mathrm{GL}(n; A)$,

$$\overline{\rho} : \Pi \to \mathrm{GL}(n; k)$$

is absolutely irreducible iff

$$r : A[[\Pi]] \to \mathrm{Mat}(n; A)$$

is surjecitve. ⌟

Proof: □

18.4 p-adic Local Galois Representations

Notation (18.4.0.1).

- This is a continuation of the section Galois Representations(Basics).
- Use notations defined in Classical Representation Theory.
- Use notations defined in Untilts and Fargues-Fontaine Curves.
- Let K be a p-adic field with (perfect) residue field k,
- $K_0 = W(k)[\frac{1}{p}]$ its maximal unramified subextension.
- The Frobenius action on K_0 is denoted by σ.
- $K_\infty = K(\mu_{p^\infty})$, $\Gamma = \mathrm{Gal}(K_\infty/K)$.

⌟

1 $\mathbb{C}_K$-Admissibility

$\mathbb{C}_K$-Admissibility

Prop. (18.4.1.1) [Variant of Hilbert's Theorem90]. Any $V \in \mathrm{Rep}^{\mathrm{fd}}_{\widehat{K^{\mathrm{ur}}}}(\mathrm{Gal}(K^{\mathrm{ur}}/K))$ is trivial. In particular, any unramified f.d. representation of Gal_K is $\widehat{K^{\mathrm{ur}}}$-admissible thus $\mathbb{C}_p$-admissible, which is a special case of(18.4.1.2). ⌟

Proof: Denote by $\mathcal{O}$ the ring of integers of $\widehat{K^{\mathrm{ur}}}$ and $\mathfrak{m}$ the maximal ideal, Let W be a f.d. $\widehat{K^{\mathrm{ur}}}$-semi-linear representation, $(v_{1,0},\ldots,v_{d,0})$ a basis of W over $\widehat{K^{\mathrm{ur}}}$ and $\mathcal{O}_W$ the $\mathcal{O}$-span of $(v_{1,0},\ldots,v_{d,0})$, then we are going to construct a sequence of tuples $(v_{1,n},\ldots,v_{d,n})$ that $v_{i,n+1} \equiv v_{i,n} \mod \mathfrak{m}^n$ and $\mathrm{Frob}_q(v_{i,n}) \equiv v_{i,n} \mod \mathfrak{m}^n$ for all i and n.

Use induction on n: the case $n = 1$ follows from the fact $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ is trivial as a $\overline{k}$-semi-linear representation of Gal_k. To prove this, notice there is a finite extension l of k and an l-semi-linear representation W_L of $G_{l/k}$ that $\overline{k} \otimes_l W_l \cong \mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$, then the assertion follows from Hilbert's theorem90(8.7.3.16).

For general n, we are looking for vectors $w_1,\ldots,w_d \in \mathcal{O}_W$ that $\mathrm{Frob}_q(v_{i,n} + \pi^n w_i) \equiv v_{i,n} + \pi^n w_i \mod \mathfrak{m}^{n+1}$, which is equivalent to $\mathrm{Frob}_q\overline{w_i} - \overline{w_i} = \frac{\mathrm{Frob}_q v_{i,n} - v_{i,n}}{\pi^n}$ in $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$. To prove this, notice $\mathrm{Frob}_q - \mathrm{id}$ is surjective on $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$, which follows from the fact $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ is trivial as proved above and $\mathrm{Frob}_q - \mathrm{id}$ is surjective on $\overline{k}$.

Now $v_{i,n}$ are Cauchy sequences and they converges to a tuple v_i that $G_{K^{ur}/K}$ acts trivially and it is an $\mathcal{O}$-basis of $\mathcal{O}_W$, as its reduction modulo $\mathfrak{m}$ is a basis of $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$, so it is a $\widehat{K^{\mathrm{ur}}}$-basis of W. □

Prop. (18.4.1.2) [$\mathbb{C}_p$-Admissibility]. For $(\rho, V) \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, the following are equivalent:

- V is $\mathbb{C}_p$-admissible.
- $\#\rho(I_K) < \infty$.
- V is $L\widehat{K^{\mathrm{ur}}}$-admissible for some finite extension L/K.

⌟

Proof: Cf.[p-adic Period Rings Intro, P18].?
2 → 3: This follows from(18.4.1.1). □

Cor. (18.4.1.3) [$H^0_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p(\psi))$, Sen-Tate]. $H^0_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p(\psi)) = \begin{cases} K & ,\#\psi(I_K) < \infty \\ 0 & ,\#\psi(I_K) = \infty \end{cases}$. In particular,

$$H^0_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p(m)) = \begin{cases} K & ,m = 0 \\ 0 & ,m \neq 0 \end{cases}.$$

⌟

Proof: This follows from(18.1.1.19) and(18.4.1.2). For the last assertion, the cyclotomic extension of K thus also the cyclotomic character of G_K is infinitely unramified, thus χ^s_{cycl} factors through a finite quotient iff $s = 0$. And $H^0(\mathrm{Gal}_K, \mathbb{C}_p) = K$ by Ax-Sen-Tate(14.2.5.8). □

Cor. (18.4.1.4) [Potentially Unramified]. If $\eta : \mathrm{Gal}_K \to \mathbb{Z}_p^*$ is a character and there is $y \in \mathbb{C}_K^\times$ that $\eta(g) = g(y)/y$, then there exists a finite Abelian extension L of K that $\eta|_{G_L}$ is unramified, i.e. η is **potentially unramified**. ⌟

Cor. (18.4.1.5). For any $n, m \in \mathbb{Z}$,

$$\mathrm{Hom}_{\mathrm{Rep}_{\mathbb{C}_K}(\mathrm{Gal}_K)}(\mathbb{C}_K(n), \mathbb{C}_K(m))$$

is of one-dimensional over K if $n = m$, and vanishes otherwise. ⌟

Proof: Let $W = \mathrm{Hom}_{\mathbb{C}_p}(\mathbb{C}_K(n), \mathbb{C}_K(m)) = \mathbb{C}_K(m - n)$, then the desired space is W^{Gal_K}, and the assertion follows from(18.4.1.3). □

<u>H^1_{cont} **of** Gal_K**-Actions on** $\mathbb{C}_p(\psi)$</u>

Def. (18.4.1.6) [Notations]. Let $K \in p$-`NField`, K_∞ is an Abelian extension of K that the Galois group Γ has a subgroup Γ_0 of finite index that $\Gamma_0 \cong \mathbb{Z}_p$, and $H_K = \mathrm{Gal}_{K_\infty}$. The natural examples is $K_\infty = K(p^{\frac{1}{p^\infty}})$.

Let $\Gamma_m = \Gamma_0^m$ and K_m the fixed field of Γ_m.

Decompose $\Gamma = \Sigma \times \Gamma_0$ and let γ be a topological generator of Γ_0, then every element of Γ_0 can be written as γ^t for some $t \in \mathbb{Z}_p$. Denote $\gamma_s = \gamma^{p^s}$.

$\psi : G_K \to \Gamma \to \mathbb{Z}_p^*$ be a character factoring through Γ, then we can form a representation $\mathbb{C}_p(\psi)$ of G_K on $\mathbb{C}_p$ that $\rho(\sigma)(x) = \psi(\sigma)\sigma(x)$. This is an action because G_K acts trivial on $\mathbb{Z}_p^*$. ⌟

Lemma (18.4.1.7). Giving an $\sigma \in \mathrm{Gal}(K/\mathbb{Q}_p)$, if $x, y \in \mathfrak{m}_{\mathbb{C}_p}$ that $x \equiv y \mod \pi_K^n$, then $[\pi_K]^\sigma(x) \equiv [\pi_K]^\sigma(y) \mod \pi_K^{n+1}$, where f^σ is given by action of σ on the coefficients. ⌟

Proof: This is because the coefficients of $[\pi_K]^\sigma$ are divisible by π_K except for degree q, where it is $x^q - y^q = (x - y)(x^{q-1} + x^{q-2}y + \ldots + y^{q-1})$ which is divisible by π_K^{n+1} because the residue field of K is of order q. □

Prop. (18.4.1.8). If we let the action of $\sigma \in \mathrm{Gal}(K/\mathbb{Q}_p)$ on the residue field giving by $\overline{\sigma} : k_K \to \overline{\mathbb{F}}_p : x \mapsto x^{q_\sigma}$, where $q_\sigma = p^{n_\sigma}$ is a p-power, given an element $\eta = (\eta_0, \eta_1, \ldots) \in TG$, we have $\eta^{q_\sigma} \equiv [\pi_K]^\sigma(\eta^{q_\sigma}_{n+1}) \mod \pi_K$, hence the above lemma(18.4.1.7) shows that $[\pi_K^n]^\sigma \eta_n^{q_\sigma} \equiv$

$[\pi_K^{n+1}]^\sigma(\eta_{n+1}^{q_\sigma}) \mod \pi_K^{n+1}$, so $[\pi_K^n]^\sigma(\eta_n^{q_\sigma})$ is a Cauchy sequence, converging to an element μ_σ(don't care about η).

If $g \in G_K$, then $g(\eta_n) = [\chi_K(g)](\eta_n)$, hence take q_σ-th power, $g(\eta_n^\sigma) \equiv [\chi_K(g)]^\sigma(\eta_n^{q_\sigma}) \mod \pi_K$, then

$$[\chi_K(g)]^\sigma[\pi_K^n]^\sigma(\eta_n^{q_\sigma}) \equiv [\pi_K^n]^\sigma g(\eta_n^{q_\sigma}) = g([\pi_K^n]^\sigma \eta_n^{q_\sigma}) \mod \pi_K.$$

hence by limiting, $g(\mu_\sigma) = [\chi_K(g)]^\sigma(\mu_\sigma)$. ⌟

Lemma (18.4.1.9).

$$v_p(\mu_\sigma) = \begin{cases} \frac{q_\sigma}{e_K(q-1)} + \frac{1}{e_K} & n(\sigma) \neq 0 \\ \frac{1}{e_K(q-1)} + v_p(\sigma(\pi_K) - \pi_K) & n(\sigma) = 0 \end{cases}$$

⌟

Proof: By(9.5.3.28), we know the Newton polygon of $[\pi_K^n]^\sigma$. When $n(\sigma) \neq 0$, $v(\eta_1^{q_\sigma}) = \frac{q_\sigma}{e_K(q-1)} > \frac{1}{e_K(q-1)}$, so the valuation of $[\pi_K]^\sigma(\eta_1^{q_\sigma})$ equals the valuation of its degree 1 term, which is $v(\pi_K \eta_1^{q_\sigma}) = \frac{q_\sigma}{e_K(q-1)} + \frac{1}{e_K}$. Now we have by(18.4.1.8), we have $[\pi_K]^\sigma \eta^{q_\sigma} \equiv [\pi_K^2]^\sigma(\eta_2^{q_\sigma}) \mod \pi_K^2$, and $\frac{q_\sigma}{e_K(q-1)} + \frac{1}{e_K} < 2/e_K$, so valuation already stable at degree 1, and $v(\mu_\sigma) = v([\pi_K]^\sigma(\eta_1^{q_\sigma}))$.

If $q_\sigma = 1$, it's more delicate, because degree 1 and degree q term has the same minimal valuation, so they may jump to higher valuations. Notice $[\pi_K^n](\eta_n) = 0$, so $[\pi_K^n]^\sigma(\eta_n) = ([\pi_K^n]^\sigma - [\pi_K^n])(\eta_n)$. And we have by(14.2.2.21), for $x \in \mathcal{O}_K$, $v(\sigma(x) - x) \geq v(x) + v(\frac{\sigma(\pi_K)}{\pi_K} - 1) + \delta_{v(x),0} v(\pi_K)$, with equality when $v_p(x) = q/e_K$. So by the Newton polygon, the minimum valuation of the coefficient of $[\pi_K^n]^\sigma - [\pi_K^n]$ appear at degree p^{n-1} and possibly p^n. The valuation of η_n is too small($\frac{1}{e_K p^{n-1}(p-1)}$) that we don't need to consider other degrees but can assure that degree p^{n-1} is of minimum valuation, which is $v(\eta_n^{p^{n-1}}) + v(\sigma(\pi_L) - \pi_L) = \frac{1}{e_K(q-1)} + v_p(\sigma(\pi_K) - \pi_K)$. □

Prop. (18.4.1.10). For any $\sigma \in \mathrm{Gal}(K/\mathbb{Q}_p)\backslash\{\mathrm{id}\}$, there is an element $\alpha_\sigma \in \mathbb{C}_p^*$ that $\sigma \circ \chi_K(g) = g(\alpha_\sigma)/\alpha_\sigma$ for all $g \in \mathrm{Gal}_K$, where χ_K is the Lubin-Tate character. ⌟

Proof: We let $\alpha_\sigma = \log_{\mathcal{F}_\pi}^\sigma(\mu_\sigma)$, by(18.4.1.9), $1/e_K < \mu_\sigma < \infty$, so by the Newton polygon analysis of $\log_{F_\pi}$(9.5.3.29), α_σ has the same valuation of μ_σ, in particular, $\alpha_\sigma \neq 0$. Then

$$g(\alpha_\sigma) = \log_{\mathcal{F}_\pi}^\sigma(g(\mu_\sigma)) = (\log_{\mathcal{F}} \circ [\chi_K(g)])^\sigma(\mu_\sigma) = (\chi_K(g) \cdot \log_{\mathcal{F}_\pi})^\sigma(\mu_\sigma) = \sigma(\chi_K(g)) \cdot \alpha_\sigma.$$

□

Cor. (18.4.1.11). $\log_p(\sigma(\chi_K(g))) = g(\log(\alpha_\sigma)) - \log_p(\alpha_\sigma)$. ⌟

Prop. (18.4.1.12) [$H^1_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p(\psi))$, Sen-Tate]. There is an inf-res exact sequence

$$0 \to H^1_{\mathrm{cont}}(\Gamma_K, \widehat{K}_\infty(\psi)) \to H^1_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p(\psi)) \to H^1_{\mathrm{cont}}(H_K, \mathbb{C}_p(\psi)),$$

and

$$H^1_{\mathrm{cont}}(H_K, \mathbb{C}_p(\psi)) = 0, \quad H^1_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p(\psi)) = \begin{cases} 0 & , \#\psi(I_K) = \infty \\ \text{a } K\text{-vector space of dimension } 1 & , \#\psi(I_K) < \infty \end{cases}.$$

⌟

Proof: For the first assertion, ψ is trivial on H_K, so $\mathbb{C}_p(\psi)\cong\mathbb{C}_p$ as H_K-representation, so it suffice to show for $\psi=\mathrm{id}$. Let f be a cocycle, as H_K is compact, $f(H_K)\in p^{-k}\mathcal{O}_{\mathbb{C}_p}$ for some integer k. So the lemma below(18.4.1.13) shows that we can move f cohomologouly to higher valuation, i.e. $f(g)=\sum x_i-g(\sum x_i)$, so f is a coboundary.

For the second assertion, we assume $\Gamma_K\neq\mathbb{Z}_p^*$, for this case, see remark(18.4.1.14) below.

let γ be a topological generator of $\Gamma_K=1+p^k\mathbb{Z}_2^*$, $k\geq 0$, because $\mathbb{Z}_p^*$ are all topological cyclic groups except for $\mathbb{Z}_2^*\cong\mathbb{Z}/2\mathbb{Z}\oplus\mathbb{Z}_2$, and γ_n be a topological generator of Γ_{F_n} which is also a power of γ. By(8.7.4.4) we know $H^1(\Gamma_K,\widehat{K_\infty}(\psi))=\widehat{K_\infty}(\psi)/1-\gamma$.

For n large, we have a decomposition $\widehat{K_\infty}(\psi)=K_n(\psi)\oplus X_n(\psi)$ by(14.2.3.33), and $1-\gamma_n$ is invertible on $X_n(\psi)$. Now $1-\gamma_n=(1-\gamma)(1+\gamma+\ldots+\gamma^{k-1})$, so $1-\gamma$ is also invertible in $X_n(\psi)$. And on $K_n(\psi)$, if ψ is of infinite order, then $1-\gamma$ is injective, otherwise $x=\psi(\gamma)^N\gamma^N(x)=\psi(\gamma)^Nx$. So it is also surjective because it is a K-linear mapping of K_n. So $\widehat{K_\infty}(\psi)/1-\gamma=0$. If ψ is of finite order then $K_n(\psi)\cong K_n$ as Γ_K-module when n is large enough that γ factors through Γ_{K_n}, by(8.7.3.1). So $K_n/1-\gamma=K_n/\ker(\mathrm{tr}_{K_n/K})=K$. □

Lemma (18.4.1.13). If $f:H_K\to p^n\mathcal{O}_{\mathbb{C}_p}$ is a continuous cocycle, then there exists a $x\in p^{n-1}\mathcal{O}_{\mathbb{C}_p}$ that the cohomologous cocycle $g\mapsto f(g)-(x-g(x))$ has values in $p^{n+1}\mathcal{O}_{\mathbb{C}_p}$. ⌟

Proof: $p^{n+2}\mathcal{O}_{\mathbb{C}_p}$ is open in $p^n\mathcal{O}_{\mathbb{C}_p}$, so there is a finite extension L/K that $f(H_L)\in p^{n+2}\mathcal{O}_{\mathbb{C}_p}$. By(14.2.3.27), there is a z that $\mathrm{tr}_{L_\infty/K_\infty}(z)=p$, so there is a $y\in p^{-1}\mathcal{O}_{L_\infty}$ that $\mathrm{tr}_{L_\infty/K_\infty}(y)=1$.

Now for a set of representatives Q of H_K/H_L, denote $x_Q=\sum_{h\in Q}h(y)f(h)$, then for $g\in H_K$, $g(Q)$ is also a set of representative, and $g(x_Q)=\sum_{h\in Q}gh(y)gf(h)=\sum_{h\in Q}gh(y)(f(gh)-f(g))=x_{g(Q)}-f(g)$, as $\mathrm{tr}(y)=1$. So $f(g)-(x_Q-g(x_Q))=x_{g(Q)}-x_Q$. The RHS is in $p^{n+1}\mathcal{O}_{\mathbb{C}_p}$, because: if we let $gh_i=h_{g(i)}a_i$, where $a_i\in H_L$, then $x_{g(Q)}-x_Q=\sum h_{g(i)}(y)f(h_{g(i)}a_i)-\sum h_{g(i)}(y)f(h_{g(i)})=\sum h_{g(i)}(y)h_{g(i)}(f(a_i))$, which is in p^{n+1} because $h_{g(i)}(y)\in p^{-1}\mathcal{O}_{\mathbb{C}_p}$ and $f(a_i)\in p^{n+2}\mathcal{O}_{\mathbb{C}_p}$ by the choice of L. □

Remark (18.4.1.14). In case $\Gamma_K=\mathbb{Z}_2^*$,

$$0\to H^1_{\mathrm{cont}}(\{\pm1\},K(\psi))\to H^1_{\mathrm{cont}}(\mathbb{Z}_2^*,\widehat{K_\infty}(\psi))\to H^1_{\mathrm{cont}}(1+2\mathbb{Z}_2^*,\mathbb{C}_p(\psi))$$

$H^1(\{\pm1\},K(\psi))=0$ whether $\psi(-1)=1$ or -1. And by the same proof as above, possibly replace X_n with X_{n+1}, to remedy the singularity of $p=2$, $H^1(1+2\mathbb{Z}_2^*,\mathbb{C}_p(\psi))=K$, with generator $[g\mapsto\frac{\chi(g)-1}{\gamma-1}(a)]$ for some a. This cocycle extends to a cocycle of $\mathbb{Z}_2^*$, so the map is surjective. ⌟

Prop. (18.4.1.15). The 1-dimensional K-vector space $H^1_{\mathrm{cont}}(\mathrm{Gal}_K,\mathbb{C}_p)$ is generated by the cocycle $[g\mapsto\log_p\chi(g)]$. ⌟

Proof: By the proof of(18.4.1.12), we know that $H^1(\Gamma_K,K_n)\xrightarrow{f}H^1(G_K,\mathbb{C}_p)$ is an isomorphism. for $\alpha\in K$, if $\chi(g)=\gamma^k$, then $f(\alpha)(g)=(1+\gamma+\ldots+\gamma^{k-1})(\alpha)=k\alpha=\alpha\cdot\log_p(\chi(g))/\log_p(\gamma)$. So by continuity, f is a multiple of $[g\mapsto\log_p(\chi(g))]$. □

Lemma (18.4.1.16). And $f\in\mathrm{Hom}(I_K^{\mathrm{ab}},\mathbb{Q}_p)$ is of the form $f(g)=\mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f\log_p\chi_K(g))$ for some $\beta_f\in K$. ⌟

Proof: By(14.6.2.25), χ_K is a canonical isomorphism $I_K^{ab}\cong\mathcal{O}_K^*$. Any $f\in\mathrm{Hom}(\mathcal{O}_K^*,\mathbb{Q}_p)$ is of the form $f(y)=\mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f\log_p(y))$ for some $\beta_f\in K$, because: by(14.2.3.9), when n is large, $\log_p$ is a bijection between U_K^n and $\pi_K^n\mathcal{O}_K$.

$\pi_K^n\mathcal{O}_K\to\mathbb{Q}_p$ can be extended to a map $K\to\mathbb{Q}_p$ as $\mathbb{Q}_p$ is divisible. Now trace is a invertible bilinear form on K, so the assertion is true on U_K^n for some n, and because U_K^n is of finite index in $\mathcal{O}_K^*$ and $\mathbb{Q}_p$ is of char 0, this is true for all $\mathcal{O}_K^*$. □

Prop. (18.4.1.17). The map $H^1(\mathrm{Gal}_K, \mathbb{Q}_p) \to H^1(\mathrm{Gal}_K, \mathbb{C}_p)$ is given as follows: as $f \in H^1(\mathrm{Gal}_K, \mathbb{Q}_p)$ must factor through $\mathrm{Gal}_K^{\mathrm{ab}}$, if the restriction of f to I_K^{ab} corresponds to β_f, then f maps to $\beta_f[g \mapsto \log_p \chi(g)]$. ⌟

Proof: $f(g) = \mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g))$ on I_K, but this map extends to map on G_K. So $f(g) = \mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g)) + c(g)$ for a unramified map c on G_K.

Now by(8.7.4.3), $H^1(G, \widehat{\mathbb{Q}}_p^{ur}/\mathbb{Q}_p)$ vanish because $H^1(G, \overline{\mathbb{F}}_p)$ vanish(8.7.3.1), so there is a $z \in \widehat{\mathbb{Q}}_p^{ur}$ that $c(g) = g(z) - z$. And

$$\mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g)) = \sum_\sigma \sigma(\beta_f \log_p \chi_K(g)) = \beta_f \,\mathrm{tr}_{K/\mathbb{Q}_p}(\log_p \chi_K(g)) + \sum_\sigma (\sigma(\beta_f) - \beta_f)\sigma(\log_p \chi_K(g)).$$

Notice(18.4.1.10) gives a β_σ that $\sigma(\log_p \chi_K(g)) = g(\beta_\sigma) - \beta_\sigma$, and $\mathrm{tr}_{K/\mathbb{Q}_p}(\log_p \chi_K(g)) = \log_p \chi(g)$ because $(N_{K/\mathbb{Q}_p}\chi_K(g))^{-1} = (\chi(g))^{-1}$, as they both correspond via local CFT to the element in G_K^{ab} which acts by g on L_π and id on K^{ur}. Thus the result. □

2 Hodge-Tate Representations

References are [Sen80] and [Car19].

Hodge-Tate Representations

Def. (18.4.2.1) **[$B_{\text{H-T}}$].** Let $B_{\text{H-T}} = \mathbb{C}_K[t, t^{-1}], B'_{\text{H-T}} = \mathbb{C}_K((t))$, and let G_K acts on it by $g(at^i) = g(a)\chi_{\mathrm{cycl}}(g)^i t^i$. In addition, there is a filtration on $B'_{\text{H-T}}$ given by $\mathrm{Fil}^m B'_{\text{H-T}} = t^m \mathbb{C}_p[[t]]$, then the graded ring of $B'_{\text{H-T}}$ is isomorphic to $B_{\text{H-T}}$. (18.4.1.3) shows that $B_{\text{H-T}}^{\mathrm{Gal}_K} = (B'_{\text{H-T}})^{\mathrm{Gal}_K} = K$.

$B_{\text{H-T}}$ and $B'_{\text{H-T}}$ are Gal_K-regular(18.1.1.17). ⌟

Proof: $B'_{\text{H-T}}$ is Gal_K-regular because it is a field. For $B_{\text{H-T}}$, $B_{\text{H-T}} \subset \mathrm{Frac}(B_{\text{H-T}}) \subset B'_{\text{H-T}}$, taking Gal_K-fixed points shows (H2). For (H3), if $\mathbb{Q}_p x$ is stable under Gal_K and x is not of the form at^i, then we can get a non-trivial Gal_K-fixed point of $\mathbb{C}_K(j-i)$, which is impossible by(18.4.1.3). □

Cor. (18.4.2.2) **[Hodge-Tate Representations].** Let $W \in \mathrm{Rep}_{\mathbb{C}_K}(\mathrm{Gal}_K)$. For $k \in \mathbb{Z}$, let

$$W\{k\} = \{x \in W | g(x) = \chi_{\mathrm{cycl}}^k(g)x\} \subset W(-k)$$

then

$$\bigoplus_{k\in\mathbb{Z}} (\mathbb{C}_K(k) \otimes_K W\{k\}) \to W$$

is injective. W is called a **Hodge-Tate representation** if this is an isomorphism. ⌟

Proof: Notice $B_{\text{H-T}} \cong \bigoplus_{m\in\mathbb{Z}} \mathbb{C}_K(m) \in \mathrm{Rep}_{\mathbb{C}_K}(\mathrm{Gal}_K)$, so

$$B_{\text{H-T}} \otimes_K (B_{\text{H-T}} \otimes_{\mathbb{C}_K} W)^{\mathrm{Gal}_K} \cong B_{\text{H-T}} \otimes_K \bigoplus_{m\in\mathbb{Z}} (\mathbb{C}_K(m) \otimes_K W\{m\}) \hookrightarrow B_{\text{H-T}} \otimes_{\mathbb{C}_K} W.$$

is injective by(18.1.1.18). □

Cor. (18.4.2.3) **[Hodge-Tate Representations].** Let K be a p-adic field, then $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ is called a **Hodge-Tate representation** if it is $B_{\text{H-T}}$-admissible. The category of Hodge-Tate representations are denoted by $\mathrm{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\mathrm{Gal}_K)$.

Then $V\in\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ is Hodge-Tate iff it is $B'_{\text{H-T}}$-admissible iff $\mathbb{C}_K\otimes_{\mathbb{Q}_p}V$ is Hodge-Tate thus decomposes as

$$\mathbb{C}_K\otimes_{\mathbb{Q}_p}V\cong\mathbb{C}_K(n_1)\oplus\ldots\oplus\mathbb{C}_K(n_d)\in\mathrm{Rep}_{\mathbb{C}_K}(\mathrm{Gal}_K).$$

⌟

Proof: If $\mathbb{C}_K\otimes_{\mathbb{Q}_p}V$ is Hodge-Tate, then clearly $\dim_K(B_{\text{H-T}}\otimes_{\mathbb{Q}_p}V)^{\mathrm{Gal}_K}=\dim_{\mathbb{Q}_p}V$, thus V is $B_{\text{H-T}}$-admissible(18.1.1.19). Conversely, $\dim_K(B_{\text{H-T}}\otimes_{\mathbb{Q}_p}V)^{\mathrm{Gal}_K}=\dim_{\mathbb{Q}_p}V=d$ implies V is Hodge-Tate by(18.4.2.2). The equivalence with $B'_{\text{H-T}}$-admissibility is similar. □

Def. (18.4.2.4)[Hodge-Tate Weights]. For $V\in\mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, V is said to have Hodge-Tate weights i with multiplicity d_i if $\dim_K W\{i\}=d_i$.

In particular, $\mathbb{Q}_p(n)$ has a single Hodge-Tate weight n. ⌟

Prop. (18.4.2.5). If $K'\in\mathtt{Field}$, $K'\subset\overline{K}$, then for $W\in\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{C}_K}(\mathrm{Gal}_K)$, the natural maps

$$K'\otimes_K D_K(W)\to D_{K'}(W),\quad \widehat{K^{\mathrm{ur}}}\otimes_K D_K(W)\to D_{\widehat{K^{\mathrm{ur}}}}(W)$$

are isomorphisms. In particular,

$$\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)\cap\mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\mathrm{Gal}_{K'})=\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)\cap\mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(I_K)=\mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$$

⌟

Proof: For $K'\subset\overline{K}$, $D_K(W)=D_{K'}(W)^{\mathrm{Gal}(K'/K)}$, thus the isomorphism follows from Galois descent(18.1.1.14). For $\widehat{K^{\mathrm{ur}}}$, Cf.[Conrad, P20]**?** □

3 Sen-Tate Theory

Colmez-Sen-Tate Conditions

Sen's Theory

Remark (18.4.3.1). Sen's theory goes further than $\mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ and to study $\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{C}_K}(\mathrm{Gal}_K)$. ⌟

Prop. (18.4.3.2)[Hilbert's Theorem90 for Gal_{K_∞}]. Any $W\in\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{C}_p}(\mathrm{Gal}_K)$ is trivial as a $\mathbb{C}_p$-semi-linear representation of Gal_{K_∞}. In particular, there is an isomorphism

$$\mathbb{C}_K\otimes_{\widehat{K_\infty}}W^{\mathrm{Gal}_{K_\infty}}\cong W\in\mathrm{Rep}_{\mathbb{C}_K}(\mathrm{Gal}_{K_\infty}).$$

⌟

Proof: The proof is similar to that of(18.4.1.1).

Let $\mathcal{O}_W$ be any $\mathcal{O}_{\mathbb{C}_p}$-lattice in W. Firstly we construct a $\mathbb{C}_p$-basis $w_1,\ldots,w_d$ of W that $w_i\in\mathcal{O}_W$ and $gw_i\equiv w_i \mod p^2\mathcal{O}_W$ for all $g\in\mathrm{Gal}_{K_\infty}$ and $p\mathcal{O}_W\subset\mathcal{O}_{\mathbb{C}_p}w_1\oplus\ldots\oplus\mathcal{O}_{\mathbb{C}_p}w_d$.

By continuity there is a finite Galois extension L/K that **?** Cf.[p-adic Hodge Intro, P23]. □

Prop. (18.4.3.3). By(18.4.3.2), the next step of Sen's theory is to study $W\in\mathrm{Rep}_{\widehat{K_\infty}}(\Gamma_K)$. To this attempt, Sen considers the subspace of Γ_K-finite vectors in W, they form a vector space $W_0\subset W$ over K_∞. Then there exists an integer r and a basis $(v_1,\ldots,v_d)$ of W that the K_r-span of v_i are stable under Γ_K-actions.

Obviously, these v_i are G_K-finite, thus in particular

$$\widehat{K_\infty}\otimes_{K_\infty}W_0\cong W.$$

⌟

Proof: Cf.[p-adic Hodge Intro, P25].**?** □

Cor. (18.4.3.4) [Sen's Operator]. Combining the previous two propositions, let $W \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{C}_p}(\mathrm{Gal}_K)$, denote $\widehat{W}_\infty = W^{G_{\overline{K}/K_\infty}}$ and W_∞ the set of Γ_K-finite vectors of $\widehat{W}_\infty$, then

$$\mathbb{C}_p \otimes_{K_\infty} W_\infty \cong W.$$

Let $v_1, \ldots, v_d$ be given by(18.4.3.3), $W_r = \oplus K_r v_i$. For $g \in G_K$, let $\rho_W(g)$ be the endomorphism of W_r given by action of g, then $\rho_W(\gamma_s)$ is linear when $s \geq r$, and because γ_s converges to id, $\log \rho_W(\gamma_s)$ is defined for s large. Then **Sen's operator** Φ_W is defined to be $\Phi_W = \frac{\log \rho(\gamma_s)}{p^s}$, or equivalently $\Phi_W(v) = \lim_{t\to 0} \frac{\gamma^t(v)-v}{t}$.

Sen's operator is defined over K, as it commutes with Γ_K seen from the limit form, and its kernel is the $\mathbb{C}_p$-subspace of W generated by elements invariant under Γ_K. ⌟

Proof: It is evident that fixed points of Γ_K are killed by Φ_W. Conversely, the kernel of Φ_W on W_∞ is stable under action of G_K, thus is a sub-representation of Γ_K in W_∞, and because W_∞ consists of finite vectors, the G_K-action is continuous w.r.t the discrete topology, and Hilbert's theorem90(8.7.3.16) shows this subspace is generated by elements invariant under G_K. □

Prop. (18.4.3.5) [Sen's Category]. Let $\mathrm{Sen}(K, K_\infty)$ be the category of f.d. K_∞-vector spaces equipped with an endomorphism defined over K, then the construction sending W to (W_∞, Φ_W) induces a functor

$$\mathrm{Sen} : \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{C}_p}(\mathrm{Gal}_K) \to \mathrm{Sen}(K, K_\infty).$$

This functor commutes with direct sums, and also under tensor products, with the Sen's operator given by

$$\Phi_{W\otimes W'} = \Phi_W \otimes \mathrm{id}_{W'} + \mathrm{id}_W \otimes \Phi_{W'}.$$

This functor is faithful, but in general not full. However, it reflects isomorphisms. ⌟

Proof: This functor is faithful because W_∞ generates W as a $\mathbb{C}_p$-vector space. To show it reflects isomorphism, Let $f : W_\infty \to W'_\infty$ be an isomorphism commuting with Sen's operator, then it extends by linearity to an isomorphism of $\mathbb{C}_p$-vector spaces $W \to W'$, and f is Γ_s-equivariant for some s by the definition of Sen's operator. Then considering the space of Γ_s-equivariant $\mathbb{C}_p$-linear morphisms from W to W', Hilbert's theorem90 shows there is a basis f_i consisting of G_K-equivariant morphisms. Then it remains to show there exists a linear K-combination of f_i that is invertible. This is possible because it is true for K_s, as f is invertible, and K is an infinite field. □

Cor. (18.4.3.6). $W \in \mathrm{Rep}^{f}_{\mathbb{C}_p}(\mathrm{Gal}_K)$ is trivial iff $\Phi_W = 0$. ⌟

Proof: As $\mathcal{S}$ reflects isomorphisms, compare with the trivial representation $\mathbb{C}_p^d$. □

Prop. (18.4.3.7) [Hodge-Tate Representations and Sen's Operators]. A representation $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(G_K)$ is Hodge-Tate iff the Sen's operator $\Phi_{\mathbb{C}_p\otimes_{\mathbb{Q}_p}V}$ is semisimple with eigenvalues in $\mathbb{Z}$. For a general V, the eigenvalues of $\Phi_{\mathbb{C}_p\otimes_{\mathbb{Q}_p}V}$ is called the **generalized Hodge-Tate weights** of V. ⌟

Proof: If V is a Hodge-Tate representation, then clearly $\Phi_W(v) = \lim_{t\to 0} \frac{\gamma^t(v)-v}{t}$ acts by k on $\mathbb{C}_p(k)$, thus it is semisimple with eigenvalues in $\mathbb{Z}$. Conversely, on the i-eigenspace of Φ, tensoring χ_{cycl}^{-i}, Φ acts trivially, then because the kernel of Φ are the fixed points of Γ_K(18.4.3.4), thus this eigenspace is isomorphic to $\mathbb{C}_p(i)^d$, so V is Hodge-Tate. □

4 Fontaine's Rings

Notation (18.4.4.1). In this subsection, we denote $B_{\mathrm{dR}}, B_{\mathrm{crys}}$ etc. to denote Fontaine's ring w.r.t. the perfectoid field $\mathbb{C}_K$ defined in Fontaine's Period Rings. ⌟

Lemma (18.4.4.2). Let $\varepsilon = (\ldots, \varepsilon_1, \varepsilon_0) \in \mathcal{O}^\flat_{\mathbb{C}_K}$ s.t. $\varepsilon_0 = 1$ and $\varepsilon_1 \neq 1$, then $|\varepsilon - 1| = \frac{p}{p-1}$. ⌟

Proof:

$$|\varepsilon - 1| = |(\varepsilon-1)^\sharp|_{\mathbb{C}_K} = |\lim_{n\to\infty}(\varepsilon_n - 1)^{p^n}|_{\mathbb{C}_K} = \lim_{n\to\infty} p^n|\varepsilon_n - 1| = \lim_{n\to\infty}\frac{p^n}{p^{n-1}(p-1)} = \frac{p}{p-1}$$

□

Prop. (18.4.4.3) [$\mathbb{Q}_p$-Line in B_{dR}]. $\theta([\varepsilon]-1) = \varepsilon_0 - 1 = 0$, so $[\varepsilon]-1 \in \ker\theta$, and we can define

$$t_\varepsilon = \log([\varepsilon]) = \sum_{n\geq 1}(-1)^{n-1}\frac{([\varepsilon]-1)^n}{n} \in B^+_{\mathrm{dR}}.$$

Then this is a uniformizer in the CDVR B^+_{dR}. Moreover, any other choice of ε is of the form $\varepsilon' = \varepsilon^a$ for $a \in \mathbb{Z}_p$, then $t_{\varepsilon'} = at_\varepsilon$, and $\gamma(t_\varepsilon) = \chi_{\mathrm{cycl}}(\gamma)t$ for any $\gamma \in \mathrm{Gal}_K$. ⌟

Proof: t_ε is a uniformizer because $[\varepsilon]-1$ is: $[\varepsilon^{1/p}]-1$ is a unit in B_{dR}, and

$$\eta = \frac{[\varepsilon]-1}{[\varepsilon^{1/p}]-1} = 1 + [\varepsilon^{1/p}] + \ldots + [\varepsilon^{(p-1)/p}]$$

is distinguished, because if $\eta = \sum [c_n]p^n$, consider reducing to the residue field: $W(\mathcal{O}_{\mathbb{C}^\flat_K}) \to W(\mathcal{O}_{\mathbb{C}^\flat_K}/t)$, then $\overline{\varepsilon} = 1$ by(18.4.4.2), and $\overline{\eta} = p$, thus $|c_0| < 1, |c_1 - 1| < 1$, so it is distinguished(5.5.4.20), thus a uniformizer by(17.11.1.2).

For the last assertion, by the formal property of log, it suffices to show that if $a_i \to a \in \mathbb{Z}_p$, then $[\varepsilon^{a_i}] \to [\varepsilon^a] \in B_{\mathrm{dR}}$. Then it suffices to show that for $a \in \mathbb{Z}_p, |a|$ small,

$$|[\varepsilon^a] - 1| \to 0.$$

And this can be done with the topology given in(17.11.1.20)**?** □

Cor. (18.4.4.4). $\mathrm{gr}(B_{\mathrm{dR}}) \cong B_{\text{H-T}}$. ⌟

Cor. (18.4.4.5). B_{dR} is Gal_K-regular, but B^+_{dR} is not Gal_K-regular. ⌟

Proof: B_{dR} is Gal_K-regular because it is a field. B^+_{dR} is not Gal_K-regular because $\mathbb{Q}_p t_\varepsilon$ is stable under Gal_K-action but t_ε is not invertible in B^+_{dR}. □

Prop. (18.4.4.6) [Galois Actions]. Gal_K acts on $\mathcal{O}_{\mathbb{C}_K}/(p)$ thus acts on $\mathcal{O}_{\mathbb{C}^\flat_K}$ and on A_{inf}. Then Fontaine's functor $\theta : A_{\mathrm{inf}} \to \mathcal{O}_{\mathbb{C}_K}$ is Gal_K-equivariant, thus $\ker\theta$ is Gal_K-stable, so Gal_K-acts on B^+_{dR} and B_{dR}, and $B_{\mathrm{dR}} \to \mathbb{C}_K$ is Gal_K-equivariant. ⌟

Prop. (18.4.4.7). There is a canonical lifting of $\overline{K} \to \mathbb{C}_K$ along $B^+_{\mathrm{dR}} \to \mathbb{C}_K$, and it is Gal_K-equivariant.

However, this embedding is not continuous, thus there is no embedding $\mathbb{C}_K \subset B^+_{\mathrm{dR}}$. ⌟

Proof: $K_0 = W(k)[\frac{1}{p}] \subset W(\mathcal{O}^\flat_{\mathbb{C}_K})[\frac{1}{p}] = B_{\mathrm{inf}} \subset B_{\mathrm{dR}}$, and it follows from Hensel's lemma that any element in $\overline{K}$ lifts uniquely to an element of B^+_{dR}, so $\overline{K} \subset B^+_{\mathrm{dR}}$, and is Gal_K-invariant, by uniqueness and the fact $B_{\mathrm{dR}} \to \mathbb{C}_K$ is Gal_K-equivariant(18.4.4.6).

For the last assertion, if the embedding is continuous, the $B^+_{\mathrm{dR}} \to \mathbb{C}_K$ has a section, and the filtration splits so $B_{\mathrm{dR}} \cong B_{\text{H-T}}$. □

Prop. (18.4.4.8).

- $K = (B^+_{\mathrm{dR}})^{\mathrm{Gal}_K} = B^{\mathrm{Gal}_K}_{\mathrm{dR}}$
- $K_0 = B^{\mathrm{Gal}_K}_{\mathrm{crys}}$, and the canonical morphism $K \otimes_{K_0} B_{\mathrm{crys}} \to B_{\mathrm{dR}}$ is injective.
- $\mathbb{Q}_p = B^{\mathrm{Gal}_K}_e$.
- $\mathbb{Q}_p = (\mathrm{Fil}^0 B_\mu)^{\mathrm{Gal}_K}$ for $\mu = \mathrm{crys}$ or $\mu \geq 1$.

⌟

Proof: 1: Firstly $K \subset B_{\mathrm{dR}}$ and is invariant under Gal_K by(18.4.4.7). On the other hand, the exact sequence

$$0 \to \mathrm{Fil}^{m+1} B_{\mathrm{dR}} \to \mathrm{Fil}^m B_{\mathrm{dR}} \to \mathbb{C}_p(m) \to 0(18.4.4.13).$$

induces an injection

$$B^{\mathrm{Gal}_K}_{\mathrm{dR}} \cap \mathrm{Fil}^m B_{\mathrm{dR}} / B^{\mathrm{Gal}_K}_{\mathrm{dR}} \cap \mathrm{Fil}^{m+1} B_{\mathrm{dR}} \hookrightarrow \mathbb{C}_p(m)^{\mathrm{Gal}_K}.$$

Thus $B^{\mathrm{Gal}_K}_{\mathrm{dR}} = B^{\mathrm{Gal}_K}_{\mathrm{dR}} = K$.

2: The injectivity of $K \otimes_{K_0} B_{\mathrm{crys}} \to B_{\mathrm{dR}}$ Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.2.8].

3: From 2 and notice $B_e = B^{\varphi=\mathrm{id}}_{\mathrm{crys}}$.

4: Cf.[Period Rings, P45].**?** □

Lemma (18.4.4.9). Let $W \in \mathcal{V}\mathrm{ect}^{\mathrm{fd}}_K$, then the map:

$$\{\text{Filtrations on } W\} \to \{\mathrm{Gal}_K\text{-stable } B^+_{\mathrm{dR}}\text{-lattice in } W \otimes_K B_{\mathrm{dR}}\} : \mathrm{Fil} \mapsto \mathrm{Fil}^0(W \otimes_K B_{\mathrm{dR}})$$

is bijective and the inverse is given by $\Gamma \mapsto \{(t^n\Gamma)^{\mathrm{Gal}_K} \subset (B_{\mathrm{dR}} \otimes_{B^+_{\mathrm{dR}}} \Gamma)^{\mathrm{Gal}_K} = W\}_{n\in\mathbb{Z}}$. ⌟

Proof: Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.4.3].**?** □

deRham and Crystalline Representations

Def. (18.4.4.10) [deRham, Crystalline and Semistable Representations]. Situation as in(18.4.4.8), for $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$,

- V is called a **deRham representation** iff V is B_{dR}-admissible**??**, or equivalently

  $$\dim_K (B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V)^{\mathrm{Gal}_K} = \dim_{\mathbb{Q}_p} V.$$

  The category of deRham representations of Gal_K are denoted by $\mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$.

- V is called a **crystalline representations** iff V is B_{crys}-admissible, or equivalently

  $$\dim_{K_0} (B_{\mathrm{crys}} \otimes_{\mathbb{Q}_p} V)^{\mathrm{Gal}_K} = \dim_{\mathbb{Q}_p} V.$$

  The category of crystalline representations of Gal_K are denoted by $\mathrm{Rep}^{\mathrm{crys}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$.

⌟

Def. (18.4.4.11)[$\mathrm{Rep}'_{B_e}(\mathrm{Gal}_K)$]. Denote by $\mathrm{Rep}'_{B_e}(\mathrm{Gal}_K)$ the category of finite locally free B_e-modules M with a semi-linear Gal_K-action that there exists a Gal_K-invariant B^+_{dR}-lattice $\Gamma \in M \otimes_{B_e} B_{\mathrm{dR}}$ that G_K acts continuously. ⌟

Summary

Prop. (18.4.4.12) [Diagram of Inclusions].

$$\begin{array}{ccccccccccc} B^+_{\mathrm{inf}} & \longrightarrow & B^+_{\mu} & \hookrightarrow & B^+_{\mathrm{crys}} & \hookrightarrow & B^+_{\mu} & \hookrightarrow & B^+_{\max} & \hookrightarrow & B^+_{\mathrm{dR}} \\ & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ & & \underset{(\mu>p-1)}{B_{\mu}} & \hookrightarrow & B_{\mathrm{crys}} & \hookrightarrow & \underset{(1\leq\mu\leq p-1)}{B_{\mu}} & \hookrightarrow & \underset{=B_1^+}{B_{\max}} & \hookrightarrow & B_{\mathrm{dR}} \end{array}$$

⌟

Prop. (18.4.4.13) [Properties of B_{dR}].

- B_{dR} is a discretely valued field with residue field $\mathbb{C}_K$ and valuation ring B^+_{dR}.
- B_{dR} is an algebra over $\overline{\widehat{K^{\mathrm{ur}}}} = \overline{K}\widehat{K^{\mathrm{ur}}}$ but not over $\mathbb{C}_K$.
- B_{dR} has a special uniformizer t_ε s.t. $\mathbb{Q}_p t_\varepsilon \cong \mathbb{Q}_p(1) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$.
- B_{dR} has a filtration $\{\mathrm{Fil}^m B_{\mathrm{dR}} = t_\varepsilon^m B^+_{\mathrm{dR}}\}$, and $B^{\mathrm{gr}}_{\mathrm{dR}} \cong B_{\text{H-T}}$ as graded rings.
- $B_{\mathrm{dR}}^{\mathrm{Gal}_K} = K$.

⌟

Proof: 1 follows from(17.11.1.18), 2 follows from(18.4.4.7). 3 follows from(18.4.4.3). 4 follows from(18.4.4.4). 5 follows from(18.4.4.8). □

Prop. (18.4.4.14) [Properties of B_{crys}].

- B_{crys} is an algebra over $\widehat{K^{\mathrm{ur}}}$.
- B_{crys} has a Frobenius endomorphism φ.
- There is a canonical embedding $B_{\mathrm{crys}} \otimes_{K_0} K \hookrightarrow B_{\mathrm{dR}}$, and $t_\varepsilon \in B_{\mathrm{crys}}$.
- $B_{\mathrm{crys}}^{\mathrm{Gal}_K} = K_0$.
- $(B_{\mathrm{crys}} \cap B^+_{\mathrm{dR}})^{\varphi=1} = \mathbb{Q}_p$.

⌟

Proof: ? □

5 deRham Representations

Lemma (18.4.5.1). Let V be a finite $\mathbb{Q}_p$-vector space with an action of Gal_K, then the action is continuous iff the induced action on $V \otimes_{\mathbb{Q}_p} B^+_{\mathrm{dR}}$ is continuous. ⌟

Proof: This is because the action of Gal_K on B^+_{dR} is continuous, and V has the induced topology in $V \otimes_{\mathbb{Q}_p} B^+_{\mathrm{dR}}$. □

Prop. (18.4.5.2) [$\mathbb{C}_K$-admissible Representations are deRham]. $\mathrm{Rep}^{\mathbb{C}_K\text{-adm}}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \subset \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$. ⌟

Proof: For $V \in \mathrm{Rep}^{\mathbb{C}_K}_{\mathbb{Q}_p}$, by(18.4.1.2), there exists a finite extension L/K s.t. V is $L\widehat{K^{\mathrm{ur}}}$-admissible. Thus V is deRham as $L\widehat{K^{\mathrm{ur}}} \subset B_{\mathrm{dR}}$(18.4.4.13). □

Prop. (18.4.5.3) [Potentially deRham are deRham]. Let $K' \subset \mathbb{C}_K$ be another p-adic field, then

$$\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \cap \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_{K'}) = \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K).$$

In particular, being deRham is not sensible to ramifications, which is a bad feature compared to being crystalline or semistable. ⌟

Proof: Because $\widehat{K^{\mathrm{ur}}} \subset \widehat{(K')^{\mathrm{ur}}}$ is of finite degree, it suffices to prove for two cases: K'/K is finite or $K' = \widehat{K^{\mathrm{ur}}}$. But the finite case follows from Galois descent the same as??. The second case follows from [Conrad, P80]? □

Prop. (18.4.5.4) [Filtered D_{dR}]. For $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, there is a finite filtration Fil on $D_{\mathrm{dR}}(V)$ s.t.

$$\mathrm{Fil}^m D_{\mathrm{dR}}(V) = (t^m B_{\mathrm{dR}} \otimes_E V)^{\mathrm{Gal}_K} \subset D_{\mathrm{dR}}(V).$$

⌟

Prop. (18.4.5.5) [deRham Representations are Hodge-Tate]. For $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$,

- there is an injection of graded vector spaces

$$\mathrm{gr}(D_{\mathrm{dR}}(V)) \hookrightarrow D_{\text{H-T}}(V),$$

- If $V \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, the map in item1 is an isomorphism, and V is Hodge-Tate.
- If $V \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$,

$$B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V) \cong B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V$$

  identifies filtrations.

⌟

Proof: 1: Consider the exact sequences

$$0 \to \mathrm{Fil}^{m+1} B_{\mathrm{dR}} \to \mathrm{Fil}^m B_{\mathrm{dR}} \to \mathbb{C}_p(m) \to 0 (18.4.4.13).$$

Tensoring V and taking Gal_K-invariants give injections

$$h : \mathrm{gr}^m(D_{\mathrm{dR}}(V)) \hookrightarrow V(m)^{\mathrm{Gal}_K},$$

giving the injection $\mathrm{gr}(D_{\mathrm{dR}}(V)) \hookrightarrow D_{\text{H-T}}(V)$.

2: If $V \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, this is an isomorphism by dimension reason, and V is Hodge-Tate by dimension reason.

3: Firstly notice $\mathrm{Fil}^m(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \subset \mathrm{Fil}^m(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V)$ is trivial, thus it suffices to show that the induced map

$$f : \mathrm{gr}(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \to \mathrm{gr}(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V) = B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V$$

is an isomorphism. But notice

$$B_{\text{H-T}} \otimes \mathrm{gr}(D_{\mathrm{dR}}(V)) \xrightarrow{g} \mathrm{gr}(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \xrightarrow{f} B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V$$

equals $B_{\text{H-T}} \otimes h$, so g is an isomorphism because it is surjective, and thus f is also an isomorphism. □

Cor. (18.4.5.6). 1-dimensional Hodge-Tate representations are deRham. ⌟

Proof: This is because if $V \cong \mathbb{Q}_p(\psi)$ where ψ is a character of Gal_K, and $\mathbb{C}_p \otimes_E V \cong \mathbb{C}_p(m)$, then by Sen-Tate(18.4.1.3), $\psi(-m)$ is potentially unramified, thus $\mathbb{C}_p$-admissible by(18.4.1.2), and thus deRham(18.4.5.2). □

Remark (18.4.5.7) [D_{dR} Insensitive to Ramifications]. D_{dR} is far from fully faithful. In fact, any unramified representation V is deRham by(18.4.5.3), and $D_{\mathrm{dR}}(V)$ is a simple filtration with graded ring $K^d[0]$, but V can be different from trivial representation. ⌟

Prop. (18.4.5.8). The functor $D_{\mathrm{dR}} : \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \to \mathrm{Fil}\,\mathcal{V}\mathrm{ect}_K$ is faithful and exact, and commutes with taking tensor products and duals. Moreover, the perfect pairing in(18.1.1.20) is a perfect pairing of filtered vector spaces. ⌟

Proof: Let $0 \to V_1 \to V \to V_2 \to V \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ be an exact sequence, then V_i are also Hodge-Tate by(18.4.5.5), so there is an exact sequence

$$0 \to \mathrm{gr}(D_{\mathrm{dR}}(V_1)) \to \mathrm{gr}(D_{\mathrm{dR}}(V)) \to \mathrm{gr}(D_{\mathrm{dR}}(V_2)) \to 0,$$

showing that

$$0 \to D_{\mathrm{dR}}(V_1) \to D_{\mathrm{dR}}(V) \to D_{\mathrm{dR}}(V_2) \to 0$$

is an exact sequence of filtered vector spaces.

For tensor product, it suffices to show that

$$\mathrm{gr}(D_{\mathrm{dR}}(V_1) \otimes D_{\mathrm{dR}}(V_2)) \to \mathrm{gr}(D_{\mathrm{dR}}(V_1 \otimes V_2))$$

is an isomorphism, which reduces to

$$D_{\text{H-T}}(V_1) \otimes D_{\text{H-T}}(V_2) \cong D_{\text{H-T}}(V_1 \otimes V_2)(18.1.1.20).$$

For perfect pairing, it suffices to show that the map

$$D_{\mathrm{dR}}(V^\vee) \to D_{\mathrm{dR}}(V)^\vee$$

is an isomorphism of filtered vector spaces. But then it reduces to the isomorphism

$$D_{\text{H-T}}(V^\vee) \cong D_{\text{H-T}}(V)^\vee(18.1.1.20).$$

□

Prop. (18.4.5.9) [Extensions of deRham Representations]. If $0 \to V_1 \to V \to V_2 \to 0$ is an exact sequence in $\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ s.t. V_1, V_2 are deRham, and the Hodge-Tate weights of V_1 are strictly larger than that of V_2, then V is deRham.

In particular, any upper-triangular representation with diagonal $(\mathbb{Q}_p(a_1), \mathbb{Q}_p(a_2), \ldots, \mathbb{Q}_p(a_n))$ with $a_1 > a_2 \ldots > a_n$ is deRham. ⌟

Proof: By twisting, we may assume that all Hodge-Tate weights of V_1 are positive and Hodge-Tate weights of V_2 are non-positive. There is an exact sequence

$$0 \to D_{\mathrm{dR}}(V_1) \to D_{\mathrm{dR}}(V) \to D_{\mathrm{dR}}(V_2) = \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2)$$

so it suffices to show that $\mathrm{Fil}^0 D_{\mathrm{dR}}(V) \to \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2)$ is surjective. But it follows from(8.7.3.15) that there is an exact sequence

$$\mathrm{Fil}^0 D_{\mathrm{dR}}(V) \to \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2) \to H^1_{\mathrm{cont}}(\mathrm{Gal}_K, B_{\mathrm{dR}}^+ \otimes_{\mathbb{Q}_p} V_1).$$

So it suffices to show that $H^1(\mathrm{Gal}_K, B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) = 0$. The exact sequence

$$0 \to t_\varepsilon^{m+1} B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1 \to t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1 \to \mathbb{C}_p(m) \otimes_{\mathbb{Q}_p} V_1 \to 0$$

induces a surjection $H^1_{\mathrm{cont}}(\mathrm{Gal}_K, t_\varepsilon^{m+1} B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) \twoheadrightarrow H^1_{\mathrm{cont}}(\mathrm{Gal}_K, t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1)$ by hypothesis. Notice B_{dR}^+ is t_ε-complete, so we can use approximation technique similar to(8.7.4.3) to show that $H^1_{\mathrm{cont}}(\mathrm{Gal}_K, t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) = 0$. □

Remark (18.4.5.10). For an example of $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\mathrm{Gal}_K)$ that is not deRham, Cf.[Conrad, P78]. ⌟

B_{dR}-Representations

Fontaine in [Arithmétique des représentations galoisiennes p-adiques, 2004] studied $\mathrm{Rep}_{B_{\mathrm{dR}}}(\mathrm{Gal}_K)$ in similar spirit of Sen's theory. He firstly showed that any B_{dR}-representations descends to a $K_\infty((t))$-representation W, and similar to Sen's operator, Fontaine defined a K_∞-linear derivative $\nabla_W : W \to W$.

6 Crystalline Representations

References are [Crystalline Representations and F-crystals, Kisin].

Thm. (18.4.6.1). The Tannakian category of crystalline representations of Gal_K is equivalent to the Tannakian categories of weakly admmisible filtered isocrystals. ⌟

Proof: □

Prop. (18.4.6.2). Let L/K be a finite field extension, then

$$\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \cap \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{crys}}(\mathrm{Gal}_L) = \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{crys}}(\mathrm{Gal}_K).$$

⌟

Proof: Cf.[Period Rings, P52].? □

Prop. (18.4.6.3) [Unramified Representations are crystalline].

$$\mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd,ur}}(\mathrm{Gal}_K) \subset \mathrm{Rep}_{\mathbb{Q}_p}^{\mathbb{C}_p\text{-adm}+\mathrm{crys}}(\mathrm{Gal}_K).$$

⌟

Proof: By(18.4.1.1), any unramified $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ is $\widehat{K^{\mathrm{ur}}}$-admissible, thus B_{crys}-admissible as $\widehat{K^{\mathrm{ur}}} \subset B_{\mathrm{crys}}$(18.4.4.14). And V is also $\mathbb{C}_p$-admissible by(18.4.1.1).

To show the converse inclusion, use(18.4.1.2)(18.1.1.16) and the fact $L\widehat{K^{\mathrm{ur}}} \cap B_{\mathrm{crys}} = \widehat{K_0^{\mathrm{ur}}}$?. □

Remark (18.4.6.4). For examples of $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$ that is not crystalline, Cf.[Period Rings, P52].? ⌟

Prop. (18.4.6.5) [Crystalline Representation]. The functor

$$\mathcal{D} : \mathrm{Rep}_{B_e}(G_K)' \to \varphi\text{-}\mathcal{M}\mathrm{od}_{K_0} : W \mapsto (W \otimes_{B_e} B_{\mathrm{crys}})^{\mathrm{Gal}_K}$$

are left adjoint to the functor

$$\mathcal{V} : \varphi\text{-}\mathcal{M}\mathrm{od}_{K_0} \to \mathrm{Rep}_{B_e} G'_K : (D, \varphi_D) \mapsto (D \otimes_{K_0} B_{\mathrm{crys}})^{\varphi_D \otimes \varphi = \mathrm{id}}$$

Moreover, $\mathcal{V}$ is fully faithful, $\mathrm{id} \cong \mathcal{D} \circ \mathcal{V}$, $\mathcal{V} \circ \mathcal{D} \hookrightarrow \mathrm{id}$, and $M \in \mathrm{Rep}_{B_e}(\mathrm{Gal}_K)$ is in the image of $\mathcal{V}$ iff $\mathcal{V}(\mathcal{D}(M)) \cong M$. $\lrcorner$

Proof: Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.2.12]. □

Cor. (18.4.6.6). In particular, a B_e-representation is crystalline iff it is in the image of $\mathcal{V}$. Now we define a Vector bundle $\mathcal{E}$ on X to be crystalline iff the $H^0(X \backslash \{\infty\}, \mathcal{E})$ is crystalline. $\lrcorner$

7 Semistable Representations

Thm. (18.4.7.1) [deRham $\iff$ potentially Semistable(Fontaine's Potentially Semistable Theorem), Colmez/André-Kedlaya-Mebkhout]. $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ is deRham iff it is potentially semistable. $\lrcorner$

Proof: □

Cor. (18.4.7.2). For $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, we have the following implications:

$$\begin{array}{ccccc}
\text{unramified} = \mathbb{C}_p\text{-adm} + \text{crystalline} & \Longrightarrow & \text{crystalline} & \Longrightarrow & \text{semistable} \\
\Downarrow & & \Downarrow & & \Downarrow \\
\mathbb{C}_p\text{-adm} = \text{pot.unramified} = \text{Hodge-Tate with weights } 0 & \Longrightarrow & \text{pot.crys} & \Longrightarrow & \text{de Rham} = \text{pot.semistable} \\
 & & & & \Downarrow \\
 & & & & \text{Hodge-Tate}
\end{array}$$

$\lrcorner$

Prop. (18.4.7.3) [deRham Representation gives Weil-Deligne Representations]. For $K \in p\text{-}\mathtt{LField}$, there is a functor

$$\mathrm{WD} : \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_\ell}(\mathrm{Gal}_K) \to \mathfrak{wd}(W_K).$$

$\lrcorner$

Proof: ? Cf.[Fontaine-Mazur, Geometric Galois Representations] □

8 (φ, Γ)-Modules

Main References are [Fontaine90: Représentations p-adiques des corps locaux],[Fontaine94a: Le corps des périodes p-adiques] and [Fonatine94b: Repésentations p-adiques semi-stables]. I'm mostly following [Berger, Galois representations and (φ, Γ)-modules].

Def. (18.4.8.1) [φ-module]. Let M be a A-module and $\sigma : A \to A$ is a ring map. Then an additive map $\varphi : M \to M$ is called **σ-semi-linear** iff $\varphi(am) = \sigma(a)\varphi(m)$ for $a \in A$. A **φ-module** over (A, σ) is an A-module M with a σ-semi-linear φ. The category of φ-modules over A is denoted by $\varphi\text{-}\mathcal{M}\mathrm{od}_A$.

Giving a A-module M and a $\varphi : M \to M$, there is a map $\Phi : A \otimes_{\sigma,A} M = \sigma_* M \to M : \lambda \otimes m \to \lambda\varphi(m)$, which is a A-module map iff φ is σ-semi-linear.

If we define a ring $A_\sigma[\varphi]$ as the free group $A[X]$ modulo the relation $Xa = \sigma(a)X$ and ring relations in A, then it is a ring. Then a φ-module over (A, σ) is equivalent to a left $A_\sigma[\varphi]$-module.

Thus $\varphi\text{-}\mathcal{M}\mathrm{od}_A$ is a Grothendieck Abelian category with tensor products, and moreover, the kernel as $A_\sigma[\varphi]$-module is the same as the kernel as a A-module. ⌟

Def. (18.4.8.2). If there is a map $\alpha : (A_1, \sigma_1) \to (A_2, \sigma_2)$ that commutes with σ_i, then we have a **pullback** from $\Phi\mathcal{M}_1$ to $\Phi\mathcal{M}_2$: $\alpha^*(M) = (A_2)_{\sigma_2}[\varphi] \otimes_{(A_1)_{\sigma_1}[\varphi]} M$(18.4.8.1). ⌟

Def. (18.4.8.3) [Étale φ-Modules]. If A is Noetherian, then a φ-module M is called **étale** iff it is f.g and the corresponding $\Phi : \sigma_* M \to M$ in(18.4.8.1) is a bijection. The subcategory of étale φ-modules is denoted by $\varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(A)$.

In case when σ is a bijection, Φ is a bijection iff φ is a bijection. ⌟

Proof: If σ is a bijection, then $M \to \sigma_* M$ is a bijection by $\lambda \otimes m \to \sigma^{-1}(\lambda)m$. □

Prop. (18.4.8.4). If A is Noetherian and A_σ is flat, then $\varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(A)$ is a Tannakian category. ⌟

Proof: 0 is the zero object, the canonical sum&product are clearly étale . And we need to check the kernel and cokernel are étale . But we have an exact sequence $0 \to \ker \to M \to N \to \mathrm{Coker} \to 0$ so we tensor with A_σ to get a morphism of sequences that $\sigma_* M \to M, \sigma_* N \to N$ are both bijective, so by 5-lemma, it is bijection at kernel and cokernel, so they are étale . □

Def. (18.4.8.5) [Dual Étale φ-Modules]. For $E \in \texttt{Field}, M \in \varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(E)$, the isomorphism $\Phi : M_\varphi \cong M$ induces an isomorphism

$$\Phi^t : M^\vee \cong (M_\varphi)^\vee = M_\varphi^\vee.$$

Thus the dual $\Phi^{-t} : M_\varphi^\vee \cong M^\vee$ shows $M^\vee$ is also an étale φ-module. ⌟

Prop. (18.4.8.6) [$\mathbb{F}_p$-Representations and Étale φ-Modules]. Let $E \in \texttt{Field}^p$, then

- For any $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{F}_p}(\mathrm{Gal}_E)$, V is E^{sep}-admissible, and

$$D_{E^{\mathrm{sep}}}(V) = (E^{\mathrm{sep}} \otimes V)^{\mathrm{Gal}_E}$$

  has a φ-action, and it is an étale φ-module.

- For any $M \in \varphi\text{-}\mathcal{M}\mathrm{od}(E)$,

$$\mathbb{V}(M) = (E^{\mathrm{sep}} \otimes_E M)^{\varphi = \mathrm{id}}$$

  is a $\mathbb{F}_p$-representation of Gal_E, and there is an injection

$$\alpha_M : E^{\mathrm{sep}} \otimes_{\mathbb{F}_p} \mathbb{V}(M) \hookrightarrow E^{\mathrm{sep}} \otimes_E M.$$

- These two functors define an equivalence of Tannakian categories(4.2.1.13)

$$D_{E^{\mathrm{sep}}} : \mathrm{Rep}_{\mathbb{F}_p}(\mathrm{Gal}_E) \cong \varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(E) : \mathbb{V}.$$

⌟

Proof: 1: V is E^{sep}-admissible by(18.1.1.14). To show it is étale , it suffices to show that $\varphi : D_{E^{\text{sep}}}(V) \to D_{E^{\text{sep}}}(V)$ is bijective. Let $e_1, \dots, e_n$ be a basis of $D_{E^{\text{sep}}}(V)$, and $v_1, \dots, v_n$ be a basis of V, then $\underline{e} = \underline{v}B$ for some matrix $B \in \text{GL}(n; E^{\text{sep}})$. Then if $[\varphi]\underline{e} = A\overline{e}$ for $A \in \text{Mat}(n; E)$, then $A = B^{-1}\varphi(B)$, and $\det(A) = \det(B)^{p-1} \neq 0$, so φ is bijective.

2: It suffices to show that if $v_1, \dots, v_h \in \mathbb{V}(M)$ are linearly dependent over E^{sep}, then they are dependent over $\mathbb{F}_p$. For this, we use induction on h: Suppose $\sum \lambda_i v_i = 0$, we may assume that $v_h = -1$, so $v_h = \sum_{i=1}^{h-1} \lambda_i v_i$, and by an action of φ, then $\sum_{i=1}^{h-1} (\lambda_i^p - \lambda_i) v_i = 0$, so by induction hypothesis, $\lambda_i \in \mathbb{F}_p$.

3: For $V \in \text{Rep}_{\mathbb{F}_p}(\text{Gal}_E)$, because E is E^{sep}-admissible,

$$\mathbb{V}(D_{E^{\text{sep}}}(V)) = (E^{\text{sep}} \otimes_E D_{E^{\text{sep}}}(V))^{\text{Gal}_E} \cong (E^{\text{sep}} \otimes_{\mathbb{F}_p} V)^{\text{Gal}_E} = V.$$

Conversely, there is a

To show these are isomorphisms of Tannakian categories, one can easily show that both $D_{E^{\text{sep}}}$ and $\mathbb{V}$ preserve tensor products and they identify identity elements $\mathbb{F}_p$ and E. □

Cor. (18.4.8.7). Isomorphism classes of d-dimensional p-adic representations of Gal_E are in bijection with the isomorphism classes of matrixes in $\text{GL}(d; E)$ where

$$A \sim B \iff \exists P \in \text{GL}(d; E), B = P^{-1} A \varphi(P).$$

⌟

Galois Representations and Étale φ-Modules

Notation (18.4.8.8). Let $E \in \texttt{Field}^p$, denoted $\mathcal{O}_{\mathcal{E}} = \text{Coh}(E)$(5.5.3.27), and $\mathcal{E} = \text{Frac}(\mathcal{O}_{\mathcal{E}}) = \mathcal{O}_{\mathcal{E}}[\frac{1}{p}]$. $\mathcal{E}$ has a natural Frobenius. ⌟

Prop. (18.4.8.9). By the functoriality of Cohen rings**?**, if $\mathcal{O}_{\mathcal{E}^{\text{ur}}} = \text{Coh}(\overline{E})\mathcal{E}^{\text{ur}} = \mathcal{O}_{\mathcal{E}^{\text{ur}}}[\frac{1}{p}]$, then there is a bijection $\text{Gal}(\mathcal{E}^{\text{ur}}/\mathcal{E}) \cong \text{Gal}_E$. Thus there are Gal_K-action and φ-action on $\mathcal{O}_{E^{\text{ur}}}, \mathcal{E}_{\text{ur}}$ and by continuity extends to actions on $\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}}, \widehat{\mathcal{E}_{\text{ur}}}$, and

$$(\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}})^{\text{Gal}_E} = \mathcal{E}, \quad (\mathcal{E}^{\text{ur}})^{\text{Gal}_E} = \mathcal{O}_E, (\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}})^{\varphi=\text{id}} = \mathbb{Q}_p, \quad (\mathcal{E}^{\text{ur}})^{\varphi=\text{id}} = \mathbb{Z}_p.$$

⌟

Proof: **?** □

Prop. (18.4.8.10). For $M \in \varphi\text{-}\mathfrak{Mod}^{\text{ft}}(\mathcal{O}_{\mathcal{E}})$, M is étale over $\mathcal{O}_E$ iff $M/(p)$ is étale over E. ⌟

Proof: This is because étale is equivalent to the matrix of φ is a bijection, which is equivalent to its reduction modulo p is a bijection. □

Def. (18.4.8.11) [Effective φ-Modules]. An **effective φ-module** over $\mathcal{E}$ is a φ-module $(D, \varphi) \in \varphi\text{-}\mathfrak{Mod}_{\mathcal{E}}$ s.t. there is a complete $\mathcal{O}_E$-lattice M of D that $\varphi(M) \subset M$. ⌟

Def. (18.4.8.12) [Stably-Étale φ-Modules]. A **stably-étale φ-module** over $\mathcal{E}$ is a φ-module over $\mathcal{E}$ s.t. there exists a φ-stable $\mathcal{O}_{\mathcal{E}}$-lattice in $\mathcal{E}$ that is an étale φ-module over $\mathcal{O}_E$. Then the category of stably-étale φ-modules is a Tannakian category, denoted by $\varphi\text{-}\mathfrak{Mod}^{\text{st}\,.\,\text{ét}}(\mathcal{O}_{\mathcal{E}})$. ⌟

Proof: For $\mathcal{O}_\mathcal{E}$ this follows from(18.4.8.4), and for $\mathcal{E}$, notice if $D = M[\frac{1}{p}], D' = M'[\frac{1}{p}]$, then

$$\mathrm{Hom}_{\varphi\,\mathcal{M}\mathrm{od}^{\text{ét}}(\mathcal{E})}(D, D') = \mathrm{Hom}_{\varphi\,\mathcal{M}\mathrm{od}^{\text{ét}}(\mathcal{O}_\mathcal{E})}(L, L')[\frac{1}{p}]$$

and $p : D' \to D'$ is an isomorphism, so it follows that $\varphi\,\mathcal{M}\mathrm{od}^{\text{ét}}(\mathcal{O}_\mathcal{E})$ is also Abelian. □

Prop. (18.4.8.13). Any $V \in \mathrm{Rep}_{\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}}}(\mathrm{Gal}_E)$ is trivial. ⌟

Proof: Cf.[Fontaine-Ouyang]P34.? □

Thm. (18.4.8.14) [Classification of $\mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_E)$]. For $V \in \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_E)$,

$$\mathbb{M}(V) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V)^{\mathrm{Gal}_E}$$

is an étale φ-module over $\mathcal{O}_\mathcal{E}$, and for any $M \in \varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(\mathcal{O}_\mathcal{E})$,

$$\mathbb{V}(M) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_\mathcal{E}} M)^{\varphi=\mathrm{id}}$$

is a $\mathbb{Z}_p$-representation of Gal_E. And these two functors define an equivalence of categories:

$$\mathbb{M} : \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_E) \cong \varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(\mathcal{O}_\mathcal{E}) : \mathbb{V}.$$

⌟

Proof: To show $\mathbb{M}(V)$ is étale , Cf.[Fontaine]P35.

By(18.4.8.15), we have an isomorphism

$$\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} \mathbb{V}(M) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_\mathcal{E}} M,$$

and by(18.4.8.13),

$$\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_\mathcal{E}} \mathbb{M}(V) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V.$$

Thus

$$\mathbb{V}(\mathbb{M}(V)) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_\mathcal{E}} \mathbb{M}(V))^{\varphi=\mathrm{id}} \cong (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V)^{\varphi=\mathrm{id}} = V (18.4.8.9),$$
$$\mathbb{M}(\mathbb{V}(M)) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} \mathbb{V}(M))^{\mathrm{Gal}_E} \cong (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_\mathcal{E}} M)^{\mathrm{Gal}_E} = M (18.4.8.9).$$

□

Lemma (18.4.8.15). Situation as in(18.4.8.14),

$$\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V(M) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_\mathcal{E}} M.$$

⌟

Proof: Cf.[Fontaine-Ouyang]P36.? □

Thm. (18.4.8.16) [Classification of $\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_E)$].

- For $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_E)$,

$$\mathbb{D}(V) = (\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} V)^{\mathrm{Gal}_E}$$

is an stably-étale φ-module over $\mathcal{E}$, and there is a natural isomorphism

$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_\mathcal{E} \mathbb{D}(V) \cong \widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} V.$$

- for any $D \in \varphi\text{-}\mathcal{M}\mathrm{od}^{\mathrm{st\,.\,\acute{e}t}}(\mathcal{E})$,
$$\mathbb{V}(D) = (\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathcal{E}} D)^{\varphi=\mathrm{id}}$$
is a $\mathbb{Q}_p$-representation of Gal_E, and there is a natural isomorphism
$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} \mathbb{V}(D) \cong \mathcal{E}^{\mathrm{ur}} \otimes_{\mathcal{E}} D,$$
- These two functors define an equivalence of Abelian Tannakian categories(4.2.1.13):
$$\mathbb{M} : \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_E) \cong \varphi\text{-}\mathcal{M}\mathrm{od}^{sst.\,\acute{e}t}(\mathcal{E}) : \mathbb{D}.$$

⌟

Proof: For any $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_E)$, by(18.3.1.3), there exists a stable $\mathbb{Z}_p$-lattice, thus
$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} V = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} T)[\frac{1}{p}], \quad \mathbb{D}(V) = \mathbb{D}(T)[\frac{1}{p}] = \mathcal{E} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{D}(T).$$
and for any $D \in \varphi\text{-}\mathcal{M}\mathrm{od}^{\mathrm{st\,.\,\acute{e}t}}(\mathcal{E})$, there exists an $\mathcal{O}_{\mathcal{E}}$-lattice stable under φ, which is an étale φ-module over $\mathcal{O}_E$. Thus
$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathcal{E}} D = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M)[\frac{1}{p}], \quad \mathbb{V}(D) = V(M)[\frac{1}{p}] = \mathbb{Q}_p \otimes_{\mathbb{Z}_p} \mathbb{V}(M).$$
Thus it is clear that the assertion follows from that of(18.4.8.14). □

Cor. (18.4.8.17). Étale modules over E of rank d are of the form $M_A = \oplus_{i=1}^d E e_i$ with
$$\varphi : M \to M : \varphi(\lambda e_j) = \lambda^p \sum_{i=1}^d a_{ij} e_i.$$

Isomorphism classes of d-dimensional $\mathbb{Q}_p$-representations of Gal_E are in bijection with the isomorphism classes of matrixes in $\mathrm{GL}(d; \mathcal{O}_{\mathcal{E}})$ where
$$A \sim B \iff \exists P \in \mathrm{GL}(d; \mathcal{E}), B = P^{-1} A \varphi(P).$$

⌟

(φ, Γ)-Modules

Def. (18.4.8.18) [(φ, Γ)-modules]. If A is a topological ring with a Frobenius φ, and A has an action of a topological group Γ that commutes with σ, then a (φ, Γ)**-module** M is a φ-module M over A with a semi-linear action of Γ that commutes with φ.

If A is complete and φ is flat, then an **étale** (φ, Γ)**-module** M is a (φ, Γ)-module that the φ-module structure is étale (18.4.8.3).

Similar to φ-modules, (φ, Γ)-modules form a Tannakian category.? ⌟

Thm. (18.4.8.19) [Classification of $\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$]. Cf.[Fontaine, Ouyang]. ⌟

Overconvergent (φ,Γ)-Modules

Filtered (φ,N)-Modules

Def. (18.4.8.20) [$(\varphi, N, \mathrm{Gal}(L/K))$**-Modules**]. Let L/K be a Galois extension with residue field k_L and $L_0 = L \cap K_0$.

Then the category (φ,N)-$\mathcal{M}\mathrm{od}_{L/K}$ of $(\varphi, N, \mathrm{Gal}(L/K))$-modules consists of f.d. L_0-spaces V_0 with

- a σ-semi-linear endomorphism,
- a L_0-linear endomorphism N,
- a semi-linear continuous action of $\mathrm{Gal}(L/K)$ (w.r.t the discrete topology).

That satisfies:

- $N\varphi = p\varphi N$,
- N, φ commutes with $\mathrm{Gal}(L/K)$-actions.

Notice that the condition implies N maps the subspace of φ-slope l to the subspace of φ-slope $l-1$, in particular, N is nilpotent. ⌟

Prop. (18.4.8.21). Situation as in(18.4.8.20), (φ,N)-$\mathcal{M}\mathrm{od}_{L/K}$ is an Abelian Tannakian category, where the actions on the tensor is defined to as follows:

$$\varphi(v\otimes w) = \varphi(v)\otimes\varphi(w), \quad N(v\otimes w) = N(v)\otimes w + v\otimes N(w), \quad g(v\otimes w) = g(v)\otimes g(w).$$

⌟

Def. (18.4.8.22) [Filtered $(\varphi, N, \mathrm{Gal}(L/K))$**-Modules].** The category (φ,N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ of **filtered** $(\varphi, N, \mathrm{Gal}(L/K))$**-module** consists of tuples

$$(V, \varphi, N, \mathrm{Gal}(L/K), \mathrm{Fil}^\bullet)$$

where

- $(V, \varphi, N, \mathrm{Gal}(L/K)) \in (\varphi,N)$-$\mathcal{M}\mathrm{od}_{L/K}$(18.4.8.20),
- $(V\otimes_{L_0} L, \mathrm{Fil}^\bullet) \in \mathrm{Fil}_L$.

The category φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ of **filtered** φ**-modules(isocrystals)** over K is the Abelian subcategory of $(\varphi, N, \mathrm{Gal}(L/K))$-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ with $N=0$. φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{K/K}$ is also denoted by φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_K$. ⌟

Prop. (18.4.8.23) [HN-Formalism for Filtered φ**-Modules].** The category φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$(18.4.8.22) is a HN-formalism where $\mathcal{A}$ is the Abelian category φ-$\mathcal{M}\mathrm{od}(L_0)$(18.4.8.20), the rank is defined as usual and

$$\deg((V,\varphi,\mathrm{Fil}^\bullet)) = t_{\text{H-T}}(V_L, \mathrm{Fil}^\bullet) - t_N(V,\varphi)$$

where $t_{\text{H-T}}$ is the Hodge-Tate degree(4.3.4.27) and $t_N = v_p(\det(\varphi; V))$. This is a HN-formalism. ⌟

Proof: The proof is clear, the same as that of(4.3.4.27). □

Def. (18.4.8.24) [Weakly Admissible φ**-Modules].** The cateogory φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}^{\mathrm{weak.\,adm}}$ of **weakly admissible** φ**-modules** is the subcategory of φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ consisting of objects that are semistable of slope 0 w.r.t the HN-formalism(18.4.8.23). It is an Abelian category by(4.3.4.33). ⌟

Prop. (18.4.8.25) [Faltings]. The subcategory (φ,N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}^{\mathrm{weak.\,adm}} \subset (\varphi,N)$-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ is stable under tensor products. In particular, (φ,N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}^{\mathrm{weak.\,adm}}$ is an Tannakian category. ⌟

Proof: [Tensor Products in p-adic Hodge, Totaro, P9,12]. □

Cor. (18.4.8.26). The subcategory $\varphi\text{-Fil}\,\mathcal{M}\text{od}_K^{\text{weak. adm}} \subset \varphi\text{-Fil}\,\mathcal{M}\text{od}_K$ is stable under tensor products and duals. ⌟

Cor. (18.4.8.27). Tensor product of semistable filtered isocrystals in $(\varphi, N)\text{-Fil}\,\mathcal{M}\text{od}_{L/K}$ is also semistable. ⌟

Proof: This is because shifting the filtration of a semistable filtered isocrystal of slope c down by c gives a weakly admissible filtered isocrystal. □

9 (φ, Γ)-Modules over the Robba Ring

Notation (18.4.9.1).

- Let $p \in \mathbf{P}$, $\mathbb{Q}_p \subset_{\text{fin}} K$, $\Gamma = \mathbb{Z}_p^*$.
- Use notations on Robba rings as in Robba Ring.
- Let $H_p = \ker(\text{cycl}_p) \subset \text{Gal}_{\mathbb{Q}_p}$.

⌟

Prop. (18.4.9.2) [Fontaines Ring $B^{\dagger,\text{rig}}$]. There exists a $(\text{Gal}_{\mathbb{Q}_p}, K)$-regular ring $B^{\dagger,\text{rig}}$ with an action of $\text{Gal}_{\mathbb{Q}_p}$ and Frobenius φ s.t. $(B^{\dagger,\text{rig}})^{H_p} = \mathcal{R}_K$, and we can define

$$D_{\dagger,\text{rig}} : \text{Rep}_K^{\text{fd}}(\text{Gal}_K) \to (\varphi, \Gamma)\text{-}\mathcal{M}\text{od}^{\text{ét}}(\mathcal{R}_K) : V \mapsto (V \otimes_{\mathbb{Q}_p} B^{\dagger,\text{rig}})^{H_p}.$$

⌟

Proof: Cf.[Ber02]Section3.4.**?** □

Thm. (18.4.9.3) [Colmez]. The functor $D_{\dagger,\text{rig}}$ induces a tensor equivalence

$$\text{Rep}_K^{\text{fd}}(\text{Gal}_{\mathbb{Q}_p}) \cong (\varphi, \Gamma)\text{-}\mathcal{M}\text{od}^{\text{ét,slope}=0}(\mathcal{R}_K).$$

⌟

Proof: Cf.[P. Colmez, S´erie principale unitaire pour GL2(Qp) et repr´esentations triangulines de dimension 2]Prop2.7.**?** □

<u>**Triangularizable (φ, Γ)-Modules**</u>

Def. (18.4.9.4) [Classification of 1-Dimensional (φ, Γ)-Modules]. Let $\delta : \mathbb{Q}_p^* \to K^*$ be a continuous character, then there is a 1-dimensional (φ, Γ)-module over $\mathcal{R}_K$ with basis x s.t. $\varphi(a) = \delta(p)a, \gamma(a) = \delta(\gamma)a$. Then

- Any (φ, Γ)-module of rank 1 over $\mathcal{R}_K$ is isomorphic to $R_K(\delta)$ for a unique δ. And it is isoclinic of slope $v(\delta(p))$**?**.
- $\text{Ext}_{(\varphi,\Gamma)}(\mathcal{R}_K(\delta_2), \mathcal{R}_K(\delta_1))$ has dimension 1 except when $\delta_1\delta_2^{-1} = x^{-i}$ or $\chi_{\text{cycl}}x^i$ for $i \in \mathbb{N}$(where $x : \mathbb{Q}_p^* \to K^*$ is the natural inclusion), in which case it has dimension 2.

⌟

Proof: Cf.[P. Colmez, S´erie principale unitaire pour GL2(Qp) et repr´esentations triangulines de dimension 2]Section0.1.**?** □

Def. (18.4.9.5) [Triangularizable Representations]. A (φ, Γ)-module D over $\mathcal{R}_K$ is called a **triangularizable** (φ, Γ)**-module** if there is a complete flag of (φ, Γ)-submodules which are direct summands of D.

A Galois representation $V \in \mathrm{Rep}_K^{\mathrm{fd}}(\mathrm{Gal}_{\mathbb{Q}_p})$ is called triangularizable if $D_{\dagger,\mathrm{rig}}(V)$ is triangularizable.

For any triangularizable (φ, Γ)-module D over $\mathcal{R}_K$, the graded pieces $\mathrm{gr}_i(D)$ are isomorphic to $\mathcal{R}_K(\delta_i)$ where $\delta_i : \mathbb{Q}_p^\times \to L^\times$ by(18.4.9.4). These characters δ_i are called the **parameters of** D. ⌟

<u>p**-adic Hodge Theory of** (φ, Γ)**-Modules**</u>

Thm. (18.4.9.6) [Comparison of Fontaine's Functors]. For $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_{\mathbb{Q}_p})$ and $* \in \{\mathrm{crys}, \mathrm{dR}, \mathrm{Sen}\}$,

$$D_*(D_{\dagger,\mathrm{rig}}(V)) = D_*(V).$$

⌟

Proof: Cf.[Ber02]Thm0.2 and Section5.3, [L. Berger, E´quations diff´erentielles p-adiques et (φ, N)-modules filtr´es] and [P. Colmez, Les conjectures de monodromie p-adiques]Prop5.6.**?** □

18.5 Representations of Algebraic Groups

References are[Mil17].

1 Basics

Throughout this subsection, G is an affine algebraic group over a field k if not said.

Def. (18.5.1.1) [Linear Representations of Algebraic Groups]. Let R be a ring and V a free R-module, let $\mathrm{GL}(V)$ be the group functor

$$\mathcal{CA}\mathrm{lg}_R \to \mathcal{G}\mathrm{rp} : R' \mapsto \mathrm{Aut}(V \otimes_R R').$$

Then a **linear representation** (r, V) of an algebraic group G over R is a homomorphism of group functors $r : G \to \mathrm{GL}(V)$. It is called **faithful representation** if r is a monomorphism as natural transformation of functors.

If V is of f.d., this is equivalent to a homomorphism $G \to \mathrm{GL}(V)$. And by(9.1.5.6), it is faithful iff $G \to GL(V)$ is a closed embedding.

For a linear representation (r, V), let $\mathrm{End}(V) = \mathrm{Aut}(r)$. ⌟

Prop. (18.5.1.2) [Representations and Co-modules]. A representation of G on V is equivalent to a right $\Gamma(G)$-comodule structure on V(3.11.2.22). ⌟

Proof: Let $A = \Gamma(G)$. For any representation $r : G \to GL(V)$, it induces a map $G(A) \to GL_A(V \otimes A)$, which maps id_A to a map $\rho : V \to V \otimes A$. Now if $\rho(e_j) = \sum e_i \otimes a_{ij}$, then by funtoriality, the map $G(R') \to GL_R(V \otimes R')$ is given by $g \mapsto (e_j \mapsto e_i \otimes a_{ij}(g))$.

And it can be verified that this is a group homomorphism iff the comodule condition is satisfied. □

Def. (18.5.1.3) [Stabilizers]. Let (r, V) be a representation of an affine group scheme G over R, W a subspace of V, consider the functor

$$\mathrm{Stab}_G(W) : R' \mapsto \{g \in G(R') | g(W_{R'}) = W_{R'}\},$$

then if V is of f.d., $\mathrm{Stab}_G(W)$ is representable by a closed subgroup of G, called the **stabilizer group scheme** of W in V. ⌟

Proof: Let $\rho : \Gamma(G) \to V \otimes \Gamma(G)$ be the comodule action corresponding to r, let $\{e_i\}_{i \in I}$ be a basis for W, and extends it to a basis $\{e_i\}_{J \coprod I}$ of V, and

$$\rho(e_j) = \sum e_i \otimes a_{ij}, \quad a_{ij} \in \Gamma(G).$$

Let $g \in \mathrm{Hom}(\Gamma(G), R')$, then $ge_j = \sum e_i \otimes g(a_{ij})$, and then clearly G_W is represented by the quotient of $\Gamma(G)$ by the ideal generated by $\{a_{ij} | i \in I, j \in J\}$. □

Cor. (18.5.1.4). If S is a scheme and G is an affine group scheme over S, $\mathcal{V}$ a locally free sheaf on S and $\mathcal{W}$ a locally free subsheaf of $\mathcal{V}$, then similarly $\mathrm{Stab}_G(\mathcal{W})$ is representable by a closed subgroup of G over S, by considering affine-locally. ⌟

Cor. (18.5.1.5). Let (ρ, V) be a f.d. representation of G and $S \subset G(k)$ be a subset schematically dense in G, then a subspace $W \subset V$ is stable under G iff it is stable under S. ⌟

Prop. (18.5.1.6) [Fixed Subspace]. Let (r, V) be a linear representation of an algebraic group, define the **fixed subspace** by G:

$$V^G = \{v \in V | gv_R = v_R, \forall R \in \mathcal{CA}\mathrm{lg}_k, g \in G(R)\}.$$

Then for any $R \in \mathcal{CA}\mathrm{lg}_k$, $V^G \otimes R$ is the submodule of $V \otimes R$ that is fixed by elements of $G(R')$ for any $R' \in \mathcal{CA}\mathrm{lg}_R$. ⌟

Proof: Cf.[Mil17]P96. □

Cor. (18.5.1.7). The fixed subspace is compatible with base change of fields. ⌟

Def. (18.5.1.8) [Subrepresentations]. A subspace W of a linear representation V of an algebraic group G is called a **subrepresentation** of V if $\widetilde{G} = \mathrm{Stab}_G(W)$.

A linear representation is called **simple** if has no non-trivial subrepresentations. ⌟

Prop. (18.5.1.9). Let U be a normal subgroup of an algebraic group G, then for any representation V of G, V^U is a subrepresentation of V. ⌟

Prop. (18.5.1.10) [Union of F.D. Subrepresentations]. Let (r, V) be a linear representation of G, then V is a filtered union of its f.d. subrepresentations. ⌟

Proof: It suffices to consider comodules and prove any vector $v \in V$ is contained in a f.d. subcomodule. Let $\{e_i\}$ be a basis of $\Gamma(G)$, let

$$\Delta(e_i) = \sum_{i,k} r_{ijk} e_j \otimes e_k, \quad \rho(v) = \sum_i v_i \otimes e_i, \quad v_i \in V.$$

Because $(\mathrm{id}_V \otimes \Delta) \circ \rho = (\rho \otimes \mathrm{id}_{\Gamma(G)}) \circ \rho$(3.11.2.22), thus

$$\sum_{i,j,k} r_{ijk} v_i \otimes e_j \otimes e_k = \sum_k \rho(v_k) e_k$$

which means

$$\rho(v_k) = \sum_{j,k} r_{ijk} v_i \otimes e_j.$$

Thus $\mathrm{span}\{e_i\}$ is a f.d. comodule of V containing v. □

Cor. (18.5.1.11). Any simple representations of an algebraic group is of f.d. ⌟

Prop. (18.5.1.12) [Schur's Lemma]. Let (V, r) be a simple representation of an algebraic group G, then $\mathrm{End}(V)$ is a f.d. division algebra D over k. In particular, if $k = \overline{k}$, then $\mathrm{End}(V) = k$. ⌟

Prop. (18.5.1.13) [Simple Representations of Product Groups]. Let G_1, G_2 be algebraic groups and V_1, V_2 are simple representations of G_1, G_2 resp., then $V_1 \otimes V_2$ is a simple representation of $G_1 \times G_2$.

Conversely, if $\mathrm{End}(V) = k$ for any simple representation (V, r) of G_1, then any simple representation of $G_1 \times G_2$ is of this form. ⌟

Proof: Cf.[Mil17]P91. □

Def. (18.5.1.14)[Semisimple Representations]. A linear representation (r, V) of an algebraic group is called **semisimple** if it is a direct sum of simple representations. Equivalently, it is a sum of simple subrepresentation.(The proof is the same).

Or equivalently, every submodule has a complement. ⌟

Prop. (18.5.1.15)[Base Change]. Let (V, r) be a f.d. linear representation of an algebraic group over a field k, k'/k a field extension, then $(V', r') = (V, r) \otimes_k k'$ is a representation of $G_{k'}$, and

- If (V', r') is simple, and (V, r) is simple.
- If (V, r) is simple and $\mathrm{End}(V) = k$, then (V', r') is simple.
- If (V, r) is semisimple and k'/k is separable or $\mathrm{End}(V)$ is a separable algebra over k, then (V', r') is semisimple.

⌟

Proof: Cf.[Mil17]P90. □

Prop. (18.5.1.16)[Constructing All F.D. Representations]. Let V be a faithful f.d. representation of G, then every f.d. representation of G is a subquotient of $V^m \otimes (V^\vee)^n$. ⌟

Proof: Cf.[Mil17]P88. □

Def. (18.5.1.17) [Diagonalizable Representation]. A representation of an algebraic group is called **diagonalizable** if it is a direct sum of 1-dimensional representations.

Let G be an algebraic group over a field k and $r : G \to GL(V)$ be a representation. If V is a sum of 1-dimensional representations, then r is diagonalizable(18.5.1.17). ⌟

Proof: Let $V = \sum_{\chi \in X(G)} V_\chi$. If the sum is not direct, then there is are some relation $v_1 + v_2 + \ldots + v_m = 0$ for $v_i \in V_{\chi_i}$. Applying ρ shows

$$0 = v_1 \otimes a(\chi_1) + \ldots + v_m a(\chi_m)$$

so any coordinate of v_i is 0 by(9.1.1.13). □

Prop. (18.5.1.18) [Chevalley]. Let G be an algebraic group, then every algebraic subgroup $H \subset G$ arises as the stabilizer of a 1-dimensional subspace in a f.d. representation of G. ⌟

Proof: Cf.[Mil17]P94. □

Cor. (18.5.1.19). Let G be an algebraic group over a field of characteristic0, then an algebraic subgroup H of G is normal in G iff for any linear representation V of G and a character $\chi \in X(H)$, the eigenspace V_χ is stable under G. ⌟

Proof: □

Prop. (18.5.1.20). Let G be an algebraic group over a field k s.t. the order of $\pi_0(G)$ is prime $\mathrm{char}\, k$, then any representation V of G is semisimple iff it's semisimple when restricted to G^0. ⌟

Linear Algebraic Group

Def. (18.5.1.21) [Linear Algebraic Groups]. Let k be a field, then a **linear algebraic group** over k is a closed subgroup scheme of GL_n for some n.

Notice a linear algebraic group over a field of characteristic 0 is automatically smooth, by Cartier theorem(9.1.4.2). ⌟

Prop. (18.5.1.22) [Affine Algebraic Group is Linear]. If G is an affine group scheme, then the regular representation(9.2.1.2) contains a faithful f.d. subrepresentation. In particular, the regular representation is itself faithful. ⌟

Proof: Let e_i be a generator of $\Gamma(G)$ as a k-algebra, let V be a f.d. subrepresentation of the regular representation containing e_i(18.5.1.10), let v_i be a basis for V, and suppose $\Delta(e_j)=\sum e_i\otimes a_{ij}$, then the image of $\Gamma(GL(V))\to\Gamma(G)$ contains a_{ij}. Now because $\varepsilon: A\to k$ is the counit,

$$e_j=(\varepsilon\otimes\mathrm{id})\Delta(e_j)=\sum\varepsilon(e_i)a_{ij},$$

so the image contains V, so it contains $\Gamma(G)$, so this is a closed immersion, thus a faithful representation, by(18.5.1.1). □

2 Tannakian Duality

In this subsection, let G be an affine group scheme, and k is a field.

Lemma (18.5.2.1). Let G be an affine group scheme over ring R corresponding to a Hopf algebra A. If u is an R-endomorphism of A that the following diagram commutes:

$$\begin{array}{ccc} A & \xrightarrow{\Delta} & A\otimes A \\ \downarrow{\scriptstyle u} & & \downarrow{\scriptstyle 1\otimes u} \\ A & \xrightarrow{\Delta} & A\otimes A \end{array},$$

then there exists a $g\in G(R)$ that $u=r_A(g)$, where r_A is the regular action of G on A. ⌟

Proof: Let $\varphi: G\to G$ be the morphism corresponding to u, then the commutative diagram shows $\varphi_S(xy)=x\varphi_S(y)$ for $x,y\in G(S)$. Then $\varphi_S(x)=xg_S$ where $g_S=\varphi_S(e)$.

Then for $f\in A, x\in G(R)$, $x(uf)=\varphi_R(x)(f)=(xg)(f)=x(r_A(f))$, thus $u=r_A(g)$. □

Prop. (18.5.2.2). Let G be an algebraic group over k and R is a k-algebra. Suppose that for any f.d. representation (V,r_V) of G, we are given an R-linear map $\lambda_R: V_R\to V_R$ that satisfies:

- $\lambda_{V\otimes W}=\lambda_V\otimes\lambda_W$.
- $\lambda_1=\mathrm{id}$.
- For G-invariant maps $u: V\to W$, $\lambda_W\circ u_R=u_R\circ\lambda_V$.

then there exists a unique $g\in G(R)$ that $\lambda_V=r_V(g)$ for any V. ⌟

Proof: Cf.[Milne, P164].**?** □

Cor. (18.5.2.3) [Reconstruction Theorem]. Let $\omega:\mathrm{Rep}_k(G)\to Vect_k$ be the forgetful functor, and for any k-algebra R, let $\omega_R=R\otimes\omega$, then this proposition says the canonical morphism $G(R)\to\mathrm{End}^{\otimes}(\omega_R)$ is an isomorphism. Now if $\underline{\mathrm{Aut}}^{\otimes}(\omega)$ is the functor $R\mapsto\mathrm{End}^{\otimes}(\omega_R)$, then $G\cong\underline{\mathrm{Aut}}^{\otimes}(\omega)$. ⌟

Cor. (18.5.2.4). Let G, G' be affine algebraic groups over k and let $F : \mathrm{Rep}_k(G') \to \mathrm{Rep}_k(G)$ be a tensor functor that $\omega^G \circ F = \omega^{G'}$, then there exists a unique homomorphism $f : G \to G'$ that $F = \omega^f$. ⌟

Proof: Such a tensor functor defines a homomorphism

$$F^* : \underline{\mathrm{Aut}}^{\otimes}(\omega^G)(R) \to \underline{\mathrm{Aut}}^{\otimes}(\omega^{G'})(R)$$

functorial in R, thus defines a homomorphism $f : G \to G'$ by Yoneda lemma and(18.5.2.4). □

Lemma (18.5.2.5). Let μ be a cocharacter $\mathbb{G}_m \to G$ over $\overline{\mathbb{Q}_p}$, then the conjugacy class $\{\mu\}$ of μ is defined over a finite extension $E/\mathbb{Q}_p$. ⌟

Proof: By Tannakian duality, two cocharacters are conjugate over a field K iff the filtrations they defined on $V \otimes \overline{\mathbb{Q}_p}$ for some faithful $V \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$ are isomorphic by an action of $G(K)$. Now this action of $G(\overline{\mathbb{Q}_p})$ on $V_{\overline{\mathbb{Q}_p}}$ is defined over a f.d. field extension $E/\mathbb{Q}_p$, so the filtrations are isomorphic by an action of $G(E)$. □

Prop. (18.5.2.6) [Abstract Jordan Decompositions]. Let G be an algebraic group over a perfect field k and $g \in G(k)$, then there exists unique elements $g_s, g_u \in G(k)$ that for any representation (V, r_V) of G, $r_V(g_s) = r_V(g)_s$ and $r_V(g_u) = r_V(g)_u$. Furthermore,

$$g = g_s g_u = g_u g_s.$$

The elements g_s, g_u are called the semisimple and unipotent parts of g, and this decomposition is called the abstract Jordan decomposition of g. $g \in G(k)$ is called a **semisimple or unipotent element** if $g = g_s$ or $g = g_u$. ⌟

Proof: This follows from the functoriality of Jordan decompositions(3.5.8.7) and the reconstruction theorem(18.5.2.2). □

Cor. (18.5.2.7). To check a decomposition is Jordan decomposition, it suffices to check for a single faithful representation of G. ⌟

Remark (18.5.2.8). Let G be a group variety over an alg.closed field k. In general, the set $G(k)_s$ of semisimple elements in $G(k)$ is not closed for the Zariski topology, but the set $G(k)_u$ of unipotent elements are closed for the Zariski topology. To see this, embed G into GL_n for some n, then the set of unipotent elements are the matrices with characteristic polynomial $(T-1)^n$, and this is a polynomial condition. ⌟

Tannakian Reconstruction

Prop. (18.5.2.9) [Tannakian Reconstruction]. Let $(\mathcal{C}, \otimes)$ be a rigid Abelian tensor category that $k = \mathrm{End}(1)$ and $\omega : \mathcal{C} \to \mathcal{V}\mathrm{ect}_k$ an exact faithful k-linear tensor functor, then the functor $\underline{\mathrm{Aut}}^{\otimes}(\omega)$ is representable by an affine groups scheme G, and $\mathcal{C} \cong \mathrm{Rep}_k(G)$. ⌟

Proof: Cf.[Milne, Tannakian category, P21].**?** □

Cor. (18.5.2.10) [Tannakian Reconstruction]. Let $\mathcal{C}$ be a k-linear Abelian category where k is a field, and $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ a k-bilinear functor. Suppose there are given a faithful exact k-linear functor $\mathcal{C} \to \mathcal{V}\mathrm{ect}_k$ and functorial isomorphisms $\varphi_{X,Y,Z} : X \otimes (Y \otimes Z) \to (X \otimes Y) \otimes Z$ and $\psi_{X,Y} : X \otimes Y \to Y \otimes X$ that

- F commutes with $\otimes$, and maps φ and ψ to the natural associativity and commutativity isomorphism in $Vect_k$.
- There exists an identity object $1 \in \mathcal{C}$ that $k \to \mathrm{End}(1)$ is an isomorphism and $F(1)$ has dimension 1.
- Any object $L \in \mathcal{C}$ that $F(L)$ has dimension 1 is an invertible object.

Then $\mathcal{C}$ is equivalent to $\mathrm{Rep}_k(G)$ for some affine group scheme G over k. In fact, $G \cong \underline{\mathrm{Aut}}^{\otimes}(\omega)$ as in(18.5.2.3) ⌟

Proof: The proof of(18.5.2.9) shows F defines an equivalence of categories $\mathcal{C} \to \mathrm{Rep}_k(G)$ where G is an affine monoid scheme representing $\mathrm{End}_k^{\otimes}(\omega)$. Thus we may assume $\mathcal{C} = \mathrm{Rep}_k(G)$. For the rest, Cf.[Tannakian Categories, Milne, P24]. □

Cor. (18.5.2.11) [Real Algebraic Envelope]. Let K be a topological group, then the category $\mathrm{Rep}_{\mathbb{R}}(K)$ of f.d. continuous real representations, together with the forgetful functor satisfies the hypothesis of(18.5.2.10), thus there is an algebraic group $\widetilde{K}$ over $\mathbb{R}$, called the **real algebraic envelope** of K, and an equivalence of categories

$$\mathrm{Rep}_{\mathbb{R}}(\widetilde{K}) \to \mathrm{Rep}_{\mathbb{R}}(K)$$

induced by a homomorphism $K \to \widetilde{K}(R)$, which is an isomorphism when K is compact**?**. ⌟

Cor. (18.5.2.12) [Hochschild-Mostow Group]. Similar as(18.5.2.11), if G is a complex Lie group or a f.g. abstract group, and $\mathcal{C}$ the category of f.d. complex representations, then it satisfies the hypothesis of(18.5.2.10), thus it is the category of representations of an affine group scheme $A(G)$ over $\mathbb{C}$, together with a homomorphism $P : G \to A(G)$, called the **Hochschild-Mostow group** of G. ⌟

Prop. (18.5.2.13). Let $\mathcal{C}$ be a small k-linear Abelian category, and let $\omega : \mathcal{C} \to \mathcal{V}ect_k$ be an exact faithful k-linear functor, then there exists a coalgebra C s.t. $\mathcal{C}$ is equivalent to the category of C-comodules of f.d. ⌟

Proof: Cf.[Mil17] P175. □

<u>**Properties of G and $\mathrm{Rep}_k(G)$**</u>

Prop. (18.5.2.14). Let G be an affine group scheme over k, then

- G is finite iff there exists an object $X \in \mathrm{Rep}_k(G)$ that every object of $\mathrm{Rep}_k(G)$ is isomorphic to a subquotient of X^n for some $n > 0$.
- G is algebraic iff there exists an object $X \in \mathrm{Rep}_k(G)$ that every object of $\mathrm{Rep}_k(G)$ is isomorphic to a subquotient of $X^n \otimes (X^\vee)^m$ for some $m, n \geq 0$.

⌟

Proof: Cf.[Milne, Tannakian categories, P25]. □

Prop. (18.5.2.15). Let $f : G \to G'$ be a homomorphism of affine group schemes over k, and let ω^f be the corresponding functor $\mathrm{Rep}_k(G') \to \mathrm{Rep}_k(G)$. Then

- f is faithfully flat iff ω^f is fully faithful and each ω^f induces an equivalence of subobjects of X' and $\omega^f(X')$.

- f is a closed immersion iff every object of $\mathrm{Rep}_k(G)$ is isomorphic to a subquotient of an object $\omega^f(X')$.

⌟

Proof: Cf.[Milne, Tannakian categories, P25]. □

Cor. (18.5.2.16). Let k has characteristic 0, then G is connected iff for any non-trivial representation X of G, $\langle X\rangle$ is not stable under $\otimes$. ⌟

Proof: Cf.[Milne, Tannakian categories, P25]. □

3 Unipotent Groups

Def. (18.5.3.1)[Unipotent Groups]. A **unipotent algebraic group** is an algebraic group G s.t. for any non-zero linear representation V of G, $V^G\neq 0$. Equivalently, every such representation sends G into $\mathrm{Unip}(n)$ in some coordinates. ⌟

Prop. (18.5.3.2). Let G be an algebraic group over k and k'/k a field extension, then G is unipotent iff $G_{k'}$ is unipotent. ⌟

Proof: This follows from the fact that for any representation V of G, $(V\otimes k')^{G_{k'}}=V^G\otimes k'$(18.5.1.7). □

Prop. (18.5.3.3). For an affine algebraic group G over a field k, the following are equivalent:

- G is unipotent.
- G is isomorphic to a subgroup of $\mathrm{Unip}(n)$ for some n.
- The Hopf algebra $\Gamma(G)$ is coconnected.

⌟

Proof: Cf.[Mil17]P281. □

Prop. (18.5.3.4). If U is a normal unipotent subgroup of an algebraic group G, then for any semisimple representation V of G, U acts trivially. ⌟

Proof: Consider a simple subrepresentation W of V, then $W^U\neq 0$ is a subrepresentation of G by(18.5.1.9), thus U acts trivially on W. As V is a sum of simple representations(18.5.1.14), U acts trivially on V. □

Prop. (18.5.3.5). Representations of $\mathbb{G}_a$ over a field of characteristic 0 corresponds to locally nilpotent endomorphisms. ⌟

Proof: https://qchu.wordpress.com/2017/11/26/the-representation-theory-of-the-additive-group-s
□

4 Reductive Groups

Prop. (18.5.4.1). A group variety G is reductive if it has a faithful representation that is semisimple over $\overline{k}$, by(18.5.3.4). ⌟

Prop. (18.5.4.2). Let $k\in \mathtt{Field}^0, G\in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/k$ is connected, then the following are equivalent:

- G is a reductive group.

- Every f.d. representation of G is semisimple(18.5.1.14).
- Some faithful representation of G is semisimple(18.5.1.14).

⌟

Proof: □

18.6 Representations of Finite Groups of Lie Type

References are [Bon11], [Introduction to Deligne-Lustig Theory, David Schwein], [Representations of finite groups of Lie type, Dign/Michel, 1991].

Notation (18.6.0.1).
- Use notations defined in Étale Cohomology Theory.
- Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}Z_+}, k \in \texttt{Field}, \#k = q, G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/k$.
- Let $\ell \in \mathbf{P}\backslash p$, K an ℓ-adic local field with ring of integers $\mathcal{O}_K$ and residue field k.

⌟

1 Finite Groups of Lie Type

Def. (18.6.1.1) [Finite Groups of Lie Type]. For a reductive group $G/\overline{k}$, if $F \in \mathrm{End}(G)$ satisfies the fixed point of $F(\overline{k})$ is finite, then its fixed points G^F is called a **finite group of Lie type**.

If G is defined over some finite subfield k, i.e. $G = G_0 \times_k \overline{k}$, and $F = \mathrm{Fr}_{G_0}$, then $G^F = G_0(k)$ is called a **Chevalley group**. If moreover $G_0 \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/k$ is reductive and simply-connected, then $G_0(k)$ is called a **universal finite group**(of Lie type).

If G is a a finite group of Lie type that is not a Chevalley group, then it is called a **twist group**(of Lie type). ⌟

Prop. (18.6.1.2). If $p \in \texttt{Prime}$ and $q \in p^{\mathbb{Z}_+}$,
- $\#GL(2;q) = q(q-1)^2(q+1)$.
- $\#SL(2;q) = \#PGL(2;q) = q(q^2-1)$.
- $\#PSL(2;q) = \begin{cases} q(q^2-1) & ,2|q \\ \frac{1}{2}q(q^2-1) & ,2\nmid q \end{cases}$.

⌟

Thm. (18.6.1.3) [Steinberg]. If $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\overline{k}$ is simple reductive group, and $F \in \mathrm{End}(G)$ satisfies the fixed point of $F(\overline{k})$ is finite, then there are exactly the following possibilities:
- (Chevalley Groups)F is a standard Frobenius: $A_n, B_n, C_n, D_n, G_2, F_4, E_6, E_7, E_8$.
- (**Steinberg Groups**)$^2A_n, {}^2D_n, {}^3D_4, {}^2_6$.
- (**Suzuki Groups**)$^2B_2, p = 2$.
- (**Ree Groups**)$^2G_2, p = 3$.
- (**Ree Groups**)$^2F_4, p = 2$.

⌟

Proof: □

Examples

Prop. (18.6.1.4) [SL(n)].
- $\mathrm{PSL}(2,\mathbb{F}_2) \cong \mathrm{Sym}(3)$,
- $\mathrm{PSL}(2,\mathbb{F}_3) \cong \mathrm{Alt}(4)$,
- (Jordan1861) For $k \in \texttt{Field}$, $\mathrm{PSL}(n,k)$ is a simple group except for $n = 2$ and $k \cong \mathbb{F}_2$ or $\mathbb{F}_3$.

- $\mathrm{PSL}(2,\mathbb{F}_4)\cong\mathrm{PSL}(2,\mathbb{F}_5)\cong\mathrm{Alt}(5)$.
- $\mathrm{SU}(n)_{\mathbb{F}_q}$ is a twist of $\mathrm{SL}(n)_{\mathbb{F}_q}$, denoted by ${}^2A_{n-1}(\mathbb{F}_{q^2})$.

⌟

Proof: Cf.[DSV03]P74. □

Prop. (18.6.1.5). ⌟

2 Conjugacy Classes

3 Deligne-Lustig Varieties

Def. (18.6.3.1) [Deligne-Lustig Varieties]. ⌟

Affineness of Deligne-Lustig Varieties

4 Deligne-Lustig Theory

Main references are [Finite Groups of Lie Type, Carter], [P. Deligne and G. Lusztig, Representations of reductive groups over finite fields, Ann. of Math. (2) 103 (1976), no.1, 103–161.], [D-L76], https://www.dpmms.cam.ac.uk/~dbms2/deligne_lusztig/.

Deligne and Lustig used the ℓ-adic étale cohomology theory to construct all cuspidal representations of $G(\mathbb{F}_q)$.

Remark (18.6.4.1). Because $G(\mathbb{F}_q)$ is finite and $\mathbb{C}\cong\overline{\mathbb{Q}_\ell}$, we can consider representations $\mathrm{Rep}(G(\mathbb{F}_q))=\{\theta:G(\mathbb{F}_q)\to\mathrm{GL}(\overline{\mathbb{Q}}_\ell)$. ⌟

Def. (18.6.4.2) [Induction Pairs]. A **induction pair for** $G(\mathbb{F}_q)$ is a pair (T,θ), where $T\subset G$ is a maximal torus and θ is an ℓ-adic character $T(\mathbb{F}_q)\to\overline{\mathbb{Q}}_\ell^\times$. ⌟

Deligne-Lustig Inductions

Def. (18.6.4.3) [Deligne-Lustig Inductions]. Let (T,θ) be an induction pair(18.6.4.2), the action of $G(\mathbb{F}_q)$ and $T(\mathbb{F}_q)$ on $\widetilde{X}_S$ commutes, so for any $\theta\in\mathrm{Irr}(T(\mathbb{F}_q))$, the θ-isotopic part of $H^i_{\text{ét},c}(\widetilde{X}_T,\overline{\mathbb{Q}}_\ell)$ is $G(\mathbb{F}_q)$-invariant, thus we can define a **Deligne-Lustig Induction map** that on $\mathrm{Irr}(G(\mathbb{F}_q))$ is defined by

$$R_T^G:\mathrm{Irr}(T(\mathbb{F}_q))\to K_0(\mathrm{Rep}(G(\mathbb{F}_q))):\theta\mapsto\sum_i(-1)^iH^i_{\text{ét},c}(X_T,\overline{\mathbb{Q}}_\ell)^\theta.$$

⌟

Prop. (18.6.4.4). Let (T,θ) be an induction pair, if $\theta^\omega\neq\theta$ for any $w\in W$, then $R_T^G(\theta)\in\mathrm{Irr}(G(\mathbb{F}_q))$. ⌟

Proof: □

Prop. (18.6.4.5). If $(T,\theta),(T',\theta')$ are two induction pairs that are note $G(\mathbb{F}_q)$-conjugate, then $(R_T^G(\theta),R_{T'}^G(\theta'))=0$. ⌟

Proof: □

Def. (18.6.4.6) [Geometrically Conjugate Pairs]. If $(T,\theta),(T',\theta')$ are two induction pairs, they are called **geometrically conjugate** if $(T_{k'},\theta\circ\mathrm{Nm}_{k'/k}),(T'_{k'},\theta'\circ\mathrm{Nm}_{k'/k})$ are $G(k')$-conjugate for some finite extension $k'/\mathbb{F}_q$. ⌟

Prop. (18.6.4.7). If $(T,\theta),(T',\theta')$ are two induction pairs that are not geometrically conjugate, then $R_T^G(\theta), R_{T'}^G(\theta')$ are disjoint. ⌟

Proof: Cf.[D-L76]Cor6.3. □

Def. (18.6.4.8) [Dual Groups]. ⌟

Prop. (18.6.4.9). The geometric conjugacy classes of induction pairs of G corresponds to the geometric conjugacy classes of semisimple elements of G^*(18.6.4.8). ⌟

Proof: □

Def. (18.6.4.10) [Lustig Series]. Let S be a semisimple conjugacy class of G^*, the **Lustig series** $\mathcal{E}(G,S)$ is the set of irreducible representations of G occurring in $R_T^G(\theta)$ for any (T,θ) in the geometric conjugacy class corresponding to S via(18.6.4.9). By(18.6.4.7),

$$\mathrm{Irr}(G(\mathbb{F}_q)) = \coprod_{S\in G^*_{\text{ss-conj}}} \mathcal{E}(G,S).$$

$\mathcal{E}(G,(1))$ is called the set of **unipotent representations**, which are all the irreducible representations appearing in $R_T^G(\mathbb{1})$ for various T. ⌟

5 Howlett-Lehler Theory

This theory decomposes Deligne-Lustig inductions into irreducible components.

6 Character Sheaves(Lustig)

References are [Introduction to character sheaves, Lustig], [Algebraic And Geometric Methods In Representation Theory, Lustig, 2014].

Remark (18.6.6.1). Let (S,θ) be an induction pair(18.6.4.2), there is in fact an isomorphism

$$H^i_{\text{ét},c}(\widetilde{X}_S,\overline{\mathbb{Q}}_\ell) \cong H^i_{\text{ét},c}(X_S,\mathcal{F}_\theta) \in \mathrm{Rep}(G(\mathbb{F}_q))$$

where $\mathcal{F}_\theta$ is the ℓ-adic local system on X_S corresponding to the $S(\mathbb{F}_q)$-torsor and θ. Thus much of the Deligne-Lustig theory can be interpreted in the language of sheaves, called **character sheaves**. ⌟

7 Gelfand-Graev representations

8 Alvis-Curtis Duality

Cf.[Duality for representations of a reductive group over a finite field, I, II, Deligne-Lustig].

9 Deligne-Lustig Varieties

Prop. (18.6.9.1). Let ⌟

10 GL(n)

Notation (18.6.10.1). The notation is the same as in(18.11.0.1). ⌟

Principal Series Representations

Prop. (18.6.10.2). Let $(\pi, V) \in \mathrm{Rep}^{\mathrm{fd}}(GL(2,k))$, then

- if the representation (π_1, V) is defined by $\pi_1(g) = \pi(g^{-t})$, then $\pi_1 \cong \widehat{\pi}$.
- if $n = 2$ and (π, V) is irreducible, let ω be the central character of π. If (π_2, V) is defined by $\pi_2(g) = \omega(\deg g)^{-1}\pi(g)$, then $\pi_2 \cong \widehat{\pi}$.

⌟

Proof: The proof of(18.11.1.15) applies to this case, noticing a finite group is profinite hence locally profinite. □

Lemma (18.6.10.3). Let $\chi_1, \chi_2, \mu_1, \mu_2$ be characters of F^*, consider the principal representations $\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)$ of $GL(2,k)$ defined in(18.11.4.6), then

$$\dim \mathrm{Hom}_{GL(2,k)}(\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)) = \delta_{\chi_1,\mu_1}\delta_{\chi_2,\mu_2} + \delta_{\chi_1,\mu_2}\delta_{\chi_2,\mu_1}.$$

⌟

Proof: Let χ, μ be characters of $B(k)$ defined as in(18.11.4.6), then by**??**, the dimension is just the dimension of space of functions $\Delta : GL(2,k) \to \mathbb{C}$ that

$$\Delta(b_2 g b_1) = \mu(b_1)\Delta(g)\chi(b_1), \quad b_1, b_2 \in B(k).$$

Then by the Bruhat decomposition(12.11.5.5), Δ is determined by its values on 1 and w_0. Notice that if $\chi_1 \neq \mu_1$ or $\chi_2 \neq \mu_2$, we can use this condition to show $\Delta(1) = 0$, and if $\chi_1 \neq \mu_2$ or $\chi_2 \neq \mu_1$, we can use this condition to show $\Delta(w_0) = 0$, and also the construction of Δ is clear in other cases. □

Prop. (18.6.10.4) [Principal Series Representations]. Let $\chi_1, \chi_2, \mu_1, \mu_2$ be characters of F^*, then $\mathcal{B}(\chi_1, \chi_2)$ is an irreducible representation of degree $q = |F| + 1$ unless $\chi_1 = \chi_2$, in which case it is the direct sum of two irreducible representations having degree 1 and q. And $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\mu_1, \mu_2)$ iff $\{\chi_1, \chi_2\} = \{\mu_1, \mu_2\}$. ⌟

Proof: Use(18.6.10.3), then

$$\dim \mathrm{End}_{GL(2,k)}(\mathcal{B}(\chi_1, \chi_2)) = 1 + \delta_{\chi_1,\chi_2}.$$

Now by Peter-Weyl, if a representation V is isomorphic to $\sum d_i\pi_i$, where π_1 are irreducible, then $\dim_G(V) = \sum d_i^2$(11.10.4.5). Then we now $\mathcal{B}(\chi_1, \chi_2)$ decomposes into two representations if $\chi_1 = \chi_2$ and is irreducible if $\chi_1 \neq \chi_2$.

In case $\chi_1 = \chi_2$, there is an invariant subspace of dimension 1, generated by the function $f(g) = \chi(\deg g)$. so the rest representation is of dimension q, because $G(2,k)/B(k) = q + 1$. □

Def. (18.6.10.5) [Steinberg Representation]. We call the q-dimensional subrepresentation of $\mathcal{B}(1,1)$ the **Steinberg representation**. It is verified that the q dimensional subrepresentation of $\mathcal{B}(\chi, \chi)$ is the twist of the Steinberg representation. ⌟

Weil Representations

Prop. (18.6.10.6) [Weil Representation for $SL(2,k)$]. In situation (20.7.3.5), let $W = L^2(E)$, define the modified Fourier transform w.r.t. ψ as in (11.10.3.33):

$$\widehat{\Phi}(x) = q^{-1} \sum_{y \in E} \Phi(y)\psi(\mathrm{tr}(\overline{x}y)).$$

Then there is a **Weil representation** $\omega : SL(2,k) \to \mathrm{End}(W)$:

$$(\omega(t(a))\Phi)(x) = \Phi(ax), \quad w(n(z)\Phi)(x) = \psi(zN(x))\Phi(x), \quad (\omega(w_1)\Phi)(x) = \varepsilon\widehat{\Phi}(x).$$

where we are using the presentation as in 5, and $\varepsilon = 1$ is E/F is split, and -1 if it is anisotropic. ⌟

Remark (18.6.10.7). When F has characteristic $\neq 2$, this is just the Weil representation in (20.7.3.3). ⌟

Proof: This follows from direct verification, Cf.[Bump, P407]. □

Prop. (18.6.10.8) [Dihedral Weil Representations for $GL(2,k)$]. Situation as in (20.7.3.5), Define

$$W(\chi) = \{\Phi \in W | \Phi(yx) = \chi(y)^{-1}\Phi(x), y \in E_1^*\},$$

then by considering the order of E_1^*, $\dim W(\chi) = q + \varepsilon$. Also it is verified that $W(\chi)$ is stable under the Weil representation of $SL(2,k)$ (18.6.10.6).

Now we want to extend this representation to $GL(2,k)$ by defining

$$(\omega(\begin{bmatrix} a & \\ & 1 \end{bmatrix})\Phi)(x) = \chi(b)\Phi(bx)$$

where b is arbitrary that $N(b) = a$. ⌟

Remark (18.6.10.9). This is related to (20.7.3.7) and Howe duality. ⌟

Proof: It must be shown that this is truly a representation of $GL(2,k)$, it suffices to show that

$$\omega(\begin{bmatrix} a & \\ & 1 \end{bmatrix})\omega(g)\omega(\begin{bmatrix} a^{-1} & \\ & 1 \end{bmatrix}) = \omega(\begin{bmatrix} a & \\ & 1 \end{bmatrix} g \begin{bmatrix} a^{-1} & \\ & 1 \end{bmatrix}),$$

where g is a generator of $SL(2,k)$. This is clear for $g = t(a)$, and also clear for $g = n(z)$. For $g = w_1$, it suffices to check

$$\omega(\begin{bmatrix} a & \\ & 1 \end{bmatrix}) \circ \wedge \circ \omega(\begin{bmatrix} a^{-1} & \\ & 1 \end{bmatrix})\Phi(x) = \widehat{\Phi}(ax)$$

which is subtle but also clear. □

Prop. (18.6.10.10) [Split Weil Representation]. In the split case, the character χ of E^* is of the form $\chi((x,y)) = \chi_1(x)\chi_2(y)$, and then condition in (20.7.3.5) just says $\chi_1 \neq \chi_2$. Then:

$$(\pi(\chi), W(\chi)) \cong \mathcal{B}(\chi_2, \chi_1)$$

⌟

Proof: The intertwining operator is given by

$$L : W(\chi) \to \mathcal{B}(\chi_2, \chi_1) : (L\Phi)(g) = (\omega(g)\Phi)((1, 0)).$$

Firstly $L\Phi \in \mathcal{B}(\chi_2, \chi_1)$ by direct verification for $t(a), T_1(k)$ and $n(z)$. Then it is an intertwining operator is clear.

Then this is an isomorphism because both are of dimension $q + 1$(18.6.10.8) and $\mathcal{B}(\chi_2, \chi_1)$ is irreducible(18.6.10.4). □

Def. (18.6.10.11) [Cuspidal Representation]. $(\pi, V) \in \mathrm{Rep}^{\mathrm{fd}}(GL(2, k))$ is called a **cuspidal representation** if the Jacquet module $J(V) = 0$. Notice in this finite case, this is equivalent to V has no $N(k)$-fixed vector, because the contragradient is well-known as $\mathrm{Rep}(G)$ is semisimple, and the trivial isotropic parts correspond, unlike the p-adic case. ⌟

Lemma (18.6.10.12). If (π, V) is a cuspidal representation of $GL(2, k)$, then the dimension of V is a multiple of $q - 1$. ⌟

Proof: Because $N(k) \cong F$, any character of $N(k)$ is of the form $\psi_a(n(x)) = \psi(ax)$. Now decompose the contragradient representation V^* of G into isotypic parts of $N(k)$:$V^* = \oplus_{a\in F} V^*(a)$, then the hypothesis implies $V^*(0) = 0$.

Notice that the group $T_1(k)$ acts transitively on the spaces $V^*(a), a \neq 0$ by $\widehat{\pi}(\begin{bmatrix} t & \\ & 1 \end{bmatrix})l$, because

$$\begin{bmatrix} t & \\ & 1 \end{bmatrix} \begin{bmatrix} 1 & x/t \\ & 1 \end{bmatrix} = \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \begin{bmatrix} t & \\ & 1 \end{bmatrix}.$$

So the dimension of V is a multiple of $q - 1$. □

Prop. (18.6.10.13) [Anisotropic Representation]. In the anisotropic case, the Weil representation $(\pi(\chi), W(\chi))$ is cuspidal and irreducible. ⌟

Proof: Suppose it is not cuspidal, then it contains a non-zero $N(k)$-fixed vector Φ_0(18.6.10.11), which means $\Phi_0(x) = w(n(z)\Phi_0)(x) = \psi(zN(x))\Phi(x)$. Now $\Phi_0(0) = 0$ because χ is nontrivial on E_1^*, and if $x \neq 0$, then there is a z that $\psi(zN(x)) \neq 1$ because ψ is non-trivial, so $\Phi_0(x) = 0$ also, so $\Phi_0 = 0$, contradiction.

Finally, subrepresentation of cuspidal representation is cuspidal by(18.6.10.11), then $(\pi(\chi), W(\chi))$ is irreducible, by the fact it is of dimension $q - 1$(18.6.10.8) and lemma(18.6.10.12). □

Prop. (18.6.10.14) [Classification of Representations of $GL(2, k)$]. There is a list of all irreducible representations of $GL(2, k)$:

- $q - 1$ 1-dimensional representations $\chi(\deg g)$, where χ is a character of $k^\times$.
- $\frac{(q-1)(q-2)}{2}$ principal series representations of dimension $q + 1$.
- $q - 1$ Steinberg representations(with twists) of dimension q.
- $\frac{q(q-1)}{2}$ cuspidal Weil representations of dimension $q - 1$.

⌟

Proof: All these are irreducible representations by(18.6.10.4)(18.6.10.5) and(18.6.10.13). It suffices to show they are not isomorphic. Notice different kind of representation have different dimensions, thus it suffices to compare the same representations.

For principal series representations $\mathcal{B}(\chi_1,\chi_2),\chi_1 \neq \chi_2$, their isomorphisms are known by(18.6.10.4). For Steinberg representations, twisting are clearly different. For cuspidal Weil representations, there are q^q-q way of choosing χ(20.7.3.5) and **?** Cf.[Local Langlands For GL(2)].

Finally, they are all the irreducible representations by the fact $\sum d_\sigma^2 = |G| = (q-1)^2 q(q+1)$(18.1.3.4). □

Whittaker Models

Def. (18.6.10.15) [Whittaker Functionals & Whittaker Models]. Let (π, V) be an irreducible representation of $GL(2,k)$, then the notion of **Whittaker functional** and **Whittaker model** is defined as in(18.11.3.1). ⌟

Prop. (18.6.10.16) [Existence and Uniqueness of Whittaker Models]. Let $\mathcal{G}$ be the representation of $GL(2,k)$ induced from the character $\psi_N(n(z)) = \psi(z)$ on $N(k)$, then it is multiplicity-free, and every irreducible representation of dimension> 1 occurs in it. Notice that this is just the existence and uniqueness of Whittaker models. ⌟

Proof: To show multiplicity free, it suffices to show $\mathrm{End}_{GL(2,k)}(\mathcal{G})$ is commutative, by Shur's lemma(11.10.2.4). Then we use**??**, which says this ring is isomorphic to the ring of functions Δ on G that

$$\Delta(n_2 g n_1) = \psi_N(n_2)\Delta(g)\psi_N(n_1).$$

where the multiplication is convolution**??**.

Notice it follows from the the Bruhat Decomposition(12.11.5.5) that the double coset $N(k)\backslash GL(2,k)/N(k)$ is uniquely represented by matrices with exactly two non-zero entries. Then it is clear a diagonal coset can support a function Δ iff it is a scalar multiple of I. In other words, the representatives are

$$\begin{bmatrix} a & \\ & a \end{bmatrix}, \quad \begin{bmatrix} & b \\ c & \end{bmatrix}.$$

Consider the involution of G given by

$$\iota(g) = w_1 g^t w_1^{-1},$$

then it is an anti-involution of G and it induces isomorphism on $N(k)$, so it induces an anti-involution of order two on the ring of functions Δ by $\iota(\Delta)(g) = \Delta(\iota(g))$. Notice this is an anti-involution because of(11.10.1.27) and the fact a finite group is unimodular. But this anti-involution fixes the representatives as above, so it is in fact identity on these Δ, which proves the convolution is commutative.

For the last assertion, just notice the dimension of $\mathcal{G}$ is $(q-1)(q^2-1)$, and the sum dimensions of irreducible representations of dimension> 1 is just $(q-1)(q^2-1)$ by(18.6.10.14). □

Cor. (18.6.10.17). Frobenius reciprocity(11.10.5.5) implies that the space of Whittaker functionals is of dimension 1 for any irreducible representation of dimension> 1. ⌟

11 SL(n)

Def. (18.6.11.1) [Drinfeld Curves]. The **Drinfeld curve** is defined to be the affine plane curve $\mathrm{Dri}/\mathbb{A}_q^2$

$$\mathrm{Dri} : x^q y - x y^q = 1$$

with completion $\overline{\mathrm{Dri}} = \mathrm{Dri} \cup \{\infty\} \subset \mathbb{P}_q^2$. ⌟

Prop. (18.6.11.2). There is a natural $\mu_{q+1} \times SL(2,\mathbb{F}_q)$-action on Dri, which induces a map on $H^*_{\text{ét},c}(\text{Dri},\mathbb{Q}_\ell)$. Then we get the Deligne-Lustig induction

$$R^G_{T'} : \mu^*_{q+1} \to K_0(\text{Rep}^{\text{fd}}(SL(2,\mathbb{F}_q)).$$

18.8 Representations of Semisimple Lie Algebras and Category $\mathcal{O}$

Main references are[Eti21] and[Car05].

This section studies representations of split semisimple Lie algebras. For a split semisimple Lie algebra $(\mathfrak{g},\mathfrak{h})$, we use notations as in(3.7.3.30).

1 Semisimple Representations

Lemma (18.8.1.1). If $\mathfrak{g}$ is a semisimple Lie algebra over k, then every 1-dimensional representation of $\mathfrak{g}$ is trivial. ⌟

Proof: Such a representation vanishes at $[\mathfrak{g},\mathfrak{g}]$, which equals $\mathfrak{g}$ by(3.7.2.4). □

Prop. (18.8.1.2) [Weyl]. For a Lie algebra $\mathfrak{g}$ over a field k,

- If the adjoint representation $\mathfrak{g}\to\mathfrak{gl}_{\mathfrak{g}}$ is semisimple, then $\mathfrak{g}$ is semisimple.
- If $\mathfrak{g}$ is semisimple and k has characteristic 0, then $\mathrm{Rep}(\mathfrak{g})$ is semisimple.

⌟

Proof: If the adjoint representation of $\mathfrak{g}$ is semisimple, then every ideal of $\mathfrak{g}$ has a complement, thus if $\mathfrak{g}$ is not semisimple, it has a dimension 1 quotient. But notice the Lie algebra k of dimension 1 has non-semisimple representations, for example $c\mapsto\begin{bmatrix}0&0\\c&0\end{bmatrix}$, contradiction.

Semisimplicity of a Lie algebra is invariant under base change, also does simplicity of the category of representations(18.8.1.4), so we can assume that k is alg.closed. Now we need to show that any proper submodule W of a $\mathfrak{g}$-module V has a complement.

Assume first that $\dim V/W=1$ and W is a simple $\mathfrak{g}$-module. This implies $\mathfrak{g}$ acts trivially on V/W by(18.8.1.1). Let c_V be the Casimir element of V(3.7.9.11), then c_V is also trivial on V/W. And c_V acts as a nonzero scalar on W as W is simple, by(3.7.9.11). Then the kernel of c_V is of 1-dimensional, and is a $\mathfrak{g}$-complement of W in V.

Next if $\dim V/W=1$ but W is not simple $\mathfrak{g}$-module, then there is a submodule $W'\subset W$. By induction, the $\mathfrak{g}$-submodule W/W' has a complement V'/W' in V/W'. Then V'/W' has dimension 1, thus by induction, $V'=W'\oplus L$ for some 1-dimensional $\mathfrak{g}$-module. Then L is complementary to W in V.

Finally for the general case, let $\mathfrak{g}$ acts on $\mathrm{Hom}_k(V,W)$, consider the subspaces V_1,W_1 of $\mathrm{Hom}_k(V,W)$, where V_1 is the subspace of maps that restriction to W is a constant multiple of identity, and W_1 is the subspaces of W consisting of maps vanishing on W. They are both $\mathfrak{g}$-modules and $\dim V_1/W_1=1$. Then the above case shows $V_1=W_1\oplus L$ for some 1-dimensional $\mathfrak{g}$-module L. Because $\mathfrak{g}$ acts trivially on L(18.8.1.1), this means $L=\mathbb{F}f$ consists of $\mathfrak{g}$-homomorphisms. But $f|_W$ is non-zero constant, so the kernel of f is a complement of W in V. □

Cor. (18.8.1.3). Let (V,ρ) be a representation of a semisimple Lie algebra $\mathfrak{g}$ and $f:\mathfrak{g}\to V$ a linear map that

$$f([x,y])=\rho(x)f(y)-\rho(y)f(x),$$

then there exists a $v_0\in V$ that $f(x)=\rho(x)v_0$. ⌟

Proof: The condition on f is equivalent to $(f,\rho):\mathfrak{g}\to\mathfrak{af}(V)$(3.7.1.11) is a homomorphism of Lie algebras. And this induces a representation ρ' of $\mathfrak{g}$ on $V'=V\oplus k$ that $\rho'(x)(V')\subset V$ for all $x\in\mathfrak{g}$. Because $\mathfrak{g}$ is semisimple, there is a line $L\subset V'$ that $V'=V\oplus L$ and $\mathfrak{g}$ acts trivially on L(18.8.1.1).

In other words, there is a vector $(-v_0, 1)$ that $\rho'(x)(-v_0, 1) = 0$ for all $x \in \mathfrak{g}$. So $f(x) = \rho(x)(v_0)$ for all x. So we are done. □

Prop. (18.8.1.4) [Semisimplicity and Extension]. Let $\mathfrak{g}$ be a Lie algebra over a field k. If $\mathrm{Rep}(\mathfrak{g}_K)$ is semisimple for some extension field K/k, then also is $\mathrm{Rep}(\mathfrak{g})$. ⌟

Proof: This is because for any representation (V, ρ) of $\mathfrak{g}$, $K \otimes_k \mathrm{End}(\rho) \cong \mathrm{End}(\rho_K)$, because this is true for $\mathrm{End}(V)$, and being $\mathfrak{g}$-equivariant is a linear condition. Then we can use(3.6.1.25) and(3.6.1.26). □

Prop. (18.8.1.5) [Semisimple Representations]. The following conditions on a representation $\mathfrak{g} \to \mathfrak{gl}_V$ are equivalent:

- ρ is semisimple.
- $\rho(\mathfrak{g})$ is reductive and its center consists of semisimple endomorphisms.
- $\rho(\mathfrak{r})$ consists of semisimple endomorphisms.
- The restriction of ρ to $\mathfrak{r}$ is semisimple.

⌟

Proof: $1 \to 2$: If ρ is semisimple, then $\rho(\mathfrak{g})$ is reductive by(3.7.4.4). Its center consists of semisimple endomorphisms by [Mil13]P60**?**.

$2 \to 3$: This is because if $\rho(\mathfrak{g})$ is reductive, then its center equals its radical and contains $\rho(\mathfrak{r})$, so $\rho(\mathfrak{r})$ consists of semisimple endomorphisms.

$3 \to 4$: [Mil13]P60**?**.

$4 \to 1$: [Mil13]P60**?**. □

Cor. (18.8.1.6). Let ρ and ρ' be representations of $\mathfrak{g}$. If ρ and ρ' are semisimple, then so are $\rho \otimes \rho'$ and $\rho^\vee$.

In particular, the category $\mathrm{Rep}^{ss}(\mathfrak{g})$ of semisimple representations of a Lie algebra $\mathfrak{g}$ form a Tannakian category, thus there is an algebraic group G that $\mathrm{Rep}^{ss}(\mathfrak{g}) = \mathrm{Rep}(G)$. ⌟

Proof: Use the third criterion, for any $x \in \mathfrak{r}$, as $\rho(x), \rho'(x)$ are semisimple, so is $\rho(x) \otimes \rho'(x)$, so $\rho \otimes \rho'$ is also semisimple by(18.8.1.5). □

representations of $\mathfrak{sl}_2(\mathbb{C})$

Def. (18.8.1.7) [Primitive Element]. Let V be a $\mathfrak{sl}_2$-module, an element $v \in V$ is called **primitive of weight** λ if it is non-zero and $Xe = 0, He = \lambda e$. ⌟

Prop. (18.8.1.8). Every non-zero f.d. $\mathfrak{sl}_2$-module contains a primitive element. ⌟

Proof: en element e is primitive iff the line generated by e is stable under the action of $\{X, H\}$: if $Xe = \lambda e$ and $He = \mu e$, then using the $[H, X] = 2X$, we see that $2\lambda 0$, thus $\lambda = 0$, and e is primitive. So each f.d. $\mathfrak{sl}_2$-module contains a primitive element, by Lie's theorem(3.7.1.24). □

Prop. (18.8.1.9) [Submodule Generated by Primitive Element]. Let V be a $\mathfrak{sl}_2$-module and $e \in V$ a primitive element of weight λ. Let $e_n = Y^n e/n!$, and $e_{-1} = 0$, then we have

$$He_n = (\lambda - 2n)e_n, \quad Ye_n = (n+1)e_{n+1}, \quad Xe_n = (\lambda - n + 1)e_{n-1}.$$

⌟

Proof: By induction on n,

$$HY^n e = ([H,Y]+YH)Y^{n-1}e = (\lambda-2(n-1)-2)Y^n e = (\lambda-2n)e.$$

$Ye_n = (n+1)e_{n+1}$ is obvious.

And

$$\begin{aligned} nXe_n &= XYe_{n-1} = [X,Y]e_{n-1} + YXe_{n-1} \\ &= He_{n-1} + (\lambda-n+2)Ye_{n-2} \\ &= (\lambda-2n+2+(\lambda-n+2)(n-1))e_{n-1} \\ &= n(\lambda-n+1)e_{n-1} \end{aligned}$$

□

Cor. (18.8.1.10). Only two cases arise: either

- The elements $\{e_n\}$ are linearly independent.
- The elements $e_0, e_1, \ldots, e_m$ are linearly independent, and $e_{m+1} = e_{m+2} = \ldots = 0$, and weight λ of e equals m.

And if V is f.d., then case 1 cannot happen, and the subspace W generated by $e_0, \ldots, e_m$ is a $\mathfrak{g}$-module and it is irreducible. ⌟

Proof: Because each e_i has different eigenvalue under action of H, thus if they are all nonzero, then they are linearly independent. If $e_0, e_1, \ldots, e_m$ are linearly independent, and $e_{m+1} = e_{m+2} = \ldots = 0$, then by the proposition,

$$Xe_{m+1} = (\lambda - m)e_m$$

and $e_{m+1} = 0$ with $e_m \neq 0$, thus $\lambda = m$. Now the formulas in(18.8.1.9) shows that W is a $\mathfrak{g}$-module. And if $W' \subset W$ is a subspace invariant under $\mathfrak{g}$, then it contains some eigenvalues e_k of H, and then the formulas in(18.8.1.9) shows it contains all $e_0, e_1, \ldots, e_m$, thus $W' = W$. Thus W is irreducible. □

Prop. (18.8.1.11) [Irreducible Representations of $\mathfrak{sl}_2(\mathbb{C})$]. Let $W_m = \{e_0, \ldots, e_m\}$ be a $m+1$-dimensional vector space and $\mathfrak{sl}_2$ acts on W_m by

$$He_n = (m-2n)e_n, \quad Ye_n = (n+1)e_{n+1}, \quad Xe_n = (m-n+1)e_{n-1}.$$

Then W_n is a f.d. irreducible representation of $\mathfrak{sl}_2$, and any f.d representation of $\mathfrak{sl}_2$ of dimension $m+1$ is isomorphic to one of W_m. ⌟

Proof: The first assertion follows from(18.8.1.10) and the fact e_0 is a primitive element. For the second assertion, notice any f.d. representation W of $\mathfrak{g}$ contains a primitive element(18.8.1.8) thus by(18.8.1.10) generates an irreducible $\mathfrak{sl}_2$-submodule W_n, thus this submodule equals W, and $n+1 = m+1$, thus $n = m$. □

Remark (18.8.1.12). Notice this is special case of(18.8.2.15). ⌟

Cor. (18.8.1.13). W_0 is the just trivial action of $\mathfrak{sl}_2$, W_1 is isomorphic to the natural action of $\mathfrak{sl}_2$ on $\mathbb{C}^2$, and W_2 is isomorphic to the adjoint action of $\mathfrak{sl}_2$ on itself. ⌟

Proof: In fact, W_1 can be identified with the vector space $\mathbb{C}\{x,y\}$ where

$$Hx = x, Hy = -y, Yx = y, Yy = 0, Xy = x, Xx = 0.$$

Then the m-th symmetric tensor of W_1 is isomorphic to the vector space of polynomials in x, y of degree m, and by(3.7.9.2),

$$H(C_m^k y^k x^{m-k}) = (m-2k)(C_m^k y^k x^{m-k}),$$

$$Y(C_m^k y^k x^{m-k}) = (k+1)(C_m^{k+1} y^{k+1} x^{m-k-1}),$$
$$X(C_m^k y^k x^{m-k}) = (m-k+1)(C_m^{k-1} y^{k-1} x^{m-k+1}).$$

So it is isomorphic to W_{m+1}. □

Cor. (18.8.1.14) [Representations of $\mathfrak{sl}_2(\mathbb{K})$]. Let $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$,

- Any f.d. representation V of $\mathfrak{sl}_2(\mathbb{K})$ is isomorphic to a direct sum of W_ms, and Thus
- The endomorphism on V induced by H is diagonalizable and with integral eigenvalues. if $\pm n$ are eigenvalues of H, then so are $n-2, n-4, \ldots, 4-n, 2-n$.
- For any $n \geq 0$, the linear maps

  $$Y^n : V^n \to V^{-n}, X^n : V^{-n} \to V^n$$

  are isomorphisms. In particular, V^{-n} and V^n have the same dimensions.

⌟

Proof: by Weyl's theorem(18.8.1.2), any representation of $\mathfrak{sl}_2(\mathbb{K})$ is isomorphic to a direct sum of irreducible representations, and the irreducible representations of $\mathfrak{sl}_2(\mathbb{C})$ clearly comes from real representations of $\mathfrak{sl}_2(\mathbb{R})$, thus irreducible representations of $\mathfrak{sl}_2(\mathbb{R})$ must be of the same form(otherwise tensor with $\mathbb{C}$ and decompose, and use conjugation).

Because we can assume V is one of W_m, so the other assertions are clear. □

2 Verma Modules

Def. (18.8.2.1) [Weights]. Let $(\mathfrak{g}, \mathfrak{h})$ be a semisimple Lie algebra with root system R and V is a $\mathfrak{g}$-module. If $\lambda \in \mathfrak{h}^*$, a vector $v \in V$ is said to have weight λ iff $hv = \lambda(h)v$ for any $h \in \mathfrak{h}$. The space of vectors in V of weight λ is denoted by $V[\lambda]$. An **integral weight** is a weight λ of the form $\lambda = \sum n_i \alpha_i^\vee$, where $\alpha_i \in R$, equivalently its values on h_i are all integers.

V is said to have a **weight decomposition** if $V = \oplus_{\lambda \in \mathfrak{h}^*} V[\lambda]$. ⌟

Prop. (18.8.2.2). Any f.d. $\mathfrak{g}$-module V has a weight decomposition, and the weights are all integral. ⌟

Proof: For any i, V is a $\mathfrak{s}_i = \{e_i, h_i, f_i\}$-module(3.7.3.20), so by the representation theory of $\mathfrak{sl}_2$, h_i acts semisimply on V, and the eigenvalues are integers. Thus $\mathfrak{h}$ acts semisimply on V, thus there is a weight decomposition, and the weights are all integral. □

Def. (18.8.2.3) [Highest Weight Representations]. A vector $v \in V$ is called a **highest weight vector** if it is a weight vector and $\mathfrak{n}_+ v = 0$, or equivalently $e_i v = 0$ for any e_i. A **highest weight representation** with highest weight λ is a representation that is generated by a highest weight vector of weight λ. ⌟

Prop. (18.8.2.4). Any f.d. $\mathfrak{g}$-module contains a highest weight vector, thus any irreducible f.d $\mathfrak{g}$-representation is a highest weight representation. ⌟

Proof: Let $P = \sum_i \alpha_i^\vee$, and choose a weight λ that (λ, P) is maximal, then $e_i v$ has weight $\lambda + \alpha_i$, thus $e_i v = 0$ for any i. □

Verma Modules

Def. (18.8.2.5) [Verma Modules]. Let $\lambda \in \mathfrak{h}^*$, $I_\lambda \subset U(\mathfrak{g})$ be the left ideal generated by the elements $h - \lambda(h)$ and e_i, then the **Verma module** $M_\lambda = U(\mathfrak{g})/I_\lambda$. has a weight decomposition, and it is a highest weight representation with highest vector $v_\lambda = \overline{1}$ with weight λ. ⌟

Prop. (18.8.2.6) [M_λ is Noetherian]. M_λ satisfies ascending chain condition on f.d. submodules. ⌟

Proof: This is because $U(\mathfrak{g})$ is left Noetherian(3.7.8.16) and $M_\lambda = U(\mathfrak{g})/I_\lambda$. □

Prop. (18.8.2.7). The map $\varphi : U(\mathfrak{n}_-) \to W_\lambda : \varphi(x) = xv_\lambda$ is an isomorphism of left $U(\mathfrak{n}_-)$-modules. ⌟

Proof: This follows from PBW theorem. □

Cor. (18.8.2.8). M_λ has a weight decomposition with $P(M_\lambda) = \lambda - Q^+$, and weight spaces of M_λ are all of f.d.. ⌟

Prop. (18.8.2.9). If V is a $\mathfrak{g}$-module and $v \in V$ is a highest weight vector, then there is a unique homomorphism $M_\lambda \to V$ of $\mathfrak{g}$-modules that maps v_λ to v. ⌟

Cor. (18.8.2.10). Every highest weight representation has a decomposition into f.d. weight spaces. And they have a unique highest weight vector up to a scalar. ⌟

Prop. (18.8.2.11) [Quotient of Verma Modules]. M_λ has a unique irreducible quotient L_λ. In particular, L_λ is a quotient of every highest weight representation of $\mathfrak{g}$ with weight λ, by(18.8.2.9). ⌟

Proof: As M_λ has a weight decomposition, any submodule Y of M_λ has a weight decomposition, and cannot has weight λ, otherwise it generates M_λ by(18.8.2.10). Then the sum J_λ of all proper submodules of M_λ also cannot have weight λ, thus also proper. Then $L_\lambda = M_\lambda/J_\lambda$ is the unique irreducible quotient of M_λ. □

Cor. (18.8.2.12) [Classification of Irreducible Highest Weight Representations]. Any irreducible highest weight representation of $\mathfrak{g}$ is of the form L_λ where $\lambda \in \mathfrak{h}^*$. ⌟

Prop. (18.8.2.13) [Composition Factors of Verma Modules]. The Verma module M_λ has a finite composition series $M_\lambda = N_0 \supset N_1 \supset \ldots \supset N_r = 0$ that each N_i/N_{i+1} is irreducible and isomorphic to $L_{\omega(\lambda+\rho)-\rho}$ for some $\omega \in W$. ⌟

Proof: We can find a(not necessarily finite) series of submodules of M_λ that the subquotients are irreducible as M_λ satisfies ascending chain condition on submodules(18.8.2.6). □

Lemma (18.8.2.14). Let V be a $\mathfrak{g}$-module with weight decomposition into f.d. weight spaces. If V is a sum of f.d. $\mathfrak{s}_i$-modules for each i, then for each $\lambda \in P$ and $w \in W$, $\dim V[\lambda] = \dim V[w\lambda]$. ⌟

Proof: As W is generated by s_i, it suffices to prove for $w = s_i$, $\dim V[\lambda] = \dim V[w\lambda]$.

If $(\lambda, \alpha_i^\vee) = m \geq 0$ for some i, consider the operator $f_i^m : V[\lambda] \to V[s_i\lambda]$ is an isomorphism by hypothesis and the representation theory of $\mathfrak{sl}_2$. Similarly, if $(\lambda, \alpha_i^\vee) = -m \leq 0$, then $e_i^m : V[\lambda] \to V[s_i\lambda]$ is an isomorphism. □

Prop. (18.8.2.15) [Classification of F.D. Irreducible Representations]. F.d. irreducible representations of $\mathfrak{g}$ are classified by their highest dominant integral weights $\lambda \in P^+$ via the bijection $\lambda \mapsto L_\lambda$. Moreover, for any $\mu \in P$ and $w \in W$, $\dim L_\lambda[\mu] = \dim L_\lambda[w\mu]$. ⌟

Proof: Firstly if V is a f.d. $\mathfrak{g}$-module, then $\lambda \in P^+$ by(18.8.2.2). Now if $\lambda \in P^+$, then in L_λ, $f_i^{\lambda(h_i)+1} v_\lambda = 0$ for any i, because by(18.8.1.9), $e_i f_i^{\lambda(h_i)+1} v_\lambda = 0$, and $e_j f_i^{\lambda(h_i)+1} v_\lambda = 0$ for $j \neq i$ as v_λ is a highest weight vector. So $f_i^{\lambda(h_i)+1} v_\lambda$ generates a proper submodule of L_λ, which must be 0 as it cannot contain v_λ, and L_λ is irreducible.

Thus v_λ generate the $\mathfrak{s}_i$-module of highest weight $\lambda(h_i)$, and any element of $\mathfrak{g}$ generate a f.d. $\mathfrak{s}_i$-module, so V is a sum of f.d. $\mathfrak{s}_i$-modules for each i, thus by lemma(18.8.2.14), $\dim L_\lambda[\mu] = \dim L_\lambda[w\mu]$. To show L_λ is of f.d., first notice $P(L_\lambda) \cap P^+$ is finite, and $WP^+ = P$(3.9.2.16), and the fact $P(L_\lambda)$ is W-invariant. □

Prop. (18.8.2.16). $L_\lambda^* = L_{-w_0\lambda}$. ⌟

Proof: It suffices to show the lowest weight of L_λ is $w_0\lambda$: $w_0\lambda$ is a weight by(18.8.2.15), and if $\lambda' < w_0\lambda$, then $w_0\lambda' > \lambda$. □

Lemma (18.8.2.17). The representation L_n of $\mathfrak{sl}_2$ is of real type if n is even and of quaternion type if n is odd. ⌟

Proof: $L_n = \mathrm{Sym}^n L_1$, thus we can take the bilinear form $\mathrm{Sym}^n B$, where B is the alternating form on $L_1 \cong \mathbb{C}^2$, which is symmetric if n is even and alternating if n is odd. □

Prop. (18.8.2.18) [Type of Irreducible Representations]. Let $\lambda \in P^+$ that $\lambda = -w_0\lambda$, so L_λ is self-dual by(18.8.2.16), and it is of real type if $n = (2\rho^\vee, \lambda)$ is even and of quaternion type if $(2\rho^\vee, \lambda)$ is odd. ⌟

Proof: The number n is the eigenvalue of h on v_λ, where $\{h, e, f\}$ is the principal $\mathfrak{sl}_2$-subalgebra, and the other eigenvalues are all smaller. Then $L_\lambda \cong L_n \oplus \bigoplus_{-i<n} L_{m_i}$, so the invariant form on L_λ restricts to a non-zero invariant form on L_n, so the assertion follows from(18.8.2.17). □

Fundamental Representations

Prop. (18.8.2.19) [Fundamental Representations]. The following are equivalent for a dominant integral weight ω of a split semisimple Lie algebra $\mathfrak{g}$:

- ω is minuscule(3.9.3.15).
- All weights of the representation L_ω belongs to the orbit $W\omega$.
- The restriction of L_ω to $\mathfrak{s}_i$ is a direct sum of 1-dimensional and 2-dimensional subrepresentations.

Such a representation L_ω is called a **fundamental representation** of $\mathfrak{g}$. ⌟

Proof: $1 \to 2$: By(18.8.2.15), for any weight μ of L_ω, there is a $w \in W$ that $w\mu$ is dominant and $\omega - w\mu \in Q^+$. Thus $w\mu = \omega$ by(3.9.3.17), and $\mu \in W\omega$.

$2 \to 1$: If ω is not minuscule, then there is some positive α that $(\omega, \alpha^\vee) > 1$, so $2(\omega, \alpha) < (\alpha, \alpha)$, and $\omega - \alpha$ is a weight of L_ω(the weight of $f_\alpha v_\omega$, and it is not conjugate to ω, as $(\omega-\alpha, \omega-\alpha) = (\omega,\omega) - 2(\alpha,\omega) + (\alpha,\alpha) < (\omega,\omega)$.

$2 \iff 3$: If ω is minuscule and $v \in L_\omega$ be a highest weight vector for $\mathfrak{s}_i$, then $h_{\alpha_i} v = \omega(h_\alpha) = (\omega, \alpha^\vee) = 0$ or v(3.7.3.21). Thus we get 4 by the representation theory of $\mathfrak{sl}_2$. The reverse argument is also true. □

Cor. (18.8.2.20). The character for a fundamental representation L_ω is

$$\chi_\omega = \sum_{w \in W} e^{w\omega}.$$

⌟

Prop. (18.8.2.21). Let ω be a minuscule weight, then for any dominant integral weight λ,

$$L_\omega \otimes L_\lambda \cong \oplus_{w \in W, \lambda + w\omega \in P^+} L_{\lambda + w\omega}.$$

⌟

Proof: By Weyl's character formula and(18.8.2.20),

$$\chi_{L_\omega \otimes L_\lambda} = \frac{\sum_{\mu \in W\omega} \sum_{w \in W} \varepsilon(w) e^{w(\lambda+\rho)+\mu}}{\Delta} = \frac{\sum_{\gamma \in W\omega} \sum_{w \in W} \varepsilon(w) e^{w(\lambda+\rho+\gamma)}}{\Delta}$$

If $\lambda+\gamma \notin P^+$, then $(\lambda+\gamma, \alpha_i^\vee) < 0$ for some i. But $(\gamma, \alpha_i^\vee) \geq -1$ as ω is minuscule, so $(\lambda+\gamma, \alpha_i^\vee) = -1$, and $(\lambda+\gamma+\rho, \alpha_i^\vee) = 0$. Then for such γ, in the summand the w term cancels with ws_i term. Thus the summand equals the character for $\sum_{w \in W} e^{w\omega}$. Then we finish by(18.8.3.3). □

Prop. (18.8.2.22) [Fundamental Representations for Simple Lie Algebras]. By(3.9.3.20),

- for B_n, the fundamental representation corresponding to the minuscule weights ω_n is called the **Spin representation**, denoted by S.
- for C_n, the fundamental representation corresponding to the minuscule weights ω_1 is the standard representation of $\mathfrak{sp}_{2n}$.
- for D_n, the fundamental representation corresponding to the minuscule weights $\omega_1, \omega_{n-1}, \omega_n$ are the standard representation and two Spin representations S^+, S^-.
- for E_7, the unique fundamental representation has dimension 56**?**.
- for E_6, the two fundamental representations are dual, and have dimensions 27**?**.

⌟

Prop. (18.8.2.23) [Bott Periodicity for Spin Representations]. Let $\mathfrak{g} = \mathfrak{so}_m$, then the behavior of the spin representation of $\mathfrak{g}$ is

- S is of real type if $m \equiv 1, 7 \mod 8$.
- S is of quaternionic type if $m \equiv 3, 5 \mod 8$.
- S_+, S_- are of real type if $m \equiv 0 \mod 8$.
- $S_+^* \cong S_-$ are of complex type if $m \equiv 2, 6 \mod 8$.
- S_+, S_- are of quaternionic type if $m \equiv 4 \mod 8$.

⌟

Proof: We use(18.8.2.18). If $\mathfrak{g} = \mathfrak{so}_{2n}$, then $\rho^\vee = \rho = sum\omega_i = (n-1, n-2, \ldots, 1, 0)$, so $(2\rho^\vee, \omega_{n-1}) = (2\rho^\vee, \omega_n) = \frac{n(n-1)}{2}$.

If $\mathfrak{g} = \mathfrak{so}_{2n+1}$, then it can be verified that $\rho^\vee = (n, n-1, \ldots, 0)$, so $(2\rho^\vee, \omega_n) = \frac{n(n+1)}{2}$.

Also we need to consider w_0, so $\mathfrak{so}_{4n+2}$ are of complex type. □

3 Weyl Character Formula

Def. (18.8.3.1) [Central Characters of a Representation]. Let $V = \oplus_{\mu\in P} V[\mu]$ be a f.d. representation of a split semisimple Lie algebra $\mathfrak{g}$, the **central character** is an analytic function on $\mathfrak{h}$ that

$$\chi_V(h) = \sum_{\mu\in P} \dim V[\mu] e^{\mu(h)}.$$

In fact χ is an element in $\mathbb{Z}[e^{\alpha_1}, \ldots, e^{\alpha_r}, e^{-\alpha_1}, \ldots, e^{-\alpha_r}]$. ⌟

Thm. (18.8.3.2) [Weyl Characteristic Formula, Weyl1925]. Let $\lambda \in P^+$, then the character $\chi_\lambda = \chi_{L_\lambda}$ of the f.d. irreducible representation L_λ of $\mathfrak{g}$(18.8.2.15) is given by

$$\chi_\lambda = \frac{\sum_{w\in W} \varepsilon(w) e^{w(\lambda+\rho)}}{\Delta}.$$

where Δ is the Weyl denominator(18.8.4.3). ⌟

Proof: We already know that $\Delta\chi_\lambda \sum_{\mu\in P} c_\mu e^\mu$ is W-anti-invariant, $c_{\lambda+\rho} = 1$, and $c_\mu = 0$ unless $\mu \in \lambda + \rho - Q^+$, so it suffices to show $c_\mu = 0$ if $\mu \in P^+ \cap (\lambda + \rho - Q^+)$ and $\mu \neq \lambda + \rho$.? □

Cor. (18.8.3.3) [Characters Determine Representations]. F.d. representations of a semisimple Lie algebra is determined by its characters, as the maximal exponent of χ_λ are different for different λ. ⌟

Cor. (18.8.3.4). For $\mathfrak{sl}_2(\mathbb{C})$, $\chi_{W_n}(z) = e^{nz} + e^{(n-2)z} + \ldots + e^{-nz} = \frac{e^{(n+1)z} - e^{-(n+1)z}}{e^z - e^{-z}}$. Notice these functions are linearly independent, so by(18.8.1.14), representations of $\mathfrak{sl}_2(\mathbb{C})$ are determined by their characters. ⌟

Cor. (18.8.3.5) [Weyl Denominator Formula].

$$\Delta = \sum_{w\in W} \varepsilon(w) e^{w\rho}.$$

⌟

Proof: This follows from the Weyl character formula by setting $\lambda = 0$. □

Prop. (18.8.3.6) [Kostant's Multiplicity Theorem]. Let $\mathfrak{g}$ be a split semisimple Lie algebra and $\lambda \in P^+$, then

$$\dim L_\lambda[\gamma] = \sum_{w\in W} \varepsilon(w) \mathfrak{P}(w(\lambda+\rho) - \rho - \gamma).$$

where $\mathfrak{P}$ is the Kostant's partition function(3.9.2.19). ⌟

Proof: This follows from the formula

$$\Delta^{-1}=e^{-\rho}\frac{1}{\prod_{\alpha\in R^+}(1-e^{-\alpha})}=e^{-\rho}\sum_{\alpha\in Q(R)}\mathfrak{P}(\alpha)e^{-\alpha}.$$

applied to Weyl's character formula(18.8.3.2). □

Prop. (18.8.3.7) [Steinberg's Multiplicity Formula]. Let $\lambda,\mu\in P^+$, then

$$L_\lambda\otimes L_\mu\cong\sum_{\nu\in P^+}c_{\lambda\mu\nu}L_\nu,$$

where

$$c_{\lambda\mu\nu}=\sum_{w,w'\in W}\varepsilon(w)\varepsilon(w')\mathfrak{P}(w(\lambda+\rho)+w'(\mu+\rho)-(\nu+2\rho)).$$

where $\mathfrak{P}$ is the Kostant's partition function(3.9.2.19). ⌟

Proof: Cf.[Cartar, P265]. □

Cor. (18.8.3.8) [Clebsch-Gordan Rule]. The tensor products of representations of $\mathfrak{sl}_2(\mathbb{C})$ satisfy

$$W_m\otimes W_n\cong\bigoplus_{i=0}^{\min(m,n)}W_{|m-n|+2i}.$$

⌟

Proof: This follows from(18.8.3.7) or from(18.8.3.4). □

Prop. (18.8.3.9) [Weyl Dimension Formula]. Let $\mathfrak{g}$ be a split semisimple Lie algebra and $\lambda\in P^+$, then

$$\dim L_\lambda=\frac{\prod_{\alpha\in R^+}(\alpha,\lambda+\rho)}{\prod_{\alpha\in R^+}(\alpha,\rho)}$$

⌟

Proof: Choose an element $h_\rho\in\mathfrak{h}$ that corresponds to $\rho\in\mathfrak{h}^*$ via the Killing form, then

$$\chi_\lambda(2th_\rho)=\frac{\sum_{w\in W}\varepsilon(w)e^{2t(w(\lambda+\rho),\rho)}}{\prod_{\alpha\in R^+}(e^{t(\alpha,\rho)}-e^{-t(\alpha,\rho)})}.$$

The crucial fact is that we can use Weyl's denominator formula(18.8.3.5) on the nominator, to get

$$\chi_\lambda(2th_\rho)=\frac{\prod_{\alpha\in R^+}(e^{t(\alpha,\lambda+\rho)}-e^{-t(\alpha,\lambda+\rho)})}{\prod_{\alpha\in R^+}(e^{t(\alpha,\rho)}-e^{-t(\alpha,\rho)})}.$$

Now taking limit $t\to 0$, we get the desired formula. □

Remark (18.8.3.10). The Weyl dimension formula can be used to determine a representation V is irreducible or not: First calculate the maximal weight, then used the Weyl dimension formula to calculate the dimension to see if it is equal to the dimension of V. ⌟

4 Category $\mathcal{O}$

Def. (18.8.4.1) [$\mathcal{O}_{int}$]. Let $(\mathfrak{g}, \mathfrak{h})$ be a split semisimple Lie algebras, the category $\mathcal{O}_{int}$ is the category of representations V of $\mathfrak{g}$ that with weight decomposition into f.d. weight spaces that the weights $P(V)$ is contained in the union of sets $\lambda^i - Q^+$ for f.m. weights $\lambda^1, \ldots, \lambda^N \in P^\vee(R)$. ⌟

Def. (18.8.4.2)[Characters]. The character for a f.d. representation can be extended to category $\mathcal{O}_{int}$ as a formal Laurent series

$$\chi \in \mathbb{Z}[[e^{-\alpha_1^\vee}, \ldots, e^{-\alpha_r^\vee}]][e^{\alpha_1^\vee}, \ldots, e^{\alpha_r^\vee}] : \chi_V(h) = \sum \dim V[\mu] e^{\mu(h)}.$$

⌟

Prop. (18.8.4.3). The character of M_λ is given by

$$\chi_{M_\lambda} = \frac{e^\lambda}{\prod_{\alpha \in R^+}(1 - e^{-\alpha})} = \frac{e^{\lambda+\rho}}{\Delta}, \quad \Delta = \prod_{\alpha \in R^+} (e^{\alpha/2} - e^{-\alpha/2}).$$

where Δ is called the **Weyl denominator** of $\mathfrak{g}$. ⌟

18.9 Representations of (Non-Compact)Lie Groups

Notation (18.9.0.1).

- Use notations as in Lie Groups.

⌟

Remark (18.9.0.2) [Non-compact Lie Groups]. The feature of representations of non-compact Lie groups is most intersecting representations are infinite dimensional and involves topologies. The vector space V is assumed to be Hausdorff, second countable and complete, locally convex, and separable. ⌟

1 Basics

Prop. (18.9.1.1) [Left Invariant Differential Operators]. For a connected Lie group G, consider its left and right regular action λ, ρ on $C^\infty(G)$(11.10.1.1). We may write $\mathrm{d}X$ for $X \in \mathfrak{g}$ as the representation of $\mathfrak{g}$ via ρ, then it commutes with λ. Then it induces a map of $U(\mathfrak{g})$ to the ring of left G-invariant differential operators on G.(3.7.8.1). ⌟

Prop. (18.9.1.2) [Center element Bi-invariant]. If G is a connected Lie group with Lie algebra $\mathfrak{g}$ and $D \in Z(U(\mathfrak{g}))$, then the differential operator D defined in(18.9.1.1) is invariant under both left and right regular representations of G. ⌟

Proof: The left invariance is general from(18.9.1.1), for the right invariance, Because G is connected, it suffices to prove invariance for a nbhd of identity of G, thus suffices to prove

$$\rho(g_t)D = D\rho(g_t), \quad g_t = \exp(tX).$$

For this, let $\varphi(g,t) = (\rho(g_t)D - D\rho(g_t))(g)$ and take derivative w.r.t t, then it reads:

$$\frac{\partial}{\partial t}\varphi(g,t) = (DdX\rho(g_t)f - dX\rho(g_t)Df)(g) = dX\varphi(g,t)$$

because dX commutes with D. And also $\varphi(g,0) = 0$, so by lemma(18.9.1.3), $\varphi(g,t) = 0$ for any t, g. □

Lemma (18.9.1.3). If G is a connected Lie group with Lie algebra $\mathfrak{g}$, and $\varphi \in C^\infty(G \times \mathbb{R})$ satisfies

$$\frac{\partial}{\partial t}\varphi(g,t) = \mathrm{d}X.\varphi(g,t)$$

for some $X \in \mathfrak{g}$ and $\varphi(g,0) = 0$, then $\varphi = 0$. ⌟

Proof: Let $\varphi_g(u,v) = \varphi(g\exp(uX), v)$, then the condition says

$$\frac{\partial}{\partial u}\varphi_g(u,v) = \frac{\partial}{\partial v}\varphi_g(u,v),$$

which means $\varphi_g(u,v) = F(u+v)$, and the fact $\varphi_g(u,0) = 0$ shows $F = 0$. □

Cor. (18.9.1.4). If $G = GL(2,\mathbb{R})^+$, then $\mathfrak{g} = \mathfrak{gl}_2(\mathbb{R})$, and the Casimir element(3.7.8.20) $\Delta = -1/2(1/2h^2 + ef + fe)$ corresponds via(18.9.1.1) to a bi-invariant differential operator on $C^\infty(G)$, and it is called the **Laplace-Beltrami operator**. ⌟

Differential Vectors

Def. (18.9.1.5) [Smooth Vectors]. Let V be a continuous representation of G on a locally convex TVS. we define the space V^∞ of **smooth vectors** of V as $V^\infty = \cap_n V^n$ where

$$V^0 = \{v \in V^{n-1}, \frac{d}{dt}\exp(t\xi)v \text{ exists,}\} \quad V^n = \{v \in V^{n-1}, T_\xi(v) \in V^{n-1}, \forall \xi \in \mathfrak{g}\}.$$

And V^∞ is given the inverse limit topology. ⌟

Prop. (18.9.1.6) [Action of Distribution on Smooth Vectors]. There is a continuous action of $Distr_c(G)$ on V^∞: $T \mapsto \pi(T)$ compatible with the convolution structure on $Distr_c(G)$. ⌟

Proof: For $v \in V^\infty$, define $F^v(g) = g(v)$. For $T \in Distr_c(G)$, define

$$\pi(T)v = (T, F^v)$$

. For example,

- $\pi(\delta_x) = \pi(x)$.
- $\pi(u) = u$ for $u \in U(\mathfrak{g})$.
- $\pi(fdg)v = \int_G f(g)\pi(g)vdg$ for $f \in C_c(G)$.
- $\pi(f * g) = \pi(f)\pi(g)$.

□

Cor. (18.9.1.7). If $f \in C_c^\infty(G)$, then for any $v \in V$, the vector $T_{f\mu_{Haar}}(v) \in V^\infty$. ⌟

Proof: Notice $X\pi(f)v = \pi(X * f)v$, and we calculate $X * f$:

$$(X * f, v) = \int \frac{d}{dt}\pi(e^{tX}y)vf(y)dy = \frac{d}{dt}\int f(y)\pi(e^{tX}y)vdy = \frac{d}{dt}\int f(e^{-tX}y)\pi(y)vdy = \pi(f_X)v$$

where $f_X(g) = \frac{d}{dt}(e^{-tX}g)|_{t=0}$ is smooth. Iterating, we can show $\pi(f)v \in V^\infty$. □

Cor. (18.9.1.8) [Smooth Vectors Dense]. V^∞ is dense in V. ⌟

Proof: Choose a Dirac sequence $\{f_n\}$, then $T_{f_n\mu_{Haar}}v \in V^\infty$ converges to v, by(18.9.1.6). □

Cor. (18.9.1.9). If V is a f.d. vector space, then $V^\infty = V$. ⌟

Prop. (18.9.1.10) [Smooth Vectors in S^1]. Let $K = S^1$ and ρ be the regular representation on the Hilbert space $L^2(K) = L^2[0, 2\pi]$, then the smooth vectors in ρ are just precisely the elements of $C^\infty(K)$. ⌟

Proof: Take a Fourier expansion $f(x) = \sum a_n e^{2\pi inx}$. Suppose f is a C^1 vector, then there is a $g(x) = \sum b_n e^{2\pi inx}$ that $\lim \frac{1}{t}(f_t - f) = g$, so

$$\lim \sum_n |\frac{1}{t}(e^{2\pi int} - 1)a_n - b_n|^2 = 0.$$

which means $b_n = 2\pi ina_n$.

So if f is a C^∞ vector, then $|a_n|$ decay rapidly, and f and all its derivatives converge absolutely so f is smooth. Conversely, integration shows the Fourier coefficients of any smooth function f decay rapidly. □

Examples

Prop. (18.9.1.11) [Store-Newmann]. The Heisenberg representation of H acting on $L^2(\mathbb{R})$ is unitary and irreducible, where $\pi(p_a) = e^{iax}\cdot$, and $\pi(r_b) = T_b$. ⌟

Prop. (18.9.1.12) [$\widetilde{SL_2(\mathbb{R})}$]. Let $\widetilde{SL_2(\mathbb{R})}$ be the universal covering of $SL_2(\mathbb{R})$. Then $\mathrm{Rep}_f(\widetilde{SL_2(\mathbb{R})}) = \mathrm{Rep}_f(SL_2(\mathbb{R}))$. In particular, $\widetilde{SL_2(\mathbb{R})}$ admits no f.d. faithful representations, and the only quotient groups of it that admit f.d. faithful representations are $SL_2(\mathbb{R})$ and $PSL_2(\mathbb{R})$. ⌟

Proof: Let $\rho : \widetilde{SL_2(\mathbb{R})} \to GL(n, \mathbb{R})$ be a representation inducing a real Lie algebra representation ρ_*. Consider its complexification $\rho \otimes \mathbb{C} : \widetilde{SL_2(\mathbb{R})} \to GL(n, \mathbb{C})$. Because $SL(2, \mathbb{C})$ is simply connected(12.12.2.1), $\rho_* \otimes \mathbb{C}$ corresponds to a complex representation $\rho' : SL(2, \mathbb{C}) \to GL(n, \mathbb{C})$ by(12.11.3.13). Now because $\widetilde{SL_2(\mathbb{R})}$ is simply connected, so there is a real Lie group homomorphism $\gamma : \widetilde{SL_2(\mathbb{R})} \to SL(2, \mathbb{C})$ that $\rho' \circ \gamma = \rho$. But because ρ, ρ' both commutes with conjugation, so does γ. Thus the image of γ is in $GL(2, \mathbb{R})$, and ρ factors through $SL(2, \mathbb{R})$.

There is a quotient map $\pi : \widetilde{SL_2(\mathbb{R})} \to PSL_2(\mathbb{R})$, and $PSL_2(\mathbb{R})$ has trivial center, so the center of $\widetilde{SL_2(\mathbb{R})}$ is contained in $\ker(\pi)$, which is isomorphic to $\pi_1(PSL_2(\mathbb{R})) = \mathbb{Z}$, and is central in $\widetilde{SL_2(\mathbb{R})}$ by(12.11.1.6). so the center of $\widetilde{SL_2(\mathbb{R})}$ is just $\mathbb{Z}$. By what has been proved, for any representation of other covering space of $PSL_2(\mathbb{R})$, the induced representation on $\widetilde{SL_2(\mathbb{R})}$ factors through $SL_2(\mathbb{R})$, thus trivial on the subgroup $2\mathbb{Z} \subset \mathbb{Z}$, and the original representation factors through $SL_2(\mathbb{R})$ or $PSL_2(\mathbb{R})$. So the only possibility of faithful representation is $SL_2(\mathbb{R})$ or $PSL_2(\mathbb{R})$. For $PSL_2(\mathbb{R})$, take the □

Prop. (18.9.1.13) [F.D. Representations of $SL_2(\mathbb{K})$]. Let $\mathbb{K} = \mathbb{C}$ or $\mathbb{R}$, then the representations of $SL(2, \mathbb{K})$ are isomorphic to direct representations (ρ_n, V_n), where V_n =homogeneous polynomials of degree n in indeterminants x, y, and

$$\rho_n(\begin{bmatrix} a & b \\ c & d \end{bmatrix})(x^k y^{n-k}) = (ax + by)^k (cx + dy)^{n-k}.$$

⌟

Proof: We can check these representations truly induce irreducible representations of their Lie algebras $\mathfrak{sl}_2(\mathbb{K})$. Notice $SL(2, \mathbb{C})$ is simply connected(12.12.2.1), so(18.9.1.12) and(12.11.3.13) gives the result. □

2 Finite-Dimensional Representations

Prop. (18.9.2.1). Finite dimensional representations of a semisimple Lie group is completely reducible. ⌟

Proof: This is because its Lie algebra representation is completely reducible(18.8.1.2), and each subrepresentation corresponds to a Lie group subrepresentation. □

3 $(\mathfrak{g}, K)$-Modules

$(\mathfrak{g}, K)$-Modules

Def. (18.9.3.1) [$(\mathfrak{g}, K)$-Modules]. If G is a Lie group that may not be connected, and $K \subset G$ be a maximal compact Lie subgroup(9.3.6.11), then K acts on $\mathfrak{g}$. Then a $(\mathfrak{g}, K)$**-module** is a $\mathbb{C}$-vector space that has a K-finite action and a $\mathfrak{g}$ action that satisfies:

- for $k\in K,\eta\in\mathfrak{g}$, $T_kT_\eta T_{k^{-1}}=T_{Ad_k(\eta)}$.
- The action of $\mathfrak{k}$ on V induced by K agrees with the restriction of the action of $\mathfrak{g}$.

A $(\mathfrak{g},K)$-module is called **admissible** iff every V^ρ is of f.d.. ⌟

Def. (18.9.3.2) [Contragradient $(\mathfrak{g},K)$-Module]. If M is an admissible $(\mathfrak{g},K)$-module, then we can define its **contragradient $(\mathfrak{g},K)$-module** as

$$M^\vee=(M^*)^\infty=\oplus_\rho(M^\rho)^*,$$

which is the K-finite part of the usual dual of M, and $\mathfrak{g}$ clearly acts on it. ⌟

$(\mathfrak{g},K)$-Modules and $\mathfrak{g}$-Modules

Def. (18.9.3.3). Let K_0 be the unital component of K, then there are forgetful functors

$$\mathcal{M}\mathrm{od}_{(\mathfrak{g},K)}\to\mathcal{M}\mathrm{od}_{(\mathfrak{g},K_0)}\to\mathcal{M}\mathrm{od}_{\mathfrak{g}}.$$

⌟

Prop. (18.9.3.4). The functor $(\mathfrak{g},K_0)-mod\to\mathfrak{g}-mod$ is fully faithful, and its essential image is stable under taking submodules. ⌟

Proof: Cf.[Gaitsgory P39]. □

Cor. (18.9.3.5). If $M\in(\mathfrak{g},K)-mod$ is irreducible as a $\mathfrak{g}$-module, then it is irreducible. ⌟

Prop. (18.9.3.6). The functor $\mathcal{M}\mathrm{od}_{(\mathfrak{g},K)}\to\mathcal{M}\mathrm{od}_{\mathfrak{g}}$ sends f.g. objects to f.g. objects. ⌟

Proof: By(18.9.3.4), it suffices to consider the functor $(\mathfrak{g},K)-mod\to(\mathfrak{g},K_0)-mod$. Let M be f.g. $(\mathfrak{g},K)$-module, and $\cup M_i=M$ be a chain of $(\mathfrak{g},K_0)$-submodules. Pick $k\in K$ for each element of $\pi_0(K)$(f.m.), then each $M_i'=\sum_k k(M_i)$ is a $(\mathfrak{g},K)$-submodule, thus $M_i'=M$ for some i. Now we can choose j large that $k(M_i)\in M_j$ for any k, then $M_j=M$(because we may choose M_i be f.g. $(\mathfrak{g},K_0)$-modules)?. □

Cor. (18.9.3.7). The category $\mathcal{M}\mathrm{od}_{(\mathfrak{g},K)}$ is Noetherian. ⌟

Proof: If $M\in(\mathfrak{g},K)-mod$ is f.g. and $M_1\subset M$, then M is f.g. as $\mathfrak{g}$-module, then M_1 is f.g. as $\mathfrak{g}$-module by(3.7.8.16). So clearly it is also f.g. as a $(\mathfrak{g},K)$-module. □

Prop. (18.9.3.8). For an irreducible $(\mathfrak{g},K)$-module M, the underlying $\mathfrak{g}$-module is a direct sum of f.m. irreducibles. ⌟

Proof: By(18.9.3.4), it suffices to prove M is a direct sum of f.m. irreducible $(\mathfrak{g},K_0)$-modules. M is f.g. as a $(\mathfrak{g},K_0)$-modules by the proof of(18.9.3.6), so it has a maximal submodule M' that $N=M/M'$ is irreducible. Pick $k\in K$ for each component of K, consider

$$M''=\cap_k k(M')$$

which is a proper $(\mathfrak{g},K)$-submodule of M, so it is 0, Hence the map

$$M\to\oplus(N)^k$$

is injective, where N^k is N twisted by conjugate action of k, so it is a submodule of a semisimple-module, thus semisimple. □

Properties of $(\mathfrak{g}, K)$-Modules

Cor. (18.9.3.9) [Schur's Lemma]. Schur's lemma holds for irreducible $(\mathfrak{g}, K)$-modules. ⌟

Proof: It suffice to show any endomorphism S of an irreducible $(\mathfrak{g}, K)$-module M has an eigenvalue. But S preserves M^ρ for any ρ, and M^ρ is of f.d, thus it has an eigenvalue over $\mathbb{C}$. □

Cor. (18.9.3.10) [Irreducible Unitary Representation Determined by Finite Part]. If V_1, V_2 are two irreducible unitary representations of G that are infinitesimal equivalent, then they are isomorphic. ⌟

Proof: Firstly they are admissible by(18.9.4.7), so we can talk about their corresponding $(\mathfrak{g}, K)$-modules M_i, then V_i are the Hilbert space completion of M_i by(18.9.3.24).

Now M_i has Hermitian forms, so $M_i \cong (M^*)^{alg}$, and if $S: M_1 \cong M_2$, then S^*S is an automorphism of M_1, thus by(18.9.3.25)(18.9.3.9) it is a scalar map, so after a scalar change, we may assume S preserves Hermitian structure thus induces an isomorphism of vector spaces $V_1 \cong V_2$, so by(18.9.3.24) it is an isomorphism of G-representations. □

Prop. (18.9.3.11). Any irreducible $(\mathfrak{g}, K)$-module has a Banach space structure. ⌟

Proof: □

Action of $Z(U(\mathfrak{g}))$

Prop. (18.9.3.12). Let M be an admissible $(\mathfrak{g}, K)$-module, then

$$M \cong \oplus_{\chi \in \mathrm{Spec}(Z(\mathfrak{g}))} M_\chi$$

s.t. $Z(\mathfrak{g})$ acts on each M_χ with a generalized character χ.

Now let $(\mathfrak{g}, K) - \mathcal{M}\mathrm{od}_\chi$ be the full subcategory of $(\mathfrak{g}, K)$-modules on which $Z(\mathfrak{g})$ acts with a generalized character χ.**?** Cf.[Gaitsgory P42]. ⌟

Proof: $Z(\mathfrak{g})$ commutes with G thus K action, so it preserves each M^ρ, which are of f.d.. □

Prop. (18.9.3.13). The category $(\mathfrak{g}, K) - \mathcal{M}\mathrm{od}_\chi$ has only f.m. isomorphism classes of irreducible objects. ⌟

Proof: Cf.[Gaitsgory]. □

Prop. (18.9.3.14). If M is a f.g. $(\mathfrak{g}, K)$-module, then for any ρ of K, M^ρ is f.g. over $Z(\mathfrak{g})$. ⌟

Proof: Cf.[Gaitsgory P43]. □

Prop. (18.9.3.15). For $M \in (\mathfrak{g}, K) - mod_\chi$, the following are equivalent:

- M is f.g..
- M is of finite length.
- M is admissible.

⌟

Proof: $2 \to 1$ is trivial, $1 \to 3$ is by(18.9.3.14).

For $3 \to 2$: Use(18.9.3.13), there are only f.m. irreducible classes ρ_α, let $\rho = \oplus_\alpha \rho_\alpha$, then if there is a chain of length n, then there are at least n linearly independent morphisms in $\mathrm{Hom}_K(\rho, M)$. Thus n is bounded, because $\dim_K \mathrm{Hom}_K(\rho, M)$ is finite because M is admissible. □

Cor. (18.9.3.16). The category $(\mathfrak{g}, K) - mod_\chi$ is Artinian(4.8.3.19). ⌟

Cor. (18.9.3.17). Every irreducible $(\mathfrak{g}, K)$-module is admissible. ⌟

Proof: Firstly irreducible module are in $(\mathfrak{g}, K) - mod_\chi$ for some χ, and then use the proposition and(18.9.3.8). □

Cor. (18.9.3.18) [Harish-Chandra Modules]. For a $(\mathfrak{g}, K)$-module, the following conditions are equivalent:

- M is f.g. and admissible.
- M is f.g. and its support over $\mathrm{Spec}(Z(\mathfrak{g}))$ is finite.
- M is admissible and its support over $\mathrm{Spec}(Z(\mathfrak{g}))$ is finite.
- M is of finite length.

Then such modules are called a **Harish-Chandra module**. ⌟

Proof: ? □

Real Reductive Groups

Def. (18.9.3.19) [Admissible Representation]. Let G be a connected real reductive group(which is relevant, thus the complex representations of G and $G(\mathbb{R})$ are the same(9.3.6.8)), Let $K \subset G(\mathbb{R})$ be a maximal compact subgroup. Define $V^\infty, V^\rho, V^{K-fin}$ as in(11.10.4.7)(18.9.1.5).

An **admissible representation** of G is a representation V that for any f.d. irreducible representation ρ of K, V^ρ is of f.d. ⌟

Prop. (18.9.3.20). For any ρ, $V^\infty \cap V^\rho$ is dense in V^ρ. ⌟

Proof: ? □

Cor. (18.9.3.21). If V is admissible, then $V^{K-fin} \subset V^\infty$ by(18.9.1.9). ⌟

Prop. (18.9.3.22). If V is admissible, then V^{K-fin} is a $(\mathfrak{g}, K)$-module(18.9.3.1), and the map $V \mapsto V^{K-fin}$ induces a functor

$$Rep(G)_{adm} \to (\mathfrak{g}, K) - mod_{adm}.$$

And we call two admissible representations V_1, V_2 of G **infinitesimal equivalent** iff they are isomorphic after this functor. ⌟

Proof: By(18.9.3.21), $\mathfrak{g}$ can act on V^{K-fin}, and $U(\mathfrak{g})$ fixes V^{K-fin}: if $f \in V^{K-fin}$, let R be a f.d. K-subspace of V containing f, then $\mathfrak{k}f \in R$. Let R_1 be the f.d. vector space spanned by $\mathfrak{g}R$, then R_1 is invariant under $\mathfrak{k}$: for $X \in \mathfrak{k}, Y \in \mathfrak{g}, \varphi \in R$

$$X(Y\varphi) = [X, Y]\varphi + Y(X\varphi) \in R_1$$

so $R_1 \subset V^{K-fin}$, so $\mathfrak{g}$ fixes V^{K-fin}.

Also we check

$$T_k T_\eta T_{k^{-1}} = T_{Ad_k \eta}$$

which is by definition, and the second condition in(18.9.1.9) is also obvious. □

Lemma (18.9.3.23). Let V be an admissible representation of G, and $v \in V^{K-fin}$, then for any $\eta \in V^*$, the function $g \mapsto \eta(g(v))$ is real analytic. ⌟

Proof: Cf.[Gaitsgory P37]. □

Prop. (18.9.3.24) [$\mathrm{Rep}^{\mathrm{adm}}(G)$ **and** $(\mathfrak{g},K)$**-Modules].**

- If V_1,V_2 be two admissible representations of G, if $S:V_1\to V_2$ is a continuous map of TVS. Assume $S(V_1^{K-fin})\subset V_2^{K-fin}$ and induces a $(\mathfrak{g},K)$-module map, then the initial S is a map of G-representations.
- If $V\in Rep(G)_{adm}, M=V^{K-fin}$, then the functors

$$(V_1\subset V)\mapsto (V_1)^{K-fin}\subset M;\quad (M_1\subset M)\mapsto \overline{M}_1\subset V$$

induces mutually inverse bijections between closed G-subrepresentations of V and $(\mathfrak{g},K)$-submodules of M.

⌟

Proof: 1: It suffices to show for $v_1\in V^{K-fin}$, $T_gS(v_1)ST_g(v_1)$. So by Hahn-Banach it suffices to show for any $\eta\in V_2^*$,

$$\eta(T_gS(v_1))=\eta(ST_g(v_1)).$$

Both sides are analytic in g by(18.9.3.23), so it suffices to show all their derivatives at 1 are equal, and use the fact $\pi_0(K)\to\pi_0(G)$ is surjective(9.3.6.11). And the derivatives equal because S commutes with $\mathfrak{g}$-action.

2: Firstly $\overline{M}_1$ is a G-representation: because $\overline{M}_1=((M_1)^\perp)^\perp$ by Hahn-Banach. so it suffices to show for $v_1\in M_1,\eta(g(v_1))=0$ for any $\eta\in(M_1)^\perp$. Then this uses analyticity(18.9.3.23) as above and the fact M_1 is a $(\mathfrak{g},K)$-subrepresentation.

For the bijection, notice V_1^{K-fin} is dense in V_1 by(11.10.4.17). Conversely, for a submodule M_1, it suffices to show the image of $T_{\xi_\rho\mu_{Haar}}(\overline{M}_1)\subset M_1^\rho$ by(11.10.4.13). However $T_{\xi_\rho\mu_{Haar}}(M_1)\in M_1^\rho$ by(11.10.4.13), so this is true by continuity. □

Cor. (18.9.3.25)[Irreducibility of $(\mathfrak{g},K)$**-Modules].** An admissible G-representation V is irreducible iff V^{K-fin} is irreducible as $(\mathfrak{g},K)$-modules. ⌟

Irreducible Admissible $(\mathfrak{g},K)$-Modules of $GL(2,\mathbb{R})$

Prop. (18.9.3.26) [Lie Theory]. Let V be an irreducible admissible $(\mathfrak{g},K)$-module for $GL(2,\mathbb{R})^+$, then

- V^k is the space of all vectors $x\in V$ that $Hx=kx$.
- If $x\in V^k$, then $Rx\in V^{k+2}, Lx\in V^{k-2}$.
- If $0\neq x\in V^k$, then $\mathbb{C}x=V^k,\mathbb{C}R^nx=V^{k+2n},\mathbb{C}L^nV^{k-2n}$ and

$$V=\mathbb{C}x\oplus\bigoplus_{n>0}\mathbb{C}R^nx\oplus\bigoplus_{n>0}\mathbb{C}L^nx.$$

- Suppose $\Delta=\lambda$ on V, then if $x\in V^k$, then

$$LRx=(-\lambda-\frac{k}{2}(1+\frac{k}{2}))x,\quad RLx=(-\lambda+\frac{k}{2}(1-\frac{k}{2}))x.$$

⌟

Proof: 1: Let $W = iH$. If $x \in V^k$, then

$$Wx = \frac{d}{dt}\pi(e^{tW})x = \frac{d}{dt}\pi(k_t)x = \frac{d}{dt}e^{ikt}x = ikx$$

thus $Hx = kx$. And we know V decomposes as direct sums of representations of K(11.10.4.4), thus the result follows.

2: clear from(3.7.2.11).

3: Because the RHS is a $\mathfrak{g}$-submodule, by representation of $\mathfrak{sl}_z(\mathbb{C})$(18.8.1.11). And it is also a K-subrepresentation, by item1.

4: By(18.8.1.11). □

Cor. (18.9.3.27) [Non-Discrete Case]. For any $\lambda, \mu \in \mathbb{C}$ that $\lambda \neq \frac{k}{2}(1+\frac{k}{2})$ for k even/odd, there exists at most one isomorphism class of irreducible admissible even/odd $(\mathfrak{g}, K)$-module V on which Δ, I acts by λ, μ respectively, and the K-type is one vector f_k for each $k \in \mathbb{Z}$. ⌟

Proof: This follows from the classification of representation of $\mathfrak{sl}_2(\mathbb{C})$(18.8.1.11). Notice the action of K is controlled by(18.9.3.26) item1. □

Cor. (18.9.3.28) [Discrete Case]. Let $k \geq 1$ be an integer and $\lambda = \frac{k}{2}(1+\frac{k}{2})$. Let V be an irreducible admissible $(\mathfrak{g}, K)$-module with parity equals k, Let Σ be the K-types of V, then Σ is one of the following sets:

- $\Sigma^+(k) = \{l \in \mathbb{Z} | l \equiv k \mod 2, l \geq k\}$
- $\Sigma^-(k) = \{l \in \mathbb{Z} | l \equiv k \mod 2, l \leq -k\}$
- $\Sigma^0(k) = \{l \in \mathbb{Z} | l \equiv k \mod 2, -k < l < k\}$

And there are at most one isomorphism class with each Σ. ⌟

Proof: This follows from the classification of representation of $\mathfrak{sl}_2(\mathbb{C})$(18.8.1.11). Notice the action of K is controlled by(18.9.3.26) item1. □

Def. (18.9.3.29) [$H(s_1, s_2, \varepsilon)$]. If $\lambda \geq 1/4$, let $s - 1/2$ be the square root of $1/4 - \lambda$ which is imaginary, and let s_1, s_2 be determined that $\mu = s_1 + s_2, s = \frac{1}{2}(s_1 - s_2 + 1)$.

Consider the 1-dimensional representation σ of $B(\mathbb{R})^+$ that

$$\sigma(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix}) = \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_1} |y_2|^{s_2},$$

If s_1, s_2 are purely imaginary(i.e. μ is purely imaginary), then this representation is unitary, and we can consider the induced representation on $GL(2, \mathbb{R})^+$(11.10.5.3), then it is a unitary representation of $GL(2, \mathbb{R})^+$. For $f \in \operatorname{ind}_{B(\mathbb{R})^+}^G$,

$$f(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix} g) = \operatorname{sgn}(y_1)|y_1|^{s_1+1/2}|y_2|^{s_2-1/2}f(g)$$

and

$$(f_1, f_2) = \frac{1}{2\pi}\int_0^{2\pi} f_1(k_\theta)\overline{f_2(k_\theta)}d\theta.$$

so $H(s_1, s_2, \varepsilon)$ is identical to $L^2[-\pi/2, \pi/2]$ by Iwasawa decomposition(12.12.0.4). Then its K-finite vectors can be determined, which are sums of

$$f_l(g) = u^{s_1+s_2}y^s e^{il\theta}, l \equiv \varepsilon \mod 2.$$

so $H(s_1,s_2,\varepsilon)$ is admissible.

Even if μ is not purely imaginary, we can still define $H(s_1,s_2,\varepsilon)$ as above, and we consider its smooth vectors $H^\infty(s_1,s_2,\varepsilon)$, which are just the smooth functions in $H(s_1,s_2,\varepsilon)$, by(18.9.1.10). ⌟

Prop. (18.9.3.30). We can define the regular action of G on $H(s_1,s_2,\varepsilon)$(but may not be unitary), and the subspace $H^\infty(s_1,s_2,\varepsilon)$ is the space of smooth vectors for this representation. ⌟

Proof: It suffices to define the regular action of G on $H^\infty(s_1,s_2,\varepsilon)$ and show it is a bounded operator, so that it can be extended to $H(s_1,s_2,\varepsilon)$ by continuity.

By Cartan decomposition(12.11.5.1), G is generated by K and diagonal matrices of positive entries. $\rho(K)$ clearly preserves the inner product, so it suffices to consider these matrices.

By(20.1.1.20) and the calculation $d\theta'=y_1y_2D(\theta)^{-2}d\theta$, we have

$$\int_0^{2\pi}|\pi(\mathrm{diag}(y_1,y_2))f(k_\theta)|^2d\theta=(y_1y_2)^{s_1-1/2}\int_0^{2\pi}D(\theta)^{-s_1+s_2+1}|f(k_{\theta'})|^2d\theta'.$$

where

$$\theta'=\arctan(\frac{y_1}{y_2}\tan\theta),\quad D(\theta)=\sqrt{y_1^2\sin^2\theta+y_2^2\cos^2\theta}.$$

$D(\theta)$ is bounded above and below, thus $\pi(\mathrm{diag}(y_1,y_2))$ is a bounded operator. Also to show this representation is continuous, it suffices to show for $|f|_2$ small and y_1,y_2 small, $|\pi(\mathrm{diag}(y_1,y_2))f|_2$ is small. And this is also a consequence of the above formula. □

Lemma (18.9.3.31). For $f_l\in H(s_1,s_2,\varepsilon)$ as in(18.9.3.29), we have

$$Hf_l=lf_l,\quad ,Rf_l=(s+\frac{l}{2})f_{l+2},Lf_l=(s-\frac{l}{2})f_{l-2},\Delta f_l=\lambda f_l,\quad If_l=\mu f_l$$

⌟

Proof: Clear from(20.1.1.1) and definition of f_l(18.9.3.29). □

Prop. (18.9.3.32)[Existence of $(\mathfrak{g},K)$-Modules]. Let $s=\frac{1}{2}(s_1-s_2+1),\lambda=s(1-s),\mu=(s_1+s_2)$, then (subquotients) of the $(\mathfrak{g},K)$-module $\mathfrak{H}$ of $H(s_1,s_2,\varepsilon)$ afford classes in(18.9.3.27) and(18.9.3.28). More precisely, Δ and I acts by scalars λ,μ respectively, and

- If s is not of the form $k/2,k\equiv\varepsilon\mod 2$, then $\mathfrak{H}$ is irreducible.
- If $s\geq 1/2$ and $s=\frac{k}{2}$ where $k\geq 1$ is an integer that $k\equiv\varepsilon\mod 2$, then $\mathfrak{H}$ has two irreducible invariant subspaces $\mathfrak{H}_+,\mathfrak{H}_-$ with K-types $\Sigma+,\Sigma_-$ respectively, and the quotient $\mathfrak{H}/\mathfrak{H}_+\oplus\mathfrak{H}_-$ is irreducible and has K-type $\Sigma^0(k)$.
- If $s\leq 1/2$ and $s=1-\frac{k}{2}$ where $k\geq 1$ is an integer that $k\equiv\varepsilon\mod 2$. Then $\mathfrak{H}$ has an invariant subspace $\mathfrak{H}^0$ with K-types $\Sigma^0(k)$ and the quotient $\mathfrak{H}/\mathfrak{H}^0$ decomposes into two irreducible invariant subspaces $\mathfrak{H}^+,\mathfrak{H}^-$ with K-types $\Sigma+,\Sigma_-$ respectively.

⌟

Proof: The action of H,R,L,Δ,I is all clear from(18.9.3.31), and the decomposition and irreducibility is all clear from the representation theory of $\mathfrak{sl}_2$ and(18.9.3.27)(18.9.3.28). □

Prop. (18.9.3.33) [List of Irreducible Admissible $(\mathfrak{g},K)$-Modules for $GL(2,\mathbb{R})^+$]. Every irreducible admissible $(\mathfrak{g},K)$-module may be realized as the space of K-finite vectors in an admissible representation of G on a Hilbert space. Let $\lambda,\mu\in\mathbb{C}$, and $\varepsilon=0,1$.

- If λ is not of the form $\frac{k}{2}(1-\frac{k}{2})$, where $k \equiv \varepsilon \mod 2$, then there exists a unique irreducible admissible $(\mathfrak{g}, K)$-module of parity ε on which Δ, I acts by scalars λ, μ, denoted by $P_\mu(\lambda, \varepsilon)$. These are called the **principal series**.
- If $\lambda = \frac{k}{2}(1-\frac{k}{2})$ for some $1 \leq k \equiv \varepsilon \mod 2$, then there exists three(two for $k=1$) irreducible admissible $(\mathfrak{g}, K)$-module of parity ε on which Δ, I acts by scalars λ, μ. Their K-types are $\Sigma^\pm$, Σ^0 respectively. The irreducible admissible $(\mathfrak{g}, K)$-modules of K-types $\Sigma^\pm$ are denoted by $D_\mu^\pm(k)$. If $k > 1$, $D_\mu^\pm(k)$ are called **discrete series** and for $k = 1$ they are called **limits of discrete series**.

⌟

Proof: This is a consequence of(18.9.3.27)(18.9.3.28) and(18.9.3.32). □

Prop. (18.9.3.34) [List of Irreducible Admissible $(\mathfrak{g}, K)$-Modules for $GL(2,\mathbb{R})$]. Let $\mu \in \mathbb{C}$, and $\varepsilon = 0, 1$.

- The f.d. representations are obtained by tensoring the symmetric powers of the standard representation of G with the 1-dimensional representation of the form $\chi \circ \det$.
- If χ_1, χ_2 are quasi-characters of $\mathbb{R}^*$ that $\chi_1\chi_2^{-1}$ is not of the form $y \mapsto \mathrm{sgn}(y)^\varepsilon |y|^{k-1}$, where $k \equiv \varepsilon \mod 2$, then there is a irreducible $(\mathfrak{g}, O(2,\mathbb{R}))$-module $\pi(\chi_1, \chi_2)$.
- If $\mu \in \mathbb{R}$ and $k \geq 1$ is an integer, then there are representations $D_\mu(k) = (D_\mu^+(k) \oplus D_\mu^-(k))$, called **discrete series** if $k \geq 2$ and **limits of discrete series** if $k = 1$.

⌟

Proof: Use(18.1.1.12) on $SO(2,\mathbb{R}) \subset O(2,\mathbb{R})$. It turns out $P_\mu(\lambda, \varepsilon)$ can be extended in two ways to a representation of $O(2,\mathbb{R})$: $H(s_1, \varepsilon_1, s_2, \varepsilon_2)$, corresponding to item2. It is unitarizable as $H(s_1, s_2, \varepsilon)$ is unitarizable.

The (limits of) discrete series are conjugate in pairs and combined to give a representation of $O(2,\mathbb{R})$, which is item3. It is unitarizable as it is just $H(s_1, s_2, \varepsilon)/\mathfrak{H}^0$.

The case $D_\mu^0(k)$ are also of type I and can be extended, and this irreducible representation are exactly the smooth parts of the symmetric representation of $GL(2,\mathbb{R})$ twisted by $\chi \circ \det$. □

Cor. (18.9.3.35) [Contragradient]. Let $G = GL(2,\mathbb{R}), K = O(2,\mathbb{R})$, (π, V) be an irreducible admissible $(\mathfrak{g}, K)$-module, then the contragradient $\widehat{\pi}$ is isomorphic to the $(\mathfrak{g}, K)$-module $T_k' = T_{k^{-t}}$ and $T_X' = T_{X^{-t}}$.

And it is also isomorphic to $\pi \otimes (\omega \circ \det)$. ⌟

Proof: This is a consequence of the classification of irreducible $(\mathfrak{g}, K)$-modules(18.9.3.33), where the K-type are unchanged, eigenvalues of Δ are unchanged, and eigenvalue of I is changed to $-\mu$, so they are isomorphic. □

4 Unitary Representations

The theory of abstract harmonic analysis applies in this case11.10.

Lemma (18.9.4.1) [Auxiliary Compact Supported Function Approximation]. Let G be a locally compact Lie group and K a compact subgroup. If $\mathcal{H}$ is a unitary representation of G on a Hilbert space, and let $f \neq 0 \in \mathcal{H}$, then for any $\varepsilon > 0$, there is a $\varphi \in C_c^\infty(G)$ s.t. $\pi(\varphi)$ is self-adjoint and $|\varphi(\rho)f - f| < \varepsilon$.

Moreover, if $f \in \mathcal{H}^\xi$ which is the decomposition part for K, we can assume $\varphi(kg) = \varphi(gk) = \xi(k)^{-1}\varphi(g)$. In particular if $\mathcal{H}^\xi$ is f.d., we find a φ that $\pi(\varphi)f = f$. ⌟

Proof: By continuity, there is a nbhd H of 1 that $|\pi(g)f-f|<\varepsilon$, then we can choose a φ positive real valued with support in U with integral 1, then $|\pi(\varphi)f-f|<\varepsilon$ by(11.8.3.22). We can also choose $\varphi(g)=\varphi(g^{-1})$, then $\pi(\varphi)$ is self-adjoint.

For the second case, notice first there is a nbhd V of 1 that $kVk^{-1}\in U$ for any $k\in K$(4.12.1.6), so let φ_1 be a positive real valued function supported in V, and let

$$\varphi_0(g)=\int_K \varphi_1(kgk^{-1})dk$$

then φ_0 is supported in U and $\varphi(kgk^{-1})=\varphi_0(g)$ for any $k\in K$. Assume now that $\pi(k_\theta)=e^{ik\theta}f$, then we can use(11.10.1.39) for $P=G$ to see that

$$\pi(\varphi_0)f=\int_G\varphi_0(h)\pi(h)fdh=\int_G\int_K\varphi_0(hk)\pi(hk)fdkdh=\int_G\int_K\xi(k)\varphi_0(hk)dk\pi(h)fdh=\pi(\varphi)f$$

where

$$\varphi(g)=\int_K\xi(k)\varphi_0(gk)dk=\int_K\xi(k)\varphi_0(kg)dk$$

so $\varphi(k)=\varphi(gk)=\xi^{-1}(k)\varphi(g)$ as required. □

Unitary Irreducible Representation is Admissible

G appearing in this subsubsection are assumed to be a Lie group.

Prop. (18.9.4.2). If V is an irreducible unitary representation of G, then the image of the induced action of $Meas_c(G)$ is dense in $\mathrm{End}(V)$ in the strong topology(11.7.3.4). ⌟

Proof: This follows immediately from the von Neumann theorem(11.16.1.3) and Schur's lemma(11.10.2.4): if we denote the algebra generated by $Meas_c(G)$ by A, then

$$\overline{A}=(A^c)^c=(\mathbb{C})^c=\mathrm{End}(V).$$

□

Prop. (18.9.4.3). If V Is a representation of G that the image of the induced action of $Meas_c(G)$ is dense in $\mathrm{End}(V)$ in the strong topology, then

$$\dim(V^\rho)\leq\dim(\rho)^2.$$

⌟

Proof: Follows directly from the following two lemmas(18.9.4.5)(18.9.4.6). □

Cor. (18.9.4.4)[Irreducible Unitary Representation is Admissible]. For any irreducible unitary representation of G, the K-finite part is an irreducible admissible $(\mathfrak{g},K)$-module, and $\dim(V^\rho)\leq\dim(\rho)^2$. ⌟

Proof: Follows directly from(18.9.3.25),(18.9.4.2) and(18.9.4.3). □

Lemma (18.9.4.5). For any $\rho\in\mathrm{Irrep}(K)$, let $A_\rho=\xi_\rho\cdot Meas_c(G)\cdot\xi_\rho$, this is an algebra that acts on V^ρ by(11.10.4.13). Then there exists a family of f.d. representations π of A_ρ that:

- Each π is of dimension$\leq n=\dim(\rho)^2$.

- For every element $a \in A_\rho$, there exists a π that $\pi(a)$ is non-trivial.

⌟

Proof: Consider the set of all irreducible f.d. representations of G, and π^ρ their ρ-isotopic parts. Then these are representations of A_ρ, and for any $\varphi \in Meas_c(G)$, there is a π that $T_\varphi \neq \mathrm{Id}$?, and each π^ρ has dimension$\leq \dim(\rho)^2$?. Cf.[Gaitsgory P46]. □

Lemma (18.9.4.6). If A is an associative algebra equipped with a family of f.d. modules satisfying conditions in(18.9.4.5), then if V is a representation of A that the image of A is dense in $\mathrm{End}(V)$ in the strong topology, then $\dim V \leq n$. ⌟

Proof: For an associated algebra A, consider the minimal integer r that the property $P(r)$:

$$\sum_{\sigma\in\Sigma_r} \mathrm{sgn}(\sigma) a_{\sigma(1)}\cdots a_{\sigma(r)} = 0$$

for any $a_1,\ldots,a_r$, then Amitsur-Levitski showed that for $A = GL(n,\mathbb{C})$, $r = 2n$(3.7.11.7).

Now the condition of A in(18.9.4.5) shows that P_{2n} is true for A. If $\dim V \geq n+1$, then the image of A satisfies $P(2n)$, so also $\mathrm{End}(V)$ satisfies $P(2n)$ because A is dense in $\mathrm{End}(V)$. But V contains a subgroup $GL(n+1,\mathbb{C})$, so it cannot satisfy $P(2n)$ by(3.7.11.7), contradiction. □

Cor. (18.9.4.7). Let V be an irreducible unitary representation of G, then for any $\rho \in Irrep(K)$,

$$\dim(V^\rho) \leq \dim(\rho)^2.$$

In particular, every unitary irreducible representation of G is admissible. ⌟

Proof: Directly from Lemmas(18.9.4.2) and(18.9.4.3) above, as the action of A_ρ on V^ρ is also have dense image in the strong topology. □

Prop. (18.9.4.8). If M is an irreducible $(\mathfrak{g},K)$-module equipped with an invariant inner product $((km_1,km_2) = (m_1,m_2), (\xi m_1,m_2)+(m_1,\xi m_2) = 0)$, then the Hilbert space completion of M carries a unique unitary G-representation s.t. $V^{K-fin} = M$ as $(\mathfrak{g},K)$-modules. ⌟

Proof: By(18.9.4.9), the Hermitian form can be extended continuously to the Banach space completion of M, It suffices to prove the extended Hermitian form is continuous, because them we can choose its completion w.r.t. $(-,-)$.

For the invariance, consider $f(g) = (gm_1,m_2)-(m_1,g^{-1}m_2)$, then notice $(a,-)$ are continuous functional on V, thus by(18.9.3.23) and similar analytic method as in(18.9.3.24) using the invariance of inner product. □

Lemma (18.9.4.9). Situation as in(18.9.4.8), M has a Banach norm that $(m,m) \leq ||m||^2$. ⌟

Proof: (18.9.3.11) shows M does have a Banach norm. Then let $M \cong V^{K-fin}$ and $M^{*alg} \cong (V^*)^{K-fin}$. However the Hermitian form induces $M \cong M^{*alg}$, thus we can form

$$M \xrightarrow{\Delta} M\oplus M \to V\oplus V^*$$

let V' be the closure of the image of M, then it is a G-representation by(18.9.3.24), and then

$$(m,m) \leq ||i_1(m)||||i_2(m)|| \leq (||i_1(m)||+||i_2(m)||)^2.$$

□

Cor. (18.9.4.10). The above proposition(18.9.4.8) is true for M admissible. ⌟

Hecke Algebras

Prop. (18.9.4.11) [Hecke Algebras of Lie Groups].

- If K is a compact Lie group, then the **Hecke algebra** $\mathcal{H}_K$ is defined to be the ring of smooth functions on K that is K-finite under both left and right translations, where the algebra is given by convolution. By Peter-Weyl theorem, these functions are dense in $C(K)$ and $L^2(K)$, and it is an idempotented algebra over $\mathbb{C}$**?** Cf.[Bump, P309].
- If G is a real reductive group and K is a maximal compact subgroup, then the **Hecke algebra** $\mathcal{H}_G$ is defined to be $\mathcal{H}_G = \mathcal{H}_K \otimes_{U(\mathfrak{k}_\mathbb{C})} U(\mathfrak{g}_\mathbb{C})$, where the right action of $U(\mathfrak{k}_\mathbb{C})$ on $\mathcal{H}_K$ is given by

$$f * D = \rho(D) f,$$

? Cf.[Bump, P312].

⌟

Proof: □

Prop. (18.9.4.12) [Equivalence of Representations Lie Group Case].

- For a compact Lie group K, the category $\mathcal{M}(K)$ of smooth representations of $\mathcal{H}_K$ is equivalent to the category of unitary representations of K.
- For a real reductive group G and a maximal compact subgroup K, the category of (admissible)$(\mathfrak{g}, K)$-modules is equivalent to the category of smooth(admissible) modules of $\mathcal{H}_G$.

⌟

Proof: Cf.[Cohomological Induction and Unitary Representations, P75]. □

Irreducible Unitary Representations of $GL(2,\mathbb{R})^+$

Lemma (18.9.4.13) [Finite Dimensional Case]. The only irreducible f.d. unitary representations of the group $GL(n,\mathbb{R})^+$ are the 1-dimensional characters $g \mapsto \det(g)^r$ where r is purely imaginary. ⌟

Proof: Such a representation defines a continuous map of $GL(n,\mathbb{R})^+$ into the compact unitary group $U(n)$. Now it induces a Lie algebra map $\mathfrak{sl}_n(\mathbb{R}) \to \mathfrak{u}_m$. This map must be trivial because otherwise this is an embedding because $\mathfrak{sl}_n(\mathbb{R})$ is simple. But this is impossible because the adjoint action of $\mathfrak{sl}_n(\mathbb{R})$ has real eigenvalues but the adjoint action of $\mathfrak{u}_m$ are all purely imaginary by(3.7.5.4). So the action is trivial on $SL(n,\mathbb{R})^+$, so induces an irreducible representation of $\det(g)$, which is clearly 1-dimensional. □

Lemma (18.9.4.14). Because for a unitary representation $\mathcal{H}$ of G, for $X \in \mathfrak{g}$, we have

$$(Xu, v) = -(u, Xv),$$

so $(Xv, w) = -(v, \overline{X}w)$ when complexified. So

$$(Rv, w) = -(v, Lw)$$

for any $v, w \in \mathcal{H}$, by(20.1.0.1). ⌟

Lemma (18.9.4.15) [Principal Series]. For the principal series $P_\mu(\lambda, \varepsilon)$ of $GL(2,\mathbb{R})^+$, there exists an irreducible unitary representation in this class if μ is purely imaginary and $\lambda \geq 1/4$ real. ⌟

Proof: Consider the unitary representation $H(s_1, s_2, \varepsilon)$ defined in(18.9.3.29), then it is irreducible and its class is $P_\mu(\lambda, \varepsilon)$ by(18.9.3.32) and(18.9.3.25). □

Lemma (18.9.4.16)[Possibilities of Unitary Representations]. Let $\mathcal{H}$ be a unitary representation of $GL(2,\mathbb{R})^+$. Assume Δ, I acts by scalars λ, μ respectively, then

- μ is purely imaginary and λ is real.
- If the $(\mathfrak{g}, K)$-module type of $\mathcal{H}$ is a principal series $P_\mu(\lambda, \varepsilon)$, then $\lambda > 0$, and if $\varepsilon = 1$, $\lambda > 1/4$. ⌟

Proof: 1: This follows from(18.9.4.14), as action of I is skew-symmetric and action of Δ is symmetric.

2: By(18.9.3.27), $V^k \neq 0$ for $k \equiv \varepsilon \mod 2$, let $f_k \in V^k$. Because $-4\Delta - H^2 + 2H = 4RL$(20.1.0.1), take $k = \varepsilon$, then

$$(-4\lambda - \varepsilon^2 + 2\varepsilon) f_\varepsilon = 4RL f_\varepsilon.$$

But by(18.9.4.14),

$$(4RL f_\varepsilon, f_\varepsilon) = -4(L f_\varepsilon, L f_\varepsilon) < 0$$

thus $4\lambda > 2\varepsilon - \varepsilon^2$. □

Cor. (18.9.4.17) [Reduction of μ]. The infinitesimal equivalence class of representations $P_\mu(\lambda, \varepsilon)$ or $D_\mu^\pm(k)$ contains an irreducible unitary representation iff μ is purely imaginary and the corresponding class $P(\lambda, \varepsilon)$ or $D^\pm(k)$ contains an irreducible unitary representation. ⌟

Proof: μ must be purely imaginary by the proposition. And we may tensoring a unitary representation by a $\deg(g)^r$, it is also unitary iff r is purely imaginary, and this increases the value of action of I by $2r$ and doesn't affect μ and ε because Δ has nothing to do with u(20.1.1.1). □

Prop. (18.9.4.18) [Intertwining Integral]. Let $s = \frac{1}{2}(s_1 - s_2 + 1)$, define for $f \in V$,

$$M(s) : H^\infty(s_1, s_2, \varepsilon) \to H^\infty(s_2, s_1, \varepsilon) : (M(s)f)(g) = \int_{N(F)} f(w_0 u g) du.$$

Then if $\mathrm{Re}(s_1 - s_2) > 0$, the integral is absolutely convergent, and commutes with the action of G. ⌟

Proof: Replacing f with $\rho(h)f$, we see that the convergence of $M(s)(f)(h)$ is equivalent to the convergence of $M(s)(\rho(h)f)$, so we assume $h = 1$.

We use the identity

$$\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} = \begin{bmatrix} \Delta_x^{-1} & -x\Delta_x^{-1} \\ & \Delta_x \end{bmatrix} k_{\theta_x}$$

similar to(20.1.1.20) where

$$\Delta_x = \sqrt{1 + x^2}, \quad \theta(x) = \arctan(-1/x).$$

Then

$$(M(s)f)(1) = \int_{-\infty}^{\infty} (1 + x^2)^{-s} f(k_{\theta(x)}) dx$$

which convergences for $s > 1/2$, that is $\mathrm{Re}(s_1 - s_2) > 0$.

To show $M(s)f \in H(s_2, s_1, \varepsilon)$, we check

$$(M(s)f)(\begin{bmatrix} 1 & \xi \\ & 1 \end{bmatrix} g) = (M(s)f)(g), \quad (M(s)f)(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g) = \mathrm{sgn}(y_1)^\varepsilon |y_1|^{s_2 + \frac{1}{2}} |y_2|^{s_1 - \frac{1}{2}} (M(s)f)(g).$$

The first one is an easy consequence of change of variable, for the second,

$$\begin{aligned}(M(s)f)(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g) &= \int f(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g)dx \\ &= \int f(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix}\begin{bmatrix} 1 & y_1^{-1}y_2 x \\ & 1 \end{bmatrix} g)dx \\ &= \frac{y_1}{y_2}\int f(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix}\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)dx \\ &= \frac{y_1}{y_2}\mathrm{sgn}(y_1)^\varepsilon |y_1|^{s_2-\frac{1}{2}}|y_2|^{s_1+\frac{1}{2}}\int f(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)dx \\ &= \mathrm{sgn}(y_1)^\varepsilon |y_1|^{s_2+\frac{1}{2}}|y_2|^{s_1-\frac{1}{2}}(M(s)f)(g)\end{aligned}$$

To check $M(s)f$ is smooth, notice that the restriction of $M(s)f$ to K equals

$$(M(s)f)(k_t) = \int_{-\infty}^{\infty}(1+x^2)^{-s} f(k_{\theta(x)+t})dx.$$

The convergence is uniform in t, thus is smooth in t.

The commutativity of $M(s)$ with G-action is immediate, because left and right action commutes. □

Prop. (18.9.4.19). Let $f_{k,s}$ be the function f_k in $H(s_1,s_2,\varepsilon)$(18.9.3.29) where $\mathrm{Re}(s_1-s_2)>0$ and $s=\frac{1}{2}(s_1-s_2+1)$, then

$$M(s)f_{k,s} = (-i)^k\sqrt{\pi}\frac{\Gamma(s)\Gamma(s-\frac{1}{2})}{\Gamma(s+\frac{k}{2})\Gamma(s-\frac{k}{2})}f_{k,1-s}$$

⌟

Proof: Because $M(s)$ commutes with G-action, $M(s)f_{k,s}$ is a multiple of $f_{k,1-s}$, thus it suffices to calculate $(M(s)f_{k,s})(1)$, which is

$$(M(s)f)(1) = \int_{-\infty}^{\infty}(1+x^2)^{-s}e^{ik\theta(x)}dx, \quad \theta(x)=\arctan(-1/x)$$

by(18.9.4.18).

This integral then is calculated to be the expression above, by(11.3.10.1). □

Lemma (18.9.4.20) [Complementary Series]. For μ purely imaginary and $0<\lambda<1/4$ and $\varepsilon=0$, there exists an irreducible unitary representation in this class of the $(\mathfrak{g},K)$-module $P_\mu(\lambda,0)$. ⌟

Proof: Let s_1,s_2 be complex numbers, we construct first a Hermitian pairing

$$H(s_1,s_2,\varepsilon)_{fin}\times H(-\overline{s_1},-\overline{s_2},\varepsilon)_{fin}\to\mathbb{C}:(f,g')\mapsto\int_K f(k)\overline{g'(k)}dk$$

which is invariant under action of G by(11.10.1.45). Now let $s_2=-\overline{s_1}$, then $s=\frac{1}{2}(s_1-s_2+1)$ is real and $\mu=s_1+s_2$ is purely imaginary. Then composing this pairing with $i^\varepsilon M(s): H(s_1,s_2,\varepsilon)_{fin}\to H(s_2,s_1,\varepsilon)_{fin}=H(-\overline{s_1},-\overline{s_2},\varepsilon)_{fin}$, then

$$(f,\overline{f}')=\int_K f(k)\overline{i^\varepsilon M(s)f'(k)}dk.$$

is G-invariant. We will show that it is positive definite if $\varepsilon = 0$ and $1/2 < s < 1$.

It can be seen from(18.9.4.19) that an orthogonal basis for $H(s_1, s_2, 0)_{fin}$ under this pairing is $f_{k,s}$ for k even. And by(18.9.4.19),

$$(f_{k,s}, f_{k,s}) = (-1)^{k/2}\sqrt{\pi}\frac{\Gamma(s)\Gamma(s-\frac{1}{2})}{\Gamma(s+\frac{k}{2})\gamma(s-\frac{k}{2})}$$

which is positive for $1/2 < s < 1$. Now we obtain a unitary representation of G on the Hilbert completion of this space(11.10.2.8).

Now we have constructed a unitary representation in the infinitesimal equivalence class $P_\mu(\lambda, 0)$ with $\lambda = s(1-s)$, $s = \frac{1}{2}(s_1 - \overline{s_1} + 1)$, so any $0 < \lambda < 1/4$ is possible. □

Lemma (18.9.4.21). For any integer k, there is a bijection between holomorphic functions φ on $\mathcal{H}$ and smooth functions Φ on $GL(2,\mathbb{R})^+$ that is invariant under $Z(R)^+$ and

$$\Phi(gk_\theta) = e^{ik\theta}\Phi(g), \quad L\Phi = 0.$$

┘

Proof: The bijection is given by

$$\varphi(z) = y^{-k/2}\Phi(\begin{bmatrix} y & x \\ & 1 \end{bmatrix}), \quad \Phi(g) = ((y^{k/2}\varphi)[g]_k)i.$$

and the proof is a combination of formal calculation in(20.1.2.9) and(20.1.1.19) forgetting Γ:

$$L_k(y^{k/2}f(z)) = -(z-\overline{z})\frac{\partial}{\partial\overline{z}} - \frac{k}{2}(y^{k/2}f(z)) = -2iy^{(k+2)/2}\frac{\partial}{\partial\overline{z}}f(z).$$

□

Lemma (18.9.4.22) [Discrete Series]. if $k > 1$, then there exists a unitary representation in the infinitesimal equivalence class $D^{\pm}(k)$, more precisely,

- Let $L^2(\mathcal{H}, \mu_k)$ be the L^2-space of holomorphic functions f on the upper plane $\mathcal{H}$ w.r.t the measure $\mu_k = y^k\frac{dxdy}{y^2}$(11.5.3.3). Then the left action

$$\pi_k(g)f = f[g^{-1}]_k.$$

  of G is unitary and this representation π_k is in the infinitesimal equivalence class $D^-(k)$.

- Consider the automorphic of $GL(2,\mathbb{R})^+$:

$$\iota(\begin{bmatrix} a & b \\ c & d \end{bmatrix}) = \begin{bmatrix} a & -b \\ -c & d \end{bmatrix}$$

  then the representation $\pi_k \circ \iota$ is in the infinitesimal equivalence class $D^+(k)$

┘

Proof: The second one follows from the first one, as ι interchanges the action of K thus the K-types.

For the first one, firstly it is a unitary representation: for $z' = g(z) = x' + iy'$, we have

$$y' = \frac{ad-bc}{|cz+d|^2}y$$

and $\mu_z = \mu_{z'}$, thus

$$||\pi(g^{-1})f||^2 = \int_{\mathcal{H}} |f(z')|^2 \frac{(ad-bc)^k}{|cz+d|^{2k}} y^k \mu_z = \int_{\mathcal{H}} |f(z')|^2 (y')^k \mu_{z'} = ||f||^2.$$

For the infinitesimal equivalence class, we consider the orthogonal basis $\varphi_n = (\frac{z-i}{z+i})^n \frac{(2i)^k}{(z+i)^k}$ and prove

$$\pi(k_\theta^{-1})\varphi_n = e^{2\pi i(k+2n)\theta}\varphi_n.$$

Then this will determine the K-type of π_k. This can be proven by direct calculation, Cf.[Ngo, P39]. □

Cor. (18.9.4.23). By(18.9.4.21) and the measure μ_k we choose, it is clear that there is an isometry between $L^2(\mathcal{H}, \mu_k)$ and a subspace of $L^2(G/Z)$ that is compatible with the left G action on $L^2(G)$, but the left and right action on $L^2(G/Z)$ is isomorphic, as $f(t) \mapsto f(t^{-1})$ intertwine them, because G/Z is unimodular. So this representation is **square integrable**, i.e. it can be embedded in $L^2(G/Z)$. ⌟

Lemma (18.9.4.24) [Limits of Discrete Series]. There exists a unitary representation in the infinitesimal equivalence class $D^{\pm}(1)$. ⌟

Proof: These two classes already appear in the unitary representation $H(0, 0, 1)$, by(18.9.3.32). □

Prop. (18.9.4.25) [List of Irreducible Unitary Representations of $GL(2, \mathbb{R})^+$]. Let μ be purely imaginary,

- The 1-dimensional representation $g \mapsto |\deg(g)|^\mu$.
- The unitary principal series $P_\mu(\lambda, \varepsilon)$, where $\varepsilon = 0, 1$ and $\lambda \geq 1/4$.
- The complementary series representations $P_\mu(\lambda, 0)$ where $0 < \lambda < 1/4$.
- The holomorphic discrete series $D^0_\mu(k)(k \geq 2)$ and limits of discrete series $(k = 1)$ $D^{\pm}_\mu(k)$.

Notice each of these infinitesimal equivalence classes of irreducible representations has a unique representative that is a unitary representation by(18.9.3.10). ⌟

Proof: By(18.9.3.25) and(18.9.3.10), the conclusion follows from the classification of $(\mathfrak{g}, K)$-modules(18.9.3.33) and determining which infinitesimal class has a unitary representative, which follows from(18.9.4.13)(18.9.4.16), (18.9.4.15)(18.9.4.17), (18.9.4.20)(18.9.4.22), (18.9.4.24). □

Cor. (18.9.4.26). Similar as in(18.9.3.34), by(18.9.3.25), we can classify all irreducible unitary representations of $GL(2, \mathbb{R})$. ⌟

18.10 Cuspidal Representations

1 GL(n)

References are [Local Langlands Correspondence for GL(2)], [Bushnell and P. Kutzko. The admissible dual of GL(N) via compact open subgroups].

Prop. (18.10.1.1) [Bushnell-Kutzko]. All cuspidal representations of $GL(n, F)$ can be constructed by induction from open subgroups. ⌟

Proof: Cf.[Bushnell, C. and P. Kutzko, The admissible dual of $GL(N)$ via compact open subgroups, Princeton University Press, Princeton (1993).] □

2 SL(n)

[Bushnell and P. Kutzko.The admissible dual of SL(N)]

18.11 Admissible Representations of GL(n) over p-Adic Number Fields

Main references are [Bum98], [Representation theory of GL(n) over non-Archimedean local fields, Prasad],[B-Z76], [C.J. Bushnell and P.C. Kutzko, The admissible dual of GL(N) via compact open subgroups, Princeton university press, Princeton, (1993).]

Notation (18.11.0.1).

- Use notations defined in Classical Representation Theory.
- Let K be a p-adic local field or a finite field.
- Use group-theoretic notations as in(20.5.0.3).
- Fix a non-trivial character ψ of K with conductor $\mathfrak{p}^{-n(\psi)}$.
- Choose the Haar measure dx on K that is self-dual w.r.t. ψ as in(11.10.3.33).
- For $\alpha \in \mathbb{A}^{n-1}(K)$, let $\psi_{N,\alpha}$ be a character of $N(K)$ given by $\psi_N(g) = \sum_i \psi(\alpha_i g_{i,i+1})$.

⌟

Def. (18.11.0.2) [p-adic Local Fields]. If K is a p-adic local field, let $\mathcal{O}_K$ the ring of integers in K, $\mathfrak{p}$ the maximal ideal in $\mathcal{O}_K$, and ϖ a fixed uniformizer of $\mathfrak{p}$.

Denote $\mathcal{K} = GL(n, \mathcal{O}_K)$, $G_n^0 = \det^{-1}(\mathcal{O}^*) \subset GL(n, K)$.

Define subgroups $\mathrm{Unip}_k(n, K)$ of $\mathrm{Unip}(n, K)$ as $\mathrm{Unip}_k(n, K)$ is the group of unipotent matrices that $v(e_{ij}) \geq k(i-j)$. Then $\cup_{k>0} \mathrm{Unip}_k(n, K) = \mathrm{Unip}(n, K)$. In particular, $\mathrm{Unip}(n, K)$ is exhausted by compact open subgroups.

For any character χ of $\mathcal{O}_K^*$, by continuity, there is a minimum v that $c(1 + \mathfrak{p}^v) = 1$, and $\mathfrak{p}^v$ is called the **conductor** of χ. ⌟

1 Basics

References are [Representations of p-adic Groups Bernstein]. [Bum98]Chap4.

Geometry

Prop. (18.11.1.1). $GL(n, K)$ is unimodular, and the modular function of $B(K)$ is $\Delta_B(\begin{bmatrix} x & y \\ & z \end{bmatrix}) = \frac{z}{x}$ by(11.10.1.20). Also denote $\delta = \Delta_B^{-1}$. ⌟

Def. (18.11.1.2) [Unramified Quasi-Characters]. A **unramified quasi-character** on F is a quasi-character χ that $\chi(\mathcal{O}_K^\times) = 0$.

Define $\alpha(\chi) = \chi(\varpi)$ if χ is unramified and 0 otherwise, called the **Satake parameter** of χ. ⌟

Prop. (18.11.1.3) [Diagonal Quasi-Characters]. Let $\chi_1, \ldots, \chi_n$ be quasi-characters of K^*, then define two quasi-characters χ, χ' on $T(K)$:

$$\chi(\mathrm{diag}(y_1, \ldots, y_n)) = \chi_1(y_1) \ldots \chi_n(y_n), \quad \chi(\mathrm{diag}(y_1, \ldots, y_n)) = \chi_n(y_1) \ldots \chi_1(y_n).$$

When $n = 2$, the quasi-character χ on $T(K)$ is called **regular** if $\chi_1 \neq \chi_2$, and **dominant** if $|\chi_1(\varpi)| < |\chi_2(\varpi)|$. ⌟

Prop. (18.11.1.4) [Iwasawa Decomposition]. $GL(n,K) = B(K)\mathcal{K}$, in particular, $B(K)\backslash G$ is compact. ⌟

Proof: Prove by induction on n. $n=1$ is clear. Given a $g \in GL(n,K)$, we consider its bottom row, as let x_{n_k} be the term of minimal multiplicative valuation, then we can right multiply by a permutation matrix $w \in K$ that x_{nn} is of minimal valuation. Now right multiply by a matrix k, which is 1 on the diagonal and $k_{ni} = -x_i x_n^{-1}$ on the bottom row, then $k \in K$, and gk has bottom row$= e_n$. Thus we can induct and find a $k_0 \in \mathcal{K}$ that $gk_0 \in B(K)$. □

Prop. (18.11.1.5) [p-adic Cartan Decomposition]. A complete set of double coset representatives for $\mathcal{K}\backslash GL(n,K)/\mathcal{K}$ consists of diagonal matrices $\{\begin{bmatrix}\varpi^a & \\ & \varpi^b\end{bmatrix}, a \leq b \in \mathbb{Z}\}$. ⌟

Proof: This follows directly from Smith normal form(12.11.5.7). □

Cor. (18.11.1.6). $GL(n,K)$ is σ-compact. ⌟

Def. (18.11.1.7) [Principal Congruence Subgroups]. There is a map $\pi : \mathcal{K} \to GL(n, \mathcal{O}_K/(\varpi^m))$, the kernel of which is called the **principal congruence subgroup** of level m, denoted by $\mathcal{K}_m$. ⌟

Def. (18.11.1.8) [Partition and Groups]. Let $\alpha = (n_1, \ldots, n_k)$ be a partition of n, define

$$\mathrm{GL}_\alpha = \mathrm{GL}(n_1) \times \ldots \times \mathrm{GL}(n_k), \quad \mathcal{K}_\alpha = \mathcal{K} \cap GL_\alpha(F), \quad B_\alpha = B \cap \mathrm{GL}_\alpha, \quad D_\alpha = D \cap \mathrm{GL}_\alpha$$

And for a principal congruence subgroup $\mathcal{K}_m$ of $GL(n,K)$, $\mathcal{K}_m \cap GL_\alpha(F)$ is called a principal congruence subgroup of $GL_\alpha(F)$.

Denote U_α the subgroup of U_n That $a_{ij} = 0$ for i,j in the same segment of α and $i \neq j$. Let $P_\alpha = \mathrm{GL}_\alpha \ltimes U_\alpha$ be the parabolic subgroup corresponding to .

For $\beta \prec \alpha$, denote

$$U_\beta(\alpha) = U_\beta \cap \mathrm{GL}_\alpha, \quad P_\beta(\alpha) = P_\beta \cap \mathrm{GL}_\alpha = \mathrm{GL}_\beta \ltimes U_\beta(\alpha).$$

Let $N = \mathcal{K}_m \cap G_\alpha$ be a principal congruence subgroup, denote

$$N_\beta^+(\alpha) = N \cap U_\beta(\alpha), \quad N_\beta^-(\alpha) = N \cap \overline{U}_\beta(\alpha), \quad N_\beta^0(\alpha) = N \cap GL_\beta(F).$$

Moreover, define $K_0(\mathfrak{a}) = \pi^{-1}(B(\mathcal{O}_F/\mathfrak{a})), K_1(\mathfrak{a}) = \pi^{-1}(N(\mathcal{O}_F/\mathfrak{a}))$. In particular, $K_0(\mathfrak{p})$ are called the **Iwahori subgroup**, a vector is called **Iwahori fixed** iff it is $K_0(\mathfrak{p})$-fixed. ⌟

Prop. (18.11.1.9) [Iwahori Factorizations]. If $\mathfrak{a} \neq \mathcal{O}$, there are **Iwahori factorizations**

$$K_0(\mathfrak{a}) = N_-(\mathfrak{a})T(\mathcal{O})N(\mathcal{O}), \quad K_1(\mathfrak{a}) = N_-(\mathfrak{a})T(\mathfrak{a})N(\mathcal{O})$$

$$N = N_\beta^-(\alpha)N_\beta^0(\alpha)N_\beta^+(\alpha) = N_\beta^+(\alpha)N_\beta^0(\alpha)N_\beta^-(\alpha)$$

⌟

Proof: This is by column and row reduction. Cf.[Bernstein-Zelevinsky 1, P32].**?** □

Cor. (18.11.1.10). Denote $K_0 = K_0(\mathfrak{a})$ or $K_1(\mathfrak{a})$, and $T_0 = T(\mathcal{O})$ or $T(\mathfrak{a})$ respectively, then we can decompose the Haar measure on K_0 as

$$\int_{K_0} \varphi(k)dk = \int_{N_-(\mathfrak{a})}\int_{T_0}\int_{N(\mathcal{O})} \varphi(n_- t_0 n) dn dt_0 dn_- = \int_{N_-(\mathfrak{a})}\int_{T_0}\int_{N(\mathcal{O})} \varphi(n t_0 n_-) dn dt_0 dn_-.$$

⌟

Proof: Use(11.10.1.39), noticing all groups here are compact. □

Cor. (18.11.1.11) [Iwahori-Bruhat Decomposition].

$$GL(2,K)=B(K)K_0(\mathfrak{p})\coprod B(K)w_0K_0(\mathfrak{p}).$$

? How about the general case? ⌟

Proof: By pulling back the Bruhat decomposition of $GL(2,\mathcal{O}/\mathfrak{p})$ to $\mathcal{K}=GL(2,\mathcal{O})$, we have

$$\mathcal{K}=K_0(\mathfrak{p})\cup K_0(\mathfrak{p})w_0K_0(\mathfrak{p}).$$

The Iwahori factorization shows $K_0(\mathfrak{p})=(K_0(\mathfrak{p})\cap B(K))N_-(\mathfrak{p})$. Then this implies

$$\mathcal{K}=K_0(\mathfrak{p})\cup(K_0(\mathfrak{p})\cap B(K))w_0K_0(\mathfrak{p}),$$

because $w_0^{-1}N_-(\mathfrak{p})w_0\in K_0(\mathfrak{p})$. Then Iwasawa decomposition $G=BK$ gives the desired result. Notice this decomposition is clearly disjoint. □

Prop. (18.11.1.12).

- Any open normal subgroup of $GL(2,K)$ must contain $SL(2,K)$.
- If a subgroup of $GL(2,K)$ contains $N(K)$ and an open subgroup, then it must contain $SL(2,K)$.

⌟

Proof: 1: this normal subgroup contains $\begin{bmatrix}1&a\\&1\end{bmatrix}$ for $|a|$ small enough, and it is also a group, but $\begin{bmatrix}t&\\&t^{-1}\end{bmatrix}^{-1}\begin{bmatrix}1&a\\&1\end{bmatrix}\begin{bmatrix}t&\\&t^{-1}\end{bmatrix}=\begin{bmatrix}1&at^{-1}\\&1\end{bmatrix}$, thus it contains all $N(K)$. and then by item2 it contains $SL(2,K)$. Now for any f.d. irreducible smooth representation of $GL(2,K)$, choose a basis $v_1,\ldots,v_n$, then there is an open normal subgroup fixing all v_i, thus $SL(n,F)$ acts trivially on V, and then it factors through $\det:GL(2,K)\to K^\times$, and any irreducible representation of $K^\times$ is of 1-dimensional by Schur's lemma, so V must be 1-dimensional.

2: It contains some matrix that is not upper-triangular, so it contains $SL(2,K)$ by(3.1.5.9). □

Hecke Algebras

Prop. (18.11.1.13) [Spherical Idempotents]. The Hecke algebra $\mathcal{H}_{GL(n,K)}$(18.1.5.12) has a spherical idempotent(3.6.4.10) $e_{\mathcal{K}}$, where the anti-involution is given by transposition.

Then via the correspondence(18.1.5.16), $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is called a **spherical representation** if its corresponding $\mathcal{H}_{GL(n,K)}$-module is spherical(3.6.4.11). Equivalently, it contains a $\mathcal{K}$-fixed vector. And the dimension of spherical vectors is≤ 1 by(3.6.4.11). ⌟

Proof: For the invariance of $\mathcal{H}[e_{\mathcal{K}}]$, notice that $\mathcal{H}[e_{\mathcal{K}}]=\mathcal{H}_{\mathcal{K}}$ is the subspace of $\mathcal{K}$-bi-invariant functions on G, but we have the p-adic Cartan decomposition(18.11.1.5), so the value of $\varphi\in H[e_{\mathcal{K}}]$ are determined by restriction on the diagonal matrices, but they are invariant under transposition. This shows $e_{\mathcal{K}}$ is spherical. □

Prop. (18.11.1.14) [Transpose Invariant Distribution]. If $\mathcal{D}$ is a distribution on $GL(n,K)$ that is invariant under conjugation, then it is also invariant under transpose. ⌟

Proof: This follows from(18.1.5.11), as we look at the conjugate action of G on itself, with σ being the transposition. Conjugate action is constructive, by(9.2.1.23), and $g^\sigma = g^{-t}$, and a matrix is conjugate to its traspose(3.5.4.18). □

Prop. (18.11.1.15) [Gelfand-Kazhdan]. If $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n, K))$, then:

- If π_1 is defined by $\pi_1(g) = \pi(g^{-t})$, then $\pi^\vee \cong \pi_1$.
- suppose $n = 2$ and ω is the central character of π, then if $\pi_2 = \pi \otimes (\omega^{-1} \circ \deg)$, then $\pi^\vee \cong \pi_2$.

⌟

Proof: 1: It is clear that the character(18.1.5.27) of a representation is conjugation invariant, thus by(18.11.1.14) it is transpose invariant.

Now the character of π_1 is $\chi_1(\varphi) = \chi(\varphi'')$, where $\varphi''(g) = \varphi(g^{-t})$, and this equals $\chi(\varphi')$ where $\varphi'(g) = \varphi(g^{-1})$, because the character is transpose invariant. It is also clear that $\widehat{\varphi'} = \pi(\varphi)^t$ on a finite space V^K, then $\widehat{\chi}(\varphi) = \chi(\varphi') = \chi_1(\varphi)$, so by(18.1.5.32) $\pi \cong \pi_1$.

2: If $n = 2$, we use further the property that if $g = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then

$$g^{-1} = (\deg g)^{-1} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} = (\deg g)^{-1} \begin{bmatrix} & 1 \\ -1 & \end{bmatrix} g^t \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}^{-1}$$

then the assertion is clear using item1. □

Cor. (18.11.1.16). Let π be an admissible representation of $GL(n, K)$, then π is irreducible iff $\pi^\vee$ is irreducible. ⌟

Smooth Representations

Def. (18.11.1.17) [Twists]. Let $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$, for any quasi-character χ of $K^\times$, denote $\pi(\chi)$ the representation $\pi \otimes (\chi \circ \det)$. And for $s \in \mathbb{C}$, denote $\pi(s)$ the representation of π tensored by the 1-dimensional representation $g \mapsto |\det(g)|^s$ ⌟

Prop. (18.11.1.18) [Admissible Representation of $\mathbb{G}_m^N(K)$]. Any non-zero $(\pi, V) \in \mathrm{Rep}^{\mathrm{adm}}(\mathbb{G}_m^N(K))$ contains a 1-dimensional invariant subspace. ⌟

Proof: Consider the restriction on $\mathbb{G}_m^n(\mathcal{O}_K)$, by(18.1.5.25), $V = \oplus_{\chi \in \widehat{(\mathcal{O}_K^*)^k}} V_\chi$, and $\dim V_\chi < \infty$. As $(1, \ldots, \varpi, \ldots, 1)$ commutes with $\mathbb{G}_m^n(\mathcal{O}_F)$, it preserves V_χ for each χ. And these elements commute, so they have a common eigenvalue, which means V has a 1-dimensional invariant subspace. □

Lemma (18.11.1.19). Let $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n, K))$, then $\pi|_{G_n^0}$ splits into a finite direct sum of irreducible representations of G_n^0. ⌟

Proof: This follows from(18.1.2.11). □

Lemma (18.11.1.20). If $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n, K))$ satisfies V is generated by V^{K_m}, then for any submodule V', V' is generated by $V^N \cap V'$. ⌟

Proof: Cf.[B-Z76]P38. □

Prop. (18.11.1.21) [Irreducible Smooth Representation is Admissible]. For any connected reductive group G over a p-adic number field F, $\mathrm{Irr}^{\mathrm{alg}}(G(F)) = \mathrm{Irr}^{\mathrm{adm}}(G(F))$. ⌟

Proof: ? We only prove for $G = \mathrm{GL}(n)$.

By(18.11.2.9)(18.11.2.10) and(18.11.2.8), it suffices to prove for π quasi-cuspidal. But then this follows from(18.11.2.12)(18.11.1.19) and(18.1.5.48). □

Prop. (18.11.1.22)[Howe]. Let $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n,K))$, then π is of finite length iff it is admissible and f.g.. ⌟

Proof: A finite length representation is admissible by(18.11.1.21) and(18.1.5.24). For the converse, as V is f.g., take N compact open s.t. V is generated by V^N, and $\dim V^N < \infty$ as V is admissible. Then by(18.11.1.19): $V' \to V' \cap V^N$ is an injection from the set of subrepresentations of V to the set of subspaces of V^N, thus V is of finite length. □

Finite dimensional Representations

Prop. (18.11.1.23). Any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$ has dimension 1. ⌟

Proof: By the no-small-subgroup argument, the kernel of this representation contains an open normal subgroup. But any open normal subgroup of $GL(2,V)$ contains $SL(2,V)$ by(18.11.1.12), thus this is a representation of $K^\times$, which must be of 1-dimensional by(18.11.1.18). □

Lemma (18.11.1.24) [2-Dimensional Smooth Representation of $K^\times$]. Any $\rho \in \mathrm{Rep}^{\mathrm{adm,dim}=2}(K^\times)$ is one of the following form:

- $\rho(t) = \mathrm{diag}(\xi(t), \xi'(t))$, where ξ, ξ' are two quasi-characters of $K^\times$.
- $\rho(t) = \xi(t)\begin{bmatrix} 1 & v(t) \\ & 1 \end{bmatrix}$, where ξ is a quasi-character of $K^\times$.

⌟

Proof: There exists a 1-dimensional invariant subspace spanned by x by(18.11.1.18), on which $K^\times$ acts by a quasi-character ξ, and consider the quotient space, on which $K^\times$ acts by a quasi-character ξ'. choose y that is linearly-independent of x, then $\rho(t)y = \xi'(t)y + \lambda(t)x$, and

$$\lambda(tu) = \xi'(u)\lambda(t) + \lambda(u)\xi(t)$$

which is symmetric in t, u.

If $\xi \neq \xi'$,

$$\lambda(t)(\xi(u) - \xi'(u)) = \lambda(u)(\xi(t) - \xi'(t))$$

therefore $\lambda(t) = C(\xi(t) - \xi'(t))$, so $z = y - Cx$ is fixed by $\rho(K^\times)$.

If $\xi - \xi'$, then λ/ξ is an additive character of $K^\times$, thus it is trivial on $\mathcal{O}^*$, so $\lambda(t) = cv(t)$. □

Zelevinsky Segments

Def. (18.11.1.25) [Zelevinsky Segments]. For $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, a **Zelevinsky segment** $\Delta(\pi, m)$ is an ordered m-tuple $(\pi, \pi(1), \ldots, \pi(m-1))$ of cuspidal representations of $GL(n,K)$.

For two segments $\Delta(\pi_1, m)$ and $\Delta(\pi_2, n)$, $\Delta(\pi_1, m)$ **precedes** $\Delta(\pi_2, n)$ if $\Delta(\pi_1, m) \cap \Delta(\pi_2, n) = \varnothing$ and $(\Delta(\pi_1, m), \Delta(\pi_2, n))$ is another segment. They are called **linked segements** if one precedes another. ⌟

Def. (18.11.1.26) [Dual Segments]. For a segment $\Delta(\pi, m) = (\pi, \pi(1), \ldots, \pi(m-1))$, its **dual segment** $\Delta^\vee$ is the segment $(\pi^\vee(1-m), \pi^\vee(2-m), \ldots, \pi) = \Delta(\pi^\vee(1-m), m)$. ⌟

Def. (18.11.1.27) [$\pi(\Delta)$]. Let $\Delta = \Delta(\pi, m)$ be a Zelevinsky segment of length m and degree mn, we can define an admissible representation $\pi(\Delta)$ of $GL(mn, K)$ given by

$$\pi(\Delta) = \pi \times \pi(1) \times \ldots \times \pi(m-1) = I_{P(n,n,\ldots,n)}^{GL(mn,K)}(\otimes \pi_i)$$

⌟

Def. (18.11.1.28) [Zelevinsky Conditions]. A tuple of Zelevinsky segments $\Delta_1, \ldots, \Delta_r$ is said to satisfy the **Zelevinsky condition** if for each $i < j$, Δ_i doesn't precedes Δ_j. ⌟

2 Cuspidal Representations

Jacquet Functors

Def. (18.11.2.1) [Jacquet Functors]. Let $P = LU$ be a parabolic subgroup of G, if (π, V) be a representation of $G(F)$, then $V_U = V/(\text{span}\{\rho(u)v - v | u \in U\}) = V/V(U)$ is naturally a $L \cong P/U$ representation, so we can define the **Jacquet functor**:

$$J_P^G : \text{Rep}^{\text{alg}}(G(F)) \to \text{Rep}^{\text{alg}}(L(F)) : V \mapsto V_U.$$

Given a character ψ of $U(F)$, similarly $V_{U,\psi} = V/(\text{span}\{\rho(u)v - \psi(u)v | u \in U\}) = V/V(U,\psi)$ is a $Z(K)$-module, we can also define similarly the **twisted Jacquet functor**

$$J_{P,\psi}^G : \text{Rep}^{\text{alg}}(G(F)) \to \text{Rep}^{\text{alg}}(Z(K)) : V \mapsto V_{U,\psi}.$$

For convenience, define the **normalized Jacquet functor**: $r_P^G = \sqrt{\frac{\Delta_P}{\Delta_G}} \otimes J_P^G$.

$J_P^G, J_{P,\psi}^G, r_P^G$ are exact functors, by(18.1.2.4). ⌟

Prop. (18.11.2.2). For the the minimal parabolic subgroup $P = B(K)$, $J_{N,\psi_{a,N}}(V) \cong J_{N,\psi_U}(V)$ for $a \in \mathbb{G}_m^{n-1}(F) \times 1$. ⌟

Proof: This is because $\pi(a)$ maps $V(N, \psi_{a,N})$ isomorphically to $V(N, \psi_N)$, thus induces an isomorphism $J_{N(K),\psi_{a,N}}(V) \cong J_{N(K),\psi_N}(V)$. □

Prop. (18.11.2.3). $J_P^G, J_{P,\psi}^G, r_P^G$ map smooth representations of finite length to smooth representations of finite length(because it is f.g.). ⌟

Proof: If V is a f.g. G-module, then it is a f.g. P-module, because $G = PK$, and Kv_i is of f.d. for any $v \in V$. Thus the quotient V_U of V is also f.g..

For finite length**?**, Cf.[Bernstein-Zelevinsky2, P8]. □

Lemma (18.11.2.4) [Jacquet]. If (π, V) is a smooth representation of $GL(n, K)$, then using the notation as in(18.11.1.10), where $\mathfrak{a}$ is a proper ideal, V^{K_0} and $V^{N_-(\mathfrak{a})T_0}$ have the same image in the Jacquet module $J(V)$. ⌟

Proof: One inclusion is trivial, for the other, if $x \in V^{N_-(\mathfrak{a})T_0}$ then $x_1 = \int_{K_0} \pi(k)xdk$ lies in V^{K_0}, so it suffices to show x and x_1 have the same image in $J(V)$. But by(18.11.1.10)

$$x_1 = \int_{N_-(\mathfrak{a})} \int_{T_0} \int_{N(\mathcal{O})} \pi(nt_0n_-)xdndt_0dn_- = \int_{N(\mathcal{O})} \pi(n)xdn$$

and notice $p(\pi(n)x) = p(x)$. □

Prop. (18.11.2.5) [Jacquet Modules are Admissible]. Let (π, V) be a smooth representation of $GL(2,K)$, then

- Using the notation as in(18.11.1.10), if $\mathfrak{a}$ is a proper ideal, then the projection map $p : V \mapsto J(V)$ induces a surjection of $V^{K_0} \to J(V)^{T_0}$.
- If (π, V) is admissible, then $J(V)$ is also admissible representation of $T(F)$.

? For $GL(n,K)$ case, Cf.[Bernstein-Zelevinksy1, P33].? ⌟

Proof: 2 follows from 1 because we can choose $T_0 = T(\mathfrak{a})$ to be arbitrarily small, then it is of f.d., thus admissible.

For 1, notice fist that any $x \in J(V)^{T_0}$ is an image of a $x_1 \in V^{T_0}$, because $p(\pi(t)x) = \pi(t)p(x) = p(x)$, thus we can choose $x_1 = \frac{1}{V(T_0)}\int_{T_0} \pi(t)x dt$.

Thus for any f.d. subspace $\overline{U}$ of $J(V)^{T_0}$, we can find a f.d. $U \subset V^{T_0}$ that is mapped isomorphically onto $\overline{U}$. Now U is fixed by some $N_-(\mathfrak{p}^n)$ for n large, so U is fixed by $N_-(\mathfrak{p}^n)T_0$. Notice $\mathfrak{a} = \mathfrak{p}^m$ for some m, and

$$\pi(d)N_-(\mathfrak{p}^n)T_0\pi(d)^{-1} = N_-(\mathfrak{a})T_0, \quad d = \begin{bmatrix} \varpi^{n-m} & \\ & 1 \end{bmatrix},$$

so $\pi(d)U$ is stabilized by $N_-(\mathfrak{a})T_0$. Hence by lemma(18.11.2.4), $\pi(d)p(U) = p(\pi(d)U) \subset p(V^{K_0})$, so the dimension of $\overline{U}$ is bounded by dimension of V^{K_0}, so we can choose $\overline{U}$ just to be $J(V)^{T_0}$. Now $\pi(d)$ commutes with $T(F)$, so we have $\pi(d)J(V)^{T_0} = J(V)^{T_0} \subset p(V^{K_0})$. The reverse containment is clear. □

Parabolic Induction

Def. (18.11.2.6) [Parabolic Induction]. Let $P = LU$ be a parabolic subgroup of G, let $\mathrm{pr} : P \to P/U \cong L$, the **parabolic induction** functor I_P^G is the functor

$$I_P^G : \mathrm{Rep}^{\mathrm{alg}}(L) \to \mathrm{Rep}^{\mathrm{alg}}(G) : \rho \mapsto \mathrm{Ind}_P^G(\rho \circ \mathrm{pr})(18.1.5.34).$$

⌟

Prop. (18.11.2.7)[Parabolic Induction and Jacquet Functor]. For any parabolic subgroup P, I_P^G is right adjoint to the normalized Jacquet functor r_P^G. ⌟

Proof: For $\sigma \in \mathrm{Rep}^{\mathrm{alg}}(L), \rho \in \mathrm{Rep}^{\mathrm{alg}}(G)$,

$$\mathrm{Hom}_{P/U}(\sqrt{\frac{\Delta_P}{\Delta_G}} \otimes (\mathrm{res}_P^G(\sigma))_U, \rho) \cong \mathrm{Hom}_P(\mathrm{res}_P^G(\sigma), \sqrt{\frac{\Delta_G}{\Delta_P}} \otimes (\rho \circ \mathrm{pr})) = \mathrm{Hom}_G(\sigma, \mathrm{Ind}_P^G(\rho \circ \mathrm{pr})).$$

□

Prop. (18.11.2.8). I_P^G maps admissible representations to admissible representations and maps finite length representations to finite length representations. ⌟

Proof: By(18.1.5.44) and Iwasawa decomposition.

For finte length? □

Cuspidal Representation

Main references are [The Local Langlands Correspondence: The non-Archimedean case, 1994], [Induced Representations of Reductive p-Adic Groups, Berstein Zelevinsky].

Def. (18.11.2.9) [Cuspidal Representations]. $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(G(F))$ is called a **quasi-cuspidal representation** if for any proper parabolic subgroup $P = LU$ of G, $r_P^G(V) = 0$. A **cuspidal representation** is a representation that is both quasi-cuspidal and admissible. The category of cuspidal representations is denoted by $\mathrm{Rep}^{\mathrm{cusp}}(G(F))$. ⌟

Prop. (18.11.2.10) [Cuspidal Dichotomy]. If $\pi \in \mathrm{Irr}^{\mathrm{alg}}(G(F))$, then either π is (quasi-)cuspidal, or π is a subrepresentation of $I_P^G(\rho)$, where $P = LU$ is a proper parabolic subgroup of G, and $\rho \in \mathrm{Irr}^{\mathrm{alg}}(L(F))$ is (quasi-)cuspidal. ⌟

Proof: If π is not (quasi-)cuspidal, choose a minimal parabolic P that $r_P^G(\pi) \neq 0$. As $r_P^G(\pi)$ is f.g.(18.11.2.3), by(18.1.2.8), it has an irreducible subquotient σ. Then

$$0 \neq \mathrm{Hom}_M(r_P^G\pi, \sigma) = \mathrm{Hom}_G(\pi, I_P^G\sigma).$$

And by minimality, σ is (quasi-)cuspidal by(18.11.2.5). □

Prop. (18.11.2.11) [Representation from Finite Case]. Let (π_0, V_0) be an irreducible cuspidal representation of $GL(2, \mathbb{F}_q)$, then it is representation of $\mathscr{K}$ by the projection $\mathscr{K} \to GL(2, \mathbb{F}_q)$, with central character ω_0. Extend ω_0 to a character ω of $K^\times$, then extend π_0 to a representation of $\mathscr{K}Z(K)$ with central character ω. Finally let $(\pi, V) = \mathrm{ind}_{\mathscr{K}Z(K)}^{GL(2,K)} \pi_0$. Then π is a unitarizable cuspidal irreducible admissible representation of $GL(2, K)$. ⌟

Proof: To show it is admissible, we use Mackey's intertwining formula(18.1.5.43). By(18.1.5.25), it suffices to show for any $\rho\,\mathrm{ind}\,\mathrm{Irr}^{\mathrm{adm}}(\mathscr{K})$, $\dim \mathrm{Hom}_{\mathscr{K}}(\pi_0, \rho) < \infty$. By p-adic Cartan decomposition(18.1.5.43), a representative set for $\mathscr{K}\backslash G/\mathscr{K}Z(K)$ is $\{\begin{bmatrix} 1 & \\ & \varpi^n \end{bmatrix}, 0 \leq n \in \mathbb{Z}\}$. Notice π_0 is of f.d., thus it suffices to show that only f.m. $\mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0, \rho^{\varpi^n}) \neq 0$. For this, notice that by continuity, for n large, $\rho^{\varpi^n}(\begin{bmatrix} 1 & b \\ & 1 \end{bmatrix}) = \mathrm{id}$ for any $b \in \mathcal{O}$, thus any $\varphi \in \mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0, \rho^{\varpi^n}) \neq 0$ factors through the Jacquet module of π, which is 0 as π_0 is cuspidal.

By(18.1.5.45), π is unitarizable. And then by(18.1.5.46), it suffices to show that $\dim \mathrm{End}(\pi) = 1$. By Mackey theory again,

$$\mathrm{Hom}_G(\pi, \pi) \subset \mathrm{Hom}_G(\pi, \mathrm{Ind}_{\mathscr{K}Z(K)}^{GL(2,K)} \pi_0) = \prod_{n \geq 0} \mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0, \rho^{\varpi^n})$$

by the same reason as above, for $n > 0$, this is 0, and for $n = 0$, this has dimension 1 because π_0 is an irreducible representation of K.

It remains to show π is cuspidal: Use Mackey theory again. By Iwasawa decomposition, a representative set for $\mathscr{K}\backslash G/\mathscr{K}Z(K)$ is $\{\begin{bmatrix} 1 & \\ & \varpi^n \end{bmatrix}, 0 \leq n \in \mathbb{Z}\}$. Now it suffices to show $\mathrm{Hom}_{\mathrm{Unip}(2,K)}(\pi_0, 1) = 0$. But this is because π_0 is cuspidal. □

Thm. (18.11.2.12) [Harish-Chandra]. then for $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n, K))$, the following are equivalent:

- π is quasi-cuspidal.
- For any principal congruence subgroup $\mathcal{K}_m$, the function $D_{\xi,K}: G \to V : g \mapsto \pi(e_K)\pi(g^{-1})\xi$ has compact support modulo $Z(K)$.
- Every matrix coefficient of π is compactly supported modulo $Z(K)$.
- The restriction of π to G_n^0 is compact.

⌟

Proof: 2 → 3 is verbatim as that of(18.1.5.48), 3 → 4 is easy. 4 → 2 follows from the definition of compact representations and the fact $GL(n,K)/G_n^0 Z(K)$ is finite.

1 $\iff$ 2: Cf.[Bernstein-Zelevinsky, P34].**?** □

Cor. (18.11.2.13) [Contragradient of Cuspidal Representations]. For $\pi \in \mathrm{Rep}^{\mathrm{cusp}}(GL(n,K))$, $\widehat{\pi} \in \mathrm{Rep}^{\mathrm{cusp}}(GL(n,K))$ too. ⌟

3 Whittaker Models

Def. (18.11.3.1) [Whittaker Functionals & Whittaker Models]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{alg}}(GL(n,K))$,

- a **Whittaker functional** on V is a $\mathrm{Unip}(n,K)$-map $\lambda : V \to \psi_N$.(Compare with(20.1.3.9).)
- a **Whittaker model** is a subrepresentation of $\mathrm{Ind}_{\mathrm{Unip}(n,K)}^{GL(n,K)}(\psi_N)$ that is isomorphic to π and consists of functions φ of moderate growth.

An irreducible smooth representation having a Whittaker functional is called a **generic representation**. ⌟

Remark (18.11.3.2). Generic representations are important because for any global number field F and $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$, all the local components π_v are generic, by(20.5.3.7).

Whittaker models are important because we can use it to attach local Euler factors for such representations. ⌟

Prop. (18.11.3.3).

- The definition of generic is independent of ψ, by(18.11.2.2).
- π is generic iff $\pi^\vee$ is generic.**?**
- For a quasi-character χ of $K^\times$, π is generic iff $\pi(\chi)$ is generic, as $J_{\mathrm{Unip}(n,K),\psi_N}(\pi) = J_{\mathrm{Unip}(n,K),\psi_N}(\pi(\chi))$.

⌟

Prop. (18.11.3.4) [Transpose Invariant Distribution]. If $\Delta \in \mathcal{D}(GL(n,K))$ is a distribution that satisfies

$$\lambda(u)\Delta = \psi_N(u)^{-1}\Delta, \quad \rho(u)\Delta = \psi_N(u)\Delta,$$

where ψ is defined in(20.1.3.9), then Δ is stable under involution $\iota : GL(n,K) \to GL(n,K) : \iota(g) = w^0 g^t w^0$(18.11.0.1). ⌟

Proof: Firstly notice that ι fixes $N(K)$, and $\psi_N(\iota(g)) = \psi_N(g)$, so $\iota(\Delta)$ also satisfies these equations, so we can replace Δ by $\Delta - \iota(\Delta)$, then assume $\iota(\Delta) = -\Delta$ and prove $\Delta = 0$.

Consider the group G that is a semi-direct product

$$1 \to N(K) \times N(K) \to G \to \mathbb{F}_2$$

and $\iota\in\mathbb{F}_2$ acts on $N(K)\times N(K)$ by $(u_1,u_2)\mapsto(\iota(u_2)^{-1},\iota(u_1)^{-1})$.

Define a character χ on G by $\chi((u_1,u_2))=\psi_N(u_1)^{-1}\psi_N(u_2),\chi(\iota)=-1$, then G acts on $GL(n,K)$ by

$$\sigma((u_1,u_2))=\lambda(u_1)\rho(u_2),\quad \sigma(\iota)=\iota$$

then the conditions are summarized into a single condition:

$$\sigma(g)\Delta=\chi(g)\Delta.$$

We only prove for $n=2$:**?**

Consider the action of $N(K)\times N(K)$ on $GL(2,K)$ by left-right action, then we can use(18.1.5.10) and(18.1.5.11), because the action is constructive, by(9.2.1.23), and $\iota N(K)\iota=N(K)$, and ι preserves orbits except for $\mathrm{diag}\{a,d\},a\neq d$.

But there are no desired distribution on this orbit: this orbit is homeomorphic to $N(K)$ via $u\mapsto u\mathrm{diag}(a,d)$, and the distribution is transferred to a left invariant distribution, thus by(18.1.5.4) it is just the Haar measure

$$\Delta(f)=c_1\int_{N(K)}f(u\begin{bmatrix}a&b\\&d\end{bmatrix})\psi_N(u)du.$$

We notice using a right-invariant version of(18.1.5.4) that

$$\Delta(f)=c_2\int_{N(K)}f(\begin{bmatrix}a&b\\&d\end{bmatrix}u)\psi_N(u)du=c_2\int_{N(K)}f(u\begin{bmatrix}a&b\\&d\end{bmatrix})\psi_N(\begin{bmatrix}a&b\\&d\end{bmatrix}^{-1}u\begin{bmatrix}a&b\\&d\end{bmatrix})du$$

as $N(K)$ is unimodular. Notice now $c_1\psi_N(u)=c_2\psi_N(\begin{bmatrix}a&b\\&d\end{bmatrix}^{-1}u\begin{bmatrix}a&b\\&d\end{bmatrix})$ cannot happen for all u, as this implies $c_1=c_2$ by choosing $u=I$, and then $\psi(x)=\psi(ax/d)$, which is impossible by(11.10.3.35). So if some u this is not equal, then we find a function supported at a nbhd of u, then this two distributions cannot be equal. □

Prop. (18.11.3.5)[Local Multiplicity One Theorem]. For $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, the space of Whittaker functionals has dimension≤ 1. ⌟

Proof: Define another representation $\pi'(g)=\pi(\iota(g)^{-1})$, then this representation is isomorphic to π_1 defined in(18.11.1.15)($\pi(w^0)$ is an isomorphism), which is isomorphic to the contragradient of π, so there is a pairing on V that

$$(\pi(g)\xi,\eta)=(\xi,\pi(\iota(g))\eta).$$

Now for any smooth functional Λ, there is an element $[\Lambda]$ that $(\xi,[\Lambda])=\Lambda(\xi)$.

Now for any linear functional Λ on V and $\varphi\in\mathcal{H}_G$, we can define another smooth linear function $(\Lambda*\varphi)(\xi)=\Lambda(\pi(\varphi)\xi)$. Then clearly $\varphi*(\varphi_1*\varphi_2)=(\Lambda*\varphi_1)*\varphi_2$. We need the following lemma:

Lemma (18.11.3.6).

- $\pi(g)[\Lambda*\varphi]=[\Lambda*\rho(\iota(g)^{-1})\varphi]$.
- If L is a smooth functional, $[L*\varphi]=\pi(\iota(\varphi))[L]$.
- If L is a Whittaker functional, $[\Lambda*\lambda(u)\varphi]=\psi_N(u)[\Lambda*\varphi]$.

⌟

Proof: 1:

$$(\xi,\pi(g)[\Lambda*\varphi])=(\pi(\iota(g))\xi,[\Lambda*\varphi])=(\Lambda*\varphi)(\pi(\iota(g))\xi)$$
$$=\int_G\Lambda(\pi(h)\pi(\iota(g))\xi)\varphi(h)dh=\int_G\Lambda(\pi(h)\xi)\varphi(h\iota(g)^{-1})dh=(\xi,[\Lambda*\rho(\iota(g)^{-1})\varphi]).$$

2: $(\xi,[L*\varphi])=(L*\varphi)(\xi)=L(\pi(\varphi)\xi)=(\pi(\varphi)\xi,[L])=(\xi,\pi(\iota(\varphi))[L])$.

3:

$$(\xi,[\Lambda*\lambda(u)\varphi])=(\Lambda*\lambda(u)\varphi)(\xi)=\int_G\Lambda(\pi(g)\xi)\varphi(u^{-1}g)dg$$
$$=\int_G\Lambda(\pi(u)\pi(g)\xi)\varphi(g)dg$$
$$=\psi_N(u)(\Lambda*g)(\xi)=\psi_N(u)(\xi,[\Lambda*\varphi])$$

□

Now if Λ_1,Λ_2 are two Whittaker functionals, we will show they are propositional: we define a distribution Δ on G that $\Delta(\varphi)=\Lambda_1([\Lambda_1*\varphi])$, then by the lemma above, (18.11.3.4) can be applied to $\overline{\Delta}$ so we have $\Delta=\iota(\Delta)$.

Next we show for any linear functional Λ, $V=\{[\Lambda*\varphi]|\varphi\in\mathcal{H}\}$: Notice the RHS is G-invariant by(18.11.3.6), and it is not empty by smoothness technique. To go further, need another lemma:

Lemma (18.11.3.7). If $\varphi\in\mathcal{H}$ satisfies $\Lambda_1*\varphi=0$, then $\Lambda_2*\varphi=0$. ⌟

Proof: Firstly, all $\Lambda_1*\pi(g)\varphi=0$, which follows from(18.11.3.6) item1. Hence,

$$\Lambda_2([\Lambda_1*\lambda(g)\iota(\varphi)])=\Delta(\iota(\rho(\iota(g)^{-1})\varphi)\varphi)=\Delta(\rho(\iota(g)^{-1})\varphi)=\Lambda_2([\Lambda_1*\rho(\iota(g)^{-1})\varphi])=0.$$

hence by linearity, for any $\sigma\in\mathcal{H}$, $\Lambda_2([\Lambda_1*\sigma*\iota(\varphi)])=0$, which by(18.11.3.6) item2 is equivalent to $\Lambda_2(\pi(\varphi)[\Lambda_1*\varphi])=0=(\Lambda_2*\varphi)[\Lambda_1*\varphi]$, because $\Lambda_1*\sigma$ is smooth. But we know $[\Lambda*\varphi]$ can be any $v\in V$, thus $\Lambda_2*\varphi=0$. □

By the lemma, we can define a map $T:V\to V:T([\Lambda_1*\varphi])=[\Lambda_2*\varphi]$, which is a G-homomorphism by(18.11.3.6), and it is defined on all of V, so $T\xi=c\xi$ for some c, then we see $\Lambda_2=c\Lambda_1$, by a smoothness technique. □

Cor. (18.11.3.8) [Local Multiplicity One]. For $(\pi,V)\in\mathrm{Irr}^{\mathrm{alg}}(GL(n,K))$, there exists at most one Whittaker model for π. ⌟

Proof: A Whittaker model is equivalent to a $GL(n,K)$-homomorphism $V\to\mathrm{Ind}_{\mathrm{Unip}(n,K)}^{GL(n,K)}(\mathbb{C}_{\psi_N})$, which by smooth Frobenius reciprocity(18.1.5.37) is equivalent to a $N(K)$-homomorphism $V\to\mathbb{C}_{\psi_N}$, which is just a Whittaker functional. So this proposition is equivalent to(18.11.3.5). □

Prop. (18.11.3.9). A Whittaker functional for (π,V) is the same as a linear functional on $J_{\mathrm{Unip}(n,K),\psi_N}(V)$. ⌟

Cor. (18.11.3.10). For $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, $\dim J_{\mathrm{Unip}(n,K),\psi_N}(V)\le 1$, by(18.11.3.5). ⌟

Existence of Whittaker Models

Def. (18.11.3.11) [Sheaf on F associated to V]. As $\mathrm{Unip}(2) \cong \mathbb{A}^1$, any smooth representation V of $\mathrm{Unip}(2, K)$ corresponds to a smooth $\mathcal{H}(F)$-module by(18.1.5.16), thus we can view it as a $C_c^\infty(F)$-module by

$$\varphi(v) = \int_{\mathrm{Unip}(2,K)} \widehat{\varphi}(x)\pi(u)v dx.$$

Then this module is smooth thus non-degenerate by(18.1.5.16), then we can define $\mathcal{S}(V)$ the sheaf associated to V, as in(4.4.4.14). ⌟

Cor. (18.11.3.12). Let V be a smooth $B(K)$-sheaf and let $a \in K$, then the stalk

$$\mathcal{S}(V)_a \cong \begin{cases} J(V) & a = 0 \\ J_{\psi_a}(V) \cong J_\psi(V) & a \neq 0 \end{cases}.$$

⌟

Proof: By definition(4.4.4.14), the stalk is V modulo the subgroup consisting of elements v that $\chi_U \cdot v = 0$, where $U = a + \mathfrak{p}^k$ for some large k. Back the definition of $\mathcal{S}(V)$, consider the Fourier transform

$$\widehat{\chi_{a+\mathfrak{p}^k}}(x) = \overline{\psi(ax)} V(\mathfrak{p}^k)\chi_{\mathfrak{p}^{n-k}}(x)$$

where $\mathfrak{p}^n$ is the conductor of ψ. Thus

$$\chi_{a+\mathfrak{p}^k} v = C \int_{\mathfrak{p}^{n-k}} \overline{\psi(ax)}\pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})v dx = 0$$

for large k, which is equivalent to $v \in V_{N,\psi_a}$ by(18.1.2.6). Finally, $J_{\psi_a}(V) \cong J_\psi(V)$ by(18.11.2.2). □

Cor. (18.11.3.13) [Existence of Whittaker Functional]. $(\pi, V) \in \mathrm{Rep}^{\mathrm{adm}}(\mathrm{GL}(2, K))$ has a Whittaker functional unless it factors through the determinant map. In particular, if π is irreducible, then $\dim J_\psi(V) = 1$ iff it is not 1-dimensional, or to say, it is ∞-dimensional. ⌟

Proof: The existence of a Whittaker functional is equivalent to the fact $J_\psi(V) \neq 0$, which is the stalk of the sheaf $\mathcal{S}(V)$. If it vanishes, then $\mathcal{S}(V)$ is a skyscraper sheaf by(18.11.3.12), and by the correspondence of $\mathcal{S}(V)$ and V(4.4.4.14), V equals $\Gamma(F, \mathcal{S}(V)) = J(V)$, thus $\mathrm{Unip}(2, K)$ acts trivially on V.

So also all the conjugates of $\mathrm{Unip}(2, K)$ acts trivially, so $SL(2, K)$ acts trivially, by5, thus the representation factors through the quotient $K^\times$, the rest is clear.

Finally, if it is irreducible, then it factors through the determinant map iff $V \cong \mathbb{C}$ and $\pi(g) = \chi(\det(g))$, by(18.11.1.18). So $J_\psi(V) = 0$ as ψ is non-trivial. □

Prop. (18.11.3.14) [GL(n) Case]. In fact, $\pi = Q(\Delta_1, \ldots, \Delta_k) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$ is generic iff no two of Δ_i are linked, in which case

$$\pi = Q(\Delta_1) \times \ldots \times Q(\Delta_k).$$

In particular, π is generic iff its Gelfand-Kirillov dimension is maximal among those irreducible admissible representations with the same cuspidal supports. ⌟

Proof: Cf.[Induced Representations of Reductive p-Adic Groups, Zelevinsky(1980)].? □

Kirillov Model

Def. (18.11.3.15) [Kirillov Model]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{alg}}(GL(n,K))$, a **Kirillov model** $\mathcal{K}(\pi)$ is a subrepresentation of $\mathrm{Ind}_{\mathrm{Unip}(n,K)}^{P_{n-1,1}(F)}(\psi)$ that is isomorphic to $\pi|_{B_1(F)}$, and consist of functions on $B_1(F)$ that φ is compactly supported on T_1(Notice this condition is automatic by(18.11.3.19)).

When $n = 2$, it is equivalently a subspace of $C^\infty(K^\times)$ with an action of $B_1(F)$ that satisfies

$$[\pi(\begin{bmatrix} a & b \\ & 1 \end{bmatrix})\varphi](x) = \psi(bx)\varphi(ax)$$

and isomorphic to (π, V) via the isomorphism $v \mapsto \varphi_v$. ⌟

Proof: The last assertion is because $B_1(F) = \mathrm{Unip}(2,K)T_1(F)$, thus the value of a function in $\mathrm{Ind}_{N(K)}^{B_1(F)}(\psi)$ is determined by its restriction on $T_1(F) \cong K^\times$. □

Prop. (18.11.3.16). The action of $B_1(F)$ on $C_c^\infty(K^\times)$ as defined in(18.11.3.15) is irreducible. ⌟

Proof: Let U be a non-zero invariant subspace of $C_c^\infty(K^\times)$, we will show that for any $a \in K^\times$, U contains χ_U for any sufficiently small nbhd U of a. Let $\varphi \in U$ and $\varphi(b) \neq 0$, then by action of $\begin{bmatrix} b/a & \\ & 1 \end{bmatrix}$, we may assume $\varphi(a) \neq 0$.

If $f \in C_c^\infty(F)$, f acts on φ via

$$\pi(f)\varphi = \int_F f(x)\pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\varphi dx,$$

which in fact a finite sum of elements in $N(K)v$. Then $\pi(f)\varphi(y) = \int_F f(x)\psi(xy)\varphi(y)dx = \widehat{f}(y)\varphi(y)$. By the isomorphism $\mathcal{H}_{\mathcal{F}} \cong C_c^\infty(F)$(18.1.5.19), we can choose f that $\widehat{f} = \varphi(a)^{-1}\chi_U$ for a small nbhd U of a that φ is constant on U, then $\pi(f)\varphi = \chi_U$. □

Lemma (18.11.3.17). For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, if $\dim V = \infty$, then $V^{\mathrm{Unip}(2,F)} = 0$. ⌟

Proof: Cf.[Bump, P464]**?**

The stabilizer of v is open, thus by(18.11.1.12) it is fixed by all $SL(2,K)$. Also it is fixed by the center $Z(K)$. Now $GL(2,K)/SL(2,K)Z(K) \cong K^\times/(K^\times)^2$ which is finite by(14.2.3.6), thus the invariant subspace generated by v is of f.d., contradiction. □

Lemma (18.11.3.18). If $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, and Λ is a Whittaker functional on V, then for $v \neq 0 \in V$, there exists some $a \in K^\times$ that $\Lambda(\pi(\begin{bmatrix} a & \\ & 1 \end{bmatrix})v) \neq 0$. ⌟

Proof: For any $a \in K^\times$, it is clear that the kernel of the map $v \mapsto \Lambda(\pi(\begin{bmatrix} a & \\ & 1 \end{bmatrix})v)$ contains V_{N,ψ_a}**??** but by local multiplicity one(18.11.3.5), $\dim J_{\psi_a}(V) \leq 1$, and this map is non-trivial because Λ is non-trivial, thus the kernel is exactly V_{N,ψ_a}.

Thus if $\Lambda(\pi(\begin{bmatrix} a & \\ & 1 \end{bmatrix})v) = 0$, then v is the section of $\mathcal{S}(V)$ that vanishes at all $a \neq 0$, thus for any $x \in F$, $v' = v - \pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})v$ vanishes at every $a \in F$, thus $v' = 0$. Then $v = 0$ by(18.11.3.17). □

Prop. (18.11.3.19) [Kirillov Model and Whittaker Model]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, if it has a Whittaker functional Λ, then it has a Whittaker model $\mathcal{W}$ consisting of functions $W_v(g) = \Lambda(\pi(g)v)$, and we can define functions on $K^\times$ by

$$\varphi_v(a) = W_v(\begin{bmatrix} a & \\ & 1 \end{bmatrix}).$$

Then G acts on $\mathcal{K}(\pi)$ by acting on the subscript. Then it is a Kirillov model for V, and consists of functions that is compactly supported on F.

Conversely, if $\{\varphi_v | v \in V\}$ is a Kirillov model for (π, V), then we can construct functions on $GL(2,K)$ by $W_v(g) = \varphi_{\pi(g)v}(1)$. Then this is a Whittaker model for V. ⌟

Proof: The equations can be checked by hand. To given an action $\pi(\varphi_v) = \varphi_{\pi(g)v}$ on $\{\varphi_v | v \in V\}$, we need to show that $W_v \mapsto \varphi_v$ is injective, which is true by(18.11.3.18). Then $v \mapsto \pi_v$ is an isomorphism.

It remains to show that $\varphi_v \in C_c^\infty(K^\times)$. As π is a smooth representation, for any v, W_v is stable under $N(\mathfrak{p}^k)$ for some k, thus by equation above, $\varphi_v(a) = \psi_a(n)\varphi_v(a)$ for all a and $n \in N(\mathfrak{p}^k)$. Then if $|a|$ is sufficiently large, $\psi_a(n) \neq 0$ for some $n \in N(\mathfrak{p}^k)$, implying $\varphi_v(y) = 0$. □

Prop. (18.11.3.20) [Kirillov Model and Jacquet Functor]. Let V be a generic irreducible admissible representation of $GL(2,K)$, thus having a Kirillov model by(18.11.3.19), thus we can identify V with a space of functions on $K^\times$, and there is an exact sequence of vector spaces

$$0 \to C_c^\infty(K^\times) \to \mathcal{K}(\pi) \to J_{\mathrm{Unip}(2,K)}(\pi) \to 0.$$

⌟

Proof: V_N is generated by elements of the form $v' = \pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})v - v$. Notice $\varphi_{v'}(y) = (\psi(xy) - 1)\varphi_v(y)$, as ψ is continuous, when $|y|$ is small, $\varphi_{v'}(y) = 0$.

To show that if $C_c^\infty(K^\times) \subset V_N$, notice V_N is non-zero, because $\dim V = \infty$ but $\dim J(V)$ is finite(18.11.4.20). Notice V_N is stable under $B(K)$ action, thus it must be $C_c^\infty(K^\times)$ by(18.11.3.16). □

Prop. (18.11.3.21). If (π, V) is an irreducible generic admissible representation of $GL(2,K)$ thus having a Kirillov model. If χ is a quasi-character of $T(F)$ that $\pi(t)\overline{\varphi}_v = (\delta^{1/2}\chi)(t)\overline{\varphi}_v \in J(V)$, then for $|t|$ small, $\varphi_v(t)$ is a constant multiple of $|t|^{1/2}\chi_1(t)$. ⌟

Proof: Let $t_0 \in \mathfrak{p}\backslash\mathfrak{p}^2$, then

$$\pi(\begin{bmatrix} t_0 & \\ & 1 \end{bmatrix})\varphi - |t_0|^{1/2}\chi_1(t_0)\varphi \in V_N,$$

thus by(18.11.3.20), there exists some $\varepsilon(t_0) > 0$ that

$$\varphi(tu) - |t|^{1/2}\chi_1(t)\varphi(u) = 0$$

for $t = t_0$ and $|u| \le \varepsilon(t_0)$. Because both sides are locally constant on t, by the compactness of $\mathfrak{p}\backslash\mathfrak{p}^2$, there exists some $\varepsilon > 0$ that for the equation is true for all $t \in \mathfrak{p}\backslash\mathfrak{p}^2$ and $|u| \le \varepsilon$.

Now any element $t \in \mathfrak{p}$ can be factored into product of elements in $\mathfrak{p}\backslash\mathfrak{p}^2$, so by induction this is true for any $t \in \mathfrak{p}$. Thus we are done. □

Lemma (18.11.3.22) [Gelfand Uniqueness Principle]. Let $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, and let χ be a quasi-character of $K^\times$, then there are at most two essentially different values of s that there are at least two linear functionals $L : V \to \mathbb{C}$ that satisfies

$$L(\pi(\begin{bmatrix} y & \\ & 1 \end{bmatrix})v) = \chi(y)|y|^s L(v).$$

⌟

Remark (18.11.3.23). In fact, for any s, there exists at most one such linear functional**?**. ⌟

Proof: If $\dim V = 1$, this is trivial. Otherwise $\dim V = \infty$ and (π, V) has a Kirillov model. Identify V with its Kirillov model. Suppose L_1, L_2 are two linear functionals that satisfies the equation, consider their restriction to $V_N = C_c^\infty(K^\times)$, on which $B_1(F)$ acts, thus L_1, L_2 are linearly dependent when restricted to V_N by(18.1.5.5). Thus there exists constants c_1, c_2 that $c_1L_1 + c_2L_2$ factors through $J(V)$. $\dim J(V) \leq 2$ by(18.11.4.20). So by(18.11.1.24) for all but two possible choices of s, $c_1L_1 + c_2L_2 = 0$, thus there are two linear functionals only for possibly two choices of s. □

4 Bernstein-Zelevinsky Classification

Thm. (18.11.4.1) [Bernstein-Zelevinsky].

1. For any Zelevinsky segment Δ of length m, the representation $\pi(\Delta)$ has length 2^{m-1}.
2. Let Δ be a Zelevinsky segment, then $\pi(\Delta)$ has a unique irreducible subrepresentation $Z(\Delta)$ and a unique irreducible quotient representation $Q(\Delta)$.
3. Let $(\Delta_1, \ldots, \Delta_r)$ be a tuple of Zelevinsky segments satisfying the Zelevinsky condition(18.11.1.28), then $Q(\Delta_1) \times \ldots \times Q(\Delta_r) \in \mathrm{Rep}^{adm}(GL(\sum n_i m_i, F))$ admits a unique irreducible quotient $Q(\Delta_1, \ldots, \Delta_r)$. Moreover, $Q(\Delta_1, \ldots, \Delta_r)$ is independent of the order of $\Delta_1, \ldots, \Delta_r$(also need to satisfy the Zelevinsky condition).
4. Any irreducible representation (π, V) of $GL(n, K)$ is isomorphic to one of the form $\pi \cong Q(\Delta_1, \ldots, \Delta_r)$ where $\Delta_i = \Delta(\pi_i, m_i)$ and $\sum n_i m_i = n$. for a unique tuple of segments $(\Delta_1, \ldots, \Delta_r)$ satisfying Zelevinsky condition up to permutation.
5. Let $(\Delta_1, \ldots, \Delta_r)$ be a tuple of segments satisfying the Zelevinsky condition, then $Q(\Delta_1, \ldots, \Delta_r)$ is irreducible iff no two elements are linked.
6. $Q(\Delta_1, \ldots, \Delta_r)^\vee = Z(\Delta_1^\vee, \ldots, \Delta_r^\vee)$.
7. Dual statement of item$3-6$ holds for $Z(\Delta_1) \times \ldots \times Z(\Delta_r)$, which admits a unique irreducible subrepresentation $Z(\Delta_1, \ldots, \Delta_r)$.

⌟

Proof: □

Cor. (18.11.4.2) [Principal Series]. $\mathcal{B}(\chi_1, \chi_2)$ is irreducible except the following two cases:

- If $\chi_2 = \chi_1(1)$, then $\mathcal{B}(\chi_1, \chi_2)$ has a 1-dimensional invariant subspace and the quotient representation is irreducible.
- If $\chi_2 = \chi_1(-1)$, then $\mathcal{B}(\chi_1, \chi_2)$ has an irreducible invariant subspace of codimension 1.

In these cases, the infinity-dimensional irreducible representations are called the **Steinberg representations** $\sigma(\chi_1, \chi_2)$, and the one-dimensional representation is denoted by $Z(\chi_1, \chi_2)$. ⌟

Proof: Firstly we prove if $\mathcal{B}(\chi_1,\chi_2)$ has a non-trivial subspace, then it has a non-trivial subspace of dimension 1 or codimension 1: Let V' be the invariant subspace and V'' the quotient space, by the exactness of Jacquet functor(18.11.2.1) and(18.11.3.10), at least one of $J_\psi(V'), J_\psi(V'')$ vanishes. If $J_\psi(V')=0$, then by(18.11.3.13) it factors through the determinant map, thus it has a 1-dimensional invariant space. If $J_\psi(V'')=0$, then we can use(18.11.4.9) and(18.1.5.21) to dualize.

Next, if $\mathcal{B}(\chi_1,\chi_2)$ has a 1-dimensional subspace $V=\{f\}$, then $\pi(g)f=\rho(\det(g))f$ for some quasi-character ρ of $K^\times$. Now consider the fact $f\in\mathcal{B}(\chi_1,\chi_2)$, take $b=\mathrm{diag}(y,y^{-1})$, then $(\delta^{1/2}\chi)(b)=1$, showing $\chi_1\chi_2^{-1}=|\cdot|^{-1}$. The codimension1 case is dual by(18.1.5.21) and(18.11.4.9), so $\mathcal{B}(\chi_1,\chi_2)$ is irreducible except when $\chi_1\chi_2^{-1}=|\cdot|^{\pm 1}$.

Finally, if $\chi_1\chi_2^{-1}=|\cdot|^{-1}$, let $\chi_1=\chi|\cdot|^{-1/2}$, then $f(g)=\chi(\det(g))$ is an invariant 1-dimensional subspace, and this is the only 1-dimensional invariant subspace that factors through the determinant map, because if $f(g)=\chi'(\det(g))\in\mathcal{B}(\chi_1,\chi_2)$, then $\chi'=\chi_1|\cdot|^{1/2}=\chi_2|\cdot|^{-1/2}=\chi$.

Also the quotient representation is irreducible because the same argument by Jacquet module shows if it is non-irreducible, then it has an invariant subspace of dimension 1 that G action factors through the determinant map or of codimension 1, which means there are two invariant 1-dimensional subspace that the G-action factors through the determinant map, or a invariant subspace of codimension1 of $\mathcal{B}(\chi_1,\chi_2)$, the latter case contradicting the argument above. For the former case, we get a 2-dimensional subrepresentation of $\mathcal{B}(\chi_1,\chi_2)$ that factors through the determinant map. The argument above shows it is generated by $\chi(\det())$ and some function f, but f must satisfy $f(g)=\chi(\det(g))f(1)+a$, which is possible only if $a=0$, so $f=\chi\circ\det$, contradiction.

The codimension 1 case is dual by(18.1.5.21) and(18.11.4.9). □

Cor. (18.11.4.3) [Steinberg Representation]. Consider the segment $\Delta(|\cdot|^{\frac{1-n}{2}},n)$ of length n and degree n, then $(\pi(\Delta),V)$ is the space of functions $B\backslash G\to\mathbb{C}$. Thus $Z(\Delta)$ is the trivial representation, and $Q(\Delta)$ is called the (standard)**Steinberg representation**, denoted by St_n. It is self-dual.

If $n=2$, then $\pi(\Delta)$ has length 2, thus there are an exact sequences,

$$0\to 1\to|\cdot|^{-1/2}\times|\cdot|^{1/2}\to\mathrm{St}_2\to 0,\quad 0\to\mathrm{St}_2\to|\cdot|^{1/2}\times|\cdot|^{-1/2}\to 1\to 0$$

⌟

Cor. (18.11.4.4) [Classification of $\mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$]. The $n=2$ case is particularly clear: any $\pi\in\mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$ has the following possibilities:

1. π is cuspidal.
2. $\pi=Q(\chi|\cdot|^{-1/2},\chi|\cdot|^{1/2})$, which equals $\mathrm{St}_2(\chi)$.
3. $\pi=\chi_1\times\chi_2$, where χ_1,χ_2 are not linked, which is the principal series.
4. $\pi=Q(\chi|\cdot|^{1/2},\chi|\cdot|^{-1/2})$, which equals $\mathbb{1}(\chi)$.

⌟

Def. (18.11.4.5) [Cuspidal Supports]. For a $\pi=Q(\Delta_1,\ldots,\Delta_r)\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, where $\Delta_i=(\pi_i,m_i)$, define the **cuspidal supports** of π as the set

$$\mathrm{Supp}(\pi)=\{\pi_i(j)\}_{1\le i\le r,1\le j\le m_i-1}.$$

⌟

Principal Series Representations

Def. (18.11.4.6) [Principal Series Representations]. Given a diagonal quasi-character χ of $T(F)$, define the **principal series representation** of G as

$$\mathcal{B}(\chi_1,\ldots,\chi_n)=I_{B(K)}^{G(F)}(\chi)(18.1.5.34)=\{f\in C^\infty(G)|f(\begin{bmatrix}y_1 & & *\\ & \ldots & \\ & & y_n\end{bmatrix}g)=\chi_1(y_1)\ldots\chi_n(y_n)|y_1^{n-1}y_2^{n-3}\ldots y_n^{-n+1}|^{1/2}f$$

It is admissible of finite length by(18.11.2.8). If it is irreducible, its isomorphism class is denoted by $\pi(\chi_1,\chi_2)$. ⌟

Lemma (18.11.4.7). By(18.1.5.41), we have a map $P:C_c^\infty(G(F))\to\mathcal{B}(\chi_1,\ldots,\chi_n)$:

$$(P\varphi)(g)=\int_{B(K)}\varphi(b^{-1}g)(\delta^{1/2}\chi)(b)db$$

Then this map is intertwining and surjective. Moreover, we have

$$P(\lambda(b)^{-1}\varphi)=(\delta^{-1/2}\chi)(b)P(\varphi),\quad b\in B(K)$$

⌟

Prop. (18.11.4.8). The representation $B(\chi_1,\ldots,\chi_n)$ admits at most one Whittaker functional. In other words, $\dim J_\psi(B(\chi_1,\ldots,\chi_n))\leq 1$. in fact, it is exactly one, as will be shown by(18.11.4.2) and(18.11.3.13). ⌟

Proof: Let $\Lambda:V\to\mathbb{C}$ be a Whittaker functional, then we define a distribution Δ on $GL(2,K)$ as $\Delta(\varphi)=\Lambda(P\varphi)$. Then

$$\lambda(b)\Delta=(\delta^{-1/2}\chi)(b)\Delta, b\in B(K),\quad \rho(n)\Delta=\psi_N(n)^{-1}\Delta, n\in N(K)$$

by(18.11.4.7). Because P is surjective(18.11.4.7), it suffices to show that these Δ are unique up to scalar.

Consider the left-right action of $B(K)\times N(K)$ on $G(F)$, then there are $n!$ orbits $B(K)WN(K)$ by Bruhat decomposition(12.11.5.6). For $w\neq 1$, the orbit $B(K)wN(K)$ is isomorphic to $B(K)\times N(K)$ via $(b,n)\mapsto bwn^{-1}$, thus the restriction of Δ on $B(K)wN(K)$ must be of the form

$$\Delta_1(\varphi)=C\int_{B(K)}\int_{N(K)}\varphi(bwn^{-1})\psi_N(n)(\delta^{1/2}\chi^{-1})(b)dbdn$$

by(18.1.5.4). This is the unique map that satisfies the condition.

As for the distribution on $B(K)$, the same reasoning shows the restriction of Δ on $B(K)$ must be of the form

$$\Delta_2(\varphi)=C\int_{B(K)}\varphi(b)(\delta^{1/2}\chi^{-1})(b)db,$$

but it satisfies $\rho(n)\Delta_2=\Delta_2$, so there are no distribution on $B(K)$. Finally, (4.4.4.11) gives us the result. □

Cor. (18.11.4.9). The contragradient of $\chi_1\times\ldots\times\chi_n$ is $\chi_1^{-1}\times\ldots\times\chi_n^{-1}$. ⌟

Proof: If $f \in \mathcal{B}(\chi_1, \chi_2)$, $f' \in \mathcal{B}(\chi_1^{-1}, \chi_2^{-1})$, then the pairing $(f, f') = \int_K f(k)f'(k)dk$ is G-invariant by(11.10.1.45), so this defines a smooth functional $l_{f'}$, and it is non-degenerate, the mapping $f' \mapsto l_{f'}$ is injective(by letting $f = 1/f'$ on a $B(K)$-orbit that f' is non-zero) from $\mathcal{B}(\chi_1^{-1}, \chi_2^{-1})$ to $\mathcal{B}(\chi_1, \chi_2)^\vee$. Now by symmetry the other side is also injective, and we are done because $(V^\vee)^\vee =\cong V$(18.1.5.23). □

Cor. (18.11.4.10). $\mathrm{Hom}(\mathcal{B}(\chi_1, \ldots, \chi_n), \mathcal{B}(\mu_1, \ldots, \mu_n)) \neq 0$ only if $\{\chi_1, \ldots, \chi_n\} = \{\mu_1, \ldots, \mu_n\}$. ⌟

Proof: By smooth Frobenius reciprocity(18.1.5.37),

$$\mathrm{Hom}_G(\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)) \cong \mathrm{Hom}_{B(K)}(\mathcal{B}(\chi_1, \chi_2), \delta^{1/2}\mu).$$

The proof below is similar to that of(18.11.4.8): For such a map Λ, we define a distribution $\Delta(\varphi) = \Lambda(P(\varphi))$, then

$$\lambda(b)\Delta = (\delta^{-1/2}\chi)(b)\Delta, \quad \rho(b)\Delta = (\delta^{-1/2}\mu^{-1})(b)\Delta, \quad b \in B(K).$$

So by the exact sequence(4.4.4.11), such distribution exists on one of the orbits $B(K)wN(K)$.

If such a distribution exists on $B(K)wN(K)$ for $w \neq 1$, then noticing $\rho(n)\Delta = \Delta$ for $n \in N(K)$, by(18.1.5.4)

$$\Delta(\varphi) = \int_{B(K)} \int_{N(K)} \varphi(bwn^{-1})(\delta^{1/2}\chi^{-1})(b)dbdn,$$

then we apply $\rho(t)$ with t diagonal, then

$$\begin{aligned}(\delta^{-1/2}\mu^{-1})(t)\Delta(\varphi) = (\rho(t)\Delta)(\varphi) &= \int_{N(K)} \int_{B(K)} \varphi((bwt^{-1}w^{-1})w(tnt^{-1})^{-1})(\delta^{1/2}\chi^{-1})(b)dbdn \\ &= \delta(t)^{-1}(\delta^{-1/2}\chi^{-1})(wtw^{-1})\Delta(\varphi)\end{aligned}$$

via change of variables(11.10.1.16). Notice that $\delta(t) = \delta(wtw^{-1})^{-1}$, thus $\mu(t) = \chi(wtw^{-1})$, which means $\chi_i = \mu_{w(i)}$.

Similarly, if such a distribution exists on $B(K)$, then

$$\Delta(\varphi) = \int_{B(K)} \varphi(b)(\delta^{1/2}\chi^{-1})(b)db.$$

Apply $\rho(b)$, then $\delta^{-1/2}\chi(b) = (\delta^{-1/2}\mu)(b)$, so $\chi_i = \mu_i$. □

Intertwining Integrals and Whittaker Functional

Prop. (18.11.4.11)[Intertwining Integral]. Let ξ_i be two characters of $K^\times$, and $\chi_i = |\cdot|^{s_i}\xi_i$, $(\pi, V) = \mathcal{B}(\chi_1, \chi_2)$, $(\pi', V') = \mathcal{B}(\chi_2, \chi_1)$. Define for $f \in V$,

$$Mf : GL(2, K) \to \mathbb{C} : Mf(g) = \int_{N(K)} f(w_0 ug)du$$

then if $\mathrm{Re}(s_1 - s_2) > 0$, the integral is absolutely convergent, $Mf \in V'$, and M is a nonzero intertwining, so $V \cong V'$ if they are both irreducible. ⌟

Proof: Should compare this proof with(18.9.4.18).

For the convergence, it suffices to check for $\begin{bmatrix}1 & x\\ & 1\end{bmatrix}$, $|x|$ large, but then

$$f(\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)=f(\begin{bmatrix}x^{-1} & -1\\ & x\end{bmatrix}\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}g)=|x|^{-1}(\chi_1^{-1}\chi_2)(x)f(\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}g)$$

and because f is locally constant, when $|x|$ is large, $f(\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}g)=f(g)$, thus the convergence on the unbounded region is dominated by

$$\int_{|x|>q^N}|x|^{-1}|(\chi_1^{-1}\chi_2)(x)|dx=\int_{|x|>q^N}|x|^{-s_1+s_2-1}dx,$$

which converges for $\mathrm{Re}(s_1-s_2)>0$.

To show $Mf\in V'$, we need to check

$$Mf(\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)=Mf(g),\quad Mf(\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g)=|y_1/y_2|^{1/2}\chi_2(y_1)\chi_1(y_2)Mf(g).$$

The first is trivial and for the second:

$$Mf(\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g)=\int_F f(\begin{bmatrix}y_2 & \\ & y_1\end{bmatrix}\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & y_2y_1^{-1}x\\ & 1\end{bmatrix}g)dx$$

so it is clear.

Finally M is clearly intertwining, and it is not trivial by looking at the function f:

$$f=|y_1/y_2|^{1/2}\chi_1(y_1)\chi_2(y_2)\chi_{\mathcal{O}_F}(x),\text{ where }g=\begin{bmatrix}y_1 & z\\ & y_2\end{bmatrix}\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}$$

and vanish if $g\in B(K)$. Notice the representation of g is unique by Bruhat decomposition. Then $Mf(1)=1$. □

Prop. (18.11.4.12) [Analytic Continuation of Intertwining Integral]. Let ξ_i be two characters of $K^\times$, $\chi_i=|\cdot|^{s_i}\xi_i$, $(\pi_{s_1,s_2},V_{s_1,s_2})=\mathcal{B}(\chi_1,\chi_2),(\pi'_{s_2,s_1},V'_{s_2,s_1})=\mathcal{B}(\chi_2,\chi_1)$.

Notice that by Iwasawa decomposition(18.11.1.4), an arbitrary $f\in\mathcal{B}(\chi_1,\chi_2)$ is determined by its restriction on K, and if a function f_0 on K satisfies

$$f_0(\begin{bmatrix}y_1 & x\\ & y_2\end{bmatrix}k)=\xi_1(y_1)\xi_2(y_2)f_0(k),y_1,y_2\in\mathcal{O}^*,$$

then f_0 can extends uniquely to an element $f_{s_1,s_2}\in V_{s_1,s_2}$ for any s_1,s_2, called the **flat sections** of f_0.

Then the intertwining integral Mf_{s_1,s_2} defined in(18.11.4.11) is analytic for the dominant χ in the flat family, and has an analytic continuation to all s_1,s_2 that $\chi_1\neq\chi_2$, and defines a nonzero operator $V_{s_1,s_2}\to V'_{s_2,s_1}$. ⌟

Proof: The proof is parallel to that of(18.11.4.11).

$$Mf_{s_1,s_2}(g)=\int_{|x|\leq q^N} f_{s_1,s_2}(\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)dx+\int_{x\geq q^{N+1}}|x|^{-s_1+s_2-1}(\xi_1^{-1}\xi_2)(x)dxf_{s_1,s_2}(g)$$

the first term can easily be extended, and the second term vanishes if $\xi_1^{-1}\xi_2$ ramifies, and equals something like a multiple of $\frac{(\chi_1^{-1}\chi_2(\varpi))^{N+1}}{1-\chi_1^{-1}\chi_2(\varpi)}$, which extends unless $\chi_1=\chi_2$.

For the intertwining property, it is because equalities maintain along analytic continuation, in particular, it is non-trivial as $Mf_{s_1,s_2}(1)=1$. □

Cor. (18.11.4.13). $Z(\chi_1,\chi_2)\cong Z(\chi_2,\chi_1)$, $\sigma(\chi_1,\chi_2)\cong\sigma(\chi_2,\chi_1)$. If $\mathcal{B}(\chi_1,\chi_2)$ is irreducible, then $\pi(\chi_1,\chi_2)\cong\pi(\chi_2,\chi_1)$. Moreover, there are no other isomorphisms between these representations. ⌟

Proof: It suffices to show there are no other isomorphisms, and this is by(18.11.4.10). □

Prop. (18.11.4.14) [Whittaker functional of $\mathcal{B}(\chi_1,\chi_2)$]. There is a Whittaker functional on $\mathcal{B}(\chi_1,\chi_2)$ defined by

$$\Lambda(f)=\int_F f(w_0\begin{bmatrix}1 & x\\ & 1\end{bmatrix})\psi(-x)dx.$$

This integral is absolutely convergent if χ is dominant and is analytic for the flat family of χ, by method the same as in the proof of(18.11.4.11). And this can also be extended to all χ(as flat section(18.11.4.12)) by defining

$$\Lambda(f)=\lim_{k\to\infty}\int_{\mathfrak{p}^{-k}} f(w_0\begin{bmatrix}1 & x\\ & 1\end{bmatrix})\psi(-x)dx.$$

⌟

Remark (18.11.4.15). Compare with(20.5.3.3). ⌟

Proof: This makes sense because it stabilize as $k\to\infty$: when k is large,

$$\int_{\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}} f(w_0\begin{bmatrix}1 & x\\ & 1\end{bmatrix})\psi(-x)dx=q^{-k-1}f(1)\int_{\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}}\psi(-x)(\chi_1^{-1}\chi_2)(x)dx$$

By continuity(See the proof of(18.11.4.11)). If $\psi(t)\neq 0$, choose k large that $\chi_1^{-1}\chi_2(x)=\chi_1^{-1}\chi_2(x+t)$ for any $x\in\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}$, thus this integral vanishes. □

Remark (18.11.4.16). For general n, this method won't work, and another method is used in**??**Bernstein, J., Letter to Piatetski-Shapiro (1985). To appear in Cogdell and Piatetski-Shapiro (book in preparation).] to extend analytically. ⌟

Prop. (18.11.4.17). If $\mathcal{B}(\chi_1,\chi_2)$ is irreducible, with the notations in(18.11.4.11), the intertwining integral $M:\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1)$ satisfies

$$\Lambda'\circ M=\xi_1\xi_2^{-1}(-1)\gamma(1-s_1+s_2,\xi_1^{-1}\xi_2,\psi)\Lambda,$$

where Λ is the Whittaker functional defined in(18.11.4.14), and $\gamma(s,\chi,\psi)$ is the local constant defined in(21.3.2.8). ⌟

Proof: Cf.[Bump, P485].**?** □

Cor. (18.11.4.18) [Composition of Intertwining Integrals]. If $\mathcal{B}(\chi_1,\chi_2)$ is irreducible, $M:\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1), M':\mathcal{B}(\chi_2,\chi_1)\to\mathcal{B}(\chi_1,\chi_2)$ are intertwining integrals, then $M'\circ M$ is the scalar $\gamma(1-s_1+s_2,\xi_1^{-1}\xi_2,\psi)\gamma(1+s_1-s_2,\xi_1\xi_2^{-1},\psi)$.

If $\mathcal{B}(\chi_1,\chi_2)$ is reducible, $M'\circ M=0$. ⌟

Proof: The irreducible case follows from the proposition. For the reducible case, let $\chi_1\chi_2^{-1}=|\cdot|$, the intertwining integral $\mathcal{B}(\chi_2,\chi_1)\to\mathcal{B}(\chi_1,\chi_2)$ is non-zero, so the image is ether $\mathcal{B}(\chi_1,\chi_2)$ or $\pi(\chi_1,\chi_2)$. In the first case, $\mathcal{B}(\chi_2,\chi_1)$ has a infinite dimensional proper quotient, contradiction. The intertwining integral $\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1)$ is non-zero, so the image is either $\mathcal{B}(\chi_2,\chi_1)$ or $\sigma(\chi_1,\chi_2)$. In the first case, $\mathcal{B}(\chi_1,\chi_2)$ has a 1-dimensional quotient, contradiction. □

Jacquet Module

Prop. (18.11.4.19) [Jacquet Module of $\mathcal{B}(\chi_1,\ldots,\chi_n)$]. Let χ_i be quasi-characters of $K^\times$, then the Jacquet module of $\chi_1\times\ldots\times\chi_n$ has dimension $n!$.

And if $n=2$, the representation of $T(F)$ on the Jacquet module is isomorphic to the representation

$$t\mapsto\begin{cases}\begin{bmatrix}(\delta^{1/2}\chi)(t) & \\ & (\delta^{1/2}\chi')(t)\end{bmatrix}, & \chi_1\neq\chi_2\\ (\delta^{1/2}\chi)(t)\begin{bmatrix}1 & v(t_1/t_2)\\ & 1\end{bmatrix}, & \chi_1=\chi_2=\chi\end{cases}.$$

⌟

Proof: Firstly we show $\dim J(\mathcal{B}(\chi_1,\chi_2))=2$: Let $\Lambda:V\to\mathbb{C}$ be a functional that $\Lambda(\rho(n)v)=\Lambda(v)$ for $n\in N(K)$, then we define a distribution Δ on $GL(2,K)$ as $\Delta(\varphi)=\Lambda(P\varphi)$. Then

$$\lambda(b)\Delta=(\delta^{-1/2}\chi)(b)\Delta, b\in B(K),\quad \rho(n)\Delta=\Delta, n\in N(K)$$

by(18.11.4.7). Because P is surjective(18.11.4.7), it suffices to show that there are exactly two linearly independent such Δ.

Consider the left-right action of $B(K)\times N(K)$ on $GL(2,K)$, then there are $n!$ orbits $B(K)WN(K)$ by Bruhat decomposition(12.11.5.6). For $w\neq 1$, the orbit $B(K)wN(K)$ is isomorphic to $B(K)\times N(K)$ via $(b,n)\mapsto bwn^{-1}$, thus the restriction of Δ on it must be of the form

$$\Delta_1(\varphi)=C\int_{B(K)}\int_{N(K)}\varphi(bwn^{-1})(\delta^{1/2}\chi^{-1})(b)dbdn$$

by(18.1.5.4).

As for the distribution on $B(K)$, the same reasoning shows the restriction of Δ on $B(K)$ must be of the form

$$\Delta_2(\varphi)=C\int_{B(K)}\varphi(b)(\delta^{1/2}\chi^{-1})(b)db,$$

and it truly satisfies $\rho(n)\Delta_2=\Delta_2$. Finally, (4.4.4.11) gives us the result.

Next we consider $J(V)$ as a 2-dimensional $T(F)$-representation must be of the two forms in(18.11.1.24), it suffices to distinguish these two cases.

Denote $V=\mathcal{B}(\chi_1,\chi_2)$. Consider for any quasi-character μ of $T(F)$,

$$\mathrm{Hom}_{T(F)}(J(V),\delta^{1/2}\mu)\cong\mathrm{Hom}_{B(K)}(V,\delta^{1/2}\mu)\cong\mathrm{Hom}_{GL(2,K)}(V,\mathcal{B}(\mu_1,\mu_2))$$

So(18.11.4.10)(18.11.4.13) can be used, so if $\chi_1\neq\chi_2$, there are two μ that can make the Hom group non-vanish, so it is the first case. If $\chi_1=\chi_2$, then V is irreducible, and there is only one μ that makes this Hom group non-vanish, and the Hom group is of dimension1 by Schur's lemma, so it is the second case. □

Prop. (18.11.4.20) [Jacquet Module is Finite Dimensional]. For $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, $\dim J_{\mathrm{Unip}(n,K)}(V)\leq n!$, and if it is nonzero, then π is a subrepresentation of some $\mathcal{B}(\chi_1,\ldots,\chi_n)$. ⌟

Proof: By(18.11.2.10), π is isomorphic to a subrepresentation of some $\mathcal{B}(\chi_1,\ldots,\chi_n)$. Then by exactness of Jacquet functor(18.11.2.1), $J(V)$ is a subspace of $J(\mathcal{B}(\chi_1,\ldots,\chi_n))$, which has dimension $n!$(18.11.4.19). □

Prop. (18.11.4.21) [Jacquet Functor of $\sigma(\chi_1,\chi_2)$]. Suppose χ_1,χ_2 are characters of $K^\times$ that $\chi_1\chi_2^{-1}=|\cdot|^{-1}$, then $\mathcal{B}(\chi_1,\chi_2)$ is reducible, then the Jacquet modules of $\pi(\chi_1,\chi_2)$ and $\sigma(\chi_1,\chi_2)$ are 1-dimensional, and the characters of $T(F)$ they afford are $\delta^{1/2}\chi$ and $\delta^{1/2}\chi'$. ⌟

Proof: Clearly the Jacquet module of a representation $\mathbb{1}(\chi)$ is of dimension 1, so by the exactness of Jacquet functor(18.11.2.1) and(18.11.4.19), the Jacquet functor for $\sigma(\chi_1,\chi_2)$ is also of dimension 1.

For the determination of the Jacquet module, notice for any representation (π,V) of $GL(2,K)$,

$$\mathrm{Hom}_{T(F)}(J(V),\delta^{1/2}\mu)\cong\mathrm{Hom}_{B(K)}(V,\delta^{1/2}\mu)\cong\mathrm{Hom}_{GL(2,K)}(V,\mathcal{B}(\mu_1,\mu_2)).$$

So for $\pi=\pi(\chi_1,\chi_2)$, $\mathrm{Hom}_{T(F)}(J(V),\delta^{1/2}\mu)=\mathbb{C}$ for $\mu=\chi$, so $J(\pi(\chi_1,\chi_2))$ is $\delta^{1/2}\chi$. For $\pi=\sigma(\chi_1,\chi_2)$, then $\mathrm{Hom}_{T(F)}(J(V),\delta^{1/2}\mu)=\mathbb{C}$ for $\mu=\chi'$ by(18.11.4.13), so $J(\sigma(\chi_1,\chi_2))$ is $\delta^{1/2}\chi'$. □

Kirillov Modules of Principal Series

Prop. (18.11.4.22)[Kirillov Model of Principal Series]. Let $\pi(\chi_1,\chi_2)$ be an irreducible principal series,

- If $\chi_1\neq\chi_2$, then the Kirillov model of $\pi(\chi_1,\chi_2)$ consists of smooth functions φ on $K^\times$ that is compactly supported on F and $\varphi(t)$ is a linear combination of the function $|t|^{1/2}\chi_1(t)$ and $|t|^{1/2}\chi_2(t)$ when $|t|$ is small.
- If $\chi_1=\chi_2$, then the Kirillov model of $\pi(\chi_1,\chi_1)$ consists of smooth functions φ on $K^\times$ that is compactly supported on F and $\varphi(t)$ is a linear combination of the function $|t|^{1/2}\chi_1(t)$ and $v(t)|t|^{1/2}\chi_1(t)$ when $|t|$ is small.

⌟

Proof: First assume that $\chi_1=\chi_2$, then by(18.11.4.19), there are two functions φ_1,φ_2 that satisfies

$$\pi(t)\overline{\varphi}_1=(\delta^{1/2}\chi)(t)\overline{\varphi}_1,\quad \pi(t)\overline{\varphi}_2=(\delta^{1/2}\chi)(t)\overline{\varphi}_2+v(t_1/t_2)(\delta^{1/2}\chi)(t)\overline{\varphi}_1.$$

Then by(18.11.3.21), $\varphi_1(u)=C|u|^{1/2}\chi_1(u)$ for $|u|$ small, and because $\overline{\varphi}_1\neq 0\in J(V)$, $C\neq 1$ by(18.11.3.20), and we can assume that $C=1$. Then for any $t_0\in\mathfrak{p}\backslash\mathfrak{p}^2$,

$$\pi(\begin{bmatrix}t_0&\\&1\end{bmatrix})\varphi_2-|t_0|^{1/2}\chi_1(t_0)[\varphi_1+\varphi_2]\in V_N.$$

Thus by(18.11.3.20), there exists some constant $\varepsilon(t_0)$ that

$$\varphi_2(tu) = |t|^{1/2}\chi_1(t)\varphi_2(u) + |tu|^{1/2}\chi_1(tu).$$

is true for $t = t_0$ and $|u| \leq \varepsilon(t_0)$. Notice both sides are locally constant on t, so this is true for t near t_0. Because $\mathfrak{p}\backslash\mathfrak{p}^2$ is compact, there is a ε that this is true for any $t \in \mathfrak{p}\backslash\mathfrak{p}^2$ and $|u| \leq ve$.

Now any element $t \in \mathfrak{p}$ can be factored into product of elements in $\mathfrak{p}\backslash\mathfrak{p}^2$, so by induction

$$\varphi_2(tu) = |t|^{1/2}\chi_1(t)\varphi_2(u) + v(t)|tu|^{1/2}\chi_1(tu).$$

for any $t \in \mathfrak{p}$ and $|u| \leq \varepsilon$. So the theorem is true for φ_1 and φ_2, thus true for any other function because they differs from a linear combination of these two by an element in V_N, which vanishes for $|t|$ small, by(18.11.3.20).

Case1 is similar and easier. □

Prop. (18.11.4.23) [Kirillov Model of Steinberg Representations]. Let $\sigma(\chi_1, \chi_2)$ be a Steinberg representation of $GL(2, K)$, where $\chi_1\chi_2^{-1} = |\cdot|^{-1}$, then the Kirillov model of $\sigma(\chi_1, \chi_2)$ consists of smooth functions φ on $K^\times$ that is compactly supported on F and $\varphi(t)$ is a constant multiple of $|t|^{1/2}\chi_2(t)$ when $|t|$ is small. ⌟

Proof: The proof is the same as that of(18.11.4.22), with(18.11.4.21) used instead of(18.11.4.19). □

5 Spherical Representations

Def. (18.11.5.1) [Normalized Spherical Vector]. Let $\chi_1, \ldots, \chi_n$ be nonramified quasi-characters of $K^\times$, then $\mathcal{B}(\chi_1, \ldots, \chi_n)$ contains a K-fixed vector φ_K that is defined to be

$$\varphi_{\mathcal{K}}(bk) = (\delta^{1/2}\chi)(b), b \in B(K), k \in \mathcal{K}$$

Notice this is well-defined, because for $u \in B(K) \cap \mathcal{K}$, $(\delta^{1/2}\chi)(u) = 1$. $\varphi_{\mathcal{K}}$ is $\mathcal{K}$-spherical, and we refer to it the **normalized spherical vector** in V. Such a $\mathcal{B}(\chi_1, \ldots, \chi_n)$ is called a **unramified principal series** if it is irreducible.

Notice when $n = 2$ and $\chi_2 = \chi_1|\cdot|$, this spherical vector just spans the 1-dimensional invariant subspace in(18.11.4.2). ⌟

Prop. (18.11.5.2) [Satake Isomorphism]. There is an isomorphism

$$S : \mathcal{H}_K \cong \mathbb{C}[t_1, t_1^{-1}, \ldots, t_n, t_n^{-1}]^W.$$

s.t. if $\varphi \in \mathcal{H}_K$, for any spherical principal series $\pi(\chi_1, \ldots, \chi_n)$ and a spherical vector v, $\pi(\varphi)v = S(\varphi)(\alpha_1, \ldots, \alpha_n)$, where $\alpha_i = \chi(\chi_i)$ are the Satake parameters of χ_i. ⌟

Remark (18.11.5.3). For general Satake isomorphism, Cf.(18.12.0.3). ⌟

Proof: Cf.[Spherical representations and the Satake isomorphism]? □

Cor. (18.11.5.4). When $n = 2$, under the Satake isomorphism, the Hecke operators $T(\mathfrak{p}) = \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix}$ and $R_p = \varpi I$ are mapped to

$$q^{1/2}(t_1 + t_2), \quad t_1 t_2,$$

resp. ⌟

Proof: For any unramified spherical representation with Satake parameters α_1, α_2, using the representative of $\mathscr{K}\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}\mathscr{K}$ over $\mathscr{K}$ as in(20.2.2.9),

$$(T(\mathfrak{p})\varphi_{\mathscr{K}})(1) = \int_{\mathscr{K}\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}\mathscr{K}} \varphi_K(g)dg = \sum_{\gamma\in K\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}K/K} \varphi_K(\gamma)$$

$$= (\Delta^{1/2}\chi)(\begin{bmatrix}1 & \\ & \varpi\end{bmatrix}) + q(\Delta^{1/2}\chi)(\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}) = q^{1/2}(\alpha_1+\alpha_2)$$

and similarly for $R(\mathfrak{p})$. □

Cor. (18.11.5.5) [Spherical Representation of $GL(n,K)$]. Every irreducible admissible spherical representation (π, V) of $GL(n,K)$ is of the form $Q(\Delta_1,\Delta_2,\ldots,\Delta_n)$ where $\Delta_i = (\chi_i, 1)$, χ_i are unramified quasi-characters. ⌟

Proof: Use the Satake isomorphic to find Satake parameters of unramified quasi-characters χ_i that makes the representation of $\mathcal{H}_K \cong \mathbb{C}[t_1, t_1^{-1},\ldots,t_n,t_n^{-1}]^W$ isomorphic to that of π, then by(3.6.4.3), $\chi_1\times\chi_2\times\ldots\times\chi_n$ has a unique irreducible subquotient that has the came spherical character as π, then by(3.6.4.12), this subquotient is isomorphic to π. Now use the fact we can change the order of χ_i s.t. it is just $Q(\Delta_1,\Delta_2,\ldots,\Delta_n)$. □

Prop. (18.11.5.6) [Intertwining Operator on Spherical Vector]. For χ_1,χ_2 unramified with Satake parameter α_i, consider $M:\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1)$, then

$$M\varphi_{K,\chi} = \frac{1-q^{-1}\alpha_1\alpha_2^{-1}}{1-\alpha_1\alpha_2^{-1}}\varphi_{K,\chi'}.$$

⌟

Proof: Clearly this equation is true up to scalar because M is intertwining, so it suffices to calculate $(M\varphi_K)(1)$. For this, we assume χ is dominant(18.11.5.2) because we can use analytic continuation. Then

$$(M\varphi_K)(1) = \int_F \varphi_K(w_0\begin{bmatrix}1 & x\\ & 1\end{bmatrix})dx.$$

The integral is 1 on $\mathcal{O}$, and for $m>0$, on $\mathfrak{p}^{-m}\backslash\mathfrak{p}^{-m+1}$, by(18.11.4.11), it equals $q^{-m}\alpha_1^m\alpha_2^{-m}q^m(1-q^{-1})$, so the total sum is $1+(1-q^{-1})\alpha_1\alpha_2^{-1}/(1-\alpha_1\alpha_2^{-1})$. □

Prop. (18.11.5.7). If χ_1,χ_2 are nonramified, $V=\mathcal{B}(\chi_1,\chi_2)$, $K_0(\mathfrak{p})$ is the Iwahori subgroup(18.11.1.8), then the composition

$$V^{K_0(\mathfrak{p})}\hookrightarrow V\to J(V)$$

is an isomorphism. In particular, it is of dimension 2. ⌟

Proof: Firstly notice $V^{K_0(\mathfrak{p})}$ has dimension≤ 2, because of the decomposition(18.11.1.11) and definition, and $J(V)$ has dimension2 by(18.11.4.19), so it suffices to show the map is surjective. The image is just $J(V)^{T(\mathcal{O})}$ by(18.11.2.5). But by(18.11.4.19) and the fact χ_i are nonramified, all of $J(V)$ are $T(\mathcal{O})$-fixed, thus $J(V)^{T(\mathcal{O})}=J(V)$. □

Cor. (18.11.5.8) [Casselman Basis]. When $\chi_1 \neq \chi_2$, we can easily find a basis of $V^{K_0(\mathfrak{p})}$, that is

$$L_1(\varphi) = \varphi(1), \quad L_0(\varphi) = (M\varphi)(1)$$

where M is intertwining integral defined in(18.11.4.12). These are $N(K)$-invariant, thus define functionals on $J(V) \cong V^{K_0(\mathfrak{p})}$. They are linearly independent checked on $T(F)$.

Then the dual basis $\varphi_0, \varphi_1 \in V^{K_0(\mathfrak{p})}$ are called the **Casselman basis**.

φ_0 has a simple form: using Iwahori-Bruhat decomposition(18.11.1.11),

$$\varphi_0(g) = \begin{cases} (\Delta^{1/2}\chi)(b) & g = bw_0k \in B(K)wK_0(\mathfrak{p}) \\ 0 & \text{otherwise} \end{cases}.$$

⌟

Proof: It is easily verified that this formula is well-defined and defines a Iwahori-fixed vector, so it suffices to valuate it by L_i. Clearly $L_1(\varphi_0) = 0$, and for $L_0(\varphi_0)$, notice that

$$w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \in B(K)w_0K_0(\mathfrak{p})$$

iff $x \in \mathcal{O}$, so $L_0(\varphi_0) = 1$. □

Lemma (18.11.5.9). When $\chi_1 \neq \chi_2$ nonramified and $m \geq 0$, the function

$$F_m(g) = \int_{\mathcal{O}} \varphi_K(g \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} a_m)dx, \quad a_m = \begin{bmatrix} \varpi^m & \\ & 1 \end{bmatrix}$$

is an Iwahori-fixed vector, and

$$F_m = q^{-m/2}\alpha_2^m M(\varphi_K)(1)\varphi_0 + q^{-m/2}\alpha_1^m\varphi_1$$

⌟

Proof:

$$\int_{K_0(\mathfrak{p})} \pi(ka_m)\varphi_K dk = \int_{N_-(\mathfrak{p})}\int_{T(\mathcal{O})}\int_{N(\mathcal{O})} \varphi_K(gn_-t_0na_m)dndt_0dn_-\text{(18.11.1.9)}$$

noticing that $a_m^{-1}t_0n_-a_m \in K$ as $m \geq 0$, so the integrand is independent of t_0, n_- and equals F_m, and it is clearly Iwahori-fixed. And

$$c_1 = L_1(F_m) = F_m(1) = \varphi_K(a_m) = (\Delta^{1/2}\chi)(a_m) = q^{-m/2}\alpha_1^m.$$

Similarly, for χ dominant,

$$c_0 = L_0(F_m) = \int_{N(K)} F_m(w_0n)dn = \int_{N(K)}\int_{N(\mathcal{O})} \varphi_K(w_0nn'a_m)dn'dn.$$

By Fubini, the n' can be omitted, thus it equals $(M\varphi_K)(a_m) = (\Delta^{1/2}\chi')(a_m)$. □

Spherical Whittaker Function and Spherical Functions

See [Casselman, W., The unramified principal series of p-adic groups I: the spherical function, Compositio Math. 40 (1980), 387-406.] and [Casselman, W. and J. Shalika, The unramified principal series of p-adic groups II: the Whittaker function, Compositio Math. 40 (1980), 207-231.] for more general calculations.

Def. (18.11.5.10) [Spherical Whittaker Function]. The **spherical Whittaker function** of a generic spherical representation is the spherical vector W^0 in the Whittaker model normalized that $W_0(1) = 1$**?**.

For $n = 2$, we can define another normalization $W_0(g) = \Lambda(\pi(g)\varphi_K)$, where Λ is the Whittaker functional defined in(18.11.4.14) and φ_K is the normalized spherical vector defined in(18.11.5.1). ⌟

Prop. (18.11.5.11). We may assume that the conductor of ψ is $\mathcal{O}$, because any other character is of the form $x \mapsto \psi(ax)$, thus

$$W_0(g, \psi_a) = \int_F \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)\psi(-ax)dx = |a|^{-1/2}\chi_2(a)W_0(\begin{bmatrix} a & \\ & 1 \end{bmatrix} g, \psi),$$

(and also by analytic continuity). In particular, $\mu(\mathcal{O}) = 1$(14.4.5.6).

Notice that

$$W_0(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}\begin{bmatrix} z & \\ & z \end{bmatrix} gk) = \psi(x)\omega(z)W_0(g), z \in K^\times, k \in K,$$

where $\omega = \chi_1\chi_2$, so to calculate W_0, it suffices to compute $W_0(\begin{bmatrix} \varpi^m & \\ & 1 \end{bmatrix} = a_m)$. ⌟

Remark (18.11.5.12). We want to calculate the spherical Whittaker function W_0 explicitly because it is used to evaluate the local part of the global L-function(21.3.6.3). ⌟

Lemma (18.11.5.13) [Calculating W_0]. For $\mathcal{B}(\chi_1, \chi_2)$ with Satake parameters α_1, α_2, the spherical Whittaker function satisfies

$$W_0(1) = 1 - q^{-1}\alpha_1\alpha_2^{-1}, \quad W_0(a_m) = 0$$

for $m < 0$. ⌟

Proof: As in the proof of(18.11.4.11), because φ_K is K-invariant, we have

$$\int_{\mathcal{O}} \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = 1,$$

$$\int_{\mathfrak{p}^{-1}\setminus\mathcal{O}} \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = q^{-1}\alpha_1\alpha_2^{-1}\int_{\mathfrak{p}^{-1}\setminus\mathcal{O}} \psi(-x)dx = -q^{-1}\alpha_1\alpha_2^{-1},$$

$$\int_{\mathfrak{p}^{-k-1}\setminus p^{-k}} \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = q^{-k-1}\alpha_1^{k+1}\alpha_2^{-k-1}\int_{\mathfrak{p}^{-k-1}\setminus\mathfrak{p}^{-k}} \psi(-x)dx = 0, \quad k \geq 1$$

For $W_0(a_m)$, choose $x \in \mathcal{O}$ that $\psi(\varpi^m x) \neq 1$, then

$$W_0(a_m) = W_0(a_m \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) = W_0(\begin{bmatrix} 1 & \varpi^m \\ & 1 \end{bmatrix} a_m) = \psi(\varpi^m x)W_0(a_m)$$

so $W_0(a_m) = 0$. □

Lemma (18.11.5.14) [Functional Equation]. For fixed g, $W_0(g)$ is an analytic function of α_1, α_2, and $(1 - q^{-1}\alpha_1\alpha_2^{-1})^{-1}W_0(g)$ is symmetric in α_1, α_2. ⌟

Proof: The Whittaker functional is defined by calculated by continuation(18.11.4.14), and for χ dominant, W_0 is analytic(18.11.4.14), thus by calculation in(18.11.5.13), its value at 1 is identically 1, thus so does its analytic continuation. Then to check after switching α_1, α_2 it is the same meromorphic function, it suffices to show for all irreducible principal series $\mathcal{B}(\chi_1, \chi_2)$. But in this case, $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\chi_2, \chi_1)$, so their Whittaker model thus spherical Whittaker function differ only by a scalar, thus the same. □

Prop. (18.11.5.15) [Calculating W_0].

$$(1 - q^{-1}\alpha_1\alpha_2^{-1})^{-1}W_0(a_m) = \begin{cases} q^{-m/2}\frac{\alpha_1^{m+1}-\alpha_2^{m+1}}{\alpha_1-\alpha_2} & m \geq 0 \\ 0 & m < 0 \end{cases}$$

⌟

Proof: By?? we can assume χ is dominant and use analytic continuation.

$$W_0(a_m) = \int_F F_m(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx,$$

by(18.11.4.14)(18.11.5.9) and a change of variable. Then use(18.11.5.9), we see that

$$W_0(a_m) = C_1 q^{-m/2}\alpha_1^m + C_0 q^{-m/2}\alpha_2^m$$

where

$$C_0 = (M\varphi_K)(1)\int_F \varphi_0(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx$$

And $\int_F \varphi_0(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = 1$, by the same consideration as in the proof of(18.11.5.8).

Finally, $(M\varphi_K)(1)$ can be calculated by(18.11.5.6), and the requirement of(18.11.5.14) will determine C_1. □

Prop. (18.11.5.16) [Spherical Function]. For a spherical irreducible admissible representation (π, V) of $GL(2, K)$, its contragradient $\widehat{V}$ is also spherical(3.6.4.11). Then we define the **spherical function**

$$\sigma(g) = (\pi(g)v, \widehat{v})$$

where $v, \widehat{v}$ are spherical and normalized that $\langle v, \widehat{v}\rangle = 1$. This is bi-invariant under K-action By(18.11.5.5).

By(18.11.5.5), (π, V) is of the form $\chi(\det(g))$ or $\pi(\chi_1, \chi_2)$ for π_i nonramified. In the former case the spherical function is just $\chi \circ \det$. Now we only consider the latter interesting case, for which there is a spherical functional $\widehat{v} : \varphi \mapsto \int_K \varphi(k)dk$, and it is 1 on the normalized spherical vector v(18.11.5.1), and

$$\sigma(g) = \int_K (\pi(g)\varphi_K)(k)dk = \int_K \varphi_K(kg)dk$$

⌟

Prop. (18.11.5.17) [Macdonald Formula]. The spherical function for unramified principal series behave well under $Z(K)$-action and is K-binvariant, so in order to compute it, it suffices to compute its value on a_m. We have:

$$\sigma(a_m) = \frac{q^{-m/2}}{1+q^{-1}}[\alpha_1^m \frac{1-q^{-1}\alpha_2\alpha_1^{-1}}{1-\alpha_2\alpha_1^{-1}} + \alpha_2^m \frac{1-q^{-1}\alpha_1\alpha_2^{-1}}{1-\alpha_1\alpha_2^{-1}}]$$

⌟

Proof: First notice that

$$\int_K F_m(k)dk = \int_K \int_{\mathcal{O}} \varphi_K(k \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} a_m) dx dk = \int_K \varphi_K(ka_m)dk$$

by a change of variable. Then by(18.11.5.9), this equals

$$[\int_K \varphi_0(k)dk] q^{-m/2}\alpha_2^m \frac{1-q^{-1}\alpha_1\alpha_2^{-1}}{1-\alpha_1\alpha_2^{-1}} + [\int_K \varphi_1(k)dk] q^{-m/2}\alpha_1^m.$$

Next we calculate $\int_K \varphi_0(k)dk$ directly: By(18.11.5.8), this equals the volume of $K \cap (K_0(\mathfrak{p})w_0K_0(\mathfrak{p})) = K_0(\mathfrak{p})w_0K_0(\mathfrak{p})$. $K/K_0(\mathfrak{p}) \cong GL(2,\mathbb{F}_q)/B(\mathbb{F}_q)$ has cardinality $q+1$, and by pulling back the Bruhat decomposition of $GL(2,\mathbb{F}_q)$, $K_0(\mathfrak{p})w_0K_0(\mathfrak{p})$ consists of q left cosets of $K_0(\mathfrak{p})$. So

$$\int_K \varphi_0(k)dk = \frac{q}{1+q}.$$

Finally the expression is symmetric in α_1, α_2, because the spherical vectors in $V, \widehat{V}$ are unique(3.6.4.11), and $\widehat{\mathcal{B}(\chi_1,\chi_2)} = \mathcal{B}(\chi_2,\chi_1)$. Also, the expression is a combination of α_i^m and the coefficient is independent of m, so it can be determined as above. □

6 Unitarizable, Tempered & L^2 Representations

Def. (18.11.6.1) [L^2-Representations]. An admissible irreducible representation (π, V) of G is called **essentially square-integrable** if for any $v \in V$ and $\lambda \in V^\vee$, the matrix coefficients $c_{v,\lambda}$ is L^2 on K.

It is called **square-integrable** if moreover the central character ω_π is unitary. ⌟

Remark (18.11.6.2) [Casselman]. For any smooth representation of $GL(n,K)$, there exists a unique real-valued quasi-character χ that the central character of $\pi \otimes (\chi \circ \det)$ is unitary. ⌟

Def. (18.11.6.3) [Tempered Representations]. Let G be a reductive group over F and π an admissible representation of $G(F)$, then π is called an **essentially tempered representation** if the matrix coefficients of π are all contained in $L^{2+\varepsilon}(K)$ for any $\varepsilon > 0$.

It is called a **tempered representation** if moreover the central character ω_π is unitary. ⌟

Prop. (18.11.6.4) [Jacquet, Zelevinsky].

- $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is essentially square-integrable iff it is of the form $Q(\Delta)$ for a single Zelevinsky segment Δ.
- $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is square-integrable iff it is of the form $Q(\Delta)$ for a single Zelevinsky segment, and the central character of $\sigma(\frac{m-1}{2})$ is unitary, where $\Delta = \Delta(\sigma, m)$.

- $\pi \in \text{Irr}^{\text{adm}}(GL(n,K))$ is tempered iff $\pi = Q(\Delta_1,\ldots,\Delta_r)$, where each $Q(\Delta_i)$ is square-integrable.

⌟

Proof: Cf.[Generic Representations, Jacquet(1977)]. □

Cor. (18.11.6.5)[Classification of Irreducible tempered representations of $GL(2)$]. Irreducible tempered representations of $GL(2,K)$ are one of the following form:

- Cuspidal representation with unitary central characters.
- Steinberg representations with unitary central characters.
- Principal representations $\mathcal{B}(\chi_1,\chi_2)$ with χ_1,χ_2 unitary.

⌟

Proof: Cf.[G-H11]P365. □

Cor. (18.11.6.6)[Tempered Representation is Generic]. Irreducible tempered representations are precisely generic ones $Q(\Delta_1)\times\ldots\times Q(\Delta_r)$ s.t. each $Q(\Delta_i)$ has a unitary central character. ⌟

Proof: It suffices to show that no two Δ_i,Δ_j are linked. But notice if $\Delta_i=(\sigma_i,m_i)$, then $\sigma(i)(\frac{m_i-1}{2})$ is the central character, so there are no chance that they are linked. □

Unitarizable Representations

Lemma (18.11.6.7) [Possibility of Unitarization of Principal Series]. If $\mathcal{B}(\chi_1,\chi_2)$ admits an invariant non-degenerate Hermitian pairing, then either χ_1,χ_2 are all characters or $\chi_1=\overline{\chi_2}^{-1}$. ⌟

Proof: There is an anti-linear $GL(2,K)$-map $\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\overline{\chi_1},\overline{\chi_2})$ which is conjugation, so if there is a $GL(2,K)$-invariant Hermitian pairing on $\mathcal{B}(\chi_1,\chi_2)$, $(f_1,f_2)\mapsto(f_1,\overline{f_2})$ will be a non-degenerate $GL(2,K)$-invariant bilinear pairing

$$\mathcal{B}(\chi_1,\chi_2)\times\mathcal{B}(\overline{\chi_1},\overline{\chi_2})\to\mathbb{C}.$$

So $\mathcal{B}(\chi_1,\chi_2)\cong\mathcal{B}(\overline{\chi_1}^{-1},\overline{\chi_2}^{-1})$, so χ_i are characters or $\chi_1=\overline{\chi_2}^{-1}$ by(18.11.4.10). □

Lemma (18.11.6.8). If χ_1,χ_2 are characters, then $\mathcal{B}(\chi_1,\chi_2)$ is unitarizable, by(18.1.5.45). ⌟

Lemma (18.11.6.9). Let $\chi_s=\chi_0|\cdot|^s$, where χ_0 is a character of F. If $s\neq 0,1/2$ is a real number (so that $\mathcal{B}(\chi_s,\chi_{-s})$ is irreducible), then $\mathcal{B}(\chi_s,\chi_{-s})$ is unitarizable iff $-1/2<s<1/2$. ⌟

Proof: Because $\mathcal{B}(\chi_s,\chi_{-s})=\chi_0\otimes\mathcal{B}(|\cdot|^s,|\cdot|^{-s})$, we can assume $\chi_0=1$. Let $M_s:\mathcal{B}(\chi_s,\chi_{-s})\to\mathcal{B}(\chi_{-s},\chi_s)$ be the intertwining integral(18.11.4.12), then we see the sesquilinear pairing

$$(f_1,f_2)=\int_K(M_sf_1)(k)\overline{f_2(k)}dk$$

is G-invariant and non-degenerate by the proof of(18.11.4.9). For an irreducible representation, such a pairing must be unique, so we are reduced to checking this representation is positive/negative definite.

Consider the Iwahori-fixed vector $f_0=\Delta^{s+1/2}(b)$ for $g=bk$ as defined in(18.11.5.8), then as s varies, f_0 forms a flat section. We calculate (f_0,f_0) for $s>0$ and then use continuation:

In this case,

$$(f_0, f_0) = V(K_0(\mathfrak{p}))\int_F f_0(w_0\begin{bmatrix}1 & x\\ & 1\end{bmatrix})dx$$

and

$$\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix} \in B(K)K_0(\mathfrak{p})$$

iff $x \notin \mathcal{O}$, in which case

$$\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix} = \begin{bmatrix}x^{-1} & -1\\ & x\end{bmatrix}\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}.$$

So

$$(f_0, f_0) = \frac{1}{q+1}\int_{|x|>1} |x|^{-1-2s}dx = \frac{1-q^{-1}}{1+q}\frac{q^{-2s}}{1-q^{-2s}}.$$

We then consider the spherical vector φ_K(18.11.5.1), then(18.11.5.6) shows

$$(\varphi_K, \varphi_K) = \frac{1-q^{-1-2s}}{1-q^{-2s}}.$$

which is positive if $|s| > 1/2$. So if $\mathcal{B}(\chi_s, \chi_{-s})$ is unitarizable, $|s| < 1/2$.

Now for $|s| < 1/2$, we show $\mathcal{B}(\chi_s, \chi_{-s})$ is unitary: Modify the intertwining operator $M_s^* = (1-q^{-2s})M_s$, then it is definable for $s = 0$, by calculation in(18.11.4.12), so the modified Hermitian product

$$(\cdot,\cdot)^* = (1-q^{-2s})(-,-)$$

is defined at $s = 0$, and is positive/negative definite, because in this case it is irreducible and unitarizable(18.11.6.8). The eigenvalue of this Hermitian form deforms continuously, and it is never zero because it is non-degenerate as said above(only when $s \neq 1/2$ because we need M_s to be isomorphism), so it is always definite and $\mathcal{B}(\chi_s, .\chi_{-s})$ is unitarizable. □

Prop. (18.11.6.10)[Unitarizable Principal Series]. An irreducible principal series $\mathcal{B}(\chi_1, \chi_2)$ is unitary iff either χ_1, χ_2 are all characters, or there is a unitary character χ_0 and $-1/2 < s < 1/2$ that $\chi_1 = \chi_0|\cdot|^s, \chi_1 = \chi_0|\cdot|^{-s}$, called **complementary series representations**. ⌟

Proof: Follows immediately from the lemmas above(18.11.6.8)(18.11.6.7)(18.11.6.9). □

18.12 Local Langlands for GL(n) over p-Adic Fields

Main references are [B-K93], [Bus19] and [The Local Langlands correspondence, the Non-Archimedean Case, Kudla(1994)].

Notation (18.12.0.1).

- Let $K \in p$-LField.

⌟

Prop. (18.12.0.2). If G/K is a split almost simple algebraic group, then it is isogenous to one of the following groups: $\mathrm{SL}(n), \mathrm{SO}(n), \mathrm{Sp}(n), G_2, F_4, E_6, E_7, E_8$.

It is false in general that maximal compact subgroups of G are conjugate. However, there are **special maximal compact subgroups**, and an irreducible admissible representation of $G(F)$ is called **spherical** if it is fixed by the special maximal compact subgroup. ⌟

Proof: ? □

Prop. (18.12.0.3) [Langland's Formation of the Satake Isomorphism]. If G is split, then $\mathcal{H}_K$ is isomorphic to ring generated by the characters of irreducible analytic f.d. representations of ${}^L G$, and the spherical representations of $G(K)$ are parametrized by the semisimple conjugacy classes in ${}^L G^0$.

If G is non-split but splits over an unramified Galois extension Ω/K, let Φ be the Frobenius element in $G(\Omega/F)$, and consider the cosets $\widehat{G} \subset {}^L G$, then $\mathcal{H}_K$ is isomorphic to the ring of functions on the this coset that are generated by the restrictions of characters of irreducible representations of ${}^L G$, and the spherical representations of $G(F)$ are parametrized by the semisimple conjugacy classes in ${}^L G$ in this coset. ⌟

1 Local Langlands for p-adic GL(n)

References are [M. Harris, R. Taylor: The geometry and cohomology of some simple Shimura varieties], [The Local Langlands Correspondence for GL(n) over p-adic Fields, Wedhorn], [Yao17].

Cor. (18.12.1.1) [LLC for GL(1)].

Local class field theory told us that W_K^{ab} is isometric to $K^\times$, And notice by Schur's lemma, any smooth representation of $K^\times$ is 1-dimensional and factors through some U_K.

And a Weil-Deligne representation is now a continuous $W_K^{\mathrm{ab}} \to \mathbb{C}^*$. but it must factor through some U_K, so these two are equivalent. ⌟

Lemma (18.12.1.2) [Jacquet-Langlands]. Let E/K be a quadratic extension and χ a quasi-character of W_E, $\rho : W_F \to GL(2, \mathbb{C})$ the induced representation of W_F, then $\pi(\rho)$ in(20.6.1.5) exists. ⌟

Proof: Cf.[Bump, P556].? □

Thm. (18.12.1.3) [LLC for GL(n)]. There exists a unique collection of bijections rec_n between sets:

$$\mathrm{rec}_n : \mathrm{Irr}^{\mathrm{adm}}(GL(n,F)) \cong \mathfrak{wd}^{\varphi-ss}_{\dim -n}(W_F).$$

satisfying the following properties:

- For a quasi-character χ of K^*, $\mathrm{rec}_1(\chi) = \chi \circ \mathrm{Art}$.
- For every pair $\pi_1, \pi_2 \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$,

$$L(\pi_1 \times \pi_2, s) = L(\mathrm{rec}_{n_1}(\pi_1) \otimes \mathrm{rec}_{n_2}(\pi_2), s), \quad \varepsilon(\pi_1 \times \pi_2, s) = \varepsilon(\mathrm{rec}_{n_1}(\pi_1) \otimes \mathrm{rec}_{n_2}(\pi_2), s).$$

- For a quasi-character χ of K^* and $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, $\mathrm{rec}_n((\chi\circ\det)\otimes\pi) = \mathrm{rec}_n(\pi)\otimes\mathrm{rec}_1(\chi)$.
- For any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$ with central character ω, $\det\circ\mathrm{rec}_n(\pi) = \mathrm{rec}_1(\omega)$.
- For any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$, $\mathrm{rec}_n(\pi^\vee) = \mathrm{rec}_n(\pi)^*$.

Moreover, these bijections also preserves two more invariants:

- Conductor: $c(\pi) = c(\mathrm{rec}_n(\pi))$.
- Depth: $d(\pi) = d(\mathrm{rec}_n(\pi))$.

⌟

Proof: Cf.[Harris-Taylor] and [Laumon, G., M. Rapoport and U. Stuhler, $\mathcal{D}$-elliptic sheaves and the Langlands correspondence, Invent. Math. 113 (1993), 217-338.] □

Lemma (18.12.1.4) [Plan of Proof]. By Bernstein-Zelevinsky classification(18.11.4.1), it suffices to construct rec_n for irreducible cuspidal representations, then for any $\pi = Q(\Delta_1,\ldots,\Delta_r) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$, where $\Delta_i = \Delta_i(\pi_i, m_i)$, $\sum n_i m_i = n$, we can define

$$\mathrm{rec}_n(\pi) = \oplus_{i=1}^r \mathrm{Sp}_{m_i}(\mathrm{rec}_{n_i}(\pi_i)).$$

By work of Henniart, it suffices to prove there exist maps rec_n on irreducible cuspidal representations that satisfies these properties, because it will be automatically bijective and unique. His method is to use the numerical local Langlands correspondence. ⌟

Remark (18.12.1.5). it seems Scholze's approach bypasses Henniart numerical local Langlands correspondence. ⌟

Prop. (18.12.1.6). Under the local langlands correspondence(18.12.1.3), $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$ is

- supercuspidal iff $\mathrm{rec}_n(\pi)$ is irreducible.
- essentially square integrable iff $\mathrm{rec}_n(\pi)$ is indecomposable.
- generic iff $L(\mathrm{ad}\circ\mathrm{rec}_n(\pi), s)$ has no pole at $s = 1$.

⌟

Proof: □

Prop. (18.12.1.7) [Inertia Correspondence]. Under the local langlands correspondence(18.12.1.3), for $\pi, \pi' \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$,

- $\pi|_K \cong \pi'|_K$ iff $\mathrm{rec}_n(\pi)|_{I_F} \cong \mathrm{rec}_n(\pi')|_{I_K}$.
- (Paskunas)Let τ be a Weil-Deligne inertia type of I_K that extends to an n-dimensional irreducible F-semisimple representation of W_K, then there exists a unique irreducible smooth representation σ_τ of K s.t. for any irreducible infinite-dimensional representation π of $GL(n,F)$, $\pi|_K$ contains σ_τ iff $\mathrm{rec}_n(\pi)|_{I_F} \cong \sigma$.

⌟

Proof: □

Prop. (18.12.1.8) [LLC for GL(2)]. Under the classification of $\mathrm{Irr}^{\mathrm{adm}}(GL(2,F))$ given in(18.11.4.4), the corresponding Weil-Deligne representations are

1. For π supercuspidal, $\mathrm{rec}_2(\pi) = (\rho, 0)$, ρ irreducible, by(18.12.1.6).
2. For principal series $\chi_1 \times \chi_2$, $\mathrm{rec}_2(\pi) = (\chi_1 \otimes \chi_2, 0)$.

3. For $1(\chi)$, $\mathrm{rec}_2(\pi) = (\chi \oplus \chi(1), 0)$.
4. For $\pi = \mathrm{St}_2(\chi)$, $\mathrm{rec}_2(\chi) = \mathrm{Sp}_2(\chi) = (\chi \oplus \chi(1), N)$, where N sends χ to $\chi(1)$.

1 Connected Shimura Varieties

Def. (19.1.1.1)[Connected Shimura Data]. A **connected Shimura datum** is a pair (G, D) where $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/\mathbb{Q}$ is a semisimple algebraic group and D a $G^{\mathrm{ad}}(\mathbb{R})^0$-conjugacy classes of homomorphisms $u : \mathrm{U}(1) \to G^{\mathrm{ad}}_{\mathbb{R}}$ satisfying

SU1: Only $z, 1, z^{-1}$ appear in the character of the complex representation $\mathrm{Ad} \circ u : \mathrm{U}(1) \to \mathrm{Lie}(G^{\mathrm{ad}})_{\mathbb{C}}$.

SU2: $\mathrm{ad}(u(-1))$ is a Cartan involution on $G^{\mathrm{ad}}_{\mathbb{R}}$.?

SU3: G^{ad} has no $\mathbb{Q}$-factor H s.t. $H(\mathbb{R})$ is compact.

⌟

Prop. (19.1.1.2). Let H be an adjoint real Lie group and $u : U(1) \to H$ a homomorphism satisfying SU1, SU2, then the following are equivalent:

- $u(-1) = 1$.
- u is trivial.
- H is compact.

⌟

Proof: 1 $\iff$ 2: If $u(-1) = 1$, then u factors through $\mathrm{U}(1) \xrightarrow{2} \mathrm{U}(1)$, so the characters z, z^{-1} cannot occur in $\mathrm{Ad} \circ u$. The converse is trivial.

1 $\to$ 3: by(9.3.6.19), H is compact iff $\mathrm{ad}(u(-1)) = 1$, which is equivalent to $u(-1) = 1$ as H is adjoint. □

Prop. (19.1.1.3) [Shimura Varieties a la Shimura]. A connected Shimura datum is equivalent to the following data:

- $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/\mathbb{Q}$ semisimple of non-compact type.
- D a Hermitian symmetric domain.
- an action of $G(\mathbb{R})^0$ on D via a surjective homomorphism $G^{\mathrm{ad}}(\mathbb{R})^0 \to \mathrm{Hol}(D)^0$ with compact kernel.

⌟

Proof: Cf.[Mil17b]P45.? □

Prop. (19.1.1.4). Let (G,D) be a connected Shimura datum and X be the $G^{\mathrm{ad}}(\mathbb{R})$-conjugacy class of homomorphisms $\mathbb{S}^1 \to \mathbb{G}_{\mathbb{R}}$ containing D, and D is a connected component of X, with stabilizer $G^{\mathrm{ad}}(\mathbb{R})^0 \subset G^{\mathrm{ad}}(\mathbb{R})$. ⌟

Proof: Cf.[Mil17b]P45. □

Def. (19.1.1.5) [Connected Shimura Varieties]. Let (G,D) be a connected Shimura datum(19.1.1.1), then the map $G^{\mathrm{ad}}(\mathbb{R})^0 \to \mathrm{Hol}(D)^0$ as in(19.1.1.3) has compact kernel, so for any arithmetic subgroup $\Gamma \subset G^{\mathrm{ad}}(\mathbb{R})^0 \cap G^{\mathrm{ad}}(\mathbb{Q})$(15.5.1.1), the image $\overline{\Gamma}$ is an arithmetic subgroup of $\mathrm{Hol}(D)^0$(15.5.2.1), thus we can apply Baley-Borel compactification(12.13.7.4) to get an algebraic structure on $D(\Gamma) = \Gamma\backslash D = \overline{\Gamma}\backslash D$. Moreover, if $\Gamma' \subset \Gamma \subset G^{\mathrm{ad}}(\mathbb{R})^0 \cap G^{\mathrm{ad}}(\mathbb{Q})$ and $\overline{\Gamma'}, \overline{\Gamma}$ are both torsion-free, then by Borel(12.13.7.5), there is a morphism $D(\Gamma') \to D(\Gamma)$.

So for any $\Gamma \in G^{\mathrm{ad}}(\mathbb{R})^0 \cap G^{\mathrm{ad}}(\mathbb{Q})$ s.t. $\overline{\Gamma}$ is torsion-free, $D(\Gamma)$ is called a **connected Shimura variety relative to** (G,D). And the inverse images of these Shimura varieties are called the **connected Shimura variety attached to** (G,D), denoted by $\mathrm{Sh}^0(G,D)$. ⌟

Prop. (19.1.1.6) [Galois Action on Shimura Varieties]. ⌟

2 Shimura Varieties

Def. (19.1.2.1) [Shimura Varieties according to Deligne]. Let $K \subset G(\mathbf{A}^f)$ be a compact open subset, and

$$S_K(\mathbb{C}) = G(\mathbb{Q})\backslash X \times G(\mathbf{A}^f)/K.$$

Then when K is neat**?**(which is true when K is small enough), $S_K(\mathbb{C})$ has the structure of an algebraic variety over $\mathbb{C}$ by Baily-Borel**?**, and has a model $\mathcal{S}_K$ over the reflex field E, by[Milne]. ⌟

Proof: **?** □

3 Siegel Moduler Varieties

Prop. (19.1.3.1) [Abelian Varieties with Polarizations and Level Structures]. For $n, N \in \mathbb{Z}_+, d_1|d_2|\ldots|d_n \in \mathbb{Z}_+$ s.t. $(d_n, N) = 1$, consider the functor

$$\mathcal{A} : \mathcal{S}\mathrm{ch}\,/\mathbb{Z}[\frac{1}{Nd_n}] \to \mathcal{S}\mathrm{et}$$

s.t. for any $S \in \mathcal{S}\mathrm{ch}\,/\mathbb{Z}[\frac{1}{Nd_n}]$, $\mathcal{A}(S)$ is the set of isomorphism classes of triples (A,λ,η) where

- $A \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^n\,/S$,
- $\lambda : A \to A^\vee$ is a polarization of type $D = \mathrm{diag}(d_1,\ldots,d_n)$.
- $\eta : ((\mathbb{Z}/(N))^{2g}, \mathrm{Std}) \cong (A[N], e_N^\lambda)$ is a symplectic similitude.

⌟

Thm. (19.1.3.2) [$\mathcal{A}$ is Representable]. Situation as in(19.1.3.1), if N is large enough w.r.t. D(when $d_n = 1$, it suffices to have $N \geq 3$), then $\mathcal{A}$ is representable by a smooth quasi-projective scheme over $\mathbb{Z}[\frac{1}{Nd_n}]$. ⌟

Proof: For $S \in \mathcal{S}\mathrm{ch}$, $(A,\lambda) \in \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^{g,D}/S$, let $\mathcal{L}^\Delta(\lambda) = (\mathrm{id}_A,\lambda)^* p_A$. Then locally on étale nbhd, if $\lambda = \lambda_\mathcal{L}$ for an relative ample line bundle $\mathcal{L}$, then

$$\mathcal{L}^\Delta(\lambda) = [-1]^*\mathcal{L} \otimes \mathcal{L}(15.7.4.6)$$

is also relatively ample(6.5.4.19), and

$$\lambda_{\mathcal{L}^\Delta(\lambda)} = 2\lambda_\mathcal{L}(15.7.4.13).$$

Thus $\mathcal{L}^\Delta(\lambda)^{\otimes 3}$ is relatively very ample(15.7.5.8), and $R^i\,\mathrm{pr}_*\,\mathcal{L}^{\otimes 3} = 0$ for $i \geq 1$. Let $\mathcal{M} = \mathrm{pr}_*\,\mathcal{L}^{\otimes 3} \in \mathcal{Q}\mathcal{C}\mathrm{oh}^{\mathrm{free},6^n d}/S$, where $d = \prod d_i$.

Define a new functor $\mathcal{H}$ that is the same as $\mathcal{A}$ except for that we require a projective trivialization of $\mathcal{M}$. Then $\mathcal{H} \to \mathcal{A}$ is a $\mathrm{PGL}(6^n d - 1)$-torsor. For $X \in \mathcal{H}(S)$, $\mathrm{pr}_*\,\mathcal{L}^{\otimes 3}$ provides a projective embedding $X \subset \mathbb{P}_S^{6^n d-1}$, and for any $r \in \mathbb{Z}_+$, $\mathrm{rank}\,\mathrm{pr}_*\,\mathcal{L}^{\otimes 3r} = 6^n d r^n$, so there is a natural transformation

$$\mathcal{H} \to \underline{\mathrm{Hilb}}^{Q(t),1}_{\mathbb{P}^{6^n d-1}} : X \mapsto (X,e), \quad Q(t) = 6^n d t^n.$$

Then this is an open subfunctor whose image are contained in the moduli of pointed smooth subschemes of $\mathbb{P}^{6^n d-1}$: It is injective because any pointed smooth subscheme has at most one Abelian variety structure(15.7.1.5), and its image is a union of components of the smooth locus of $\underline{\mathrm{Hilb}}^{Q(t),1}_{\mathbb{P}^{6^n d-1}}$: This is because of(15.7.12.12).

Then $\mathcal{H}$ is a smooth quasi-projective variety. For the rest, it needs to use GIT quotient of $\mathcal{H}$ by $\mathrm{PGL}(6^d)$, using the level structure to show stability properties, which I will not cover here. Cf.[Ngo, Shimura Variaties]P15**?**. □

Prop. (19.1.3.3) [Siegel Modular Varieties]. For $k \in \texttt{Field}$, the étale shifification $\mathcal{M}^{g,d}_{\text{ét}}$ of the functor

$$\mathcal{M}^{g,d} : \mathcal{S}\mathrm{ch}/k \to \mathcal{S}\mathrm{et} : X \mapsto \mathcal{A}\mathrm{b}\,\mathcal{V}\mathrm{ar}^{g,\mathrm{polar}=d}/X$$

is representable by a variety $\mathcal{M}^{g,d} \in \mathcal{V}\mathrm{ar}/k$. ⌟

Proof: **?** □

Prop. (19.1.3.4) [Canonical Ample Divisor on $\mathcal{M}^{g,d}$]. There exists a canonical ample divisor on $\mathcal{M}^{g,d}$ given by the determinant of the sheaf of invariant differentials on the universal Abelian variety $\mathcal{A}$. ⌟

Proof: □

Prop. (19.1.3.5). The j-invariant of elliptic schemes define an isomorphism $\mathcal{M}^{1,1}_{\mathbb{Q}} \to \mathbb{A}^1_{\mathbb{Q}}$. ⌟

Proof: **?** □

Prop. (19.1.3.6). Let

$$(V,\psi) = (\mathbb{Q}^{2g}, \langle (a_i),(b_i)\rangle = \sum_{i=1}^{g}(a_i b_{g+i} - a_{g+i}b_i)),$$

and $\widetilde{G} = \mathrm{GSp}(V)$, then the Hermitian symmetric domain $\widetilde{X}$ is the Siegel double space, and for any neat compact open subgroup $\widetilde{K} \subset \widetilde{G}(\mathbf{A}^f)$, the corresponding Shimura variety $\widetilde{S}_{\widetilde{K}}$ is the moduli space of principally polarized g-dimensional Abelian varieties with level-$\widetilde{K}$-structure, which has a model over the reflex field $\mathbb{Q}$. ⌟

4 Hodge Type Shimura Varieties

A Shimura datum (G, X) is called of **Hodge Type** if it admits a closed embedding into some Siegel variety datum $(\widetilde{G}, \widetilde{X})$. Thus it carries a universal Abelian variety.

Prop. (19.1.4.1). If (G, X) is a Shimura datum of Hodge type with an embedding $(G, X) \hookrightarrow (\widetilde{G}, \widetilde{X})$, then there exists a neat subgroup $\widetilde{K} \subset \widetilde{G}(\mathbf{A}^f)$, $K = \widetilde{K} \cap G(\mathbf{A}^f)$ s.t. there is a closed embedding of Shimura varieties

$$S_K \hookrightarrow \widetilde{S}_K \otimes_{\mathbb{Q}} E.$$

⌟

Proof: [Deligne71, Prop1.15]. □

5 PEL Type Shimura Varieties

6 Complex Multiplication

7 Canonical Models

Remark (19.1.7.1) [Miyake-Shih-Shimura/Deligne/Milne-Borovoi]. Delete this?. For a Shimura datum (G, X), attached to each compact open subgroup $K \subset G(\mathbf{A}^f)$, there is a map

$$f_K : \mathrm{Sh}_k(G, X) \to \pi_K$$

where π_K is a the theory of canonical model defines

- a reflex field $E = E(G, X)$, which is a number field.
- A canonical model $(f_K)_0 : \mathrm{Sh}_K(E, G)_0 \to (\pi_K)_0$ of f_K over E, which is uniquely characterized by the reciprocity law at the special points.

and also describes the action of $\mathrm{Aut}(\mathbb{C}/E)$ on π_K. ⌟

Remark (19.1.7.2). Delete this?. The method of constructing the canonical model is the following: When our Shimura variety arises naturally as a moduli space over $\mathbb{C}$, then we can use the action of $\mathrm{Gal}(\mathbb{C}/E)$ on the $\mathbb{C}$-points to define a model of the variety over a specific number field.

The theory of complex multiplication will give us an explicit description of the action on certain special points, called the **reciprocity law** at these points, which will determine the model uniquely. ⌟

Remark (19.1.7.3). Delete this?. A heuristic reason that a Shimura variety has a canonical model is that if it is defined only on a transcendental field, then it can be spread out to give a flat family of varieties. But there are only countably many arithmetic locally symmetric varieties up to isomorphism, so there cannot be a ⌟

1 Moduli Problems

Def. (19.3.1.1) [$\Gamma(N)$-Structure]. Let $S \in \mathcal{S}\mathrm{ch}$ and $E \in \mathcal{E}\mathrm{ll}/S$, a

- **$\Gamma(N)$-structure** on E/S is a homomorphism $\varphi : (\mathbb{Z}/(N))^2 \to \ker([N])(S)$ s.t. there is an equality of effective Cartier divisors
$$E[N] = \sum_{(a,b)\in(\mathbb{Z}/(N))^2} [\varphi((a,b))].$$
- **$\Gamma_1(N)$-structure** on E/S is a homomorphism $\varphi : \mathbb{Z}/(N) \to \ker([N])(S)$ s.t. the effective Cartier divisor
$$\sum_{a\in\mathbb{Z}/(N)} [\varphi(a)].$$
is a subgroup scheme of E.
- **balanced $\Gamma_1(N)$-structure** on E/S is an exact sequence
$$0 \to K \to E[N] \to K' \to 0$$
of group schemes over S s.t. K, K' both has rank N over S.
- **$\Gamma_0(N)$-structure** on E/S is a finite subgroup scheme $K \subset E[N]$ over S that is cyclic of rank n.

⌟

Prop. (19.3.1.2) [Functors]. ⌟

Prop. (19.3.1.3) [Weil-Pairing]. Let $S \in \mathcal{S}\mathrm{ch}$ and $E \in \mathcal{E}\mathrm{ll}/S$ with a $\Gamma(N)$-structure, ⌟

Prop. (19.3.1.4) [Moduli Interpretation of Modular Curves]. The functor $\mathcal{S}\mathrm{ch}/\mathbb{Q} \to \mathcal{S}\mathrm{et}$ that maps S to the isomorphism classes of elliptic curves over S with a $\Gamma(N)$-structure is representable by ⌟

Def. (19.3.1.5) [Atkin-Lehner Involutions]. ⌟

Representability

Prop. (19.3.1.6)[Level Structure Schemes]. For any $S \in \mathcal{S}\mathrm{ch}$, $E \in \mathcal{E}\mathrm{ll}/S$, and $M, N \in \mathbb{Z}_+$ invertible on S, there exists a moduli scheme $S(M,N)$ that is finite étale over S, which represents the moduli problem:
$$S(M,N)(T) = \{\text{monomorphism}\alpha : (\mathbb{Z}/(M) \times \mathbb{Z}/(N))_T \hookrightarrow E_T\}.$$
And denote $S(N) = S(N,N), S_1(N) = S(N,1), S_1'(N) = S(1,N)$.

And also denote the $S_0(N)$ parametrizing $\Gamma_0(N)$-structure. Then it is a quotient of $S_1(N)$. ⌟

Proof: ? □

Prop. (19.3.1.7) [$\mathcal{E}_{0,N}$]. If $k \in \texttt{Field}$ and $(N, \operatorname{char} k) = 1$, then the moduli problem $\mathcal{E}_{0,N}$ of the set of elliptic curves with a cyclic N-subgroup has a coarse moduli scheme M over k. And if $\operatorname{char} k = 0$, M is canonically isomorphic to $Y_0(N)_{\mathbb{Q}} \otimes k$, and the map

$$\mathcal{E}_{0,N}(k) \to M(k) \cong Y_0(N)_{\mathbb{Q}}(k) \xrightarrow{(j, j_N)} \operatorname{Spec} k[X,Y]/\Phi_m(X,Y).$$

is given by $(E, S) \mapsto (j(E), j(E/S))$. ⌟

Proof: ? □

Prop. (19.3.1.8) [$\mathcal{E}_N$]. If $k \in \texttt{Field}$ and $\mathbb{Q}(\zeta) \subset k$, then the moduli problem $\mathcal{E}_N$ of the set of elliptic curves with a a $\Gamma(N)$-structure with Weil pairing ζ_N has a coarse moduli scheme M over k. And if $k = \mathbb{C}$, M is canonically isomorphic to $Y(N)$.

And for $k = \mathbb{Q}(\zeta_N)$, M has good reduction over places away from N. ⌟

Proof: ? □

Cor. (19.3.1.9) [$\mathcal{E}_2$]. The moduli problem $\mathcal{E}_2$ in fact has $\mathbb{A}^1$ as the fine moduli scheme over $\mathbb{Q}$: There is an elliptic curve $E \in \mathcal{E}\mathrm{ll}/\mathbb{A}^1$ given by

$$W_\lambda : y^2 = x(x-1)(x-\lambda), \quad \lambda \in \mathbb{A}^1.$$

And it has a $\Gamma(2)$-structure given by the points $((0,0),(1,0))$. And it can be checked that this is a fine moduli problem.? ⌟

Proof: □

2 Modular Curves

Prop. (19.3.2.1) [Shimura Curves]. For any compact open subgroup $K \subset \mathrm{GL}(2, \mathbf{A}_f)$, there exists a modular curve M_K defined over $\mathbb{Q}$ s.t.

$$M_K(\mathbb{C}) = GL(2,\mathbb{Q})\backslash\mathscr{H}^\pm \times \mathrm{GL}(2, \mathbf{A}_f)/K.$$

And there is a compactification $M_K \hookrightarrow \overline{M}_K$. where $\overline{M}_K$ is a smooth projective curve over $\mathbb{Q}$.

In particular, we can define $X(N), X_1(N)$ and $X_0(N)$. ⌟

Proof: □

Prop. (19.3.2.2) [Integral Modular Curves $Y(N)$ and $X(N)$]. For $N \geq 3$, the functor "isomorphism classes of elliptic curves with a level N structure" is representable by a scheme $Y(N)$ and a universal elliptic curve $E^{\mathrm{uni}}/Y(N)$ with a level N structure α_N.

$Y(N)$ is an affine smooth precurve over $\mathbb{Z}[\frac{1}{N}]$, finite flat of degree $\#\,\mathrm{GL}(2,\mathbb{Z}/(N))/\{\pm 1\}$ over the affine j-line $\mathbb{Z}[\frac{1}{N}, j]$, and étale away from from 0 and 1728.

The normalization $X(N)$ of the projective j-line $\mathbb{P}^1_{\mathbb{Z}[\frac{1}{N}]}$ in $Y(N)$ is a proper smooth precurve over $\mathbb{Z}[\frac{1}{N}]$.

$\Gamma(X(N() = \mathbb{Z}[\frac{1}{N}, \zeta_N]$, and $X(N) \otimes_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N]$(resp. $Y(N) \otimes_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N]$) is a disjoint union of $\varphi(n)$ affine(resp. proper) smooth curve over $\mathbb{Z}[\frac{1}{N}, \zeta_N]$.

Let $X(N)^\infty = X(N)\setminus Y(N)$, then $(X(N)^\infty)_{\mathbb{Z}[\frac{1}{N},\zeta_N]}$ is a disjoint union of points, called the **cusps** of $X(N)$. And they naturally correspond to the set of isomorphism classes of level N structures on $\mathrm{Tate}(q)_{\mathbb{Z}((q))\otimes\mathbb{Z}[\frac{1}{N},\zeta_N]}$.

The completion of $X(N)$ along any of the cusp is isomorphic to $\mathrm{Spec}\,\mathbb{Z}[\frac{1}{N},\zeta_N][[q]]$. The completion of the j-line along ∞ is also isomorphic to $\mathrm{Spec}\,\mathbb{Z}[\frac{1}{N},\zeta_N][[q]]$ via $j\mapsto q^{-1}+744+\ldots$. And the projection of these two completions along $X(N)\to\mathbb{P}^1_{\mathbb{Z}[\frac{1}{N}]}$ is just $q\mapsto q^N$.

There is a unique invertible sheave $\omega_{\overline{E^{\mathrm{uni}}}/X(N)}$ on $X(N)$ whose restriction on $Y(N)$ is $\omega_{E^{uni}/Y(N)}$, and at each cusp, it is $\mathbb{Z}[\frac{1}{N},\mu_N]$ multiples of the canonical differential of $\mathrm{Tate}(q^N)$ via the identification as above. ⌟

Proof: ? □

Prop. (19.3.2.3) [Cusps]. Let $M_K^\infty = \overline{M_K}\setminus M_K$ be the cusps, then

$$M_K^\infty(\mathbb{C}) = (\pm\,\mathrm{Unip}(\widehat{\mathbb{Z}}))\setminus \mathrm{GL}(2,\widehat{\mathbb{Z}})/K,$$

and $\mathrm{Aut}(\mathbb{C}/\mathbb{Q})$ acts on the cusps by

$$[k]^\tau = [\mathrm{diag}(\chi_{\mathrm{cycl}}(\tau),1)k],\quad k\in\mathrm{GL}(2,\widehat{\mathbb{Z}}).$$

⌟

Proof: ? □

Prop. (19.3.2.4). If $M,N\in\mathbb{Z}_+, M+N\geq 5$, the functor "isomorphism classes of elliptic curves with an injection of $\mathbb{Z}/(M)\times\mathbb{Z}/(N)$" is represented by a scheme $Y(M,N)$ and a universal elliptic curve $E^{\mathrm{uni}}/Y(M,N)$ with a level structure $\alpha:\mathbb{Z}/(M)\times\mathbb{Z}/(N)\hookrightarrow Y(M,N)$. ⌟

Proof: □

Manin-Drinfeld Theorem

Thm. (19.3.2.7) [Manin-Drinfeld Theorem]. Let $\mathcal{C}\in\mathrm{Pic}^0(M_K^c\otimes\mathbb{C})$ be the subgroup of classes of divisors supported on the cusps of $M_K^c(\mathbb{C})$, then $\mathcal{C}$ is finite. ⌟

Proof: □

3 Complex Modular Curves and Jacobians

Prop. (19.3.3.1) [Local Picture]. Let D be the unit disk and Δ be a finite group acting on D and fixing 0, then by Schwarz lemma, Δ is a finite subgroup of $\mathrm{Aut}(D,0)\cong\mathbb{R}/\mathbb{Z}$, so it is a finite cyclic group. If $|\Delta|=m$, then z^m is invariant under Δ and defines a function on $\Delta\backslash D$. It is a homeomorphism from $\Delta\backslash D$ to D, thus defines a complex structure on $\Delta\backslash D$.

Let $X=\{z\in\mathbb{C}|\,\mathrm{Im}(z)>c\}$ and h an integer. Let $\mathbb{Z}$ acts on X by $nz=z+nh$. This action can extend to $X^*=X\cup\{\infty\}$, and we can consider the quotient space $\mathbb{Z}\backslash X^*$. The function $q(z)=e^{2\pi iz/h}$ is a homeomorphism from $\mathbb{Z}\backslash X^*$ onto the open disk of radius $e^{-2\pi c/h}$ and center 0, which defines a complex structure on $\mathbb{Z}\backslash X^*$. ⌟

Lemma (19.3.3.2) [Modular Curves for $\Gamma(1)$]. Let $\mathscr{H}^*=\mathscr{H}\cup\{\infty\}$, the Riemann surface $\Gamma(1)\backslash\mathscr{H}^*$ is compact and of genus 0, so isomorphic to the Riemann surface. ⌟

Proof: We first define a complex structure on $\Gamma(1)\backslash\mathscr{H}$: Let $p:\mathscr{H}\to\Gamma(1)\backslash\mathscr{H}$ be the quotient map, and let Q be a point of $\mathscr{H}$ mapping to P. If Q is not an elliptic point, then we can choose a nbhd of Q that maps isomorphically to a nbhd of P, so we can define the complex structure near P.

If $Q=i$, then the map $z\mapsto\frac{z-i}{z+i}$ maps some open nbhd of i to an open disk D' with center 0, and the action of S is transformed to the action $z\mapsto -z$. By the local picture, $f(z)=(\frac{z-i}{z+i})^2$ is invariant under action of S and defines a complex structure near $p(i)$. Similarly, if $Q=\rho$, then $g(z)=(\frac{z-\rho}{z-\overline{\rho}})^3$ is invariant under the action of ST, and defines a complex structure near $p(\rho)$.

The space $\Gamma\backslash\mathscr{H}$ we get is not compact, and it can be compactified by adding a point ∞, the resulting space is compact because it is a quotient space of $\overline{D}\cup\{\infty\}$, which is compact. And we give a complex structure on the resulting space: The function $q=e^{2\pi iz}$ is a function mapping a nbhd of ∞ in the fundamental domain to an open disk with center 0, and thus giving a complex structure near ∞.

It can be seen directly that $\Gamma(1)\backslash\mathscr{H}^*$ is homeomorphic to a sphere, and then use the fact any Riemann surface of genus 0 is isomorphic to S^1(6.12.8.2). □

Prop. (19.3.3.3) [Modular Curves for Γ]. For a congruence group Γ, the quotient space $\Gamma\backslash\mathscr{H}$ can be compactified to a Riemann surface $X(\Gamma)$ by adjoining n points, where n is the number of cusps of Γ. ⌟

Proof: The quotient space $\Gamma\backslash\mathscr{H}$ can be given a complex structure exactly the same way as $\Gamma(1)\backslash\mathscr{H}$, and it can be compactified by adding $\mathbb{P}^1(\mathbb{Q})$, which has only f.m. orbits under action of Γ, by(20.2.1.13) and the fact Γ has finite index in $\Gamma(1)$. For the complex structure: if h is the smallest positive integer that $T^h\in\Gamma$, then $q=e^{2\pi iz/h}$ is a homeomorphism of a nbhd of ∞ in $\Gamma\backslash\mathscr{H}$ to some open disk of 0, thus defines a complex structure near ∞. For any other cusps α, let $\gamma\in\Gamma(1)$ satisfies $\alpha=\gamma(\infty)$, then $z\mapsto q(\gamma^{-1}(z))$ defines a complex structure near α. □

Def. (19.3.3.4) [Notations]. Let Γ be a congruence subgroup, then we denote

$$Y(\Gamma)=\Gamma\backslash\mathscr{H},\quad X(\Gamma)=\Gamma\backslash\mathscr{H}^*.$$

Also abbreviate $Y(\Gamma(N))$ to $Y(N)$, $X(\Gamma(N))$ to $X(N)$, and $Y(\Gamma_0(N))$ to $Y_0(N)$, and $X(\Gamma_0(N))$ to $X_0(N)$. ⌟

Prop. (19.3.3.5) [Modular Form as Differential Forms]. A holomorphic modular form of degree k in $M_k(\Gamma)$ is just a holomorphic differential form on $X(\Gamma)$ of degree k, and its dimension can be calculated, see Dimension Formulae.

Similarly, an automorphic function for Γ is the same as a function on $X(\Gamma)$(19.3.3.3). In particular, if it is holomorphic and vanishes at cusps, then it is constant. ⌟

Proof: ? □

Cor. (19.3.3.6) [Hauptmodul]. Let Γ be a congruence subgroup with only 1 cusp, a **Haptmodul** is the unique meromorphic modular form that has only a simple pole at the cusp with residue 1. ⌟

Over $\mathbb{C}$

Prop. (19.3.3.7). Let $\mathcal{E}_{0,N}$ be the functor of elliptic curves with a cyclic subgroup of order N, then there is a bijection

$$Y_0(N) = \Gamma_0(N)\backslash\mathscr{H} \cong \mathcal{E}_{0,N}(\mathbb{C}) : z \mapsto (\mathbb{C}/\Gamma(z,1), \Gamma(z,1/N)/\Gamma(z,1)).$$

⌟

Proof: Cf.[Diamond or Milne]. □

Prop. (19.3.3.8). Let $\mathcal{E}_N$ be the functor of elliptic curves with a $\Gamma(N)$ structure of Weil pairing ζ_N, then there is a bijection

$$Y(N) = \Gamma(N)\backslash\mathscr{H} \cong \mathcal{E}_{0,N}(\mathbb{C}) : z \mapsto (\mathbb{C}/\Gamma(z,1); z/N, 1/N).$$

Proof: Cf.[Diamond]. □

Modular Equations

Prop. (19.3.3.9) [$X_0(N)$, Modular Equations]. The field $C(X_0(N))$ of modular functions for $\Gamma_0(N)$ is generated by $j(z)$ and $j(Nz)$ over $\mathbb{C}$, and the minimal polynomial $F(j,Y)$ of $j(Nz)$ over $\mathbb{C}(j)$ has degree $d = [\mathrm{PSL}(2,\mathbb{Z}) : \overline{\Gamma}_0(N)]$(20.2.3.1), and $F(j,Y) \in \mathbb{Z}[j,Y]$.

When $N > 1$, $F(X,Y)$ is symmetric in X, Y, and when $N = p$ is a prime,

$$F(X,Y) \equiv X^{p+1} + Y^{p+1} - X^pY^p - XY \mod p.$$

⌟

Proof: Cf.[Milne, Modular Forms]P88. □

Cor. (19.3.3.10). The field of functions on $X(1)$ is $\mathbb{C}(j)$. ⌟

Thm. (19.3.3.11). For $E, E' \in \mathcal{E}\mathrm{ll}/\mathbb{C}$, there exists a cyclic isogeny $\alpha : E \to E'$ of degree m iff $\Phi_m(j(E), j(E')) = 0$. ⌟

Proof: Cf.[Cox, P213]. □

Action of Hecke Algebras

Prop. (19.3.3.12) [Double Coset Operators]. There is an action of $\mathcal{R}$ on $X_1(\Gamma)$ ⌟

Modular Jacobians

Def. (19.3.3.13) [Modular Jacobians]. Define $J_1(N) = \mathrm{Jac}(X_1(N))$, $J_0(N) = \mathrm{Jac}(X_0(N))$, which is defined over the same field as the defining field of $X_1(N)$ or $X_0(N)$. ⌟

Eichler-Shimura Relations

4 $X(p)$

[Maz78]Intro contains a lot numerical data for the geometry of $X_0(p)$ and its minimal quotients.

Minimal Quotients of $X(p)$

Prop. (19.3.4.1) [Minimal Quotients of $X(p)$]. Let $p \in \mathbf{P}_{\geq 5}$, then any proper subgroup of $\mathrm{GL}(2,\mathbb{Z}/(p))$ is conjugate to a subgroup of the following:

- $H = B(\mathbb{Z}/(p))$, and $X_H(p) = X_0(p)$, with field of definition $\mathbb{Q}$.
- H is the normalizer of a split Cartan subgroup $\mathrm{diag}(*,*) \coprod \begin{bmatrix} & 1 \\ 1 & \end{bmatrix} \mathrm{diag}(*,*)$, and $X_H(p) = X_{\mathrm{split}}(p)$, with field of definition $\mathbb{Q}$. Moreover,
$$g_{\mathrm{split}}(p) = \frac{11 + (p-8)p - 4\left(\frac{-3}{p}\right)}{24}.$$
- H is the normalizer of a non-split Cartan subgroup $\mathbb{F}_{p^2}^\times \subset \mathrm{GL}(2,\mathbb{Z}/(p))$, and $X_H(p) = X_{\mathrm{nonsplit}}(p)$, with field of definition $\mathbb{Q}$. Moreover,
$$g_{\mathrm{nonsplit}}(p) = \frac{23 + (p-10)p + 6\left(\frac{-1}{p}\right) + 4\left(\frac{-3}{p}\right)}{24}.$$
- H is the inverse image of $S_4 \subset \mathrm{PGL}(2,\mathbb{Z}/(p))$, and $X_H(p) = X_{S_4}(p)$, with field of definition $\begin{cases} \mathbb{Q} & , p \equiv \pm 3 \pmod 8 \\ \mathbb{Q}(\chi_p) & , p \equiv \pm 1 \pmod 8 \end{cases}$.
- H is the inverse image of $A_5 \subset \mathrm{PGL}(2,\mathbb{Z}/(p))$ if $p \equiv \pm 1 \pmod 5$, and $X_H(p) = X_{A_5}(p)$, with field of definition $\mathbb{Q}(\chi_p)$.
- H is the inverse image of $A_4 \subset \mathrm{PGL}(2,\mathbb{Z}/(p))$, and $X_H(p) = X_{A_4}(p)$, with field of definition $\mathbb{Q}(\chi_p)$.

The last 4 cases are called **exceptional groups**. ⌟

Proof: □

Cor. (19.3.4.2). $X_{\mathrm{split}}(p)$ corresponds to the problem of classifying elliptic curves with an unordered pair of p-isogenies. And $X_{\mathrm{nonsplit}}(p)$ corresponds to the problem of classifying elliptic curves with a chosen subfield $\mathbb{F}_{p^2}$ in $\mathrm{GL}(2, E[p])$(But the inclusion may be up to conjugacy). ⌟

5 Isogenies of Elliptic Curves

Conj. (19.3.5.1) [Mazur]. is it true that for any $F \in$ `NField`, the j-invariants of an elliptic curve over F with an F-rational cyclic group of order N s.t. $g(X_0(N)) \geq 2$(equivalently, $N > 21$ and $N \neq 24, 25, 27, 32, 36, 49$) ⌟

Proof: □

19.4 Shimura-Taniyama-Weil Conjecture

References are [Ring-theoretic properties of certain Hecke algebras, Taylor-Wiles], [Henri Darmon, Fred Diamond, and Richard Taylor, Fermat's last theorem, Elliptic curves, modular forms & Fermat's last theorem (Hong Kong, 1993), Int. Press, Cambridge, MA, 1997, pp. 2 – 140.], http://virtualmath1.stanford.edu/~conrad/modseminar/.

1 Weil Parametrizations

Def. (19.4.1.1) [Weil Parametrizations]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor $N = N_E$ and Néron differential α, a **Weil parametrization** is a minimal map**?** $\pi : X_0(N) \to E$ over $\mathbb{Q}$ s.t. $\varphi^*\alpha = 2\pi\,\mathrm{i}\, c_E f_E(z)\mathrm{d}z$ for some newform $f \in \mathrm{SF}_2^{\mathrm{new}}(\Gamma_0(N))$. This $c_E \in \mathbb{Q}^\times$ is called the **Manin constant** of E. ⌟

Conj. (19.4.1.2) [Manin]. For any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, $c_E = \pm 1$. ⌟

Proof: □

Thm& Conj.Cor. (19.4.1.3) [Manin-S.D]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is semistable, then $|c_E| \in 2^{\mathbb{Z}_+}$. ⌟

Proof: [Arithmetic of Weil Curves]. □

Thm& Conj.Cor. (19.4.1.4) [Raynaud]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is semistable, then $\log|c_E|$ is bounded. ⌟

Prop. (19.4.1.5) [Heights and Weil Parametrization]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with a Weil parametrization $\varphi_E : X_0(N) \to E$ and corresponding normalized modular form f_E and Manin constant c_E,then

$$\frac{1}{2}\log\Big(\frac{\deg(\varphi_E)}{[\mathrm{SL}(2,\mathbb{Z}) : \Gamma_0(N)]}\Big) = h_{\mathrm{Fal}}(E/\mathbb{Q}) + \log(4\pi^2||f_E||_{\mathrm{Pet}}) + \log|c_E|.$$

⌟

Proof: let α_E be a Néron differential of E, then $\varphi_E^*\alpha_E = 2\pi\,\mathrm{i}\, c_E f_E(z)\mathrm{d}z$, so

$$\begin{aligned} 4\pi^2|c_E|^2||f_E||_{\mathrm{Pet}}^2 &= \frac{1}{[\mathrm{SL}(2,\mathbb{Z}) : \Gamma_0(N)]}\frac{i}{2}\int_{X_0(N)} \varphi_E^*\alpha_E \wedge \overline{\varphi_E^*\alpha_E} \\ &= \frac{\deg(\varphi_E)}{[\mathrm{SL}(2,\mathbb{Z}) : \Gamma_0(N)]}\frac{i}{2}\int_{E^{\mathrm{an}}} \alpha_E \wedge \overline{\alpha_E} \\ &= \frac{\deg(\varphi_E)}{[\mathrm{SL}(2,\mathbb{Z}) : \Gamma_0(N)] H_{\mathrm{Fal}}^2(E)} (15.13.3.1) \end{aligned}$$

□

Cor. (19.4.1.6) [Lower Bounded for $\deg(\varphi_E)$]. For any $\varepsilon \in \mathbb{R}_+$, there exists $C_\varepsilon \in \mathbb{R}_+$ such that: Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with a Weil parametrization $\varphi_E : X_0(N) \to E$ and associated normalized cusp form f_E and Manin constant $c_E = 1$, then

$$\deg(\varphi_E) \ge C_\varepsilon \max(|c_4(E)|^{1/4}, |c_6(E)|^{1/6})^{2-\varepsilon}.$$

⌟

Proof: Use(19.4.1.5). Firstly, by(15.13.3.13), $h_{\mathrm{Fal}}(E/\mathbb{Q}) \ge (1-\varepsilon)\log\max(|c_4(E)|^{1/4}, |c_6(E)|^{1/6}) + O_\varepsilon(1)$. Next, $||f_E|| \ge e^{-4\pi}/(4\pi)$ by(20.2.1.22) and the fact f_E is normalized. Then the assertion follows. □

2 Modularity

Thm. (19.4.2.1)[Eichler-Shimura]. If $f \in S_2(\Gamma_0(N))$ be a Hecke eigenform with integral coefficients, then there exists an elliptic curve $E/\mathbb{Q}$ s.t. $L(E,s) = L(f,s)$(21.2.6.2)(21.3.6.17). ⌟

Proof: □

Prop. (19.4.2.2) [Modular Elliptic Curves]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, the following are equivalent:

- there exists a normalized Hecke eigenform $f \in S_2(\Gamma_0(N_E))$ with integral coefficients s.t. $L(E;s) = L(f,s)$.
- For some(every) $p \in \mathbf{P}$, $\rho_{E,p}$ is modular.
- There is a non-constant map $X_0(N) \to E$ over $\mathbb{Q}$ for some $N \in \mathbb{Z}_+$.
- E is isogenous to the modular Abelian variety A_f associated to some newform $f \in S_2(\Gamma_0(N_E))$.

And E is called a **modular elliptic curve** if these hold. ⌟

Proof: □

Lemma (19.4.2.3). For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $N \in \mathbb{Z}_+$, there is a surjection $X_0(N_E) \to E$ iff there is a surjection $J_0(N) \to E$. ⌟

Proof: If $\varphi : X_0(N) \to E$ is non-zero, then $\varphi_* : J_0(N) \to \mathrm{Jac}(E) \cong E$ is nonzero, by(15.7.10.9). If $\Phi : J_0(N) \to E$ is surjective, then $X_0(N) \xrightarrow{\text{Abel}} J_0(N) \to E$ is also surjective, by looking at the Tate module**?**. □

Lemma (19.4.2.4) [Langland-Tunnell]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is semistable and $E[\ell]$ is irreducible for some odd prime ℓ, then $E[\ell]$ is modular. ⌟

Lemma (19.4.2.5) [Taylor-Wiles]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is semistable and ℓ is an odd prime s.t. $E[\ell]$ is irreducible and modular, then T_ℓ is modular. ⌟

Proof: □

Thm. (19.4.2.6) [Modularity Theorem(Shimura-Taniyama1955), Taylor-Wiles/Breuil-Conrad-Diamond-Taylor]. Any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is modular(19.4.2.2). ⌟

Proof: Cf.[On the modularity of elliptic curves over $\mathbb{Q}$: wild 3-adic exercises, C. Breuil, B. Conrad, F. Diamond, and R. Taylor]. □

Thm. (19.4.2.7) [Wiles]. The modular deformation ring T is isomorphic to the Galois deformation ring $R_{\overline{\rho}}$. ⌟

Proof: □

Prop. (19.4.2.8) [Elliptic Curves and Modular Forms]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N and sign of functional equation w_E, and has L-function $L(E,s) = \sum c_n n^{-s}$. Let $f_E(\tau) = \sum c_n e^{2\pi i \tau}$ be the Mellin transform of $L(E,s)$, then

- f_E is a cuspidal modular form on $S_2(\Gamma_0(N))$.
- f_E is a normalized Hecke eigenfunction, and satisfies $f[w_N]_2 = -w_E f(\tau)$, where w_E is the sign of functional equation of E(21.2.6.4).

- Let ω be an invariant differential form on E, then there exists a finite morphism $\varphi : X_0(N) \to E$ over $\mathbb{Q}$ s.t. $\varphi^*(\omega)$ is a multiple of the differential form on $X_0(N)$ represented by $f(\tau)d\tau$.

⌟

Proof: □

Def. (19.4.2.9) [Manin Constant]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $\omega \in \mathcal{K}_{E/\mathbb{Q}}$, the **Manin constant** is defined to be the constant $c \in \mathbb{C}$ s.t. $f^*\omega = c \cdot 2\pi\,\mathrm{i}\, f_E dz$. ⌟

19.5 André-Oort Conjecture

References are [Canonical Heights on Shimura Varieties and the André-Oort Conjecture].

19.6 Cohomology of Unitary Shimura Varieties

References are [On the Generic Part of the Cohomology of Compact Unitary Shimura Varieties, Caraiani-Scholze], [On the Generic Part of the Cohomology of Non-Compact Unitary Shimura Varieties, Caraiani-Scholze].

1 Perfectoid Siegel Spaces

Cf.[Torsion in the Cohomology of Locally Symmetric Varieties, Scholze].

Geometric points of $\mathcal{F}l$ are in bijection with principally polarized p-divisible groups $G/\mathcal{O}_C$ with a trivialization of their Tate module.

On geometric points, the Hodge-Tate map is the map sending an Abelian variety over $\mathcal{O}_C$ to its associated p-divisible group.

2 Hodge-Tate Period Map

Given a (G, X) be a Shimura datum?, there is a flag variety we can define an **Borel embedding**

$$\beta : X \to \mathrm{Flag}_{G,\mu}(\mathbb{C}) : [\mu] \in X \mapsto \mathrm{Fil}^\bullet(\mu).$$

where μ is the X is defined over a number field E, called the reflex field of X, where $\mathrm{Fil}^p(\mu)$ for any representation is the direct sum of all subspaces of the type (p', q') with $p' \geq p$.

Choose a Hodge cocharacter $\mathbb{G}_m \to G_{\mathbb{C}}$.

Then P_μ^{std} can be defined to be the subgroup of G stabilizing $\mathrm{Fil}^\bullet(\mu)$, which is a parabolic subgroup.? And dually, we can define $\mathrm{Fil}_\bullet(\mu)$ and P_μ the stabilizer of $\mathrm{Fil}_\bullet(\mu)$.

$M_\mu = C_G(\mu)$ is the Levi component of both parabolics.

Let $Fl_{G,\mu}^{std}(\mathbb{C}) = G(\mathbb{C})/P_\mu^{std}(\mathbb{C})$, then there is a Borel embedding $X \hookrightarrow Fl_{G,\mu}^{std}(\mathbb{C})$.

Example (19.6.2.1) [Siegel Varieties]. A Shimura variety of Hodge Type can be regarded as a moduli space for Abelian varieties with certain Hodge-tensors?. ⌟

For the Siegel variety V, the flag variety $Fl_{\widetilde{G},\widetilde{\mu}}$ parametrizes totally isotropic subspaces $W \subset V$.? [Ana-Scholze]P11.

For $p \in \mathbf{P}$, consider compact open subgroups of the form $K = K^p \times K_p \subset G(\mathbf{A}^{p\infty}) \times G(\mathbb{Q}_p)$.

Fix a place $\mathfrak{p} \in \Sigma_E^p$, let $\mathscr{F}\mathscr{L}_{G,\mu}$ be the adic space associated with $\mathcal{F}l_{G,\mu} \times_E E_{\mathfrak{p}}$?.

Prop. (19.6.2.2) [Hodge-Tate Period Map]. For a Shimura datum of Hodge type (G, X) and any sufficiently small tame lever $K^p \subset G(\mathbf{A}^{p\infty})$, there exists a perfectoid space $\mathcal{S}_{K^p}$ s.t.

$$\mathcal{S}_{K^p} \sim \lim_{K_p} (S_{K^p K_p} \otimes_E E_{\mathfrak{p}})^{\mathrm{ad}},$$

and there is a $G(\mathbb{Q}_p)$-equivariant **Hodge-Tate period map**

$$\pi_{\text{H-T}} : \mathcal{S}_{K^p} \to \mathscr{F}\mathscr{L}_{\widetilde{G},\widetilde{\mu}}$$

which is equivariant w.r.t the natural Hecke action? of $G(\mathbf{A}^{p\infty})$ on the inverse system $\mathcal{S}_{K^p}$ and the trivial action of $G(\mathbf{A}^{p\infty})$ on $\mathscr{F}\mathscr{L}_{\widetilde{G},\widetilde{\mu}}$. ⌟

Proof: Cf.[Scholze, coh of symmetric spaces] or [S-Weinstein] □

Remark (19.6.2.3). This Hodge-Tate map is a p-adic analogue of the Borel embedding, and on closed points it maps an Abelian variety to its Hodge-Tate filtration of its Tate module**?**. ⌟

Prop. (19.6.2.4) [Hodge-Tate Period Map].

- The Hodge-Tate period map(19.6.2.2) factors through $\mathscr{GL}_{G,\mu}$ and the resulting map
$$\pi_{\text{H-T}}: \mathcal{S}_{K^p} \to \mathscr{GL}_{G,\mu}$$
is independent of the choice of the embedding of Shimura data.
- For any μ in the given conjugacy class defined over a finite extension of E, the tensor functor
$$f_p: \mathrm{Rep}(M_\mu) \xrightarrow{\mathrm{pr}^*} \mathrm{Rep}(P_\mu) \to \{G(\mathbb{Q}_p) - \text{equivariant vector bundles on } \mathscr{FL}_{G,\mu}\}$$
$$\xrightarrow{\pi^*_{\text{H-T}}} \{G(\mathbb{Q}_p) - \text{equivariant vector bundles on } \mathcal{S}_{K^p}\}$$
is isomorphic to the tensor functor
$$f_\infty: \mathrm{Rep}(M_\mu) \xrightarrow{\mathrm{pr}^*} \mathrm{Rep}(P^{std}_\mu) \to \{\text{automorphic bundles on } S_K\} \to \{G(\mathbb{Q}_p)\text{−equivariant vector bundles on } \mathcal{S}_{K^p}\}$$
and this isomorphism is independent of the choice of Siegel embedding, and also equivariant for the Hecke action of $G(\mathbf{A}^{p\infty})$.

⌟

3 Newton Stratification on the Flag Variety

4 Geometry of Newton Strata and Igusa Varieties

Def. (19.6.4.1) [$\mathscr{I}_{Mant}$]. The **Igusa variety** $\mathscr{I}_{Mant}$ is defined to be the projective system of $\overline{\mathbb{F}}_p$-schemes $(\mathscr{I}^b_{Mant,K^p,m})_{K^p\to 0, m\in\mathbb{Z}_+}$. ⌟

Prop. (19.6.4.2) [Igusa and Manton Varieties]. The perfect scheme Ig^b is the perfection of $\mathscr{I}^b_{Mant}$, via the natural map $\mathrm{Ig}^b \to \mathscr{I}^b_{Mant}$. ⌟

5 Cohomology of Igusa Varieties

We need to compute the alternating sum of cohomology groups $[H(\mathcal{I}\mathrm{g}^b, \overline{\mathbb{Q}_\ell})]$ as a virtual representation of $G(\mathbf{A}^{p\infty}) \times J_b(\mathbb{Q}_p)$.

It is enough to work with the classical object $\mathscr{I}^b_{Mant}$, because of(19.6.4.2) and the fact perfection doesn't change the étale topos**?**. And by Poincaré duality, it suffices to compute $[H_c(\mathcal{I}\mathrm{g}^b, \overline{\mathbb{Q}_\ell})]$. Sug Woo Shin has a formula expressing this as a sum of stable orbital integrals for G and its elliptic endoscopic groups**?**.

Notation (19.6.5.1).

- Let $F = F^+\mathcal{K}$, where F^+ is a totally real field and $\mathcal{K}$ is an imaginary quadratic field.
- Let $G/\mathbb{Q}$ be a unitary similitude group preserving an alternating Hermitian form $\langle -, - \rangle$ on $V \in \mathcal{V}\mathrm{ect}^n_F$.
- Let $(G, [h])$ be the Shimura datum with reflex field E.

- Let $\mathrm{Spl}_{F/F^+/\mathbb{Q}} = \{p \in \mathbf{P} : \forall v \in S(p) \subset \Sigma_{F^+}, v \text{ splits in } F\}$.
- Let $p \in \mathbf{P}$ be unramified in F and splits in $\mathcal{K}$.
- Let $\mathfrak{p} \in S_E(p)$.
- Let $K = K^p K_p \in G(\mathbf{A}^{p\infty}) \times G(\mathbb{Q}_p)$ be a compact open subgroup where K_p is hyperspecial?. The fact that p is unramified in F means that S_K has good reduction with integral model $\mathscr{S}_K/\mathcal{O}_{E_\mathfrak{p}}$.
- If G be a topological group, denote $\mathrm{Irr}^{\mathrm{adm}}(G)$ the set of isomorphism classes of irreducible admissible representations of G, and $\mathrm{Groth}(G)$ the corresponding Grothendieck group.?

⌟

Notation (19.6.5.2). For $F \in \texttt{NField}$, define $\ker^1(F, G) = \ker(H^1(F, G) \to \prod_{v\in\Sigma_F} H^1(F_v, G)$. ⌟

Let $K \in p\text{-}\texttt{LField}$, and G is an unramified group over K. Choose a hyperspecial group $\mathcal{K} \subset G(K)$, and a Haar measure of $G(K)$ s.t. $\mathrm{Vol}(\mathcal{K}) = 1$. Let $\mathscr{H}^{\mathrm{ur}}(G(K))$ be the subspace of $C_c^\infty(G(K))$ consisting of bi-K-invariant functions.

Def. (19.6.5.3) [Setup]. Suppose some technical conditions:

- all $p \in \mathbf{P}$ ramified in F are contained in $\mathrm{Spl}_{F/F^+/\mathbb{Q}}$.
- G is quasi-split in all finite places.

⌟

Remark (19.6.5.4). These follows from [Compact Unitary at Ramified Split Places, SS13]Chap10.? ⌟

Def. (19.6.5.5) [Endoscopic Triples]. For notation of Langlands dual,Cf.[Borel, Automorphic L-functions, 79]?. There is an action of Gal_F on $\widehat{G}$ given by the choice of slitting data.? An **endoscopic triple** for G is a triple (H, s, η) where

- H/F is a quasi-split connected reductive group,
- $s \in Z(\widehat{H})$,
- $\eta : \widehat{H} \to \widehat{G}$ is an embedding of complex Lie groups.
- $\eta(\widehat{H}) = Z_{\widehat{G}}(\eta(s))^0$.
- The $\widehat{G}$-conjugacy classes of η is fixed by Gal_F.
-

Cf.[Stable Trace Formula for Igusa Varieties, Shin]. ⌟

6 Torsion in the Cohomology of Unitary Shimura Varieties

19.7 Unitary Shimura Varieties

19.8 Supersingular-Loci

19.9 Drinfeld Modules

References are [Elliptic Modules, Drinfeld] and [Introduction to Drinfeld Modules, Hayes].

20 Automorphic Representations & Global Langlands Conjecture

20.1 Automorphic Representations over Archimedean Local Fields

Main References are [Bum98], [Bor97], [Automorphic Forms and L-Functions for the Group $GL(n,\mathbb{R})$, Goldfeld] and [A Course given by Liang Xiao]. Notice that [Bum98] has many gaps, and these gaps can be filled by [Bor97] or [?].

Notation (20.1.0.1).

- Let $K = \mathbb{R}$ or $\mathbb{C}$.
- $G = GL(n,K)^+, G_1 = SL(n,K), K = SO(n,K)$.
- Use notations defined in Arithmetic of Algebraic Groups.
- Use notations defined in Arithmetic Subgroups.
- B is the upper triangular matrices, $N(K)$ the group of unipotent upper triangular matrices in G, T the group of diagonal matrices, $Z(K)$ the group of scalar matrices.
- Define right regular action ρ of G on $C^\infty(G)$, and also the left regular action λ. We will write dX for $X \in \mathfrak{g}$ as the representation of Lie algebra of G via ρ, then it commutes with λ. So it induces a map of $U(\mathfrak{g})$ to the ring of left G-invariant differential operators on G(18.9.1.1).
- Fix a character ψ of K, define a character ψ_N on $N(K)$ by

$$\varphi_N(u) = \psi(\sum_{i=1}^{n-1} u_{i,i+1}).$$

⌟

Notation (20.1.0.2). If $n = 2$,

- G acts on $\mathscr{H}$ through linear fractional transformation(12.12.0.11) and fixes the measure $y^{-2}\mathrm{d}x\mathrm{d}y$. We will denote a, b, c, d the linear functionals on $\mathrm{Mat}(2,\mathbb{R})$ s.t. for $\gamma \in \mathrm{Mat}(2,\mathbb{R})$, $\gamma = \begin{bmatrix} a(\gamma) & b(\gamma) \\ c(\gamma) & d(\gamma) \end{bmatrix}$.
- Use the Lie algebra notations(3.7.2.11):

$$H = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \quad R = \frac{1}{2}\begin{bmatrix} 1 & i \\ i & -1 \end{bmatrix}, \quad L = \frac{1}{2}\begin{bmatrix} 1 & -i \\ -i & -1 \end{bmatrix} \quad W = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} = iH.$$

and the Casimir element in $\mathcal{Z} = Z(U(\mathfrak{g}))$:

$$\Delta = -\frac{1}{4}(H^2 + 2RL + 2LR).$$

- Let Γ be a discrete subgroup of G that the volume of $\Gamma\backslash\mathcal{H}$ is finite, we may also assume that $-1 \in \Gamma \subset SL(2,\mathbb{R})$.
- Let χ be a character of Γ and ω be a character of the center $Z(\mathbb{R}) \subset G$(the scalar matrices). Assume that $\omega(-1) = \chi(-1)$.

⌟

1 Basics

Prop. (20.1.1.1). In the coordinate(12.12.0.4), we have the following equation:

$$\frac{\partial}{\partial R} = e^{2i\theta}(iy\frac{\partial}{\partial x} + y\frac{\partial}{\partial y} + \frac{1}{2i}\frac{\partial}{\partial\theta}), \quad \frac{\partial}{\partial L} = e^{-2i\theta}(-iy\frac{\partial}{\partial x} + y\frac{\partial}{\partial y} - \frac{1}{2\,\mathrm{i}}\frac{\partial}{\partial\theta}), \quad \frac{\partial}{\partial H} = -i\frac{\partial}{\partial\theta}$$

So in particular

$$\Delta = \frac{\partial^2}{\partial\Delta^2} = -y^2(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}) + y\frac{\partial^2}{\partial x\partial\theta}.$$

⌟

Proof: $H = -iW$, and $\exp(tW) = k_t = \begin{bmatrix} \cos t & \sin t \\ -\sin t & \cos t \end{bmatrix}$, so $dW = \partial/\partial\theta$ is clear.

For dR, first notice that

$$k_\theta \exp(tR) = \exp(e^{2ti\theta}R)k_\theta,$$

as

$$\begin{aligned} k_\theta \exp(tR)k_{-\theta} = C^{-1}\begin{bmatrix} e^{i\theta} & \\ & e^{-i\theta} \end{bmatrix}\exp(te)\begin{bmatrix} e^{-i\theta} & \\ & e^{i\theta} \end{bmatrix} C &= C^{-1}\begin{bmatrix} e^{i\theta} & \\ & e^{-i\theta} \end{bmatrix}\begin{bmatrix} 1 & t \\ & 1 \end{bmatrix}\begin{bmatrix} e^{-i\theta} & \\ & e^{i\theta} \end{bmatrix} C \\ &= C^{-1}\begin{bmatrix} 1 & e^{2i\theta}t \\ & 1 \end{bmatrix} C \\ &= \exp(e^{2i\theta}tR) \end{aligned}$$

where C is the Cayley transformation, notation as in(3.7.2.11),

Now

$$(dRf)(g) = \frac{d}{dt}f(bk_\theta \exp(tR)) = \frac{d}{dt}f(b\exp(e^{2i\theta}tR)k_\theta) = e^{2i\theta}\frac{d}{dt}f(b\exp(tR)k_\theta)$$

Then notice

$$R = 1/2H + \begin{bmatrix} 0 & i \\ 0 & 0 \end{bmatrix} + 1/2\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad \exp(tR) \sim k_{t/2} + \begin{bmatrix} 1 & it \\ & 1 \end{bmatrix} + \begin{bmatrix} e^{t/2} & \\ & e^{-t/2} \end{bmatrix}$$

so we get the desired result.

For dL the calculation is similar to that of dR. □

Def. (20.1.1.2) [Cusps]. A **cusp** of Γ is a point in $\mathbb{P}^1(\mathbb{R})$ whose stablizer in Γ contains a non-trivial parabolic element(12.12.0.3).

Let ∞ be a cusp, then $\{\pm 1\}\Gamma_\infty = \{\pm 1\}\langle \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix} \rangle$ for some $r > 1$. Then if $\Gamma_\infty = \langle - \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix} \rangle$, then it is called an **irreducible cusp**, otherwise it is called a **regular cusp**. Similarly, for any other cusp $a = \xi(\infty)$, where $\xi \in SL(2,\mathbb{R})$, we called a is regular/irregular cusp iff ∞ is regular/irregular cusp w.r.t. $\Gamma' = \xi^{-1}\Gamma\xi$. ⌟

Def. (20.1.1.3) [Form Spaces]. Let $C^\infty(\Gamma\backslash G, \chi, \omega)$ be the space of smooth functions $F : G \to \mathbb{C}$ that

$$F(\gamma g) = \chi(\gamma)F(g), \quad \gamma \in \Gamma, g \in G,$$

$$F(zg) = \omega(z)F(g), \quad z \in Z(\mathbb{R}), g \in G.$$

Let the subspace $C_c^\infty(\Gamma\backslash G, \chi, \omega)$ be those functions f that $|f|$ is compactly supported in G_1. Similarly we define $C(\Gamma\backslash G, \chi, \omega)$ and $C_c(\Gamma\backslash G, \chi, \omega)$.

Define $C(\Gamma\backslash G, \chi, k)$ or $C_c(\Gamma\backslash G, \chi, k)$ to be the subspace of $C(\Gamma\backslash G, \chi)$ or $C_c(\Gamma\backslash G, \chi)$ consisting of functions F s.t. $\rho(k_\theta)F = e^{ik\theta}F$.

When ω is the character of $Z(\mathbb{R})$ that $\omega(Z(\mathbb{R}^+)) = 1$, then we denote $C^\infty(\Gamma\backslash G, \chi) = C^\infty(\Gamma\backslash G, \chi, \omega)$. ⌟

Def. (20.1.1.4) [Archimedean Automorphic Forms]. Let the space of **automorphic forms** $\mathcal{A}(\Gamma\backslash G, \chi, \omega)$ be the subspace of $C^\infty(\Gamma\backslash G, \chi, \omega)$ consisting of K-finite and $\mathcal{Z}$-finite functions satisfies the **condition of moderate growth**:

$$|F(g)| < C||g||^N$$

for some $C, N > 0$, where the height on G is induced from the inclusion

$$G \to M(n,\mathbb{R}) \times M(n,\mathbb{R}) : g \mapsto (g, g^{-1}).$$

When ω is trivial on $Z^+(\mathbb{R})$, let $\mathcal{A}(\Gamma\backslash G, \chi, k)$ be the subspace of $\mathcal{A}(\Gamma\backslash G, \chi)$ consisting of functions f that $\rho(k_\theta)(f) = e^{ik\theta}f$.

Automorphic forms are real analytic, by(20.1.1.29). ⌟

Def. (20.1.1.5) [Cuspidal Forms]. If ∞ is a cusp of Γ, then $\{\pm 1\}\Gamma_\infty = \{\pm 1\}\langle \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix} \rangle$, so a $F \in \mathcal{A}(\Gamma\backslash G, \chi, \omega)$ is called **cuspidal** at ∞ iff $\chi(\tau_r) \neq 1$ or

$$\int_0^r F(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)dx = 0.$$

for any $g \in G$. Notice this is independent of r chosen.

More generally, if a is a cusp of Γ, then choose $\xi \in SL(2,\mathbb{R})$ that $\xi(\infty) = a$, then for $F \in \mathcal{A}(\Gamma\backslash G, \chi, \omega)$, $F'(g) = F(\xi g) \in \mathcal{A}(\Gamma'\backslash G, \chi', \omega)$, where $\Gamma' = \xi^{-1}\Gamma\xi, \chi'(\gamma') = \chi(\xi\gamma'\xi^{-1})$(Because left and right actions commute). Then F is called **cuspidal** at a iff F' is cuspidal at ∞.

The subspace of cuspidal forms is denoted by $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega) \subset \mathcal{A}(\Gamma\backslash G, \chi, \omega)$. ⌟

Prop. (20.1.1.6) [Hecke Operators]. Similar as in(20.2.2.6), we can define the action of $\mathcal{R}_N$ on $C^\infty(\Gamma_0(N)\backslash\mathcal{G},\chi_d)$:

$$T_\alpha(f)(g)=\sum_i\chi_d(\alpha_i)^{-1}f(\alpha_i g),\quad \text{if } \Gamma_0(N)\alpha\Gamma_0(N)=\coprod_i\Gamma_0(N)\alpha_i.$$

and preserves automorphic or cuspidal forms. ⌟

Proof: This is an action because if $\Gamma_0(N)\alpha\Gamma_0(N)=\coprod_i\Gamma_0(N)\alpha_i,\Gamma_0(N)\beta\Gamma_0(N)=\coprod_j\Gamma_0(N)\beta_j$, then $[\alpha][\beta]=\coprod_{i,j}\Gamma_0(N)\alpha_i\beta_j$.

Also $f(\gamma x)=\chi(\gamma)f(x)$ for $\gamma\in\Gamma_0(N)$ because $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is right $\Gamma_0(N)$-invariant. □

$\Gamma\backslash\mathcal{H}$

Def. (20.1.1.7) [Right Weight Action]. There are right actions of $GL(2,\mathbb{R})^+$ on $C^\infty(\mathcal{H})$ defined to by

$$(f|_k g)(z)=(\frac{c\overline{z}+d}{|cz+d|})^k f(\frac{az+b}{cz+d})$$

⌟

Proof: It is an action because**?** □

Def. (20.1.1.8) [Holomorphic Right Weight Action]. Besides the right weight action(20.1.1.7), there is another family of actions:

$$f[\gamma]_k(z)=\deg(\gamma)^{k/2}(cz+d)^{-k}f(\frac{az+b}{cz+d}).$$

⌟

Proof: This is an action because**?** □

Remark (20.1.1.9). This action is related to that of(20.1.1.7) via(20.1.2.9). ⌟

Lemma (20.1.1.10). If f is a holomorphic function on $\mathcal{H}$ and $\gamma\in SL_2(\mathbb{R})$ satisfies $\gamma^n\neq 1$ for any $n\neq 0$ and $f[\gamma]_k=f$, then $f=0$. ⌟

Proof: Use a Cayley transformation $\mathcal{H}\to\mathbb{D}$ to map the fixed point to origin, then γ corresponds to $\mathrm{diag}(\alpha,\alpha^{-1})$, where α is not a root of unity. Then if $f(z)=\sum a_n z^n$, the formula $f[\gamma]_k=f$ says $a_n\alpha^{2n+k}=a_n$. Because $\alpha^{2n+k}\neq 1$ for any n, $a_n=0$ for any n, thus $f=0$. □

Def. (20.1.1.11) [Form Spaces]. if Γ is a discrete subgroup of G_1, let $C^\infty(\Gamma\backslash\mathcal{H},\chi,k)$ be the space of smooth functions on $\mathcal{H}$ that

$$f|_k\gamma=\chi(\gamma)f,\quad \gamma\in\Gamma.$$

And elements in $C^\infty(\Gamma\backslash\mathcal{H},1,0)$ are called **automorphic functions**.

Let the subspace $C_c^\infty(\Gamma\backslash\mathcal{H},\chi,k)$ be those functions f that $|f|$ is compactly supported in $\Gamma\backslash\mathcal{H}$. ⌟

Def. (20.1.1.12) [Behavior at Cusps]. If ∞ is a cusp of Γ, then Γ contains some $\tau_r=\begin{bmatrix}1 & r\\ & 1\end{bmatrix}$ for $r>0$, then a continuous function $f(x+iy)$ on $\mathcal{H}$ is called

- **of at most linear exponential growth** at ∞ iff $|f(x+iy)|=O(e^{Ny})$ for $y\to\infty$

- **of moderate growth** at ∞ iff $|f(x+iy)| = O(y^N)$ for $y\to\infty$.
- **decay rapidly** at ∞ iff $|f(x+iy)|\leq y^{-N}$ for some $N>0$.
- **cuspidal** at ∞ iff either $\chi(\tau_r)\neq 1$ or $\int_0^r f(z+u)du = 0$ for any $z\in\mathscr{H}$.

If f is meromorphic on $\mathscr{H}$ then we have a Fourier expansion

$$f(z) = \sum_{n=-\infty}^{\infty} a_n e^{2\pi i n z/r} = \sum_{n=-\infty}^{\infty} a_n q^n = T(q).$$

Then f is called **meromorphic/holomorphic/vanishes** at the cusp ∞ iff $T(q)$ does at $q=0$.

The general cusp case is reduced to the ∞ case the same way as in(20.1.1.5). Notice this is independent of possible r chosen. ⌟

Prop. (20.1.1.13) [Hecke Operators]. Similar as in(20.2.2.6), we can define the action of $\mathcal{R}_N$ on $C^\infty(\Gamma_0(N)\backslash\mathcal{H},\chi_d,k)$:

$$T_\alpha(f) = \sum_i \chi_d(\alpha_i)^{-1} f|_k\alpha_i (20.1.1.7), \quad \text{if } \Gamma_0(N)\alpha\Gamma_0(N) = \coprod_i \Gamma_0(N)\alpha_i.$$

and preserves automorphic or cuspidal automorphic forms. ⌟

Proof: This is an action because if $\Gamma_0(N)\alpha\Gamma_0(N) = \coprod_i \Gamma_0(N)\alpha_i, \Gamma_0(N)\beta\Gamma_0(N) = \coprod_j \Gamma_0(N)\beta_j$, then $[\alpha][\beta] = \coprod_{i,j}\Gamma_0(N)\alpha_i\beta_j$.

Also $T_\alpha(f)|_k\gamma = T_\alpha(f)$ for $\gamma\in\Gamma_0(N)$ because $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is right $\Gamma_0(N)$-invariant. □

L^2-Spaces

Def. (20.1.1.14) [Inner Product on Form Spaces]. Notice that if $f,g\in C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$(20.1.1.11), then $f\overline{g}$ is invariant under action of Γ, so we define the Hilbert space $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ as the square-integrable functions in the inner product(20.1.0.1):

$$(f,g) = \int_{\Gamma\backslash\mathscr{H}} f(z)\overline{g}(z)\frac{dxdy}{y^2}.$$

⌟

Def. (20.1.1.15) [L^2-Spaces]. $L^2(\Gamma\backslash G,\chi)$ is defined to be the space of functions on G that is χ-invariant and that is square integrable on $\Gamma\backslash G_1$(because it can descend) with the quotient Haar measure(12.12.0.4)(notice that the absolute value descents to $\Gamma\backslash G_1$) that satisfies conditions in(20.1.1.3).

$L^2_0(\Gamma\backslash G,\chi)$ is the subspace of $L^0(\Gamma\backslash G,\chi)$ of cuspidal elements, where cuspidality is defined the same way as in(20.1.1.5) but in the sense that holds for a.e. g.

$L^2(\Gamma\backslash G,\chi,k)$ be the subspace of $L^2(\Gamma\backslash G,\chi)$ consisting of functions F that $\rho(k_\theta)F = e^{ik\theta}F$. ⌟

Prop. (20.1.1.16). The space $C_c(\Gamma\backslash G,\chi)$ is dense in $L^2(\Gamma\backslash G,\chi)$. ⌟

Proof: Firstly we show $C_c(\Gamma\backslash G,\chi)$ is dense in $L^2(\Gamma\backslash G,\chi)$. Let $\mathcal{F}$ be a Poincaré fundamental domain for Γ in $SL_2(\mathbb{R})$(20.1.1.24), then elements in $C_c(\mathcal{F})$ can be extended to elements of $C_c(\Gamma\backslash G,\chi)$, and in this way, $L^2(\Gamma\backslash G,\chi)$ is identified with $L^2(\mathcal{F})$, so the claim follows from(11.3.8.6). □

Cor. (20.1.1.17). The right regular action of G extends to a continuous unitary representation of G on $L^2(\Gamma\backslash G,\chi)$. $L^2_0(\Gamma\backslash G,\chi)$ is invariant under this representation. ⌟

Proof: We must verify continuity, and this is clear using the proposition because we can choose a compact supported function f to approximate, then the right action is uniformly continuous. The unitaricity is clear. The invariance of $L^2_0(\Gamma\backslash G,\chi)$ is clear. □

Remark (20.1.1.18). Can this be extended to arbitrary locally compact group G?**?**, compare with(11.10.2.9). ⌟

Prop. (20.1.1.19) [Two Form Spaces Equal]. There is an isomorphism of Hilbert spaces

$$\sigma_k : C^\infty(\Gamma\backslash\mathscr{H},\chi,k) \cong C^\infty(\Gamma\backslash G,\chi,k) : (\sigma_k f)(g) = (f|_k g)(i).$$

that preserves the inner products thus induces an isomorphism

$$\sigma_k : L^2(\Gamma\backslash\mathscr{H},\chi,k) \cong L^2(\Gamma\backslash G,\chi,k)$$

And we have(20.1.2.1):

$$\sigma_{k+2}R_k = dR\sigma_k, \quad \sigma_{k-2}L_k = dL\sigma_k, \quad \sigma_k\Delta_k = \Delta\sigma_k.$$

Also cuspidality and the behaviors at the cusps are compatible.

Also if $\Gamma = \Gamma_0(N)$, this isomorphic is compatible with the Hecke operator actions(20.1.1.13) and(20.1.1.6). ⌟

Proof: It can be verified that the inverse of σ_k is given by

$$f(z) = F(\begin{bmatrix} y & x \\ & 1 \end{bmatrix})$$

More precisely, if coordinates(12.12.0.4),

$$F(u,x,y,\theta) = f(x+iy)e^{ik\theta}, \quad f(z) = F(0,x,y,0).$$

Check the left action of Γ and $Z^+(\mathbb{R})$: For Γ actions(20.1.1.11) and(20.1.1.3), this is because $\sigma_k(f)(\gamma g) = f|_k(\gamma g)(i) = \sigma_k(f|_k\gamma)$. Finally check that σ_k preserves inner product, which is immediate from(20.1.1.14)(20.1.1.15) and(12.12.0.4).

The equations between R_k, L_k and R, L are easily verified from(20.1.1.1).

Th action of Hecke operators are compatible by the form $(\sigma_k f)(g) = (f|_k g)(i)$ as above.

Compatibility of behaviors at cusps: It suffices to check growth conditions, and this follows from**??**. □

Technicalities

Prop. (20.1.1.20).

$$k_\theta \begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} = \begin{bmatrix} y_1y_2D(\theta)^{-1} & \xi D(\theta)^{-1} \\ & D(\theta) \end{bmatrix} k_{\theta'}.$$

where

$$\theta' = \arctan(\frac{y_1}{y_2}\tan\theta), \quad D(\theta) = \sqrt{y_1^2\sin^2\theta + y_2^2\cos^2\theta}, \quad \xi = (y_2^2 - y_1^2)\sin\theta\cos\theta.$$

⌟

Proof: Hint: find θ' first. □

Prop. (20.1.1.21)[Gelfand]. Let $G = GL(n,\mathbb{R})^+, K = SO(n)$, denote $C_c^\infty(K\backslash G/K)$ to be the smooth functions $\varphi \in C^\infty(G)$ that $\varphi(k_1 g k_2) = \varphi(g)$, then $C_c^\infty(K\backslash G/K)$ is commutative. ⌟

Proof: Consider the map $\varphi \mapsto \widehat{\varphi} : \widehat{\varphi}(g) = \varphi(g^t)$, then it is an anti-involution of $C_c^\infty(K\backslash G/K)$:

$$(\widehat{\varphi_1 * \varphi_2})(g) = \int_G \varphi_1(g^t h)\varphi_2(h^{-1})dh = \int_G \widehat{\varphi_2}(h^{-t})\widehat{\varphi_1}(h^t g)dh = \int_G \widehat{\varphi_2}(h)\widehat{\varphi_1}(h^{-1}g)dh = (\widehat{\varphi_2} * \widehat{\varphi_1})(g)$$

But we find $\widehat{\varphi} = \varphi$, because we can use(12.11.5.1), $\varphi(g) = \varphi(d) = \widehat{\varphi}(d) = \widehat{\varphi}(g)$. □

Prop. (20.1.1.22). Let $G = GL(2,\mathbb{R})^+, K = SO(2)$, let σ be a character of K, then $C_c^\infty(K\backslash G/K, \sigma)$ is commutative. ⌟

Proof: The proof is the same as that of(20.1.1.21), but modified as

$$\widehat{\varphi}(g) = \varphi(\begin{bmatrix} -1 & \\ & 1 \end{bmatrix} g^t \begin{bmatrix} -1 & \\ & 1 \end{bmatrix}).$$

□

Siegel Sets

Def. (20.1.1.23) [Siegel Sets]. ⌟

Prop. (20.1.1.24)[Poincaré Fundamental Domain]. Fundamental domain for $\Gamma \subset GL(2,\mathbb{R})$ acting on $\mathscr{H}$ is defined in(11.10.1.35). There is a well-shaped open subset F with a set $F \subset F' \subset \overline{F}$ that F' is a fundamental domain for Γ acting on $\mathscr{H}$.

Notice that if $\mathcal{F}$ is a fundamental domain for Γ in $\mathscr{H} \cong SL_2(\mathbb{R})/SO(2,\mathbb{R})$, then the inverse image of $\mathcal{F}$ is a fundamental domain for Γ in $SL_2(\mathbb{R})$, because a.e. $z \in \mathscr{H}$ is not fixed by any $\gamma \in \Gamma$. ⌟

Proof: Choose a $z \in \mathscr{H}$ which is not fixed by any $\gamma \in \Gamma$, then for any $\gamma \in \Gamma$, draw the circle of points that have the same distance to z and $\gamma(z)$, then the intersection of all the part containing z is a fundamental domain.? □

Prop. (20.1.1.25) [Siegel]. If a Poincare fundamental domain Ω has finite area, then $\partial\Omega$ is a union of f.m. geodesics, and $\partial\overline{\Omega} \cap X$ is finite, and $\Gamma(\partial\overline{\Omega} \cap X)$ is the set of cusps for Γ. ⌟

Proof: The volume of Ω has a relation with the angles of geodesics of Ω, so it can only have f.m. vertices with interior angle$< 0.9\pi$. And the Γ-orbits of these angles intersect $\overline{\Omega}$ at f.m. vertices, which is because they consists of Γ-conjugates with the same distance with z_0, and a compact set meets f.m. geodesics of Ω, because Γz_0 is discrete in $\mathscr{H}$. In particular, Γ has f.m. vertices in the boundary.

Now if Γ has infinitely many vertices, there is a vertex b that all its Γ-conjugates have angles$> 0.9\pi$, then consider the Γ-conjugates of Ω with a vertex b, then all their angle at $b > 0.9\pi$, but this cannot be possible geometrically.

For any cusp x of Γ, suppose the Poincare fundamental domain is defined using z, notice there is a $\gamma \in \Gamma$ that $d(\gamma x, z)$ attains minimum, then γx must by in the boundary of Γ, as $d(\gamma_0 z, \gamma x) = d(z, \gamma x)$, and no other z are closer to γx. □

Prop. (20.1.1.26) [Siegel Set and Fundamental Set]. Siegel set is a nicely shaped substitutes for a fundamental domain:

- Let $a_1,\ldots,a_n \in \mathbb{R}\cup\{\infty\}$ be a representation of the Γ-orbits of cusps of Γ(20.1.1.25), let $\xi \in SL(2,\mathbb{R})$ be chosen that $\xi_i(a_i)=\infty$. If $c>0, d>0$ be chosen suitably, then the set $\cup\xi_i^{-1}\mathcal{F}_{c,d}$ contains a fundamental domain of Γ.
- Suppose ∞ is a cusp of Γ, then if d is large enough, then $\mathcal{F}_d^\infty$ contains a fundamental domain for Γ.

⌟

Proof: 1: $\xi_i\Gamma\xi_i^{-1}$ contains a unipotent subgroup generated by $\begin{bmatrix}1 & \delta_i\\ & 1\end{bmatrix}$, so if $d\geq\delta_i$, then $\xi_i^{-1}\mathcal{F}_{c,d}$ contains a nbhd of the cusp a_i in the fundamental domain F of Γ. so $F-\cup\xi_i^{-1}\mathcal{F}_{c,d}$ is precompact in $\mathcal{H}$, by(20.1.1.25). Now if $c=0, d=\infty$, then $F-\cup\xi_i^{-1}\mathcal{F}_{c,d}=\varnothing$, then this is true for some c,d.

For 2: because ∞ is a cusp, we may assume $F\in\mathcal{H}\cap\{x>0\}$. If d is large, then d will contain each of the pieces $\xi_i^{-1}\mathcal{F}_{c,d}\cap F$ in item1. □

Prop. (20.1.1.27)[Compatibility of Growth Conditions]. Let $G/\mathbb{R}$ be semisimple, f be a function on $\Gamma\backslash G(\mathbb{R})$, then the following are equivalent:

- f is of moderate growth/rapidly decreasing.
- f is of moderate growth/rapidly decreasing on each cusp of Γ.
- f is of moderate growth/rapidly decreasing on each Siegel set $\mathfrak{S}_{i,c,d}$.

⌟

Proof: Cf.[Bor97]P5.11.? We only prove for $SL(2,\mathbb{R})$. □

Harish-Chandra Theorem

Thm. (20.1.1.28) [Harish-Chandra]. If G is semisimple and $f\in C^\infty(G)$ be both K-finite and $\mathcal{Z}$-finite, then

- f is real analytic.
- $U(\mathfrak{g})f$ is an admissible $(\mathfrak{g},K)$-module.
- There exists $\alpha\in C_c^\infty(G)$ that

$$\alpha(kgk^{-1})=\alpha(g),\forall k\in K,\quad f*\alpha=f.$$

- If $|f(g)|<C||g||^N$, then all $U(\mathfrak{g})f$ satisfies similar inequalities with the same N, i.e. f is uniformly of moderate growth.

⌟

Proof: We prove only for $G=\mathrm{SL}(2)$. See [Harish-Chandra, Discrete series for semisimple Lie groups, II. Explicit determination of the characters. Acta. Math. 116 (1966)] or [Gan's notes, P24] for the general case.?

Because W lies in the Lie algebra of K and $W=iH$, the hypothesis implies $\mathcal{R}f$ is f.d., where $\mathcal{R}=\mathbb{C}[\Delta,H]$. Let V be the smallest closed G-invariant subspace of $C^\infty(G)$ containing f and let $V_0=U(\mathfrak{g})f$.

We first prove that

$$V_0=\bigoplus_{-\infty}^{\infty}(V_0\cap V(n)).$$

Notice there is a continuous projection of V onto $V(n)$:

$$E_n\varphi(g) = \frac{1}{2\pi}\int_0^{2\pi} e^{-in\theta}\varphi(gk_\theta)d\theta,$$

because f is K-finite, there is an N s.t. $f = \sum_{n=-N}^{N} E_n f$. Then notice any Df is also K-finite because D is combination of polynomials in R, L, H and R, L, H shift the weights, so the LHS is contained in the RHS. It's left to show now $E_nDf \in V_0$ for any n: E_nDf can be extracted using Lagrange polynomial in H, so it is clearly in V_0.

Next we show $V_0 \cap V(n)$ is of f.d.: Let $f_1, \ldots, f_k$ be a basis of $\mathcal{R}f$, because each f_k is K-finite. so if we use the decomposition of $U(\mathfrak{sl}_2(\mathbb{C}))$(3.7.8.24), only the R, L shifting of the E_nf will be considered, and clearly each $V_0 \cap V(n)$ is of f.d.

Now we show f is analytic: because f is $\mathcal{Z}$-finite, there is an equation $P(\Delta)f = 0$ where P is a monic function, and because Δ commutes with E_k and f is K-finite, $P(\Delta)E_kf = 0$. Now the $P(\Delta)E_kf = P(\Delta_k)E_kf$ by(20.1.1.1) and(20.1.2.1), and $P(\Delta_k)$ is an elliptic operator, so E_kf is analytic by(11.12.8.5).

Now we show V is the closure of V_0: Suppose not, then by Hahn-Banach there is a non-zero continuous linear functional Λ on V that $\Lambda(V_0) = 0$. If $F \in C^\infty(G)$, let $\varphi_F(g) = \Lambda(\rho(g)F)$, and let $\varphi = \varphi_f$. Clearly $dX\varphi_F = \varphi_{dXF}$, so $D\varphi_F = \varphi_{DF}$, which implies φ is $\mathcal{Z}$-finite and smooth, and also K-finite because f does. So by what we have proved, φ is analytic. But now φ is analytic and $D\varphi(1) = \varphi_{Df}(1) = 0$ because $Df \in V_0$, so $\varphi = 0$ by Taylor expansion. So $\Lambda(\rho(g)f) = 0$ for any g, contradiction because $\rho(g)f$ is dense in V.

So actually $V(n) \subset V_0$, because $E_nV_0 = V_0 \cap V(n) \subset V(n)$ is dense, and $V_0 \cap V(n)$ is of f.d., so $V(n) \subset V_0 = V_n$(11.8.1.8) and $V_0 = \oplus V(n)$ is an admissible $(\mathfrak{g}, K)$-module.

Let J be the convolution algebra(because G is unimodular) of functions α that $\alpha(kgk^{-1}) = \alpha(g)$, then it can be checked that convolution $- * \alpha$ commutes with action of K, so $f * J$ is in the same K-type space as f, thus K-finite and in a f.d. space.

Now we can approximate f by $f * J$: choose a Dirac sequence $\{\alpha_n\} \in C_c^\infty(G_1)$, we may replace $\{\alpha_n\}$ by the function $\beta_n(g) = \int_K \alpha_n(k^{-1}gk)dk$ to obtain a Dirac sequence in J. Then $f * \alpha_n \to f$ uniformly on compact sets. But $f * J$ is f.d., so there are some $f * \alpha = f$.

Finally for the growth estimate, it suffices to check for $D \in \mathfrak{g}$. Then $dX(f) = dX(f * \alpha) = f * (dX\alpha)$, from which the estimate is clear. □

Cor. (20.1.1.29) [Automorphic Forms Generate Admissible $(\mathfrak{g}, K)$-Modules]. The space $\mathcal{A}(\Gamma\backslash G, \chi, \omega)$ and $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega)$ are stable under the action of $U(\mathfrak{g})$, and for $f \in \mathcal{A}(\Gamma\backslash G, \chi, \omega)$, f is analytic and $U(\mathfrak{g})f$ is an admissible $(\mathfrak{g}, K)$-module.

Moreover, if f satisfies condition of moderate growth(20.1.1.4) and $D \in U(\mathfrak{g})$, then Df satisfies similar conditions with the same constant N. ⌟

Proof: It suffices to prove for $\mathcal{A}(\Gamma\backslash G, \chi, \omega)$ because the cuspidality condition is clearly preserved by right action.

We want to use Harish-Chandra theorem(20.1.1.28) on $G(K)/Z(K)$. Now $|f|$ is constant on each fiber of $G(K) \to G(K)/Z(K)$. it suffices to compare the norm on $G(K)$ and $G(K)/Z(K)$.

We do this only for $GL(2, \mathbb{R})$**?**

The condition of moderate growth is compatible because the minimal $||g||$ in a $Z(\mathbb{R})$-orbit is achieved when $\deg g = 1$(20.1.1.4). So all the assertion follows from that of(20.1.1.28) and its proof. □

2 Maass Forms

Maass Forms

Def. (20.1.2.1) [Maass Operator]. A **Maass differential operators** on $C^\infty(\mathcal{H})$ is defined to be

$$R_k = (z-\overline{z})\frac{\partial}{\partial z}+\frac{k}{2} = iy\frac{\partial}{\partial x}+y\frac{\partial}{\partial y}+\frac{k}{2},\quad L_k = -(z-\overline{z})\frac{\partial}{\partial \overline{z}}-\frac{k}{2} = -iy\frac{\partial}{\partial x}+y\frac{\partial}{\partial y}-\frac{k}{2}$$

and

$$\Delta_k = -y^2(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2})+iky\frac{\partial}{\partial x} = -L_{k+2}R_k-\frac{k}{2}(1+\frac{k}{2}) = -R_{k-2}L_k+\frac{k}{2}(1-\frac{k}{2})$$

Δ_k is a symmetric(unbounded) operator on $L^2(\mathcal{H})$ with domain $C_c^\infty(\mathcal{H})$. ⌟

Proof: For the formula:?

For the symmetry: composed with the measure, the order2 part is just the ordinary Laplacian, and the order 1 part becomes $iy^{-1}\frac{\partial}{\partial x}$, then notice

$$\int_{\mathcal{H}} iy^{-1}(\frac{\partial f}{\partial x}\overline{g}+f\frac{\partial \overline{g}}{\partial x})dxdy = i\int_{\mathcal{H}} d(y^{-1}f\overline{g}dy) = 0$$

as f,g are compactly supported. □

Prop. (20.1.2.2) [Maass Operator and Weight Action]. For $f\in C^\infty(\mathcal{H}), g\in G$,

$$(R_kf)|_{k+2}g = R_k(f|_kg),\quad (L_kf)|_{k-2}g = L_k(f|_kg),\quad (\Delta_kf)|_kg = \Delta_k(f|_kg)$$

⌟

Proof: For R_k, because scalar doesn't matter, we may assume $g\in SL_2(\mathbb{R})$, and let $w=\frac{az+b}{cz+d}$, then

$$\frac{\partial}{\partial z} = \frac{\partial w}{\partial z}\frac{\partial}{\partial z} = (cz+d)^{-2}\frac{\partial}{\partial w},\quad (w-\overline{w}) = \frac{z-\overline{z}}{|cz+d|^2}.$$

So

$$(w-\overline{w})\frac{\partial}{\partial w} = (\frac{(cz+d)^2}{|cz+d|^2})(z-\overline{z})\frac{\partial}{\partial z}.$$

And for any smooth function $\varphi\in C^\infty(\mathcal{H})$,

$$(z-\overline{z})\frac{\partial}{\partial z}((\frac{c\overline{z}+d}{|cz+d|})^k\varphi) = (z-\overline{z})(\frac{c\overline{z}+d}{|cz+d|})^k\frac{\partial\varphi}{\partial z}+\frac{k}{2}[(\frac{c\overline{z}+d}{|cz+d|})^{k+2}-(\frac{c\overline{z}+d}{|cz+d|})^k]\varphi.$$

This is because

$$\frac{\partial}{\partial z}|cz+d| = \frac{c}{2}\frac{|cz+d|}{cz+d},\quad \frac{\partial}{\partial z}(\frac{c\overline{z}+d}{|cz+d|})^k = -\frac{k}{2}c(z-\overline{z})\frac{(c\overline{z}+d)^k}{|cz+d|^k(cz+d)} = \frac{k}{2}[(\frac{c\overline{z}+d}{|cz+d|})^{k+2}-(\frac{c\overline{z}+d}{|cz+d|})^k].$$

Thus,

$$\begin{aligned}R_k(f|_kg) &= [(z-\overline{z})\frac{\partial}{\partial z}+\frac{k}{2}](\frac{c\overline{z}+d}{|cz+d|})^kf(w) = [(z-\overline{z})(\frac{c\overline{z}+d}{|cz+d|})^k\frac{\partial}{\partial z}+\frac{k}{2}(\frac{c\overline{z}+d}{|cz+d|})^{k+2}]f(w)\\ &= (\frac{c\overline{z}+d}{|cz+d|})^{k+2}[(w-\overline{w})\frac{\partial}{\partial w}+\frac{k}{2}]f(w) = ((R_kf)|_{k+2}g)(z).\end{aligned}$$

The case of L_k is similar, and Δ_k follows. □

Cor. (20.1.2.3). The operator R_k, L_k, Δ_k maps functions between $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$ and arises and decreases weights respectively. ⌟

Prop. (20.1.2.4). For $f\in C^\infty(\Gamma\backslash\mathscr{H},\chi,k), g\in C^\infty(\Gamma\backslash\mathscr{H},\chi,k+2)$, if one of them decays rapidly at all cusps, then(20.1.1.14)

$$(R_kf,g)=(f,-L_{k+2}g).$$

In particular, $\Delta_k=-L_{k+2}R_k-\frac{k}{2}(1+\frac{k}{2})$ is symmetric on the subspace of $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ consisting of rapidly decaying functions(Δ is unbounded and defined only on $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$ now, but will be extended to $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ in(20.1.4.5) when $\Gamma\backslash\mathscr{H}$ is compact). ⌟

Proof: Let $\omega=y^{-1}f(z)\overline{g(z)}d\overline{z}$. It can be shown by definition and using(11.4.1.9) that $\omega(\gamma z)=\omega(z)$, so ω descends to a differential form on $\Gamma\backslash\mathscr{H}$, and because one of f,g decays rapidly at all cusps,

$$\begin{aligned}0=\int_{\Gamma\backslash\mathscr{H}}d(y^{-1}f(z)\overline{g(z)}d\overline{z})&=\int_{\Gamma\backslash\mathscr{H}}[\frac{\partial}{\partial y}(y^{-1}f\overline{g})+i\frac{\partial}{\partial x}(y^{-1}f\overline{g})]dx\wedge dy\\&=\int_{\Gamma\backslash\mathscr{H}}[(iy\frac{\partial f}{\partial x}+y\frac{\partial f}{\partial y})\overline{g}-\overline{(iy\frac{\partial g}{\partial x}-y\frac{\partial g}{\partial y})}f-f\overline{g}]\frac{dxdy}{y^2}\\&=\int_{\Gamma\backslash\mathscr{H}}[(R_kf)\overline{g}+f\overline{(L_{k+2}g)}]\frac{dxdy}{y^2}.\end{aligned}$$

so the conclusion follows. □

Cor. (20.1.2.5). If λ is an eigenvector of Δ_k on $C^\infty(\Gamma\backslash H,\chi,k)$, then either $\lambda=\frac{l}{2}(1-\frac{l}{2})$, where $1\le l\le k$ and $l\equiv k \mod 2$, or $\lambda\ge\frac{\varepsilon}{2}(1-\frac{\varepsilon}{2})$, where $\varepsilon=0$ or 1 that $k\equiv\varepsilon \mod 2$. In particular, eigenvalues of Δ_0 are≥ 0 and eigenvalues of Δ_1 are $\ge 1/4$. ⌟

Proof: This can be done by repeatedly using $\Delta_{k-2}L_k=L_k\Delta_k$ to reduce Δ_ε, or can be deduced from(20.1.4.11). □

Def. (20.1.2.6) [Maass Forms]. A twisted **Maass Form** of weight k and parameter s for Γ is an element in $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$(20.1.1.11) that is an eigenform for Δ_k of eigenvalue $\lambda=\frac{1}{4}-s^2$ and is of moderate growth at cusps of Γ(20.1.1.12). The space of Maass forms are denoted by $\mathcal{A}_{Maass}(\Gamma\backslash\mathscr{H},\chi,k)$. The space of cuspidal Maass forms are denoted by $\mathcal{A}_{CuspMaass}(\Gamma\backslash\mathscr{H},\chi,k)$.

A Maase form of weight 0 and $\chi=1$ is sometimes just a Maass form. The space of Maass form is denoted by $\mathcal{A}_{\mathrm{Maass}}(\Gamma\backslash\mathscr{H})$. ⌟

Def. (20.1.2.7) [Weak Maass Forms]. A **weak Maass form** of weight k and parameter s for Γ is an element in $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$(20.1.1.11) that is an eigenform for Δ_k of eigenvalue $\lambda=\frac{1}{4}-s^2$ and is of at most linear exponential growth at cusps of Γ(20.1.1.12). A **harmonic Maass form** is a Maass form of eigenvalue $\lambda=\frac{1}{4}-s^2$ where s is an integer. ⌟

Prop. (20.1.2.8) [Hecke Operators on Maass Forms]. If $\Gamma=\Gamma_0(N)$, the space of Maass forms is stable under the action of the Hecke algebra on $C^\infty(\Gamma_0(N)\backslash\mathscr{H},\chi,k)$(20.1.1.13), by(20.1.2.2). ⌟

Def. (20.1.2.9) [Holomorphic Modular Forms as Maass Forms]. There is a bijection

$$M_k(\Gamma,\chi)\cong\mathcal{A}_{Maass}(\Gamma\backslash\mathscr{H},\chi,k)^{L_k=0}:f\mapsto y^{k/2}f$$

that induces a bijection

$$S_k(\Gamma,\chi)\cong\mathcal{A}_{CuspMaass}(\Gamma\backslash\mathscr{H},\chi,k)^{L_k=0}.$$

⌟

Proof: Direct calculation shows $L_k(y^{k/2}f(z)) = 2iy^{(k+2)/2}\frac{\partial}{\partial\bar{z}}f(z)$, and by(11.4.1.9),

$$(\mathrm{Im}(z)^{k/2}f(z))|_k\gamma = (\frac{c\bar{z}+d}{|cz+d|})^k\,\mathrm{Im}(\gamma z)^{k/2}f(\gamma z) = (\frac{c\bar{z}+d}{|cz+d|})^k\cdot\frac{\mathrm{Im}(z)^{k/2}}{|cz+d|^k}f(\gamma z)$$
$$= \mathrm{Im}(z)^{k/2}(cz+d)^{-k}f(z) = \mathrm{Im}(z)^{k/2}(f[\gamma]_k)(z)$$

so their invariant properties are compatible. Also, if f is a holomorphic modular form, then each $y^{k/2}f[\gamma]_k$ is bounded by a polynomial of y at ∞, and conversely, if $f(q)$ is bounded by a polynomial of $\log(1/|q|)$, then**??** shows f is holomorphic at each cusp. And the cuspidal condition

$$\int_0^r \mathrm{Im}(z)^{k/2}f(z+u)du = \mathrm{Im}(z)^{k/2}\int_0^r f(z+u)du = 0$$

just means f is a cusp form. □

Prop. (20.1.2.10) [Non-holomorphic Eisenstein series is a Maass Form]. The non-holomorphic Eisenstein series $E(s,\nu+1/2)$ is a Maass form of parameter ν for $\Gamma(1)$. ⌟

Proof: $E(s,\nu+1/2)$ is automorphic and of moderate growth by(21.1.1.3) and(21.1.1.1).

To show $E(s,\nu+1/2)$ is an eigenfunction of Δ, if $\mathrm{Re}(\nu) > 1/2$, notice $\Delta(y^{\nu+1/2}) = (\frac{1}{4}-\nu^2)y^{\nu+1/2}$, and Δ is invariant under action of $SL(2,\mathbb{Z})$, thus each $\mathrm{Im}(\gamma(y^{\nu+1/2}))$ is an eigenfunction for Δ of eigenvalue $\frac{1}{4}-\nu^2$, so the same is true for $E(s,\nu+1/2)$.

For general ν, this can be seen from the Fourier coefficients of $E(s,\nu+1/2)$(21.1.1.2):**?** □

Prop. (20.1.2.11) [Maass Forms as Automorphic Forms]. If $f\in\mathcal{A}_{\mathrm{Maass}}(\Gamma\backslash\mathscr{H},\chi,k)$, then $\sigma_k(f)\in C^\infty(\Gamma\backslash G,\chi,k)$(20.1.1.19), and is an eigenform of Δ. In particular it is K-finite, $\mathcal{Z}$-finite, of moderate growth by(20.1.1.19), and it is cuspidal iff $\sigma_k(f)$ is cuspidal, so $\sigma_k(f)\in\mathcal{A}(\Gamma\backslash G,\chi,k)$. And f is cuspidal iff $\sigma_k(f)$ is cuspidal.

In fact, there are a bijections

$$\mathcal{A}_{\mathrm{Maass}}(\Gamma\backslash H,\chi,k,\lambda)\cong\mathcal{A}(\Gamma\backslash G,\chi,k,\lambda),\quad \mathcal{A}_{\mathrm{Maass}}(\Gamma\backslash H,\chi,k)\cong\mathcal{A}(\Gamma\backslash G,\chi,k)^{\Delta-ss}$$

$$\mathcal{A}_{CuspMaass}(\Gamma\backslash H,\chi,k)\cong\mathcal{A}_0(\Gamma\backslash G,\chi,k),\quad \mathcal{A}_{CuspMaass}(\Gamma\backslash H,\chi)\cong\mathcal{A}_0(\Gamma\backslash G,\chi)=L^2_0(\Gamma\backslash G,\chi)^{K-\mathrm{fin}}.$$

this is because when f is cuspidal, Δ is semisimple on the finite dimensional subspace $\mathcal{Z}f$ because of the spectral decomposition of $L^2_0(\Gamma\backslash G,\chi,k)$(20.1.4.8). ⌟

Cor. (20.1.2.12) [Modular Forms as Automorphic Forms]. Combine this and(20.1.2.9), we get a bijection

$$M_k(\Gamma,\chi)\cong\mathcal{A}(\Gamma\backslash G,\chi,k)^{L=0}$$

that induces a bijection

$$S_k(\Gamma,\chi)\cong\mathcal{A}_0(\Gamma\backslash G,\chi,k)^{L=0}.$$

⌟

Cor. (20.1.2.13) [Finitely Many Maass Forms of Given Type]. $\dim\mathcal{A}_{\mathrm{Maass}}(\Gamma_0(N)\backslash\mathscr{H},\chi,k,\lambda) < \infty$. ⌟

Proof: This follows from(20.1.1.29). □

Conj. (20.1.2.14) [Selberg Conjecture]. Let Γ be a congruence subgroup, for any cuspidal Maass form f, the eigenvalue λ of Δ_0 satisfies $\lambda\geq 1/4$, or equivalently, the parameter s is purely imaginary. In this case, the cuspidal representation generated by f is tempered.

This conjecture is true for $\Gamma=\Gamma(1)$ but wrong for some other congruence subgroups. ⌟

Harmonic Maass Forms

References are [Harmonic Maass Forms, Mock Modular Forms, And Quantum Modular Forms, Ken Ono], [Harmonic Maass Forms and Mock Modular Forms Theory and Applications].

Def. (20.1.2.15) [Harmonic Maass Forms]. A **harmonic Maass form** is a weak Maass form(20.1.2.7) of eigenvalue $\frac{k}{2}(1-\frac{k}{2})$, where k is an integer.

Any modular form corresponds to a harmonic Maass form, by(20.1.2.9). ⌟

Def. (20.1.2.16) [Mock Modular Forms]. A **Mock modular form** is the holomorphic part of a harmonic Maass form. ⌟

3 Whittaker Models

Def. (20.1.3.1)[Whittaker Function Space]. For $\psi \in \widehat{\mathbb{R}}$, denote $W_\psi =$ the space of smooth functions f on $GL(n,\mathbb{R})^+$ that satisfies

$$f(ug) = \psi_{\mathrm{Unip}(n)}(u)f(g), \quad u \in \mathrm{Unip}(n)$$

A function $f \in W$ is called:

- of **moderate growth** if for any compact set $\Omega \subset G$, $|f(\begin{bmatrix} y & \\ & 1 \end{bmatrix} g)| < C|y|^k$ for some $C, k > 0$ for any $g \in \Omega$ when $|y| \to \infty$.
- **rapidly decreasing** if for any compact set $\Omega \subset G$ and $k \in \mathbb{R}$, $|f(\begin{bmatrix} y & \\ & 1 \end{bmatrix} g)| < C|y|^k$ for some C for any $g \in \Omega$ when $|y| \to \infty$.

⌟

Lemma (20.1.3.2) [Whittaker Function]. Let $\mu, \lambda \in \mathbb{C}$ and $k \in \mathbb{Z}$. Let $W(\lambda,\mu,k)$ be the space of functions $f \in W$(20.1.3.1) on G s.t. $\Delta f = \lambda f$, $If = \mu f$, $f \in (C^\infty(G))^k$ and f is of moderate growth, then $W(\lambda,\mu,k)$ is 1-dimensional, and functions in this space are actually rapidly decreasing and analytic.

Moreover, the operators R, L map $W(\lambda,\mu,k)$ into $W(\lambda,\mu,k+2)$, $W(\lambda,\mu,k-2)$ respectively.

Also, for $|y| \to 0$ and μ imaginary, $W(\lambda,\mu,k)$ is bounded by a $|y|^{-1/2}$ for some $\varepsilon > 0$. ⌟

Proof: For $f \in W(\lambda,\mu,k)$, in coordinate(12.12.0.4), we have

$$f(g) = u^\mu \psi(x) e^{ik\theta} w(y), \quad w(y) = f(\begin{bmatrix} y^{1/2} & \\ & y^{-1/2} \end{bmatrix})$$

Thus it suffices to study the behavior of $w(y)$. By the expression of Δ(20.1.1.1), if $\psi(x) = e^{iax}$, then

$$w'' + (-a^2 + \frac{k}{2y} + \frac{\lambda}{y^2})w = 0$$

And this is the Whittaker's equation, and the only moderate growth function is rapidly decreasing and analytic. This is by direct calculation in [A course of Modern Analysis, Whittaker/Watson(1927)]**?**.

For the action of R, L, they preserve W because they are right actions. And Rf, Lf have the same eigenvalue of Δ, I because Δ, I are in the center of $U(\mathfrak{g})$. They shift the weight by(20.1.1.19) and(20.1.2.2). □

Prop. (20.1.3.3) [Uniqueness of Whittaker Models for $GL(2,\mathbb{R})$]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}, K))$, there exists at most one space $W(\pi,\psi) \in W$ consisting of K-finite functions $f \in W$ that is of moderate growth, and is invariant under the action of $U(\mathfrak{g})$ and K, and is infinitesimal equivalent to (π, V).

Moreover, functions in $W(\pi,\psi)$ are actually rapidly decreasing and analytic. The space $W(\pi,\psi)$ is called the **Whittaker model** of π, if it exists. ⌟

Proof: By(18.9.3.9), Δ, I acts by scalars λ,μ on V. By(18.9.3.26) or(18.9.3.34) if $V^k \neq 0$, then $\dim V^k = 1$. If $V^k \neq 0$, then the image of V^k under the isomorphism with $W(\pi,\psi)$ is in the space $W(\lambda,\mu,k)$. Thus $W(\pi,\psi)$ is the direct sum of the $W(\lambda,\mu,k)$ for all k that $V^k \neq 0$, so uniquely determined by(20.1.3.2). And the rapid decreasing and analytic properties are also consequences of(20.1.3.2). □

Prop. (20.1.3.4). If $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}, K))$ has a Whittaker model, then there exists some $\xi \in V$ that $W_\xi(1) \neq 0$. ⌟

Proof: Because K intersect each connected component of G, we can assume some W_ξ is non-zero on K^0, thus by analyticity(20.1.3.3), its derivatives at 1 are not identically 0, thus there exists some $D \in U(\mathfrak{g})$ that $DW_\xi(1) = W_{D\xi}(1) \neq 0$. □

Prop. (20.1.3.5) [Whittaker Models for $GL(n,\mathbb{C})$]. This result is true if $\mathbb{R}$ is replaced by $\mathbb{C}$. ⌟

Proof: Cf.[Automorphic Forms on GL(2), Jacquet/Langlands (1970) Thm5.3. P232]?. □

Prop. (20.1.3.6) [Fourier-Maass Expansion]. ⌟

Proof: □

Cor. (20.1.3.7) [Rapidly Decreasing]. Cuspidal automorphic Forms are rapidly decreasing at any Siegel set. ⌟

Proof: Cf.[Gan's Notes, P26].? □

Prop. (20.1.3.8) [Existence of Whittaker Models]. The Whittaker model exists for the ⌟

Prop. (20.1.3.9) [Shalika's Local Multiplicity One Theorem]. Given a unitary irreducible representation V of $GL(n,F)$, a **Whittaker functional** on V^∞ is a $N(F)$-map $\lambda : V^\infty \to \psi_N$.

Then the space of Whittaker functionals on V^∞ is at most 1-dimensional. ⌟

Proof:

□

4 The Spectral Problem

The Spectral Problems for $\Gamma\backslash\mathscr{H}$ Compact

Def. (20.1.4.1). In this subsection we assume $\Gamma\backslash G_1$ is compact, or equivalently $\Gamma\backslash\mathscr{H}$ is compact, because K is compact. This condition makes $C^\infty(\Gamma\backslash\mathscr{H},\chi) = L^2(\Gamma\backslash\mathscr{H},\chi)$, and will make the decomposition having only discrete parts(20.1.4.2). ⌟

Prop. (20.1.4.2) [$L^2(\Gamma\backslash G,\chi)$ Totally Decomposable]. The space $L^2(\Gamma\backslash G,\chi)$ decomposes into a Hilbert space direct sum of subspaces that are invariant and irreducible under the right regular action ρ. ⌟

Proof: This follows from(20.8.2.3). □

Lemma (20.1.4.3). Let σ be the character on K that $\sigma(k_\theta)=e^{-ik\theta}$, $C_c^\infty(K\backslash G/K,\sigma)$ is commutative by(20.1.1.22), let ξ be a character of it. Let $H(\xi)$ be the subspace of $f\in L^2(\Gamma\backslash G,\chi,k)$ that $\pi(\varphi)f=\xi(\varphi)f$ for $\varphi\in C_c^\infty(K\backslash G/K,\sigma)$.

Then $H(\xi)$ are of f.d. and different $H(\xi),H(\eta)$ are orthogonal that $\oplus_\xi H(\xi)=L^2(\Gamma\backslash G,\chi,k)$. ⌟

Proof: Suppose $0\in f\in H(\xi)$, then by(18.9.4.1), we can find a $\varphi\in C_c^\infty(K\backslash G/K,\sigma)$ s.t. $\rho(\varphi)f\neq 0$. And by hypothesis $\rho(\varphi)f=\xi(\varphi)f$, thus $\xi(\varphi)\neq 0$, and f is an eigenvalue of $\rho(\varphi)$ which is compact and self-adjoint, so the $\xi(\varphi)$-eigenspace of $\rho(\varphi)$ is f.d. and $H(\varphi)$ is contained in this space, thus f.d.

To show the orthogonality, choose $\varphi\in C_c^\infty(K\backslash G/K,\sigma)$ that $\xi(\varphi)\neq\eta(\varphi)$. Considering $\varphi=\varphi_1+i\varphi_2$, where $\rho(\varphi_1),\rho(\varphi_2)$ are both self-adjoint, then we mays assume φ is self-adjoint. Then $H(\xi),H(\eta)$ are contained in different eigenspaces of $\rho(\varphi)$, so they are orthogonal.

Finally for the direct sum, it suffices to show that if f is orthogonal to all $H(\xi)$, then $f=0$. Given f, let $\varphi_0\in C_c^\infty(K\backslash G/K,\sigma)$ be chosen that $\rho(\varphi_0)f$ is near f that $\rho(\varphi_0)f,f$ are not orthogonal(18.9.4.1).

Consider the eigenspace decomposition of $\rho(\varphi_0)$ on $L^2(\Gamma\backslash G,\chi,k)$, then $f=f_0+f_1+f_2+\ldots$, then $\rho(\varphi_0)f=\lambda_1 f+\lambda_2 f+\ldots$. Because f is not orthogonal to $\rho(\varphi_0)f$, thus f_i is not orthogonal to f for some $i\geq 1$. Let V be the λ_i-eigenvalue of $\rho(\varphi_0)$, then V is f.d. and invariant under $\rho(\varphi)$ for all $\varphi\in C_c^\infty(K\backslash G/K,\sigma)$ because $C_c^\infty(K\backslash G/K,\sigma)$ is commutative(20.1.1.22). So V is a direct sum of elements of the spaces $H(\xi)$, so V is orthogonal to f, contradiction. □

Prop. (20.1.4.4). The space $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ decomposes into a Hilbert space direct sum of eigenspaces for Δ_k. ⌟

Proof: By(20.1.1.19), it suffices to prove for $L^2(\Gamma\backslash G,\chi,k)$ and Δ. Because Δ are in the center of $U(\mathfrak{g})$, $H(\xi)$ are all Δ-invariant. So we finish by the lemma(20.1.4.3), as each $H(\xi)$ is f.d. so Δ is a self-adjoint operator on $H(\xi)$, because $C_c^\infty(\Gamma\backslash G,\chi)$ is dense(20.1.1.16). So it is a direct sum of Δ-eigenspaces. □

Prop. (20.1.4.5).

- The eigenvalues λ_i of Δ_k on $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ tends to ∞, and satisfies $\sum\lambda_i^{-2}<\infty$.
- The laplacian Δ_k has an extension to a self-adjoint operator on the Hilbert space $L^2(\Gamma\backslash\mathscr{H},\chi,k)$. ⌟

Proof: Cf.[Bump P185].**?** □

<u>**The Spectral Problems for General Case**</u>

Prop. (20.1.4.6) [Gelfand, Graev and Piatetski-Shapiro]. Let $\varphi\in C_c^\infty(G)$, then

- There exists a constant $C(\varphi)$ that for all $f\in L_0^2(\Gamma\backslash G,\chi,\omega)$, we have $||\rho(\varphi)f||_{C(G)}\leq C(\varphi)||f||_2$.
- $\rho(\varphi)$ is a compact operator on $L_0^2(\Gamma\backslash G,\chi,\omega)$.

Notice this generalizes(20.8.2.1). ⌟

Proof: We may assume Γ has cusps, otherwise this is proved in(20.8.2.1). Conjugating Γ by an element of $SL(2,\mathbb{R})$, we may assume that ∞ is a cusp for Γ, and Γ_∞ is generated by $\begin{bmatrix}1&1\\&1\end{bmatrix}$. Then it suffices to prove that

$$\sup_{g\in\mathcal{G}_{c,d}}|\rho(\varphi)f(g)|\leq C_0||f||_2,$$

because we can do the same for other cusps of Γ, and use(20.1.1.26) to show that $\sup_{g\in F}|\rho(\varphi)f(g)|\leq C_0||f||_2$, hence for all $g\in\mathcal{H}$.

Now let $\varphi_\omega(g)=\int_{R^*}\varphi(zg)\omega(z)dz$, then

$$\begin{aligned}\rho(\varphi)f(g)&=\int_{Z(R)\backslash G}f(gh)\varphi_\omega(h)dh\\&=\int_{Z(\mathbb{R})\backslash G}f(h)\varphi_\omega(g^{-1}h)dh\\&=\int_{\Gamma_\infty Z(\mathbb{R})\backslash G}\sum_{\gamma\in\Gamma_\infty}f(\gamma h)\varphi_\omega(g^{-1}\gamma h)dh\\&=\int_{\Gamma_\infty Z(\mathbb{R})\backslash G}K(g,h)f(h)dh,\end{aligned}$$

where $K(g,h)=\sum_{\gamma\in\Gamma_\infty}\chi(\gamma)\varphi_\omega(g^{-1}\gamma h)$. Then we can estimate the kernel $K(g,h)$ and show it decays rapidly for h when g is fixed, and this will give the disired result, Cf.[Bump, P286]?.

2: Let $X(\Gamma)$ be the space obtained by compactifying $\Gamma\backslash G_1$ by adjoining cusps, and let Σ be the image of the unit ball in $L^2_0(\Gamma\backslash G,\chi,\omega)$ under $\rho(\varphi)$, then we can extend each $|\rho(\varphi)f|$ to $X(\Gamma)$ that it vanish at the cusps, by the corollary to item1 below(20.1.4.7), then Σ is bounded in the L^∞-norm by item1, and it is also equicontinuous, because its derivatives can be bounded uniformly for f:

$$(X\rho(\varphi)f)(g)=\rho(\varphi_X)f(g),\quad\varphi_X(g)=\frac{d}{dt}\varphi(\exp(-tX)g)$$

so the conclusion of item1 applied to φ_Xs shows the uniformly boundedness. Now Arzela-Ascoli shows that Σ is precompact in $C(X(\Gamma))$, thus also in $L^2(X(\Gamma))$. □

Cor. (20.1.4.7). If $\varphi\in C_c^\infty(G),f\in L^2_0(\Gamma\backslash G,\chi,\omega)$, then $\rho(\varphi)f$ is smooth and rapidly decreasing at cusps. ⌟

Proof: This is contained in the proof of(20.1.4.6) above, Cf.[Bump, P286]?. □

Prop. (20.1.4.8)[$L^2_0(\Gamma\backslash G,\chi,\omega)$ Totally Decomposable]. The space $L^2_0(\Gamma\backslash G,\chi,\omega)$ decomposes into a Hilbert space direct sum of irreducible subrepresentations of G, and if H is such a subrepresentation, then the $H^{K-\text{fin}}\subset H$ is dense, and $H^{K-\text{fin}}\in\mathrm{Irr}^{\text{adm}}((\mathfrak{g},K))$ is contained in $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)$.

Moreover, $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)$ is just the smooth part of $L^2_0(\Gamma\backslash G,\chi,\omega)$. ⌟

Proof: The proof is exactly the same as that of(20.1.4.2), but where we use(20.1.4.6) in place of(20.8.2.1). Lemma(18.9.4.1) is indispensable.

$H^{K-\text{fin}}\in\mathrm{Irr}^{\text{adm}}((\mathfrak{g},K))$ by(18.9.4.4). To show it is contained in $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)$, it suffices show that $H^k\subset\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)$ for any k. For this, if $0\neq f\in H_k$, choose by(18.9.4.1) a function $\varphi\in C_c^\infty(G)$ that $\rho(\varphi)f\neq 0$, thus we can assume $\rho(\varphi)(f)=f$ by(18.9.4.1) and(20.8.2.1), as $\dim H^k<\infty$ by(18.9.4.3). Then by(20.1.4.7) f is smooth and decay rapidly, and it is clearly K-finite and $\mathcal{Z}$-finite, thus $f\in\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)$.

The last assertion follows as any cuspidal form decays rapidly thus is contained in $L^2_0(\Gamma\backslash G,\chi,\omega)$(20.1.3.7). □

Cor. (20.1.4.9) [Finite Multiplicity].

- $L^2_0(\Gamma\backslash G,\chi,\omega)=\bigoplus_\pi\pi^{m(\pi)}$, where for each π, $m(\pi)$ is finite.

- Let $\mathcal{A}(\Gamma\backslash G,\chi,\omega,\lambda)$ be the λ-eigenspace of Δ on $\mathcal{A}(\Gamma,\chi,\omega)$, and $\mathcal{A}(\Gamma\backslash G,\chi,\omega,\lambda,k)$ be the k-part in K-decomposition of $\mathcal{A}(\Gamma\backslash G,\chi,\omega,\lambda)$, and $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega,\lambda,k)$ the cuspidal part, then $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega,\lambda,k)$ is of f.d.

⌟

Proof: 1: Let (π,V) be an irreducible unitary representation of G, let k be chosen that $V^k\neq 0$, let $0\neq\xi\in V^k$, then by(18.9.4.1) there is a $\varphi\in C_c^\infty(G)$ that $\pi(\varphi)\xi=\xi$ and $\pi(\varphi)$ is self-adjoint by(18.9.4.1) and(20.8.2.1), as $\dim H^k<\infty$ by(18.9.4.3). Now consider for any continuous linear map $T:V\to L_0^2(\Gamma\backslash G,\chi,\omega)$, $T\xi$ lies in the 1-eigenspace of the compact self-adjoint operator $\rho(\varphi)$, which is of f.d. as $\rho(\varphi)$ is compact by(20.1.4.6). Of course, T is determined by $T\xi$ because V is irreducible, so these T form a f.d. vector space, so the multiplicity is finite.

2: This follows from the first, because by(20.1.4.8) the K-finite parts of an irreducible subrepresentation of $L_0^2(\Gamma\backslash G,\chi,\omega)$ are just the space of cuspidal forms contained in it, and λ,k determined the action of Δ,I, so there are at most onw representation of G that satisfies these, by classification in(18.9.3.34) and(18.9.3.10), and they appear for finite multiplicity by item1, and for each of them, the k-part is of f.d., because they are admissible(18.9.4.4). So the conclusion follows. □

Remark (20.1.4.10) [Fundamental Theorem of Harish-Chandra]. In fact, Harish-Chandra showed that for any finite codimensional ideal $J\subset\mathcal{Z}$, The subspace $\mathcal{A}(\Gamma,\chi,\omega,J)$ of automorphic forms annihilated by J is an admissible $(\mathfrak{g},K)$-module.

In particular, any irreducible admissible $(\mathfrak{g},K)$-module π appears in $\mathcal{A}(\Gamma,\chi,\omega)$ with finite multiplicity.**?**

⌟

Thm. (20.1.4.11) [Main Theorem]. Let $\chi(-1)=(-1)^\varepsilon$, $\varepsilon=0,1$, (20.1.4.2) shows the representation $\mathcal{H}=L_0^2(\Gamma\backslash G,\chi)$ decomposes into Hilbert space direct sums of irreducible representations, and Δ acts as real scalars λ on each irreducible subspace(18.9.3.33), and μ acts by 0. So comparing the classification of representations of $GL(2,\mathbb{R})$(18.9.4.25), we can list what representation can appear in it by looking at eigenvalues λ of Δ:

- There is only one f.d. irreducible unitary subrepresentation of G occurring in $\mathcal{H}$, the trivial representation.
- If $\lambda\neq\frac{k}{2}(1-\frac{k}{2})$ for any $k\geq 1\in\mathbb{Z}$ and $k\equiv\varepsilon\mod 2$, then $\lambda\geq\frac{\varepsilon}{2}(1-\frac{\varepsilon}{2})$, and this subrepresentation is isomorphic to $P(\lambda,\varepsilon)$. And let $k'\equiv\varepsilon\mod 2$ be any integer, then the multiplicity of $P(\lambda,\varepsilon)$ is equal to the multiplicity of the eigenvalue λ of $\Delta_{k'}$ on $L^2(\Gamma\backslash\mathcal{H},\chi,k')$ because $L^2(\Gamma\backslash\mathcal{H},\chi,k')\cong L^2(\Gamma\backslash G,\chi,k')$ by(20.1.1.19).
- If $\lambda=\frac{k}{2}(1-\frac{k}{2})$ for some $k\geq 1\in\mathbb{Z}$ and $k\equiv\varepsilon\mod 2$, then this subrepresentation is isomorphic to either $D^+(k)$ or $D^-(k)$, and $D^\pm(k)$ have the same multiplicity in $\mathcal{H}$, equal to the dimension $\dim(M_k(\Gamma,\chi))$(20.2.1.16) of holomorphic modular forms of weight k for Γ.
  Also if $k'\equiv\varepsilon\mod 2$ is any integer$\geq k$(resp. $\leq -k$), then the multiplicity of $D^+(k)$(resp. $D^-(k)$) is equal to the multiplicity of the eigenvalue λ of $\Delta_{k'}$ on $L^2(\Gamma\backslash\mathcal{H},\chi,k')$ because $L^2(\Gamma\backslash\mathcal{H},\chi,k')\cong L^2(\Gamma\backslash G,\chi,k')$ by(20.1.1.19).

⌟

Proof: These follow from classification of irreducible representations of $GL(2,\mathbb{R})$(18.9.4.26).

Relation with modular forms: by(18.9.3.28), the multiplicity of $D^+(k)$ equals the dimension of the $\frac{k}{2}(1-\frac{k}{2})$-eigenspace of Δ_k on $L^2(\Gamma\backslash\mathcal{H},\chi,k)$, and any f in this eigenspace is annihilated by L_k by(20.1.2.1)(20.1.2.3). But(20.1.2.9) shows the dimension of space of functions annihilated by L_k equals the dimension of modular forms of weight k. Finally notice that complex conjugation interchanges $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ and $L^2(\Gamma\backslash\mathscr{H},\chi,-k)$ and $\overline{\Delta_k}=\Delta_{-k}$(20.1.2.1), so the multiplicity of $D^+(k)$ and $D^-(k)$ equal. □

Eisenstein Series

Prop. (20.1.4.12). Let $\mathcal{A}^2(\Gamma\backslash G,\chi,\omega)=\mathcal{A}(\Gamma\backslash G,\chi,\omega)\cap L^2(\Gamma\backslash G,\chi,\omega)$, then this is exactly the space of smooth K-finite $\mathcal{Z}$-finite vectors in the discrete spectrum $L^2_{disc}(\Gamma\backslash G,\chi,\omega)$. ⌟

Proof:

1 Modular Forms

Modular Groups

Def. (20.2.1.1) [Fuchsian Groups of the First Kind]. A **Fuchsian groups of the first kind** is a discrete subgroup $\Gamma \subset \mathrm{SL}(2,\mathbb{R})$ s.t. $\mathrm{Vol}(\mathrm{SL}(2,\mathbb{R})/\Gamma) < \infty$. ⌟

Def. (20.2.1.2) [Principle Congruence Subgroups]. For $N \in \mathbb{Z}_+$, there are Fuchsian subgroups:

$$\Gamma(N) \subset \Gamma_1(N) \subset \Gamma_0(N)$$

where

$$\Gamma(N) = \{\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathrm{GL}(2,\mathbb{Z}) | a, d \equiv 1 (\mathrm{mod}\ N), b, c \equiv 0 (\mathrm{mod}\ N)\}.$$

$$\Gamma_1(N) = \{\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathrm{GL}(2,\mathbb{Z}) | a, d \equiv 1 (\mathrm{mod}\ N), c \equiv 0 (\mathrm{mod}\ N)\}.$$

$$\Gamma_0(N) = \{\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathrm{GL}(2,\mathbb{Z}) | c \equiv 0 (\mathrm{mod}\ N)\}.$$

⌟

Def. (20.2.1.3) [Congruence Subgroups]. A **congruence subgroup** is a Fuchsian subgroup $\Gamma \subset \mathrm{SL}(2,\mathbb{Z})$ that contains $\Gamma(N)$ for some N. In particular, a congruence subgroup has finite index in $\Gamma(1)$. ⌟

Def. (20.2.1.4) [Fricke Involution]. For $N \in \mathbb{Z}_+$, denote

$$w_N = \begin{bmatrix} & -1 \\ N & \end{bmatrix}, \quad W_N = \frac{1}{\sqrt{N}} w_N.$$

Then $W_N^2 = -1$, and $\Gamma_0(N)$ is stabilized by w_N and W_N. Denote

$$\Gamma_0^+(N) = \langle \Gamma_0, W_N \rangle \subset \mathrm{SL}(2,\mathbb{R}).$$

⌟

Proof:

$$w_N \begin{bmatrix} a & b \\ c & d \end{bmatrix} w_N^{-1} = \frac{-1}{N} \begin{bmatrix} Nd & c \\ N^2 b & Na \end{bmatrix} = \begin{bmatrix} -d & -c/N \\ -Nb & -a \end{bmatrix}.$$

□

Prop. (20.2.1.5). $\Gamma_0^+(4) = \langle T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}, W_4\rangle$. In fact, if $\widetilde{T} = W_4 T W_4^{-1} = \begin{bmatrix} 1 & \\ 4 & 1 \end{bmatrix}$, then $\overline{\Gamma_0(4)} = \overline{\langle T, \widetilde{T}\rangle} \in \mathrm{PSL}(2;\mathbb{R})$. ⌟

Proof: □

Lemma (20.2.1.6) [Cartan Decomposition]. There is a complete set of coset representatives for $\mathrm{SL}(2,\mathbb{Z})\backslash \mathrm{GL}(2,\mathbb{Q})^+ / \mathrm{SL}(2,\mathbb{Z})$ consisting of the diagonal matrices $\mathrm{diag}(d_1, d_2)$, where $d_1, d_2 \in \mathbb{Q}^\times$ and d_1/d_2 is a positive integer.

More generally, for $N > 0$,

$$\mathrm{GL}(2,\mathbb{Q})^+ = \coprod_{d_1,d_2\in\mathbb{Q}^\times, d_1/d_2\in\mathbb{Z}_+} \mathrm{SL}(2,\mathbb{Z}) \begin{bmatrix} d_1 & \\ & d_2 \end{bmatrix} \Gamma_0(N).$$

Also, let Σ be the set of primes dividing N, $\mathbb{Z}_\Sigma$ be the localization of $\mathbb{Z}$ at these primes, and $G_0(N)$ be the subgroup of $\mathrm{GL}(2,\mathbb{Z}_\Sigma)^+$ consisting of matrices $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ s.t. $c \in N\mathbb{Z}_\Sigma$. Then

$$G_0(N) = \coprod_{d_1,d_2\in\mathbb{Z}_\Sigma, d_1/d_2\in\mathbb{Z}_+} \Gamma_0(N) \begin{bmatrix} d_1 & \\ & d_2 \end{bmatrix} \Gamma_0(N).$$

⌟

Proof: The first assertion follows from(12.11.5.7), noticing the sign.

For the second assertion, for any $g \in G_0(N)$, let $g = \gamma_1 \,\mathrm{diag}(d_1, d_2)\gamma_2$ where $D = d_1/d_2 \in \mathbb{Z}$ and $(D, N) = 1$. Then for any $\begin{bmatrix} a & b \\ Dc & d \end{bmatrix} \in \Gamma_0(N)$, we can change (γ_1, γ_2) to $(\gamma_1 \begin{bmatrix} a & Db \\ c & d \end{bmatrix}, \begin{bmatrix} a & b \\ Dc & d \end{bmatrix}\gamma_2)$, in this way if $\gamma_2 = \begin{bmatrix} x & y \\ z & w \end{bmatrix}$, we can change z to $Dxc + dz$. Now take k s.t. $(kx + z, N) = 1$, and let c be chosen s.t. $N|D(kz + x)c + z$, and $d = kDc + 1$, then $(Dc, d) = 1$, and we can find a, b s.t. $ad - Dbc = 1$. Then for this (a, b, c, d), $\begin{bmatrix} a & b \\ Dc & d \end{bmatrix}\gamma_2 \in \Gamma_0(N)$.

Finally, if $g \in G_0(N)$ and $\gamma_2 \in \Gamma_0(N)$, then automatically $\gamma_1 \in \Gamma_0(N)$. □

Prop. (20.2.1.7) [Conjugate of Congruence Subgroup]. If Γ is a congruence subgroup of level N and $\alpha \in \mathrm{GL}(2,\mathbb{Q})^+$, then $\alpha^{-1}\Gamma\alpha$ is a congruence subgroup.

In particular, $\alpha\Gamma\alpha^{-1} \cap \Gamma$ is also a congruence subgroup, and if $\alpha \in \mathrm{SL}(2,\mathbb{Z})$ with $\delta(\alpha) = D$, then $\alpha^{-1}\Gamma\alpha$ is a congruence subgroup of level DN. ⌟

Proof: Let M_1, M_2 be positive integers s.t. $M_1\alpha, M_2\alpha^{-1} \in \mathrm{Mat}(2;\mathbb{Z})$.(In the second case we can take $M_1 = 1, M_2 = D$). If A is a matrix that $A \equiv 1 \mod M_1M_2N$, then $\alpha^{-1}(A - 1)\alpha \equiv 1 \mod N$. Thus $\alpha^{-1}\Gamma\alpha$ contains $\Gamma(M_1M_2N)$. □

Cor. (20.2.1.8) [Congruence Topology]. We can define a topology on the group $\mathrm{GL}(2,\mathbb{Q})^+$ given by a basis at the origin given by the open subgroup $\Gamma(N)$. Then(20.2.1.7) can be used to show that this is truly a topology. In fact, it is restriction on $SL(2,\mathbb{Z})$ is the same as the topology given by the inclusion $\mathrm{SL}(2,\mathbb{Z}) \subset \mathrm{SL}(2,\widehat{\mathbb{Z}})$.

But unfortunately, $\mathrm{SL}(2,\mathbb{Z})$ is not compact in this topology, because otherwise $SL(2,\mathbb{Z})$ is closed in $\mathrm{SL}(2,\widehat{\mathbb{Z}})$, contradiction. ⌟

Lemma (20.2.1.9). The action of $\Gamma(1) = \mathrm{SL}(2,\mathbb{Z})$ on $\mathscr{H}$ is properly discontinuous(4.12.1.13). ⌟

Proof: Cf.[Bump P18]. □

Prop. (20.2.1.10). The subset $F = \{z \in \mathscr{H} || \operatorname{Re}(z)| < 1/2, |z| > 1\}$ is a fundamental domain for $\Gamma(1) = \mathrm{SL}(2,\mathbb{Z})$, and moreover, let $S = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$ and $T = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$, then $S^2 = -1, (ST)^3 = (TS)^3 = -1$, and

(1) two elements z, z' of $\overline{F}$ are equivalent under $\Gamma(1)$ iff
   (a) $\operatorname{Re}(z) = -1/2$ and $z' = z + 1$, then $z' = T(z)$.
   (b) $|z| = 1$ and $z' = -\frac{1}{z}$, then $z' = S(z)$.
(2) Let $z \in \overline{F}$, if the stabilizer of z is not ± 1, then
   (a) $z = \mathrm{i}$ and $\mathrm{Stab}(\mathrm{i}) = \langle S \rangle$.
   (b) $z = \rho = e^{2\pi \mathrm{i}/6}$ and $\mathrm{Stab}(\rho) = \langle TS \rangle$.
   (c) $z = \omega$, and $\mathrm{Stab}(\omega) = \langle ST \rangle$.

⌟

Proof: 1: Let Γ' be the subgroup of $\Gamma(1)$ generated by S and T. By(11.4.1.9),

$$\operatorname{Im}(\gamma(z)) = \frac{\operatorname{Im}(z)}{|cz+d|^2}.$$

and there is a $\gamma \in \Gamma'$ that $|cz + d|$ attains the minimal value, then $\operatorname{Im}(\gamma(z))$ attains a maximal value. Now there is a n that $z' = \operatorname{Re}(T^n\gamma(z)) \in [-1/2, 1/2]$. Now I claim that $|z'| \geq 1$, because otherwise

$$\operatorname{Im}(Sz') = \operatorname{Im}(-1/z') = \frac{\operatorname{Im}(z')}{|z'|^2} > \operatorname{Im}(z'),$$

contradiction.

2: Suppose $z, z' \in \overline{F}$ are Γ-conjugate, we can assume $\operatorname{Im}(z) \leq \operatorname{Im}(z')$. Suppose $z' = \gamma(z)$ and $z = x + iy$, then

$$(cx + d)^2 + (cy)^2 \leq 1.$$

Then $|c| < 2$. If $c = 0$, then $d = \pm 1$, and γ is a translation, thus we are in case $1.(a)$. If $c = 1$, then $d = 0$, unless $z = \rho$ or ω. If $d = 0$, then $\gamma = \begin{bmatrix} a & 1 \\ -1 & \end{bmatrix}$, thus $\gamma(z) = a - \frac{1}{z}$. If $a = 0$, then we are in case $1.(b)$, and if $a \neq 0$, then $z = \rho$ or ω. and the $c = -1$ case is similar. □

Def. (20.2.1.11) [Elliptic Points]. A point $z \in \mathscr{H}$ is called a **elliptic point** if it is the fixed point of an elliptic element γ of Γ(12.12.0.3). ⌟

Prop. (20.2.1.12). Let Γ be a discrete subgroup of $\mathrm{SL}(2,\mathbb{R})$ and z an elliptic point of Γ, then the stabilizer Γ_z of z in Γ is a finite cyclic subgroup . ⌟

Proof: Because $\mathrm{SL}(2,\mathbb{R})$ acts transitively on $\mathscr{H}$, by conjugacy we can assume the elliptic point is i for another Γ'. Then the stablizer of i in $\mathrm{SL}(2,\mathbb{R})$ is $\mathrm{SO}(2,\mathbb{R}) \cong S^1$, and $\mathrm{SO}(2,\mathbb{R}) \cap \Gamma'$ is a compact and discrete subgroup, so it is finite cyclic. □

Prop. (20.2.1.13) [Cusps and Elliptic Points for $\Gamma(1)$].

- The cusps of $\Gamma(1)$ are exactly $\mathbb{P}^1(\mathbb{Q})$, and each of them is $\Gamma(1)$-equivalent to ∞.

- The elliptic points of $\Gamma(1)$ are exactly those that are $\Gamma(1)$-conjugate to i or $\rho = e^{\pi\,\mathrm{i}/3}$, with corresponding stablizer group cyclic of order 4 and 6.

⌟

Proof: 1: Clearly ∞ is fixed by the parabolic matrix $T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$. Now for any m/n that m,n is coprime, there exists integers r,s that $rm - sn = 1$. Let $\gamma = \begin{bmatrix} m & s \\ n & r \end{bmatrix}$, then $\gamma(\infty) = m/n$ thus m/n is also a cusp. Conversely, every parabolic matrix is conjugate to T, thus its fixed point is conjugate to ∞, which means the fixed point is in $\mathbb{Q} \cup \{\infty\}$.

2: For the elliptic points of $\Gamma(1)$, use(20.2.1.10). □

Siegel Modular Forms

Def. (20.2.1.14) [Siegel Modular Forms]. Let $\Gamma \subset \mathrm{Mp}(2,\mathbb{R})$ be a subgroup commensurable with $\mathrm{Mp}(2,\mathbb{Z})$, and let $(\rho, V_\rho) \in \mathrm{Rep}^{\mathrm{fd}}(\Gamma)$ that factors through a finite quotient of Γ, and let $k \in \frac{1}{2}\mathbb{Z}$, then a **Siegel modular form** of weight k and type ρ for Γ is a holomorphic function $f \in \mathcal{O}(\mathcal{H}; V_\rho)$ s.t. for $\gamma = (\begin{bmatrix} a & b \\ c & d \end{bmatrix}, \pm\sqrt{c\tau + d}) \in \Gamma$,

$$f(\frac{a\tau + b}{c\tau + d}) = (\pm\sqrt{c\tau + d})^{2k} \rho_M(\gamma) f(\tau).$$

⌟

Def. (20.2.1.15) [Holomorphic Siegel Modular Forms]. ?

The space of holomorphic Siegel modular forms is denoted by $M(\Gamma, k, \rho)$. ⌟

Def. (20.2.1.16) [Siegel Modular Forms(of half Integral Weights)]. commensurable with $\mathrm{Mp}(2,\mathbb{Z})$, and let $(\rho, V_\rho) \in \mathrm{Rep}^{\mathrm{fd}}(\Gamma)$ that factors through a finite quotient of Γ, and let $k \in \frac{1}{2}\mathbb{Z}$, then the space $M_k^!(\Gamma, \rho)$ of (meromorphic)**Siegel modular form** of weight k and type ρ for Γ consists of functions $f \in C^\infty(\mathcal{H}; V_\rho)$ s.t.

- f is meromorphic.
- (weak modularity)For $\gamma = (\begin{bmatrix} a & b \\ c & d \end{bmatrix}, \pm\sqrt{c\tau + d}) \in \Gamma$,

$$f(\frac{a\tau + b}{c\tau + d}) = (\pm\sqrt{c\tau + d})^{2k} \rho_M(\gamma) f(\tau).$$

- f is meromorphic at the cusps(20.1.1.12), i.e. for any $g = f[\gamma]_k$, the coefficients of the expansion

$$g(\tau) = \sum_{n \in \mathbb{Q}} \sum_{\gamma} c_{n,\gamma} q^n e_\gamma$$

vanishes for n small. Equivalently, $f[\gamma]_k$ are all meromorphic at ∞ for $\gamma \in \mathrm{Mp}(\mathbb{Q})$.

And a meromorphic modular form f is called a **holomorphic modular form** iff it is holomorphic and holomorphic at cusps(20.1.1.12). The subspace of holomorphic modular forms in $M^!(\Gamma, \rho)$ is denoted by $M(\Gamma, \rho)$.

A meromorphic modular form of weight 0 is called a **modular function**.

Denote $\mathrm{MF}^!_k(\Gamma,\mathbb{1})=\mathrm{MF}^!_k(\Gamma)$, $\mathrm{MF}_k(\Gamma,\mathbb{1})=\mathrm{MF}_k(\Gamma)$, and moreover we denote by $\mathrm{SF}_k(\Gamma,\chi)$ the set of **holomorphic cusp forms** consisting of all $f\in\mathrm{MF}_k(\Gamma,\rho)$ that vanishes at the cusps(20.1.1.12), and denote $\mathrm{SF}_k(\Gamma,\mathbb{1})=S_k(\Gamma)$.

Denote by $\mathrm{MF}^!(\Gamma)=\oplus_{k\geq 0}\mathrm{MF}^!_k(\Gamma)$ the graded ring of meromorphic modular forms, $\mathrm{MF}(\Gamma)=\oplus_{k\geq 0}\mathrm{MF}_k(\Gamma)$ the graded algebra of holomorphic modular forms for Γ, $\bigoplus_{k\geq 0}\mathrm{SF}_k(\Gamma)$ is a graded ideal of $\mathrm{MF}(\Gamma)$. ⌟

Prop. (20.2.1.17) [Fourier Expansions of Modular Forms]. Let $N\in\mathbb{Z}_+,k\in\mathbb{N}$ and $\Gamma\subset\Gamma(1)$ be a modular form of level N. Then $f\in\Omega(\mathcal{H},\mathbb{C})$ is in $\mathrm{MF}_k(\Gamma)$ iff it is weakly modular, and there exists some $r\in\mathbb{Z}_+$ s.t. f has a Fourier expansion

$$f(\tau)=\sum_{n\in\mathbb{N}}a_n e^{2\pi\mathrm{i}\,n/N},$$

where $a_n=O(n^r)$. ⌟

Proof: Cf.[Diamond, modular forms]P17. □

Thm. (20.2.1.18) [Valence Formula]. Let f be a meromorphic forms for Γ of weight $2k$, then

$$\frac{1}{2}\sum_{Q\text{ elliptic points with period }2}\mathrm{ord}_Q(f)+\frac{1}{3}\sum_{Q\text{ elliptic points with period }3}\mathrm{ord}_Q(f)+\sum_{Q\text{ others}}\mathrm{ord}_Q(f)=kd/6,$$

where the sum is over a set of representatives for points in $\Gamma\backslash\mathcal{H}^*$. ⌟

Proof: Cf.[Milne, P53].**?** □

Def. (20.2.1.19) [Hauptmodul]. Let Γ be a discrete subgroup of $SL(2,\mathbb{R})$ with exactly one cups, $k>0$, a **Hauptmodul** for Γ is an element in $M^!(\Gamma)$ s.t. it is holomorphic on $\mathcal{H}$ and has a simple pole at the cusp with residue 1, i.e. its Fourier series at the cusp is of the form

$$f(\tau)=q^{-1}+a_0+a_1q+\ldots.$$

⌟

Prop. (20.2.1.20) [Petersson Inner Product]. For a congruence subgroup $\Gamma\subset\Gamma(1)$(20.2.1.3) and $k,\in\mathbb{Z}_+$, $f\in M_k(\Gamma,\chi)$ and $g\in S_k(\Gamma,\chi)$, $f\overline{g}y^k$ is invariant under the action of Γ, thus we can define

$$(f,g)_{\mathrm{Pet}}=(f,g)_{\Gamma,k}\overset{\triangle}{=}\frac{1}{[\mathrm{SL}(2,\mathbb{Z}):\{\pm\}\Gamma]}\int_{\Gamma\backslash\mathcal{H}}f\overline{g}y^k\frac{\mathrm{d}x\mathrm{d}y}{y^2},$$

which is finite, and restricts to an inner product on $S_k(\Gamma,\chi)$. Moreover, this inner form is invariant of the Γ chosen. ⌟

Proof: To show it is finite, notice that $\Gamma\backslash\mathcal{H}$ is a finite translations of the fundamental domain of $\Gamma(1)$, and for $\alpha\in SL(2,\mathbb{Z})$,

$$\int_{\alpha(D)}f\overline{g}y^k\frac{\mathrm{d}x\mathrm{d}y}{y^2}=\int_D f\circ\alpha.\overline{g\circ\alpha}y(\alpha(z))^k\frac{\mathrm{d}x\mathrm{d}y}{y^2}=\int_D f[\alpha]_k.\overline{g[\alpha]_k}y^k\frac{\mathrm{d}x\mathrm{d}y}{y^2},$$

and $f[\alpha]_k,g[\alpha]_k$ are modular forms for $\Gamma'=\alpha^{-1}\Gamma\alpha,\chi'(\gamma')=\chi(\alpha\gamma\alpha^{-1})$, thus it suffices to prove the integral is finite on the fundamental domain F for $\Gamma(1)$(20.2.1.10). For this, notice g is of exponential decay for y, thus the integral is bounded by $\int_{y_1}^\infty e^{-cy}y^{k-2}\mathrm{d}y<\infty$. □

Prop. (20.2.1.21). If $\alpha \in \mathrm{GL}(2,\mathbb{R})^+$, $f \in M_k(\Gamma)$ and $g \in S_k(\alpha^{-1}\Gamma\alpha)$, then

$$(f[\alpha]_k, g)_{\alpha^{-1}\Gamma\alpha} = (f, g[\alpha^{-1}]_k)_\Gamma.$$

⌟

Proof: This is because for there is an isomorphism $\alpha : \alpha^{-1}\Gamma\alpha\backslash\mathscr{H} \cong \Gamma\backslash H$, and for any left Γ-invariant function φ,

$$\int_{\alpha^{-1}\Gamma\alpha\backslash H} \varphi(\alpha(\tau))d\mu(\tau) = \int_{\Gamma\backslash H} \varphi(\tau)d\mu(\tau)$$

and $(f\overline{g[\alpha^{-1}]}y^k)(\alpha\tau) = (f[\alpha]_k\overline{g}y^k)(\tau)$. □

Prop. (20.2.1.22) [Lower Bound on Petersson Inner Products]. For any $N \in \mathbb{Z}_+$ and $f = \sum_{n\in\mathbb{Z}_+} a_n q^n \in \mathrm{SF}(\Gamma(N))$,

$$[\Gamma(1) : \Gamma(N)]\cdot||f||_{\mathrm{Pet}} \geq \sum_{n\in\mathbb{Z}_+} \frac{|a_n|^2}{4\pi n e^{4\pi n}}.$$

⌟

Proof: Integrate on the region $\{\tau = x + \mathrm{i}\, y : |x| \leq 1/2, y \geq 1\}$. □

Prop. (20.2.1.23) [Twisted Modular Forms]. For each Dirichlet character $\chi \in \mathrm{Diri}(N)$, we can define a character of $\Gamma_0(N)$:

$$\chi_d(\begin{bmatrix} a & b \\ c & d \end{bmatrix}) = \chi(d).$$

Then we can define $\mathrm{MF}_k(N,\chi) = \mathrm{MF}_k(\Gamma_0(N),\chi)$(20.2.1.16) and $\mathrm{SF}_k(N,\chi) = \mathrm{SF}_k(\Gamma_1(N)) \cap \mathrm{MF}_k(N,\chi)$. Then there are direct sum decompositions:

$$\mathrm{MF}_k(\Gamma_1(N)) = \bigoplus_{\chi\in\mathrm{Diri}(N),\chi(-1)=(-1)^k} \mathrm{MF}_k(N,\chi), \quad \mathrm{SF}_k(\Gamma_1(N)) = \bigoplus_{\chi\in\mathrm{Diri}(N),\chi(-1)=(-1)^k} \mathrm{SF}_k(N,\chi).$$

Moreover, the summands are orthogonal w.r.t. the Petersson inner product(20.2.1.20). ⌟

Proof: Cf.[Diamond, P418]. □

Cor. (20.2.1.24) [Reduction to $\Gamma_0(N)$]. For any congruence subgroup $\Gamma(N)$, there exists $\alpha \in \mathrm{GL}(2,\mathbb{Q})^+$ s.t. $\begin{bmatrix} 1 & \\ & N \end{bmatrix} \Gamma_1(N) \begin{bmatrix} 1 & \\ & 1/N \end{bmatrix} \subset \Gamma(N)$. Thus if $f \in \mathrm{MF}_k(\Gamma(N))$, $f[\mathrm{diag}(1,N)]_k \subset \mathrm{MF}_k(\Gamma_1(N))$, which is a combination of modular forms in $\mathrm{MF}_k(\Gamma_0(N),\chi)$. Thus the study of congruence modular forms reduces to the study of $\mathrm{MF}_k(N,\chi)$. ⌟

Moduli Characterization

Prop. (20.2.1.25) [Elliptic Curves and Modular Curves]. Modular curves $Y_0(N), Y_1(N), Y(N)$ parametrizes elliptic curves over $\mathbb{C}$ with additional structures. ⌟

Proof: □

Cusp Forms

Def. (20.2.1.26) [Poincaré Series]. For any Fuchsian subgroup $\Gamma \subset \Gamma(1)$, $T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$. Let h be the minimal positive integer that $T^h \subset \Gamma$, and define Γ_0 the subgroup of Γ generated by T^h. Then we define the **Poincaré series of weight** $2k$ **and character** n **for** Γ to be the series

$$\varphi_{k,n}(z) = \sum_{\Gamma_\infty \backslash \Gamma'} \frac{e^{\frac{2\pi \mathrm{i}\, n\gamma(z)}{h}}}{(cz+d)^{2k}},$$

where Γ' is the image of Γ in $\Gamma(1)/\{\pm 1\}$. ⌟

Prop. (20.2.1.27). For $k \in \mathbb{Z}_+, n \in \mathbb{N}$, The Poincaré series(20.2.1.26) $\varphi_{2k,n}$ converge absolutely on compact subsets of $\mathscr{H}$, and $\varphi_{2k,n} \in \mathrm{MF}_{2k}(\Gamma)$. Moreover,

- $\varphi_{2k,0}(\tau)$ vanishes at all finite cusps, and $\varphi_{2k,0}(\mathrm{i}\,\infty) = 1$.
- For $n \geq 1$, $\varphi_{2k,n}(\tau) \in \mathrm{SF}_k(\Gamma)$.

⌟

Proof: Cf.[Gunning, Lectures on Modular Forms]3.9.**?** □

Prop. (20.2.1.28) [Cusp Forms are Spanned by Poincaré Series]. For any Fuchsian subgroup $\Gamma \subset \Gamma(1)$ and $k \in \mathbb{Z}_+, n \in \mathbb{N}$, if $f = \sum_{n \in \mathbb{Z}_+} a_n e^{2\pi \mathrm{i}\, nz/h} \in \mathrm{SF}_k(\Gamma)$, then

$$\langle f, \varphi_{2k,n} \rangle_{\mathrm{Pet}} = \frac{h^{2k}(2k-2)!}{(4\pi)^{2k-1}} n^{1-2k} a_n.$$

Thus the Poincaré series $\{\varphi_{2k,n}(z)\}_{n \in \mathbb{Z}_+}$ span $S_{2k}(\Gamma)$. ⌟

Proof: Cf.[Gunning, Lectures on Modular Forms]3.11.Thm5.**?** □

Modular Forms of Half Integral Weights

References are [Modular Forms of Half Integral Weight, Shimura].

Prop. (20.2.1.29) [Theta Functions]. It follows from(20.4.1.6) that

$$\theta(\frac{\tau}{4\tau+1}) = \theta(-\frac{1}{4(-1/(4\tau)-1)}) = \sqrt{2\,\mathrm{i}(\frac{1}{4\tau}+1)} = \theta(-\frac{1}{4\tau}-1) = \sqrt{4\tau+1}\theta(\tau).$$

Thus by(20.2.1.5), $\theta^2 \in \mathrm{MF}_1(\Gamma_0(4), \chi_{-4})$. ⌟

Prop. (20.2.1.30) [Dedekind η-Function]. The Dedekind η-function(9.5.2.6)

$$\eta(\tau) = e^{2\pi \mathrm{i}\,\tau/24} \prod_{n \in \mathbb{Z}_+} (1 - e^{2\pi \mathrm{i}\, n\tau})$$

belongs to $\mathrm{MF}_{1/2}(\Gamma(1), \chi)$. ⌟

Proof: To show this, it suffices to show

$$\eta(\gamma(z)) = \varepsilon(\gamma)(cz+d)^{1/2}\eta(z)$$

for every $\gamma \in \Gamma(1)$, where $\varepsilon(\gamma)$ is a 24-th root of unity. Because $[\gamma]_k$ is an action(20.2.1.16), by5, it suffices to show for $S = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}$ and $T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$. The case for T is clear from the last expression of $\eta(z)$. For S, it suffices to show that

$$\eta(-1/\tau) = \sqrt{\tau/\mathrm{i}}.\eta(\tau).$$

This is true when $\tau = \mathrm{i}$. So it suffices to show its logarithm derivative:

$$\frac{\eta'(-1/z)}{\eta(-1/z)}z^{-2} = \frac{1}{2z} + \frac{\eta'(z)}{\eta(z)}.$$

And notice

$$\frac{\eta'(z)}{\eta(z)} = \frac{2\pi\,\mathrm{i}}{24}(1 - 24\sum_{n\in\mathbb{Z}_+}\frac{ne^{2\pi\,\mathrm{i}\,nz}}{1-e^{2\pi\,\mathrm{i}\,nz}}) = \frac{2\pi\,\mathrm{i}}{24}(1 - 24\sum_{n\in\mathbb{Z}_+}\sigma(n)e^{2\pi\,\mathrm{i}\,nz}) = \frac{2\pi\,\mathrm{i}}{24}E_2(z).$$

So the assertion follows from(20.2.4.14). □

Thm. (20.2.1.31) [Serre-Stark]. Every modular forms of weight 1/2(for any level) is a linear combination of unary theta functions. ⌟

2 Hecke Algebras

Def. (20.2.2.1) [$G(N)$]. Define $G(N) = \cup_{\alpha\in GL(2,\mathbb{Q})^+}\Gamma_0(N)\alpha\Gamma_0(N)$. ⌟

Def. (20.2.2.2) [Hecke Algebra]. Notation as in(20.2.1.6), if $\alpha \in \Gamma_0(N)\backslash G(N)/\Gamma_0(N)$, then $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is finite, and if $N=1$, there is a set of representatives $\{\alpha_1,\ldots,\alpha_h\}$ s.t.

$$\Gamma(1)\alpha\Gamma(1) = \coprod_i \Gamma(1)\alpha_i = \coprod_i \alpha_i\Gamma(1) = \Gamma(1)\alpha_i^t.$$

Let $\mathcal{R}'_N$ be the free Abelian group generated by $\Gamma_0(N)\backslash G(N)$ s.t. if $\Gamma_0(N)\alpha\Gamma_0(N) = \sum_i \Gamma_0(N)\alpha_i$, then $[\alpha][\beta] = \sum_i[\alpha_i\beta]$.

Define the **Hecke algebra** $\mathcal{R}_N$ of $\Gamma_0(N)$ to be the subalgebra of $\mathcal{R}'_N$ consisting by right $\Gamma_0(N)$-invariant elements. Then $\mathcal{R}_N$ is isomorphic to the free Abelian group generated by the double coset $\Gamma_0(N)\backslash G(N)/\Gamma_0(N)$, and is commutative. ⌟

Remark (20.2.2.3). Compare this definition with that of(18.1.5.12). ⌟

Proof:

$$\begin{aligned}\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N) &\cong \Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)\alpha^{-1} \\ &\cong \Gamma_0(N)\cap\alpha\Gamma_0(N)\alpha^{-1}\backslash\alpha\Gamma_0(N)\alpha^{-1} \\ &\cong \alpha^{-1}\Gamma_0(N)\alpha\cap\Gamma_0(N)\backslash\Gamma_0(N)\end{aligned}$$

which is finite by(20.2.1.7).

By decomposition(20.2.1.6), the transposition on $G(N)$ is an involution that identifies every double coset $\Gamma(1)\alpha\Gamma(1)$, thus $\sum_i \Gamma(1)\alpha_i = \sum_i \alpha_i^t\Gamma(1)$, and also $\Gamma(1)\alpha_i \cap \alpha_i^t\Gamma(1) \neq \varnothing$, as $\Gamma(1)\alpha_i\Gamma(1) = \Gamma(1)\alpha_i^t\Gamma(1)$, thus we can replace α_i by some element in $\Gamma(1)\alpha_i \cap \alpha_i^t\Gamma(1)$.

To show $\mathcal{R}_N$ is commutative, for any $\sigma \in \Gamma(1)\backslash GL(2,\mathbb{Q})^+/\Gamma(1)$, denote $\deg(\sigma)$ to be the cardinality of $\Gamma(1)\backslash\Gamma(1)\sigma\Gamma(1)$, $\sigma[i], i \leq \deg(\sigma)$ be a set of representatives, and let $m(\alpha,\beta,\sigma[i])$ be the cardinality of $\{(i,j)|\Gamma(1)\alpha_i\beta_j = \Gamma(1)\sigma[i]\}$, then $m(\alpha,\beta,\sigma[i])$ is independent of i as right action by $\Gamma(1)$ permutes $\{(i,j)\}$. Also we see $m(\alpha,\beta,\sigma[i])$ equals $1/\deg(\sigma)$ times the number of pairs $\{(i,j)|[\sigma] = [\alpha_i\beta_j]\}$, because $[\sigma] = [\alpha_i\beta_j]$ iff $\alpha_i\beta_j \in \Gamma(1)\sigma[i]$ for some i.

Then

$$m(\alpha,\beta,\sigma[i]) = \frac{1}{\deg(\sigma)}\#\{(i,j)|[\sigma] = [\alpha_i\beta_j]\} = \frac{1}{\deg(\sigma)}\#\{(i,j)|[\sigma^t] = [\beta_j^t\alpha_i^t]\} = m(\beta,\alpha,\sigma^t[i]).$$

But as $\sigma^t[i]$ is a permutation of $\sigma[i]$, we see $\mathcal{R}$ is commutative. □

Hecke Operators

Prop. (20.2.2.4). If Γ_1,Γ_2 are congruence subgroups of X, then for any $\alpha \in GL^+(2,\mathbb{Q})$, the double coset

$$\Gamma_1\alpha\Gamma_2 = \coprod_i \Gamma_1\beta_i$$

for some $\beta_i \in \mathrm{GL}^+(2,\mathbb{Q})$. Then we can define a map

$$\mathrm{Div}(X(\Gamma_1)) \to \mathrm{Div}(X(\Gamma_2)) : [\tau] \mapsto [\beta_i\tau],$$

which induces a morphism $\mathrm{Jac}(\Gamma_1) \to \mathrm{Jac}(\Gamma_2)$**?**. ⌟

Prop. (20.2.2.5) [Action on Modular Forms]. Let Γ_1,Γ_2 be congruence subgroups of $GL^+(2,\mathbb{R})$, then ⌟

Prop. (20.2.2.6) [Hecke Operators]. The Hecke algebra $\Gamma\backslash GL^+(2,\mathbb{R})/\Gamma$ acts on $M_k(\Gamma)$ via

$$T_\alpha(f) = \sum_i f[\alpha_i]_k \text{(20.1.1.8)}, \quad \text{if } \Gamma\alpha\Gamma = \coprod_i \Gamma\alpha_i.$$

and preserves $S_k(\Gamma)$. ⌟

Proof: This is an action because if $\Gamma_0(N)\alpha\Gamma_0(N) = \coprod_i \Gamma_0(N)\alpha_i, \Gamma_0(N)\beta\Gamma_0(N) = \coprod_j \Gamma_0(N)\beta_j$, then $[\alpha][\beta] = \coprod_{i,j}\Gamma_0(N)\alpha_i\beta_j$.

Also $T_\alpha(f)[\gamma]_k = T_\alpha(f)$ for $\gamma \in \Gamma_0(N)$ because $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is right $\Gamma_0(N)$-invariant. And they are holomorphic at cusps because f is holomorphic at cusps thus all $f[\alpha_i]_k$ are holomorphic at cusps. Moreover, if f vanishes at cusps, then all $f[\alpha_i]_k$ vanishes at cusps. □

$\Gamma_0(N), \Gamma_1(N)$ Cases

Prop. (20.2.2.7) [Self-Adjointness]. The action of $\mathcal{R}_N$ on $S_k(\Gamma(N))$ is self-adjoint w.r.t to the Petersson inner product(20.2.1.20). ⌟

Proof: First notice $(\chi_d(\alpha)^{-1}f[\alpha]_k, g) = (f, \chi_d(\alpha)g[\alpha^{-1}]_k)$ for any $\alpha \in G_0(N)$ by(20.2.1.21), and $f, g \in M_k(N,\chi)$, thus $(\chi_d(\alpha)^{-1}f[\alpha]_k, g)$ only depends on the double coset $\Gamma_0(N)\alpha\Gamma_0(N)$. Thus

$$(T_\alpha f, g) = \sum_i (\chi_d(\alpha_i)^{-1}f[\alpha_i]_k, g) = \deg(\alpha)(\chi_d(\alpha)^{-1}f[\alpha]_k, g) = \deg(\alpha)(f, \chi_d(\alpha)g[\alpha^{-1}]_k)$$

However, $\det(\alpha)\alpha^{-1}$ has the same Smith normal form as α, thus it is in the same double coset as α, thus

$$\deg(\alpha)(f, \chi_d(\alpha)g[\alpha^{-1}]_k) = \deg(\alpha)(f, \chi_d(\alpha)^{-1}g[\alpha]_k) = (f, T_\alpha g).$$

□

Cor. (20.2.2.8) [Hecke Eigenforms]. The Hecke algebra is commutative and acts as self-adjoint operators on $S_k(N,\chi)$, thus there is a basis consisting of eigenfunctions for each T_α, called the **Hecke eigenforms**. ⌟

Prop. (20.2.2.9) [$T(n)$]**.** Let $T(n)$ be the sum of operators $T_{\mathrm{diag}(d_1,d_2)}$ where $d_1, d_2 \in \mathbb{N}, d_2|d_1$ and $d_1 d_2 = n$.

Equivalently by Cartan decomposition, if Δ_n is the subset of $GL(2,\mathbb{Z}) \cap G_0(N)$ consisting of matrices of determinant n, then

$$\Delta_n = \coprod_{a,d>0, ad=n, b\in\mathbb{Z}/N} \Gamma_0(N)\begin{bmatrix} a & b \\ & d \end{bmatrix}$$

and

$$T(n)f = \sum_{a,d>0, ad=n, b\in\mathbb{Z}/N} \chi(d)^{-1} f[\begin{bmatrix} a & b \\ & d \end{bmatrix}]_k.$$

⌟

Proof: By column reduction, we can make any matrix in Δ_n the form as above, and if two elements of the form $\begin{bmatrix} a & b \\ & d \end{bmatrix}$ differ by an element of $\Gamma_0(N)$, they differ by an upper-triangular matrix in $\Gamma_0(N)$, thus a, d are determined, and also $b \mod d$. □

Cor. (20.2.2.10).

- $T(1) = \mathrm{id}$.
- If $(m,n) = 1$, then $T(m) \cdot T(n) = T(mn)$.
- If p is a prime that $(p,N) = 1$ and $n \geq 1$, then $T(p^n) \cdot T(p) = T(p^{n+1}) + pR(p) \cdot T(p^{n-1})$, where $R(p)$ is the coset $\Gamma_0(N)\begin{bmatrix} p & \\ & p \end{bmatrix}$.
- $\mathcal{R}_N$ is generated by $T(p), R(p), R(p)^{-1}$.

⌟

Proof: 1: Trivial.

2: This follows from Chinese remainder theorem.

3: Omitted. □

Prop. (20.2.2.11) [Explicit Hecke Operators]. Let $f = \sum A(m)q^m \in S_k(N,\chi)$, then for $(n,N)=1$, $T(n)f$ has a Fourier expansion

$$T(n)f = \sum B(m)q^m,$$

where

$$B(m) = \sum_{ad=n, a|m} (\frac{a}{d})^{k/2}\chi(d)^{-1} dA(\frac{md}{a}).$$

⌟

Proof:

$$\begin{aligned}(T(n)f)(z) &= \sum_{ad=n} \sum_{b \mod d} (\frac{a}{d})^{k/2}\chi(d)^{-1} f(\frac{az+b}{d}) \\ &= \sum_{ad=n} \sum_{b \mod d} (\frac{a}{d})^{k/2} \sum_{m=1}^{\infty} A(m)\exp(2\pi i \frac{amz}{d})\exp(2\pi i\frac{mb}{d}) \\ &= \sum_{m=1}^{\infty} \sum_{ad=n, d|m} (\frac{a}{d})^{k/2}\chi(d)^{-1} dA(m)\exp(2\pi i\frac{amz}{d})\end{aligned}$$

Thus $B(m) = \sum_{ad=n,a|m} (\frac{a}{d})^{k/2}\chi(d)^{-1} dA(\frac{md}{a})$. □

Prop. (20.2.2.12) [Normalized Hecke Eigenforms]. If $f = \sum c_n q^n \neq 0 \in M_k(N,\chi)$ that satisfies

$$T(n)f = n^{1-k/2}\chi(n)^{-1}\lambda(n)f$$

for all $(n,N)=1$ and $\lambda(n) \in \mathbb{C}$, then $c_1 \neq 0$, and if f is normalized that $c_1 = 1$, then $c_n = \lambda(n)$ for all such n. In particular, c_n are all real, because $T(n)$ is Hermitian(20.2.2.7). ⌟

Proof: By(20.2.2.11),

$$n^{1-k/2}\lambda(n)A(m) = \sum_{ad=n,a|m} (\frac{a}{d})^{k/2}\chi(d)^{-1} dA(\frac{md}{a}),$$

thus for $(m,n)=1$, $\lambda(n)A(m) = A(mn)$, and $\lambda(n) = A(n)$. □

New Forms

Def. (20.2.2.13) [Old and New Forms]. Let $\alpha_d = \mathrm{diag}(d,1)$, and let $S_k(\Gamma_1(N))[d]$ be the subspace of $S_k(\Gamma_1(N))$ consisting of elements of the form $f + g[\alpha_d]_k$, $f, g \in S_k(\Gamma_1(N/d))$, and let

$$S_k(\Gamma_1(N))_{\text{old}} = \sum_{p\in\mathbf{P}, p|N} S_k(\Gamma_1(N))[p],$$

called the space of **old forms of level** N. Also the space

$$S_k(\Gamma_1(N))_{\text{new}} = S_k(\Gamma_1(N))^{\perp}_{\text{old}},$$

called the space of **new forms of level** N. ⌟

Remark (20.2.2.14). Omitting the $p \in$ `Prime` condition in the definition of oldforms doesn't change the space. ⌟

Remark (20.2.2.15). The dimension of newforms and oldforms are calculated by [Dimensions of the Spaces of Cusp Forms and Newforms on $\Gamma_0(N)$ and $\Gamma_1(N)$]. ⌟

Prop. (20.2.2.16). $S_k(\Gamma_1(N))_{\text{old}}$ and $S_k(\Gamma_1(N))_{\text{new}}$ are both stable under action of $\mathcal{R}_N$. In particular, they have a orthogonal basis of Hecke eigenforms for the Hecke operators, by(20.2.2.7)(20.2.2.8). ⌟

Proof: By(20.2.2.10), for $R(n)$, $R(n)(f+g[\alpha_p]) = R(n)f + (R(n)g)[\alpha_p]$, for $T(\ell)$, $\ell \neq p$, $T(\ell)(f+g[\alpha_p]) = T(\ell)f + (T(\ell)g)[\alpha_p]$ because d is prime to ℓ. □

Prop. (20.2.2.17) [Strong Multiplicity One]. If $f \in S_k(\Gamma_0(N),\chi)_{\text{new}}, f' \in S_k(\Gamma_0(N'),\chi)_{\text{new}}$ are normalized new eigenforms having the same eigenvalues for a.e. T_p, then $N = N'$ and $f = f'$. ⌟

Proof: Cf.[On some results of Artin and Lehner, Casselman].**?** □

3 Dimension Formulae

Def. (20.2.3.1) [Notations]. In this subsection,

- Γ is a **congruence subgroup of** $\mathrm{SL}(2,\mathbb{Z})$.
- g is the genus of $X(\Gamma)$.
- d is the degree of the map $X(\Gamma) \to X(1)$ which is equal to $[SL(2,\mathbb{Z}) : \{\pm 1\}\Gamma]$.
- ε_2 is the number of elliptic points with period 2.
- ε_3 is the number of elliptic points with period 3.
- ε_∞ is the number of cusps.
- $\varepsilon_\infty^{\text{reg}}$ is the number of regular cusps(20.1.1.2).
- ε_∞^{irr} is the number of irregular cusps.

⌟

Prop. (20.2.3.2) [Genus Formula].

$$g = 1 + \frac{d}{12} - \frac{\varepsilon_2}{4} - \frac{\varepsilon_3}{3} - \frac{\varepsilon_\infty}{2}.$$

⌟

Proof: Cf. [Diamond, P68].**?** □

Thm. (20.2.3.3) [Dimension Formulae for k Even]. For $k \in 2\mathbb{Z}$,

$$\dim(\mathrm{MF}_k(\Gamma)) = \begin{cases} \frac{(k-1)d}{12} + (\frac{1}{4} - \{\frac{k}{4}\})\varepsilon_2 + (\frac{1}{3} - \{\frac{k}{3}\})\varepsilon_3 + \frac{1}{2}\varepsilon_\infty & k \geq 2 \\ 1 & k = 0 \\ 0 & k < 0 \end{cases}$$

and

$$\dim(\mathrm{SF}_k(\Gamma)) = \begin{cases} \frac{(k-1)d}{12} + (\frac{1}{4} - \{\frac{k}{4}\})\varepsilon_2 + (\frac{1}{3} - \{\frac{k}{3}\})\varepsilon_3 - \frac{1}{2}\varepsilon_\infty & k \geq 4 \\ g & k = 2 \\ 0 & k \leq 0 \end{cases}$$

⌟

Proof: Cf.[Diamond P87]. □

Cor. (20.2.3.4). For any Fuchsian group $\Gamma \subset \mathrm{SL}(2,\mathbb{R})$ and $k \in \mathbb{Z}$,

$$\dim \mathrm{MF}_k(\Gamma) \leq \frac{\mathrm{Vol}(\mathrm{SL}(2;\mathbb{R})/\Gamma)}{4\pi} \cdot k + 1.$$

In particular, $\mathrm{MF}_0(\Gamma) = 0$. ⌟

Proof: Cf.[Modular Forms, 1-2-3]P12. □

Cor. (20.2.3.5). For any Fuchsian subgroup $\Gamma \subset \mathrm{SL}(2;\mathbb{R})$, any three $f, g, h \in \mathrm{MF}_*(\Gamma)$ are note alg.independent. ⌟

Proof: Otherwise for n large, $\dim \mathrm{MF}_n(\Gamma) = \Omega(n^2)$. □

Prop. (20.2.3.6) [Dimension Formulae for k Odd]. For k odd,

- if $k < 0$ or $-\mathbf{1} \in \Gamma$, then $\mathrm{MF}_k(\Gamma) = \mathrm{SF}_k(\Gamma) = 0$.
- If $k \geq 3$, $-\mathbf{1} \notin \Gamma$, then

$$\dim(\mathrm{MF}_k(\Gamma)) = (k-1)(g-1) + \lfloor \frac{k}{3} \rfloor \varepsilon_3 + \frac{k}{2}\varepsilon_\infty^{\mathrm{reg}} + \frac{k-1}{2}\varepsilon_\infty^{irr}$$

$$\dim(\mathrm{SF}_k(\Gamma)) = (k-1)(g-1) + \lfloor \frac{k}{3} \rfloor \varepsilon_3 + (\frac{k}{2} - 1)\varepsilon_\infty^{\mathrm{reg}} + \frac{k-1}{2}\varepsilon_\infty^{irr}$$

- If $k = 1$, $-\mathbf{1} \notin \Gamma$, then

$$\dim(\mathrm{MF}_1(\Gamma)) \begin{cases} = \varepsilon_\infty^{\mathrm{reg}}/2 & \varepsilon_\infty^{\mathrm{reg}} > 2g-2 \\ \geq \varepsilon_\infty^{\mathrm{reg}}/2 & \varepsilon_\infty^{\mathrm{reg}} \leq 2g-2 \end{cases}, \quad \dim(\mathrm{SF}_1(\Gamma)) = \dim(\mathrm{MF}_1(\Gamma)) - \varepsilon_\infty^{\mathrm{reg}}/2.$$

⌟

Proof: Cf.[Diamond P91]. □

Explicite Dimension Formulae for $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$

Lemma (20.2.3.7). For $N \in \mathbb{Z}_{\geq 2}$,

$$\mathrm{SL}(2,\mathbb{Z}) \to \mathrm{SL}(2,\mathbb{Z}/(N))$$

is surjective. ⌟

Proof: Cf.[**?**]P101. □

Prop. (20.2.3.8) [Degrees for $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$].

- The degree of the mapping $X(N) \to X(1)$ is

$$d = d_N = [\mathrm{SL}(2,\mathbb{Z}) : \{\pm 1\}\Gamma(N)] = \begin{cases} 1/2N^3 \prod_{p|N}(1 - 1/p^2) & N > 2 \\ 6 & N = 2 \end{cases}$$

- There is a coset decomposition $\Gamma_1(N) = \coprod_{j=1}^N \Gamma(N) \begin{bmatrix} 1 & j \\ & 1 \end{bmatrix}$, in particular, $d = [\mathrm{SL}(2,\mathbb{Z}) : \{\pm 1\}\Gamma_1(N)] = d_N/N, N \geq 2$.

- There is a coset decomposition $\Gamma_0(N) = \coprod_{y \mod N,(y,N)=1} \Gamma_1(N) \begin{bmatrix} x & k \\ N & y \end{bmatrix}$, where x, k are chosen that $xy - kN = 1$. In particular, $d = [\mathrm{SL}(2,\mathbb{Z}) : \Gamma_0(N)] = 2d_N/N\varphi(N), N \geq 2$.

⌟

Proof: 1: By(20.2.3.7), the map $SL(2,\mathbb{Z}) \to SL(2,\mathbb{Z}/N\mathbb{Z})$ is surjective, so $[\Gamma(N) : \Gamma(1)] = \#SL(2,\mathbb{Z}/N\mathbb{Z})$. Let $N = \prod p_i^{n_i}$, then $SL(2,\mathbb{Z}/N\mathbb{Z}) \cong \prod_i SL(2,\mathbb{Z}/p_i^{n_i}\mathbb{Z})$, and calculating depending on e_{11} is invertible or e_{12} is invertible, $\#SL(2,\mathbb{Z}/p_i^{n_i}\mathbb{Z}) = 2(p^{n_i} - p^{n_i-1})p^{2n_i} - (p^{n_i} - p^{n_i-1})^2 p^{n_i} = p_i^{3n_i} - p_i^{3n_i-2}$. Thus $\#\,\mathrm{SL}(2,\mathbb{Z}/(N)) = N^3 \prod_{p|N}(1-p^{-2})$, and we get the desired formula. □

Prop. (20.2.3.9) [Elliptic Points for $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$]. For $N \in \mathbb{Z}_+$,

- There are on elliptic points for $\Gamma(N)$ for $N \geq 2$.
- There are on elliptic points for $\Gamma_1(N)$ for $N \geq 4$.
- The elliptic points of period 2 for $\Gamma_0(N)$ corresponds to the ideals $J \subset \mathrm{Ideal}(\mathbb{Z}[i])$ s.t. $\mathbb{Z}[i]/J \cong \mathbb{Z}/(N)$, and the elliptic points of period 3 for $\Gamma_0(N)$ corresponds to the ideals $J \subset \mathrm{Ideal}(\mathbb{Z}[\omega])$ s.t. $\mathbb{Z}[\omega]/J \cong \mathbb{Z}/(N)$.

⌟

Proof: Cf.[Diamond]P56, 95.**?** □

Lemma (20.2.3.10). Let $s = a/c, s' = a'/c' \in \mathbb{P}^1(\mathbb{Q})$ with $(a,c) = (a',c') = 1$, then for any $\gamma \in SL(2,\mathbb{Z})$,

$$s' = \gamma(s) \iff \begin{bmatrix} a' \\ c' \end{bmatrix} = \pm\gamma \begin{bmatrix} a \\ c \end{bmatrix}.$$

⌟

Proof: □

Lemma (20.2.3.11). Let $s = a/c, s' = a'/c' \in \mathbb{P}^1(\mathbb{Q})$ with $(a,c) = (a',c') = 1$, then

- $\Gamma(N)s' = \Gamma(N)s \iff \begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} a \\ c \end{bmatrix} \mod N$
- $\Gamma_1(N)s' = \Gamma_1(N)s \iff \begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} a + jc \\ c \end{bmatrix} \mod N$, for some j.
- $\Gamma_0(N)s' = \Gamma_0(N)s \iff \begin{bmatrix} ya' \\ c' \end{bmatrix} \equiv \begin{bmatrix} a + jc \\ c \end{bmatrix} \mod N$, for some y relatively prime to N and some j.

⌟

Proof: Use(20.2.3.10).

1: One direction is clear, for the other, If $\begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} a \\ c \end{bmatrix} \mod N$, take b, d that $ac - bd = 1$, then $\gamma = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ maps $\begin{bmatrix} 1 \\ 0 \end{bmatrix}$ to $\begin{bmatrix} a \\ c \end{bmatrix}$. As $\Gamma(N)$ is normal in $\Gamma(1)$, it suffices to prove for $\begin{bmatrix} a \\ c \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$. Then $a' \equiv 1 \mod N$, take integers β, δ that $a'\delta - c'\beta = (1-\alpha')/N$, let $\gamma = \begin{bmatrix} a' & \beta N \\ c' & \delta N \end{bmatrix}$, then $\gamma \in \Gamma(N)$ and $\begin{bmatrix} a' \\ c' \end{bmatrix} = \gamma \begin{bmatrix} 1 \\ 0 \end{bmatrix}$.

2 follows from 1 and the coset decomposition $\Gamma_1(N) = \coprod_{j=1}^{N} \Gamma(N)\begin{bmatrix}1 & j\\ & 1\end{bmatrix}$.

3: There is a coset decomposition $\Gamma_0(N) = \coprod_{y \mod N,(y,N)=1} \Gamma_1(N)\begin{bmatrix}x & k\\ N & y\end{bmatrix}$, where x, k are chosen that $xy - kN = 1$. Then

$$\Gamma_0(N)s' = \Gamma_0(N)s \iff \begin{bmatrix}a'\\ c'\end{bmatrix} \equiv \pm\begin{bmatrix}xa+kc+jcy\\ cy\end{bmatrix} \mod N, \exists j, (y,N)=1$$
$$\iff \begin{bmatrix}ya'\\ c'\end{bmatrix} \equiv \begin{bmatrix}a+jc\\ cy\end{bmatrix} \mod N, \exists j, (y,N)=1$$

□

Prop. (20.2.3.12) [Cusps for $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$]. For $N \in \mathbb{Z}_+$,

- $\varepsilon_\infty(\Gamma_0(N)) = \sum_{d|N} \varphi((d, N/d))$.
-

⌟

Proof: 1: By(20.2.3.11), if $\Gamma_0(N)s' = \Gamma_0(N)s$, then $\begin{bmatrix}ya'\\ c'\end{bmatrix} \equiv \begin{bmatrix}a+jc\\ c\end{bmatrix} \mod N$, which means first $(c, N) = (c', N)$. So we consider the equivalence classes with $(c, N) = d$. In this case any equivalence class has a representative that $c = d$. Consider the equivalence relations between them, then $\begin{bmatrix}a'\\ d\end{bmatrix}$ represents the same cusp as $\begin{bmatrix}a\\ d\end{bmatrix}$ iff $(y_0 + iN/d)a' \equiv a + jd \mod N$ for some i, j, which is equivalent to $a' \equiv y_0 a \mod (c, N, a'N/d) = (d, N/d)$. So there are $\sum_{d|N} \varphi((d, N/d))$ many equivalence classes(cusps). □

Prop. (20.2.3.13) [Regular Cusps]. All the cusps of $\Gamma_0(N)$ and $\Gamma(N)$ are regular. The only irregular cusp of $\Gamma_1(N)$ are $s = 1/2$ for $N = 4$. ⌟

Proof: Cf.[?]P103. □

Thm. (20.2.3.14) [Lists of Statistics for $\Gamma_0(N), \Gamma_1(N), \Gamma(N)$]. For $N \in \mathbb{Z}_+$,

Γ	d	ε_2	ε_3	ε_∞
$\Gamma_0(N), N > 2$	$\frac{2d_N}{N\varphi(N)}$	$\begin{cases}\prod_{p|N}(1+(\frac{-1}{p})) & 4 \nmid N\\ 0 & 4|N\end{cases}$	$\begin{cases}\prod_{p|N}(1+(\frac{-3}{p})) & 9 \nmid N\\ 0 & 9|N\end{cases}$	$\sum_{d|N} \varphi((d, N/d))$
$\Gamma_1(2)(= \Gamma_0(2))$	3	1	0	2
$\Gamma_1(3)$	4	0	1	2
$\Gamma_1(4)$	6	0	0	3
$\Gamma_1(N), N > 4$	d_N/N	0	0	$\frac{1}{2}\sum_{d|N} \varphi(N)\varphi(N/d)$
$\Gamma(1)(= \Gamma_1(1))$	1	1	1	1
$\Gamma(N), N > 1$	d_N	0	0	d_N/N

where

$$d_N = \begin{cases}1/2\prod_{p|N} N^3(1-1/p^2) & N > 2\\ 6 & N = 2\end{cases}.$$

⌟

Proof: Cf.[Diamond P107].

The numbers $\varepsilon_2(\Gamma_0(N))$ and $\varepsilon_3(\Gamma_0(N))$ follow from(20.2.3.9) and the informations on $\mathbb{Z}[i]$ and $\mathbb{Z}[\omega]$(14.4.1.46). □

Example (20.2.3.15) [Statistics for $X_0(p)$]. For $p \in \mathtt{Prime}$,

- $\Gamma(1) = \coprod_j \Gamma_0(p)\alpha_j$, where $\alpha_j = \begin{bmatrix} 1 & \\ j & 1 \end{bmatrix}$ when $j \in \{0, \ldots, p-1\}$ and $\alpha_\infty = \begin{bmatrix} 1 & -1 \\ 1 & 0 \end{bmatrix}$.
- $\varepsilon_\infty = 2$.
- $\varepsilon_2(\Gamma_0(p)) = 1 + \left(\frac{-1}{p}\right)$.
- $\varepsilon_3(\Gamma_0(p)) = 1 + \left(\frac{-3}{p}\right)$.
- $d = p + 1$.
- $g = \begin{cases} \lfloor \frac{p+1}{12} \rfloor - 1 & , p \equiv 1 (\mathrm{mod}\ 12) \\ \lfloor \frac{p+1}{12} \rfloor & , \text{otherwise} \end{cases}$.

⌟

Proof: Only the first one need a proof:? □

Cor. (20.2.3.16) [List of Dimension Formulae for $\Gamma_0(N), \Gamma_1(N), \Gamma(N)$]. For $N \in \mathbb{Z}_+$,

Γ	$g(X(\Gamma))$	$\dim(M_k(\Gamma))$& $\dim(S_k(\Gamma))$, $2\vert k, k \geq 2$	$\dim(M_k(\Gamma))$& $\dim(S_k(\Gamma))$, $2\vert k+1, k \geq 3$
$\Gamma_0(N), N > 2$	long expression, cf.(20.2.3.2)	expression too long	expression too long
$\Gamma_1(2)(\Gamma_0(2))$	0	$\lfloor \frac{k}{4} \rfloor \pm 1$	0
$\Gamma_1(3)$	0	$\lfloor \frac{k}{3} \rfloor \pm 1$	$\lfloor \frac{k}{3} \rfloor \pm 1$
$\Gamma_1(4)$	0	$\frac{k-1\pm 3}{2}$	$\frac{k-1\pm 2}{2}$
$\Gamma_1(N), N > 4$	$1 + \frac{d_N}{12N} - \frac{1}{4}\sum_{d\vert N} \varphi(d)\varphi(N/d)$	$\frac{(k-1)d_N}{12N} \pm \frac{1}{4}\sum_{d\vert N} \varphi(d)\varphi(N/d)$	$\frac{(k-1)d_N}{12N} \pm \frac{1}{4}\sum_{d\vert N} \varphi(d)\varphi(N/d)$
$\Gamma(1)(\Gamma_1(1))$	0	1	1
$\Gamma(2)$	0	$\frac{k-1\pm 3}{2}$	0
$\Gamma(N), N > 2$	$1 + \frac{d_N(N-6)}{12N}$	0	$\frac{(k-1)d_N}{12N} \pm \frac{d_N}{2N}$

⌟

Proof: These follow from(20.2.3.2)(20.2.3.3)(20.2.3.6)(20.2.3.14) and(20.2.3.13). □

Remark (20.2.3.17) [Dimension for MF_1]. The only case that is not calculated is the dimensions of $\dim(M_1(\Gamma))$. But we may use(20.2.3.4) to get that

$$\dim \mathrm{MF}_1(\Gamma_1(N)) \leq \frac{d_N}{12N} + 1.$$

⌟

Cor. (20.2.3.18) [Low Genus Cases]. For $N \in \mathbb{Z}_+$,

- $g(X(N)) = 0$ iff $N \in \{1, 2, 3, 4, 5\}$.
- $g(X(N)) = 1$ iff $N = 6$.
- $g(X_1(N)) = 0$ iff $N \in \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12\}$.

- $g(X_1(N)) = 1$ iff $N \in \{11, 14, 15\}$.
- $g(X_0(N)) = 0$ iff $N \in \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 16, 18, 25\}$.
- $g(X_0(N)) = 1$ iff $N \in \{11, 14, 15, 17, 19, 20, 21, 24, 27, 32, 36, 49\}$.

⌟

Proof: If $N = \prod_p p^{e_p}$,

1, 2:

3, 4:

$$g(X_1(N)) = 1 + \frac{1}{24}\prod_{p|N} p^{2e_p}(1-\frac{1}{p^2}) - \frac{1}{4}\prod_p p^{e_p-2}(p-1)[(p+1)-e_p(p-1)],$$

so if $g(X_1(N)) = 0$,

$$\prod_p \frac{p^{e_p}(p+1)}{[(p+1)+e_p(p-1)]} < 6.$$

Then it can be verified that $e_2 \le 3, e_3 \le 2, e_5 \le 1, e_7 \le 1, e_{11} \le 1$, $e_p = 0$ for $p > 11 \in \mathbf{P}$. Then the assertion follows. 4 is similar.

5, 6:**?** □

<u>**Low Dimensional Tabulatetes**</u>

Prop. (20.2.3.19). Let $N, k \in \mathbb{Z}_+$ s.t. $2k(N+1) = 24$, then

$$\mathrm{SF}_{2k}(\Gamma_0(N)) = \mathrm{SF}_{2k}(\Gamma_1(N)) = \mathbb{C}.g(\tau).$$

where $g(\tau) = (\eta(\tau)\eta(N\tau))^k$. ⌟

Proof: Cf.[Koblitz]P130 or [Diamond]P75.

By**?**, $g(\tau)^{N+1} = \Delta(\tau)\Delta(N\tau) \in \mathrm{SF}_{24}(\Gamma_0(N))$, and it is non-vanishing on $\mathscr{H}$ as Δ does(20.2.4.23). So $(f(\tau)/g(\tau))^{N+1} \in \mathrm{MF}_0^!(\Gamma_0(N))$.

But $\mathrm{ord}_{\tau=\infty}\, g(\tau)^{N+1} = N+1$, and

$$g^{N+1}[S]_{24}(\tau) = N^{-12} q_N^{N+1} \prod[(1-q_N^n)^{24}(1-q_N^n)^{24}],$$

so $\mathrm{ord}_{\tau=0}\, g(\tau)^{N+1} = N+1$. So $(f(\tau)/g(\tau))^{N+1} \in \mathrm{MF}_0(\Gamma_0(N)) = \mathbb{C}$(20.2.3.4). □

4 Elliptic Eisenstein Series

Def. (20.2.4.1) [Eisenstein Series]. Let Γ be a congruence subgroup of $\Gamma(1)$, define the space of elliptic **Eisenstein series** $\mathrm{Eis}_k(\Gamma, \chi)$ to be the orthogonal complement of $\mathrm{SF}_k(\Gamma, \chi)$ in $\mathrm{MF}_k(\Gamma, \chi)$. Also denote $\mathrm{Eis}_k(\Gamma) = \mathrm{Eis}_k(\Gamma, 1)$. ⌟

Prop. (20.2.4.2) [Dimensions of Eisenstein Series]. Notation as in(20.2.3.1), by(20.2.3.3) and(20.2.3.6), the dimensions of the space of Eisenstein series satisfy:

$$\dim(E_k(\Gamma)) = \begin{cases} \varepsilon_\infty & k \ge 4, 2|k \\ \varepsilon_\infty - 1 & k = 2 \\ 1 & k = 0 \\ \varepsilon_\infty^{\mathrm{reg}} & k \ge 3, 2|k+1, -1 \notin \Gamma \\ \varepsilon_\infty^{\mathrm{reg}}/2 & k = 1, -1 \notin \Gamma \\ 0 & k < 0 \text{ or } 2|k+1, -1 \in \Gamma \end{cases}$$

And also the dimension of $E_k(\Gamma_0(N)), E_k(\Gamma_1(N)), E_k(\Gamma(N))$ can be read off from(20.2.3.16). ⌟

Eisenstein Series for $\Gamma(1)$

Def. (20.2.4.3). In this subsubsection, denote $q = e^{2\pi\,\mathrm{i}\,\tau}$. ⌟

Prop. (20.2.4.4) [Weakly Modular Forms and Lattices]. Let $\mathcal{L}$ be the set of lattices in $\mathbb{C}$. If $F : \mathcal{L} \to \mathbb{C}$ is a function of weight $2k$, i.e. $F(\lambda\Gamma) = \lambda^{-2k}F(\Gamma)$ for $\lambda \in \mathbb{C}^*$, then $f(z) = F(\Gamma(z, 1))$ is a weakly modular form on $\mathscr{H}$ for $\Gamma(1)$ of weight $2k$, and this is a bijection between functions of weight $2k$ on $\mathcal{L}$ and weakly modular functions on $\mathscr{H}$ for $\Gamma(1)$ of weight $2k$. ⌟

Proof: By the hypothesis, there is a function f on $\mathscr{H}$ that for any w_1, w_2 with $w_1/w_2 \in \mathscr{H}$,

$$F(\Gamma(w_1, w_2)) = w_2^{-2k} f(w_1/w_2).$$

Then the invariance of F under $\mathrm{SL}(2, \mathbb{Z})$ action implies f is weakly modular of weight $2k$. □

Prop. (20.2.4.5) [Eisenstein Series for $\mathrm{SL}(2, \mathbb{Z})$]. Let $k > 2$ be an even integer and Γ a lattice of $\mathbb{C}$, define the **Eisenstein series of weight** k to be

$$G_k(\Gamma) = \sum_{\omega\in\Lambda,\omega\neq 0} \frac{1}{\omega^k},$$

and also for a complex number z, let Λ_z be the lattice generated by 1 and z, and let $G_k(z) = G_k(\Gamma_z)$. Then $G_k(z) \in \mathrm{MF}_k(\Gamma(1))$, and

$$G_k(z) = 2\zeta(k) + 2\frac{(2\pi\,\mathrm{i})^k}{(k-1)!}\sum_{n=1}^{\infty} \sigma_{k-1}(n)q^n$$

And denote

$$E_k(z) = G_k(z)/2\zeta(k) = \sum_{(m,n)\in\mathbb{Z}^2\setminus(0,0),\gcd(m,n)=1} \frac{1}{(m\tau + n)^k} = 1 - \frac{2k}{B_k}\sum_{n=1}^{\infty} \sigma_{k-1}(n)q^n$$

the **normalized Eisenstein series**. ⌟

Proof: $G_k(z)$ is weakly modular of weight k by(20.2.4.4). For the expansion, notice by(11.4.3.11),

$$\pi\cot(\pi z) = \frac{1}{z} + \sum_{n=1}^{\infty}(\frac{1}{z+n} + \frac{1}{z-n}),$$

and by definition

$$z\cot(\pi z) = \pi\,\mathrm{i} - \frac{\pi\,\mathrm{i}}{1-q} = \pi\,\mathrm{i} - 2\pi\,\mathrm{i}\sum_{n=1}^{\infty} q^n$$

where $z \in \mathscr{H}$.

Taking $(k-1)$-th derivative of this, we get

$$\sum_{n\in\mathbb{Z}} \frac{1}{(z+n)^k} = \frac{(-2\pi\,\mathrm{i})^k}{(k-1)!}\sum_{n=1}^{\infty} n^{k-1}q^n,$$

thus

$$\begin{aligned} G_k(z) &= \sum_{(m,n)\neq(0,0)} \frac{1}{(n\tau+m)^k} \\ &= 2\zeta(k) + 2\sum_{n=1}^{\infty}\sum_{m\in\mathbb{Z}} \frac{1}{(n\tau+m)^k} \\ &= 2\zeta(k) + \frac{2(-2\pi\,\mathrm{i})^k}{(k-1)!}\sum_{n=1}^{\infty}\sum_{a=1}^{\infty} a^{k-1}q^{an} \\ &= 2\zeta(k) + 2\frac{(2\pi\,\mathrm{i})^k}{(k-1)!}\sum_{n=1}^{\infty}\sigma_{k-1}(n)q^n \end{aligned}$$

Finally the assertion about $E_k(z)$ follows from(21.7.4.1).

To show the Eisenstein series is orthogonal to any cusp form, notice for any cusp form $f \in \mathcal{S}_k(\Gamma(1))$,

$$f(\gamma\tau)(\mathrm{Im}(\gamma\tau))^k = f(z)\overline{\tau(\gamma,z)}^{-k}\,\mathrm{Im}(z)^k$$

and by(20.2.4.5)

$$G_k(\tau) = \sum_{(m,n)\neq 0\in\mathbb{Z}^2} \frac{1}{(m\tau+n)^k} = \sum_{\Gamma(1)_\infty\backslash\Gamma(1)} \frac{1}{\tau(\gamma,\tau)^k},$$

so

$$\begin{aligned} \int_{\Gamma(1)\backslash\mathscr{H}} f(\tau)\overline{G_k(z)}y^k\frac{\mathrm{d}x\mathrm{d}y}{y^2} &= \int_{\Gamma(1)\backslash\mathscr{H}}\sum_{\Gamma(1)_\infty\backslash\Gamma(1)} f(z)\overline{\tau(\gamma,z)}^{-k}y^k\frac{\mathrm{d}x\mathrm{d}y}{y^2} \\ &= \int_{\Gamma(1)\backslash\mathscr{H}}\sum_{\Gamma(1)_\infty\backslash\Gamma(1)} f(\gamma z)(\mathrm{Im}(\gamma z))^k\frac{\mathrm{d}x\mathrm{d}y}{y^2} \\ &= \int_{\Gamma(1)_\infty\backslash\mathscr{H}} f(z)(\mathrm{Im}\,z)^k\frac{\mathrm{d}x\mathrm{d}y}{y^2} \\ &= \int_0^\infty[\int_0^1 f(x+iy)\mathrm{d}x]y^{k-2}\mathrm{d}y = 0 \end{aligned}$$

as f is a cusp form. □

Cor. (20.2.4.6). By(20.2.4.5) and(9.5.1.12):

$$E_4(z) = 1+240\sum_{n=1}^{\infty}\sigma_3(n)q^n,\quad E_6(z) = 1-504\sum_{n=1}^{\infty}\sigma_5(n)q^n$$

$$E_8(z) = 1+480\sum_{n=1}^{\infty}\sigma_7(n)q^n,\quad E_{10}(z) = 1-264\sum_{n=1}^{\infty}\sigma_9(n)q^n$$

$$E_{12}(z) = 1+\frac{65520}{691}\sum_{n=1}^{\infty}\sigma_{11}(n)q^n,\quad E_{14}(z) = 1-24\sum_{n=1}^{\infty}\sigma_{13}(n)q^n.$$

⌟

Cor. (20.2.4.7) [Ramanujan Identities]. By(20.2.4.8),

$$\dim \mathrm{MF}_6(\Gamma(1)) = \dim \mathrm{MF}_8(\Gamma(1)) = \dim \mathrm{MF}_{10}(\Gamma(1)) = \dim \mathrm{MF}_{14}(\Gamma(1)) = 1,$$

so there are identities:

$$E_4^2 = E_8, \quad E_4E_6 = E_{10}, \quad E_6E_8 = E_4E_{10} = E_{14}$$

which give equations like:

$$\sigma_7(n) = \sigma_3(n) + 120\sum_{m=1}^{n-1}\sigma_3(m)\sigma_3(n-m)$$

$$11\sigma_9(n) = 21\sigma_5(n) - 10\sigma_3(n) + 1054\sum_{m=1}^{n-1}\sigma_3(m)\sigma_5(n-m).$$

⌟

Cor. (20.2.4.8) [Modular Forms for $\Gamma(1)$].

$$\mathrm{MF}_*(\Gamma(1)) = \mathbb{C}[E_4, E_6], \quad \mathrm{SF}_*(\Gamma(1)) = \Delta.\,\mathrm{MF}_*(\Gamma(1)).$$

Thus for $k \geq 4$ even,

$$\dim(S_k(\Gamma(1))) = \begin{cases} \lfloor \frac{k}{12} \rfloor - 1 & k \equiv 2 \mod 12 \\ \lfloor \frac{k}{12} \rfloor & \text{otherwise} \end{cases}.$$

$$\mathrm{MF}_k(\Gamma(1)) = \mathrm{MF}_k(\Gamma(1)) \oplus \mathbb{C}E_k.$$

⌟

Proof: Cf.[Diamond P88] or [Koblitz, Modular Forms]P118. □

Cor. (20.2.4.9). $\mathrm{MF}(\Gamma(1)) = \mathrm{MF}(\Gamma(1), \mathbb{Z})_{\mathbb{C}}$, $\mathrm{SF}(\Gamma(1)) = \mathrm{SF}(\Gamma(1), \mathbb{Z})_{\mathbb{C}}$(20.2.6.4). ⌟

Proof: By(20.2.4.20), E_4, E_6 have Fourier coefficients in $\mathbb{Z}$. □

Eisenstein Series for $\Gamma_0(N)$

Cf.[Diamond] or [Koblitz]P131.

Prop. (20.2.4.10). For $k, N \in \mathbb{Z}_+, k \geq 3$ and $\chi \in \mathrm{Diri}(N)$ s.t. $\chi(-1) = (-1)^k$, there is an Eisenstein series

$$G_{k,\chi}(\tau) = \frac{1}{2}L(1-k,\chi) + \sum_{n\in\mathbb{Z}_+}(\sum_{d|n}\chi(d)d^{k-1})e^{2\pi \mathrm{i}\,\tau} \in \mathrm{MF}_k(\Gamma_0(N), \chi).$$

⌟

Proof: □

Prop. (20.2.4.11) [Connection with Dedekind eta-Functions]. For $p \in \mathtt{Prime}_{\geq 3}$, let

$$h(\tau) = \prod_{a_2=1} p - 1G_3^{(0,a_2)((\mathrm{mod}\ \ p))}(\tau), \quad f(\tau) = \prod_{a_2=1}\frac{p-1}{2}G_3^{(0,a_2)((\mathrm{mod}\ \ p))}(\tau),$$

then

- $h(\tau) = (-1)^{(p-1)/2} f(\tau)$,
- $f(\tau) \in \mathrm{MF}_{3(p-1)/2}(\Gamma_0(p), \left(\frac{-}{p}\right))$, $h(\tau) \in \mathrm{MF}_{3(p-1)}(\Gamma_0(p))$.
- $f(\tau)$ is a constant multiple of $(\eta^p(\tau)/\eta(p\tau))^3$.

⌟

Proof: Cf.[Koblitz]P135, 136.**?** □

General Eisenstein Series

Quasimodular Forms

Def. (20.2.4.12) [Almost Modular Forms]. For a discrete subgroup $\Gamma \subset \mathrm{SL}(2;\mathbb{R})$, let $\widehat{M}_k^{\leq p}(\Gamma)$ be the space of functions in $C^\infty(\mathscr{H})$ of the form $F(\tau) = \sum_{r=0}^p f_r(\tau)(-4\pi y)^{-r}$, where f_r are holomorphic on $\mathscr{H}$ and holomorphic at the cusps, and $F[\gamma]_k = F$ for any $\gamma \in \Gamma$.

Denote $\widehat{\mathrm{MF}}_k(\Gamma) = \cup_{p=0}^\infty \widehat{\mathrm{MF}}_k^{\leq p}(\Gamma)$ and the graded ring $\widehat{\mathrm{MF}}_*(\Gamma) = \oplus_{k\geq 0}\widehat{\mathrm{MF}}_k(\Gamma)$, called the space of **almost modular forms**. ⌟

Def. (20.2.4.13) [Quasi-Modular Forms]. The graded ring $\widetilde{\mathrm{MF}}_*(\Gamma)$ of **quasi-modular forms** is defined to be the constant terms(f_0) of functions in $\widehat{\mathrm{MF}}_*(\Gamma)$. Any almost modular function is determined by its constant term, so $\widetilde{\mathrm{MF}}_*(\Gamma)$ is canonically isomorphic to $\widehat{\mathrm{MF}}_*(\Gamma)$.**?** ⌟

Proof: □

Eisenstein Series of Weight 2

Def. (20.2.4.14) [$E_2(\tau)$]. Denote

$$G_2(\tau) = \frac{1}{2}\sum_{n\neq 0}\frac{1}{n^2} + \frac{1}{2}\sum_{m\neq 0}\sum_{n\in\mathbb{Z}}\frac{1}{(m\tau+n)^2}.$$

This summation is convergent but not absolutely convergent, and

$$E_2(\tau) = \frac{6}{\pi^2}G_2(\tau) = 1 - 24q - 72q^2 + \ldots \in \widetilde{M}_2^{\leq 1}(\Gamma(1))$$

with

$$G_2^*(\tau) = G_2(\tau) - \frac{\pi}{2\,\mathrm{Im}(\tau)}, \quad E_2^*(\tau) = \frac{6}{\pi^2}G_2^*(\tau) = E_2(\tau) - \frac{3}{\pi\,\mathrm{Im}(\tau)} \in \widehat{M}_2^{\leq 1}(\Gamma(1)).$$

In particular, $E_2(\tau)$ satisfies

$$E_2[\gamma]_2(\tau) = E_2(\tau) + \frac{12}{2\pi\,\mathrm{i}}\frac{c}{c\tau+d}, \quad \gamma \in \Gamma(1)$$

⌟

Proof: For $\varepsilon \in \mathbb{R}_+$, define

$$G_{2,\varepsilon}(\tau) = \sum_{(m,n)\in\mathbb{Z}^2\setminus(0,0)}\frac{1}{(mz+n)^2|mz+n|^\varepsilon},$$

then it is absolutely convergent and

$$G_{2,\varepsilon}(\gamma(\tau)) = (cz+d)^2|cz+d|^{2\varepsilon}G_{2,\varepsilon}(\tau).$$

Then it suffices to show that $\lim_{\varepsilon\to 0} G_{2,\varepsilon}(\tau) = G_2^*(\tau)$.

Define

$$I_\varepsilon(\tau) = \int_{-\infty}^{\infty} \frac{\mathrm{d}t}{(z+t)^2|z+t|^{2\varepsilon}},$$

then

$$G_{2,\varepsilon}(\tau) - \sum_{m\in\mathbb{Z}_+} I_\varepsilon(m\tau) = \sum_{n\in\mathbb{Z}_+} \frac{1}{n^{2+2\varepsilon}} + \sum_{m\in\mathbb{Z}_+}\Big(\sum_{n\in\mathbb{Z}} \frac{1}{(m\tau+n)^2|m\tau+n|^{2\varepsilon}} - \int_n^{n+1} \frac{\mathrm{d}t}{(m\tau+t)^2|m\tau+t|^{2\varepsilon}}\Big).$$

This sum is absolutely convergent for $\varepsilon > -1/2$, thus when $\varepsilon \to 0$, it just equals $G_2(\tau)$.

On the other hand, for $\varepsilon > -1/2$,

$$I_\varepsilon(x+\mathrm{i}\,y) = \int_{-\infty}^{\infty} \frac{\mathrm{d}t}{(x+t+\mathrm{i}\,y)^2((x+t)^2+y^2)^\varepsilon} = \frac{I(\varepsilon)}{y^{1+2\varepsilon}},$$

where $I(\varepsilon) = \int_{-\infty}^{\infty}(t+\mathrm{i})^{-2}(t^2+1)^{-\varepsilon}\mathrm{d}t$. We have $I(0) = 0$, and

$$I'(0) = \int_{-\infty}^{\infty} \frac{\log(t^2+1)}{(t+\mathrm{i})^2}\mathrm{d}t = \Big(\frac{1+\log(t^2+1)}{t+\mathrm{i}} - \arctan t\Big)\Big|_{-\infty}^{\infty} = -\pi.$$

For $\varepsilon \in \mathbb{R}_+$, $\sum_{m\in\mathbb{Z}_+} I_\varepsilon(m\tau) = I(\varepsilon)\zeta(1+2\varepsilon)/y^{1+2\varepsilon}$, so $\lim_{\varepsilon\to 0}\sum_{m\in\mathbb{Z}_+} I_\varepsilon(m\tau) = -\pi/2y$. □

Eisenstein Series of Weight 1

Prop. (20.2.4.15). For $N \in \mathbb{Z}_+, k = 1$, we can modify to give a definition of

$$G_{1,\chi}(\tau) \in \mathrm{MF}_1(\Gamma_0(N), \chi).$$

⌟

Prop. (20.2.4.16) [Eisenstein Series of Weight 1]. For $N \in \mathbb{Z}_+$, the set

$$\{E^{\psi,\varphi,1}\}$$

is a basis for $\mathrm{Eis}_1(\Gamma_1(N))$. In fact, for any $\chi \in \mathrm{Diri}(N)$, the set

$$\{E^{\psi,\varphi,1}, \varphi\psi = \chi\}$$

is a basis for $\mathrm{Eis}_1(\Gamma(N), \chi)$(20.2.4.1). ⌟

Proof: Cf.[Diamond]P141. □

Derivatives

Prop. (20.2.4.17) [Derivations of Modular Forms]. Let Γ be a discrete subgroup of $\mathrm{SL}(2;\mathbb{R})$ and $f\in\mathrm{MF}_k(\Gamma)$, then

$$Df\overset{\triangle}{=}\frac{1}{2\pi\,\mathrm{i}}\frac{\partial}{\partial\tau}f=q\frac{\partial}{\partial q}f=\sum_{n=1}^{\infty}na_nq^n$$

satisfies

$$(Df)[\gamma]_{k+2}(\tau)=(Df)(\tau)+\frac{k}{2\pi\,\mathrm{i}}\frac{c}{cz+d}f(z),\quad \gamma\in\Gamma.$$

In particular, by(20.2.4.14), $\theta_k(f)=D(f)-\frac{k}{12}E_2f\in\mathrm{MF}_{k+2}(\Gamma)$, called the **Serre derivation** of f.
⌟

Proof: This follows form differentiating the equation $f(\frac{az+b}{cz+d})=(cz+d)^kf(z)$. □

Cor. (20.2.4.18).

$$D(E_2)=\frac{E_2^2-E_4}{12},\quad D(E_4)=\frac{E_2E_4-E_6}{3},\quad D(E_6)=\frac{E_2E_6-E_4}{2}$$

⌟

Proof: $D(E_4)$ and $D(E_6)$ follows from(20.2.4.17) by comparing coefficients, for $D(E_2)$, differentiating the equation $E_2(\frac{a\tau+b}{c\tau+d})=(c\tau+d)^2E_2(\tau)+\frac{12}{2\pi\,\mathrm{i}}c(c\tau+d)$, we get

$$D(E_2)[\gamma]_4(z)=D(E_2)(z)+\frac{2c}{2\pi\,\mathrm{i}}\frac{E_2(\tau)}{c\tau+d}+\frac{12c^2}{(2\pi\,\mathrm{i})^2}\frac{1}{(c\tau+d)^2}.$$

Thus by(20.2.4.14), we see $D(E_2)-\frac{1}{12}E_2^2\in\mathrm{MF}_4(\Gamma(1))$, then we can compare coefficients. □

Prop. (20.2.4.19) [Structure of $\widetilde{M}_*(\Gamma)$]. Let Γ be a discrete subgroup of $\mathrm{SL}(2;\mathbb{R})$, then

- $D(\widetilde{M}_k^{\leq p}(\Gamma))\subset\widetilde{M}_{k+2}^{\leq p+1}(\Gamma)$. In particular, $D(\widetilde{M}_*(\Gamma))\subset\widetilde{M}_*(\Gamma)$.
- If $\varphi\in\widetilde{M}_2^{\leq 1}(\Gamma)$, then for any $k,p\in\mathbb{N}$, $\widetilde{M}_k^{\leq p}(\Gamma)=\bigoplus_{r=0}^{p}M_{k-2r}(\Gamma)\varphi^r$. In particular, $\widetilde{M}_*(\Gamma(1))=\mathbb{C}[E_2,E_4,E_6]$.
- If $\varphi\in\widetilde{M}_2^{\leq 1}(\Gamma)$, then for $p,k\geq 0$,

$$\widetilde{M}_k^{\leq p}(\Gamma)=\begin{cases}\bigoplus_{r=0}^{p}D^r(M_{k-2r}(\Gamma)), & p<k/2\\ \oplus_{r=0}^{k/2-1}D^r(M_{k-2r}(\Gamma))\bigoplus\mathbb{C}\cdot D^{k/2-1}\varphi, & p\geq k/2\end{cases}$$

⌟

Proof: Cf.[BGHZ]P59. □

Δ-Function and j-Function

Def. (20.2.4.20) [Discriminant Function]. The modular **discriminant function**

$$\Delta(q(\tau))=\frac{(2\pi)^{12}}{1728}(E_4^3-E_6^2)=\sum_{n\in\mathbb{Z}_+}\tau(n)q^n=(2\pi)^{12}\Big(q-24q^2+252q^3-1472q^4+4830q^5-6048q^6-16744q^7+\dots\Big)$$

by(20.2.4.6). So $\Delta(z)\in\mathrm{SF}_{12}(\Gamma(1))$, and the coefficients $\tau(n)$ are called the **Ramanujan τ-function**.
⌟

Cor. (20.2.4.21).

$$E_6^2 - E_{12} = -(1008 + \frac{24 \cdot 2730}{691})\frac{\Delta(z)}{(2\pi)^{12}}.$$

In particular, $\tau(n) \equiv \sigma_{11}(n) \mod 691$. ⌟

Proof: Consider $E_6^2 - E_{12} \in \mathrm{SF}_{12}(\Gamma(1))$, and $\mathrm{SF}_{12}(\Gamma(1))$ is 1-dimensional and generated by Δ(20.2.4.8), thus $E_6^2 - E_{12} = c\Delta$ for some constant $c \in \mathbb{C}$. By comparing the degree 1 term of both sides:

$$\frac{\Delta(z)}{(2\pi)^{12}}(q(\tau)) = \frac{1}{1728}(E_4^3(q) - E_6^2(q)) = q - 24q^2 + \ldots.$$

$$E_{12}(\tau) = 1 + \frac{24 \cdot 2730}{691}\sum_{n=1}^{\infty}\sigma_{11}(n)q^n, \quad E_6(z) = 1 - 504\sum_{n=1}^{\infty}\sigma_5(n)q^n$$

by(20.2.4.6) and(20.2.4.20), so $c = -1008 - \frac{24 \cdot 2730}{691}$. Then the formula

$$691(E_6^2 - E_{12}) = 691c\Delta,$$

modulo 691 gives $\tau(n) \equiv \sigma_{11}(n) \mod 691$. □

Cor. (20.2.4.22) [*j*-Function]. By(20.2.1.18), the discriminant function $\Delta(z)$ has exactly one simple zero at ∞, thus we can define the ***j*-function** on $\mathscr{H}$ as

$$j : \mathscr{H} \to \mathbb{C}, j(q(\tau)) = 1728\frac{E_4(\tau)^3}{E_4^3(\tau) - E_6^2(\tau)} = \frac{1}{q} + 744 + 196884q + 21493760q^2 + 864299970q^3 + \ldots \in \frac{1}{q} + \mathbb{Z}[[q]]$$

which is an automorphic function for $\Gamma(1)$, and it induces an isomorphism

$$j : X(1) \cong \mathbb{P}^1_{\mathbb{C}}.$$

In particular, $\mathrm{MF}^!_0(\Gamma(1)) = \mathbb{C}(j(z))$. ⌟

Proof: To show it surjects onto $\mathbb{C}$, notice it induces a holomorphic map $X(1) \cong \mathbb{P}^1 \to \mathbb{P}^1$, and it maps ∞ to ∞ with no ramification, thus it has degree 1. So it is surjective. □

Prop. (20.2.4.23).

$$\Delta(q(\tau)) = (2\pi)^{12}\eta(q(\tau))^{24} = q\prod_{n=1}^{\infty}(1 - q^n)^{24}.$$

In particular, $\Delta(\tau)$ is non-vanishing on $\tau \in \mathscr{H}$. ⌟

Proof: By(20.2.1.30), $\eta^{24}(\tau) \in \mathrm{SF}_{12}(\Gamma(1))$, which has dimension 1 and is spanned by $\Delta(\tau)$(20.2.4.8). Thus the assertion follows by comparing coefficients. □

Zeros of Eisenstein Series

Thm. (20.2.4.24) [Rankin-Swinnerton.Dyer]. If $n \in \mathbb{N}, s \in \{2, 3, 4, 5, 0, 7\}$ and $k = 6n + s \geq 2$, then the Eisenstein series $E_{2k} \in M_{2k}(\Gamma(1))$ has at least weighted zero exactly $s/12$ at i and ω(which suffices to determine its zeros), and all the other n zeros are non-elliptic and located on arc between i and ω. ⌟

Proof: Firstly, by the valence formula(20.2.1.18) and by rationality reason, E_{2k} has at least weighted zero $s/6$ at i and ω. So by valence formula, it suffices to show that E_{2k} has at least n zeros on the arc between i and ω.

Let

$$\begin{aligned}F_{2k}(\theta) &= \frac{1}{2}e^{\mathrm{i}\,k\theta}E_{2k}(e^{\mathrm{i}\,\theta})\\ &= \frac{1}{2}\sum_{(c,d)\in\mathbb{Z}^2\setminus(0,0),\gcd(c,d)=1}\frac{1}{(ce^{\mathrm{i}\,\theta/2}+de^{-\mathrm{i}\,\theta/2})^{2k}}\\ &= 2\cos(k\theta)+\frac{1}{2}\sum_{(c,d)\in\mathbb{Z}^2\setminus(0,0),c^2+d^2>1,(c,d)=1}\frac{1}{(ce^{\mathrm{i}\,\theta/2}+de^{-\mathrm{i}\,\theta/2})^{2k}}.\end{aligned}$$

Then it suffices to show that $F_{2k}(\theta)$ has at least n zeros when $\theta\in(\pi/2,2\pi/3)$. For this, we may assume $n\geq 1$. Notice for these theta,

$$|ce^{\mathrm{i}\,\theta/2}+de^{-\mathrm{i}\,\theta/2}|^2=c^2+2cd\cos\theta+d^2\geq\frac{1}{2}(c^2+d^2),$$

and for $N\in\mathbb{Z}_{\geq 5}$, the number of integral solutions to $c^2+d^2=N$ is at most $2(2\sqrt{N}+1)\leq 5\sqrt{N}$.

$$\begin{aligned}\Big|\frac{1}{2}\sum_{c^2+d^2>1,(c,d)=1}\frac{1}{(ce^{\mathrm{i}\,\theta/2}+de^{-\mathrm{i}\,\theta/2})^{2k}}\Big| &\leq 1+3^{-k}+4(\frac{5}{2})^{-k}+\sum_{N=10}^{\infty}5\sqrt{N}(\frac{N}{2})^{-k}\\ &\leq 1+3^{-k}+4(\frac{2}{5})^k+\frac{5\cdot 9^{\frac{3}{2}}}{k-\frac{3}{2}}(\frac{2}{9})^k\\ &< 1.0214\end{aligned}$$

Thus, when $m\in\mathbb{Z}$ and $k/2\leq m\leq 2/3k$, $F_{2k}(m\pi/k)$ is strictly positive or negative according as m is even or odd. So by intermediate property(3.2.10.9), there are at least $\lfloor\frac{2k}{3}\rfloor-\lceil\frac{k}{2}\rceil=n$ zeros when $\theta\in(\pi/2,2\pi/3)$. □

5 Arithmetic Modular Forms

Def. (20.2.5.1) [Modular Forms]. For $R_0\in\mathcal{CR}\mathrm{ing}$, $N\in\mathbb{Z}_+$, $k\in\mathbb{N}$, the space $M(R_0,N,k)$ of **modular forms of level N and weight k over R_0** consists of rules f that functorially associates a section $f(E/S,\alpha_N)\in\Gamma(S,\omega_{E/S}^{\otimes k})$ to each datum $(E/S,\alpha_N)$, where $S\in\mathcal{S}\mathrm{ch}/R_0$, $E\in\mathcal{E}\mathrm{ll}/S$, and $\alpha_n:E/S[n]\cong(\mathbb{Z}/(n))_S^2$ is an isomorphism.

Such a modular form is automatically meromorphic at cusps, simply because $\mathrm{Tate}(q)$ is an Elliptic curve over $\mathbb{Z}[[q]]$. ⌟

Def. (20.2.5.2)[q-Expansions and Holomorphic Modular Forms]. For $f\in M(R_0,N,k)$(20.2.5.1), if $R_0\in\mathcal{CR}\mathrm{ing}/\mathbb{Z}[\frac{1}{N},\mu_N]$, the **$q$-expansion** of f is defined to be

$$f((\mathrm{Tate}(q^N),\alpha_N)_{R_0})\in(\mathbb{Z}((q))\otimes R_0)\omega_{\mathrm{can}}.$$

where $\mathrm{Tate}(q)$ is the Tate curve, and α_N is any level N-structure on $\mathrm{Tate}(q^N)$.

For any $R_0\in\mathcal{CR}\mathrm{ing}$, $f\in M(R_0,N,k)$ is said to be **holomorphic at cusps** if the q-expansion of f restricted to $R_0[\frac{1}{N},\mu_N]$ is an element is contained in $(\mathbb{Z}[[q]]\otimes R_0)\omega_{\mathrm{can}}$ for any choice of α_N. The space of holomorphic modular forms is denoted by $S(R_0,N,k)$. ⌟

Def. (20.2.5.3) [Kodaira-Spencer Maps]. If $T \in \mathcal{S}\mathrm{ch}$, S/T is smooth, and $f : E \to S \in \mathcal{E}\mathrm{ll}/S$, then there is an exact sequence

$$0 \to f^*\Omega_{S/T} \to \Omega_{E/T} \to \Omega_{E/S} \to 0$$

thus an exact sequence

$$0 \to T_{E/S} \to T_{E/T} \to f^*T_{S/T} \to 0.$$

Thus inducing a homomorphism

$$T_{S/T} \cong f_*f^*T_{S/T} \to R^1 f_* T_{E/S} = \mathrm{Lie}(E/S)^2 R^1 f_* \Omega^1_{E/S} \cong \mathrm{Lie}(E/S)^2.$$

Thus inducing a **Kodaira-Spencer map** of $\mathcal{O}_S$-modules

$$\mathrm{KS}_{E/S} : \omega^2_{E/S} \to \Omega^1_{S/T}.$$

And if $S/T \subset \overline{S}/T, \overline{S} \setminus S = S^\infty$, $E/S \subset \overline{E}/\overline{S}$ is an extension to a curve of genus 1, and the identity $e \in E(S)$ also extends to a map $\overline{e} \in \overline{E}(\overline{S})$, with $\overline{\omega}_{\overline{E}/\overline{S}} = \overline{e}^*\Omega_{\overline{E}/\overline{S}}$ extending $\omega_{E/S}$, then the Kodaira-Spencer map extends to a map

$$\mathrm{KS}_{\overline{E}/\overline{S}} : \omega^2_{\overline{E}/\overline{S}} \to \Omega^1_{\overline{S}/T}(\log S^\infty).$$

⌟

Prop. (20.2.5.4) [Kodaira-Spencer Map for Modular Curves].

- If $T = \mathrm{Spec}\,\mathbb{Q}, S = Y(N), N \geq 3$, and E/S is the universal curve, then the Kodaira-Spencer map(20.2.5.3) is an isomorphism. And on q-expansions of modular forms along any cusp t, it is of the form
$$f(q^{1/N})(\mathrm{d}\log t)^2 \mapsto f(q^{1/N})\,\mathrm{d}\log q.$$
- If $\overline{S} = X(N)_\mathbb{Q}$, and $\overline{E^{\mathrm{uni}}}$ is the regular minimal model of the universal elliptic curve, then the extended Kodaira-Spencer map(20.2.5.3) is an isomorphism. In fact, over $\mathbb{Z}[\frac{1}{N}, \zeta_N]$ and at any cusp, the square of the canonical differential ω_{can} on $\mathrm{Tate}(q^N)$ is mapped to the $N\,\mathrm{d}\log q$.
- If $S = Y(N)^{\mathrm{ord}}$, and $T = \mathrm{Spec}\,\mathbb{Z}[\mu_N]$, then S/T is smooth by, and the Kodaira-Spencer map on the q-expansions of modular forms is of the form
$$f(q^{1/N})(\mathrm{d}\log t)^2 \mapsto f(q^{1/N})\,\mathrm{d}\log q = Nf(q^{1/N})\,\mathrm{d}\log(q^{1/N}),$$
so we can define a map $\frac{1}{N}\mathrm{KS}_{Y(N)/\mathbb{Z}[\mu_N]}$.

⌟

Proof: [Katz, p-adic properties of modular forms and modular curves]A1. Prop3.17. and Cor3.18.**?**
□

Cor. (20.2.5.5) [Modular Forms as Sections on Modular Curves]. If $N \in \mathbb{Z}_{\geq 3}$ and $R_0 \in \mathcal{CR}\mathrm{ing}/\mathbb{Z}[\frac{1}{N}]$, there are isomorphisms

$$S(R_0, N, k) \cong \Gamma(X(N), \overline{\omega}^k \otimes \Omega^1_{X(N)/\mathbb{Q}} \otimes_{\mathbb{Z}[\frac{1}{N}]} R_0) \subset \Gamma(X(N), \overline{\omega}^k \otimes_{\mathbb{Z}[\frac{1}{N}]} R_0) \cong M(R_0, N, k),$$

where the middle inclusion is given by Kodaira-Spencer isomorphism(20.2.5.4).

Thus in general, for any $\mathbb{Z}[\frac{1}{N}]$-module K, we can define a **modular form of level N and weight k with coefficients in M which is holomorphic at cusps** to be a section in

$$\Gamma(X(N), \omega^k \otimes_{\otimes\mathbb{Z}[\frac{1}{N}]} M).$$

⌟

Thm. (20.2.5.6) [q-**Expansion Principle**]. For $N \in \mathbb{Z}_{\geq 3}, M \in \mathcal{M}\mathrm{od}_{\mathbb{Z}[\frac{1}{N}]}$, and f a modular form of level N and weight k with coefficients in M which is holomorphic at cusps. Suppose on each of the $\varphi(N)$ connected components of $X(N)_{\mathbb{Z}[\frac{1}{N}]}\mathbb{Z}[\frac{1}{N}, \zeta_N]$, there exists at least one cusp that the q-expansion of f vanishes, then f vanishes. ⌟

Proof: Cf.[Kat73]P84?. □

Cor. (20.2.5.7). Situation as in(20.2.5.6), if $N \subset M \in \mathcal{M}\mathrm{od}_{\mathbb{Z}[\frac{1}{N}]}$, and on each of the $\varphi(N)$ connected components of $X(N)_{\mathbb{Z}[\frac{1}{N}]}\mathbb{Z}[\frac{1}{N}, \zeta_N]$, there exists at least one cusp that the q-expansion of f is contained in $N \otimes_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N] \otimes \mathbb{Z}[[q]]$, then f is a modular form with coefficients in N. ⌟

Proof: The image of f in $\Gamma(X(N), \omega^k \otimes_{\otimes \mathbb{Z}[\frac{1}{N}]} M/N)$ is trivial. □

6 Arithmetics

Prop. (20.2.6.1) [Number Field of f]. If $f \in S_k(\Gamma_1(N))$ is a normalized eigenform, then the coefficients $a_n(f)$ are algebraic integers, and generate a number field K_f, called the **number field of** f. ⌟

Proof: Cf.[Diamond, P238]. □

Prop. (20.2.6.2). if $f \in \mathrm{SF}_2(N, \chi)$ is a normalized eigenform, then for any $\sigma \in \mathrm{Gal}_{\mathbb{Q}}$, f^σ is also a normalized eigenform in $\mathrm{SF}_2(N, \chi^\sigma)$, where $\chi^\sigma(n) = \chi(n)^\sigma$. And if f is a newform, then so is f^σ. ⌟

Proof: Cf.[Diamond, P239].? □

Cor. (20.2.6.3) [Integrality of Modular Forms]. $S_2(\Gamma_1(N))$ has a basis of modular forms with integral coefficients. ⌟

Proof: Let $f \in S_2(\Gamma_1(N))$ be a newform of level $M|N$, and K_f the number field of f. Let $\alpha_1, \ldots, \alpha_d$ be a $\mathbb{Z}$-basis of $\mathcal{O}_K$, and $\Sigma^\infty = \{\sigma_1, \ldots, \sigma_d\}$ the set of embeddings of K into $\mathbb{C}$. Let

$$g_i = \sum_{j=1}^{d} \sigma_j(\alpha_i) f^{\sigma_j},$$

then by linear independence of characters, the matrix $(\sigma_i(\alpha_j))$ is non-degenerate, so $\mathrm{span}\{g_1, \ldots, g_d\} = \mathrm{span}\{f, \ldots, f^{\sigma_d}\}$, and $g_i \in S_2(\Gamma_1(N))$ by(20.2.6.2). Then by(20.2.2.13), applying this for all old and new forms of $S_2(\Gamma_1(N))$, the assertion follows. □

Prop. (20.2.6.4)[Integral Modular Forms]. If $A \subset \mathbb{C}$ be a subring, denote $M_k(\Gamma, A) = M_k(\Gamma) \cap A[[q]]$ ⌟

7 Modular Forms Mod p

Def. (20.2.7.1) [Modular Forms Mod p]. Define $\mathrm{MF}_k(\Gamma, \mathbb{F}_p) = M_k(\Gamma, \mathbb{Z}) \otimes \mathbb{F}_p$, called the space of **modular forms mod p of weight k.** ⌟

Prop. (20.2.7.2) [Serre's Equality]. There is an isomorphism $M_{p+1}(SL(2, \mathbb{Z}), \mathbb{F}_p) \cong M_2(\Gamma_0(p), \mathbb{F}_p)$ ⌟

Proof: Because $E_k(z)1-\frac{2k}{B_k}\sum_{n=1}^\infty\sigma_{k-1}(n)q^n$, and by Kummer's congruence(22.3.1.1) $\mathrm{ord}_p(B_{p-1})=-1$, thus $E_{p-1}\mod 1\mod p$. Then multiplying by $E_{p-1}:M_2(\Gamma_0(p),\mathbb{F}_p)\to M_{p+1}(\Gamma_0(p),\mathbb{F}_p)$ raises the level by $p-1$. Then we compose with the natural averaging map $M_{p+1}(\Gamma_0(p),\mathbb{F}_p)\to M_{p+1}(SL(2,\mathbb{Z}),\mathbb{F}_p)$, which is dual to the natural inclusion $M_{p+1}(SL(2,\mathbb{Z}),\mathbb{F}_p)\to M_{p+1}(\Gamma_0(p),\mathbb{F}_p)$.

Why isomorphism.? □

8 Non-Congruent Modular Forms

Cf.[Non-Congruuent Modular Forms, Ling Long].

Thm. (20.2.8.1) [Unbounded Denominators Conjecture]. Let N be any positive integer and let $f(\tau)\in\mathbb{Z}[[q^{1/N}]]$ for $q=e^{\pi\,\mathrm{i}\,\tau}$ be a holomorphic function on the upper half plane. Suppose there exists an integer k and a finite index $\Gamma\subset SL(2,\mathbb{Z})$ that f is Γ-invariant, and f is meromorphic at the cusps of Γ, then $f(\tau)$ is a modular form for some congruent subgroup of $\mathrm{SL}(2,\mathbb{Z})$. ⌟

Proof: Cf.[the Unbounded Denominator Conjecture]. □

3

20.3 Hilbert and Siegel Modular Forms

20.4 Theta Correspondence

1 Theta Functions

Def. (20.4.1.1) [Poisson Summation for Lattices]. Let V be a vector space of dimension n with an Haar measure μ, $\Gamma \subset V$ a full lattice, and $\Gamma' \subset V^\vee$ be its $\mathbb{Z}$-dual, Let $V = \mu(V/\Gamma)$, then for any Schwartz function $f \in \mathcal{S}(V)$,

$$\sum_{x\in\Gamma} f(x) = \frac{1}{V}\sum_{y\in\Gamma'} \widehat{f}(y).$$

⌟

Proof: This is just**??**. □

Def. (20.4.1.2) [Quadratic Lattices]. Let V be a real inner product space with an Haar measure μ normalized that for an orthonormal basis e_i of V, $V/\mathbb{Z}\{e_i\}$ has volume 1, then we can identify V with V^* by this inner product. Let Γ be a full lattice, then its $\mathbb{Z}$-dual Γ^D is defined to be the lattice $V^D = \{y \in V | (x, y) \in \mathbb{Z}, \forall x \in \Gamma\}$. the **level of** Γ is defined to be the minimal $N \in \mathbb{Z}_+$ s.t. $NV^D \subset V$. It is called a **unimodular lattice** if $\mathrm{Vol}(V/\Gamma) = 1$. ⌟

Def. (20.4.1.3) [Theta Functions]. Situation as in(20.4.1.2), for any $x_0 \in \Gamma$, we can define **theta functions**

$$\theta_{\Gamma,x_0} : \mathscr{H} \times \mathbb{C} \to \mathbb{C} : \theta_{\Gamma,x_0}(\tau, z) = \sum_{x\in\Gamma} e^{-\pi\,\mathrm{i}[(x,x)\tau+(x,x_0)z]}.$$

and

$$\theta_\Gamma(\tau) = \theta_{\Gamma,0}(\tau, 0), \quad \Theta_\Gamma(t) = \theta_\Gamma(\mathrm{i}\, t) = \sum_{x\in\Gamma} e^{-\pi t(x,x)}.$$

⌟

Cor. (20.4.1.4). With the notation as in(20.4.1.3), the theta function satisfies

$$\Theta_\Gamma(t) = \frac{t^{-n/2}}{\mu(V/\Gamma)}\Theta_{\Gamma^D}(t^{-1})$$

⌟

Proof: Notice that $\Theta_{s\Gamma}(t) = \Theta_\Gamma(s^2 t)$, so this formula follows from(20.4.1.1) applied to $t^{-1/2}\Gamma$ and $f(x) = e^{-\pi(x,x)}$. □

Thm. (20.4.1.5) [Hecke-Schoenberg]. Given $k \in \mathbb{Z}_+$ and a lattice Γ of rank k, level N and discriminant Δ, then

$$\theta_\Gamma(\tau) \in \mathrm{MF}_k(\Gamma_0(N), \left(\frac{\Delta}{-}\right)).$$

⌟

Proof: □

Def. (20.4.1.6) [Simple Theta Function]. The simple theta function θ is defined to be

$$\theta(\tau) = \sum_{n\in\mathbb{Z}} e^{2\pi\,\mathrm{i}\, n^2\tau}.$$

Then by(20.4.1.4) it satisfies

$$\theta(\tau + 1) = \theta(\tau), \quad \theta(-\frac{1}{4\tau}) = \sqrt{-2\,\mathrm{i}\,\tau}\theta(\tau).$$

⌟

Self-Dual Lattices

Def. (20.4.1.7) [Self-Dual Lattices]. Situation as in(20.4.1.3), a **self-dual lattice** is a lattice Γ in V that $V^D = V$. Equivalently, if $\{f_i\}$ is a $\mathbb{Z}$-basis of Γ, then the matrix $A = ((e_i, e_j))_{i,j}$ is a matrix with integer coefficients and determinant 1. The last equivalence is because $\Gamma' \subset \Gamma$ equals Γ if $\mu(V/\Gamma) = \mu(V/\Gamma')$, but this is equivalent to $\mu(V/\Gamma) = 1$, because $\mu(V/\Gamma) \cdot \mu(V/\Gamma') = 1$.

A self-dual lattice is called **even lattice** iff $(x, x) \in 2\mathbb{Z}$ for any $x \in \Gamma$. ⌟

Example (20.4.1.8) [E_{8k}]. Let $V = \mathbb{R}^{8k}$ with the canonical inner product, denote E_{8k} the set of vectors $\sum_i x_i e_i$ in V that

$$2x_i \in \mathbb{Z}, x_i - x_j \in \mathbb{Z}, \sum_{i=1}^{8k} x_i \in 2\mathbb{Z}.$$

Notice E_8 is compatible with the root system E_8(3.9.3.2), and the root system just consists of all vectors in E_8 of length $\sqrt{2}$.

Then E_{8k} is a self-dual and even. ⌟

Cor. (20.4.1.9). Let $k \geq 2$, then all the vectors in E_{8k} of length $\sqrt{2}$ are $\{\pm e_i \pm e_j | i \neq j\}$. ⌟

Remark (20.4.1.10). For more examples of self-dual lattices, see[Ser73]Chap5. ⌟

Prop. (20.4.1.11) [Theta Function for Self-Dual Even Lattices]. Let $\Gamma \subset V$ be a self-dual even lattice(20.4.1.7), then the dimension n of V is divisible by 8, and the theta function $\theta_\Gamma(z) \in M_{n/2}(\Gamma(1))$. ⌟

Proof: We first show that

$$\theta_\Gamma(-1/z) = (-\mathrm{i}\, z)^{n/2} \theta_\Gamma(z)$$

and because both sides are holomorphic functions on $\mathcal{H}$, it suffices to show this for $z = it, t > 0$. Thus it suffices to show

$$\Theta_\Gamma(t^{-1}) = t^{-n/2} \Theta_\Gamma(t).$$

And this is just(20.4.1.4), because Γ is self-dual(20.4.1.7).

Then $\theta_\Gamma[ST]_{n/2} = (-\mathrm{i})^{n/2} \theta_\Gamma$(20.2.1.10), but $(ST)^3 = 1$, so $(-\mathrm{i})^{3n/2} = 1$, so $8|n$, and $\theta_\Gamma \in M_{n/2}(\Gamma(1))$. □

Thm. (20.4.1.12) [Siegel's Mass Formula]. Cf.[Chao Li]. ⌟

Prop. (20.4.1.13) [Theta Function for Non-Even Self-Dual Lattices]. If we consider theta function for non-even self-dual lattices in $\mathbb{R}^n$, then we get a modular form of weight $n/2$ w.r.t. the subgroup of $\mathrm{SL}(2, \mathbb{Z})$ generated by the elements S and T^2. This image of this subgroup has index 3 in $\mathrm{PSL}(2, \mathbb{Z})$, and it has two cusps, thus two Eisenstein series.

In particular, we can apply this to the lattice $\{e_i\}$, and use this information to obtain formula giving the number of ways to represent an integer into a sum of n squares. ⌟

Proof: □

Twisted Theta Functions

2 Jacobi Forms

Cf.[Jacobi Forms, Zagier].

Def. (20.4.2.1)[Jacobi Forms]. A **Jacobi form** for $\mathrm{SL}(2,\mathbb{Z})$ is a holomorphic function $\varphi:\mathscr{H}\times\mathbb{C}\to\mathbb{C}$ s.t.

- For any $\begin{bmatrix}a & b\\ c & d\end{bmatrix}\in\mathrm{SL}(2,\mathbb{Z})$,

$$\varphi(\frac{a\tau+b}{c\tau+d},\frac{z}{c\tau+d})=(c\tau+d)^k e^{2\pi\mathrm{i}\,\frac{mcz}{c\tau+d}}\varphi(\tau,z).$$

- For any

⌟

Prop. (20.4.2.2). The theta functions $\theta_{\Gamma,x_0}(\tau,z)$ defined in(20.4.1.3) is a Jacobi form of weight rank $\Gamma/2$ and index (x_0,x_0). ⌟

3 Theta Lifts

References are [Borcherds] and [Borcherds Products on 0(2, l) and Chern Classes of Heegner Divisors].

20.5 Adelic Automorphic Representations

Main references are [Bum98], [Gan07], [G-H11], [Borel, Casselman, Automorphic forms, representations and L-function (Corvallis)], [Automorphic Forms on GL(2), Jacquet and Langlands(1970)]. [Introduction to Langlands Program, Cogdell].

Notation (20.5.0.1).

- Use notations defined in Adeles and Ideles.
- Use notations defined in Admissible Representations of $\mathrm{GL}(n)$ over p-Adic Number Fields.
- Use notations defined in Arithmetic of Algebraic Groups.
- Use notations defined in Automorphic Representations over Archimedean Local Fields.
- Fix a global field F and let $\mathbf{A} = \mathbf{A}_F$.
- Fix a linear algebraic group $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/F$ with center Z.
- Fix a central character $\omega : Z(\mathbf{A}_F)/Z(F) \to \mathbb{C}^\times$. Notice if $G = \mathrm{GL}(2)$, ω is just a Hecke character.

⌟

Def. (20.5.0.2) [Lie Algebra]. Let $\mathfrak{g}_\infty = \mathrm{Lie}(G(\mathbf{A}_\infty))$ be the Lie algebra of $G(\mathbf{A})$, $\mathcal{Z} = Z(U(\mathfrak{g}_\infty))$. ⌟

Notation (20.5.0.3) [Group-Theoretic Notations].

- If $G = \mathrm{GL}(n)$, B is the Borel subgroup of upper triangular matrices, $\mathrm{Unip}(n)$ is the subgroup of upper triangle unipotent matrices.
- M_n is the **mirabolic subgroup** of B with $a_{n,n} = 1$, which is isomorphic to $\mathrm{GL}(n-1) \ltimes \mathbb{A}^n$.
- T the group of diagonal matrices. T_1 is the subgroup of T that $a_{nn} = 1$.
- Denote w^0 the matrix$= \sum_{i=1}^n e_{i,n-i}$.
- If $n = 2$, denote $w_0 = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}, w_1 = \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}$,
$$t(y) = \begin{bmatrix} y & \\ & y^{-1} \end{bmatrix}, \quad n(z) = \begin{bmatrix} 1 & z \\ & 1 \end{bmatrix} \quad y \in F^*, z \in F.$$
following5.

⌟

Def. (20.5.0.4). For $\alpha \in F^{n-1}$, let $\psi_{N,\alpha}$ be a character of $N(F)$ given by $\psi_N(g) = \sum_i \psi(\alpha_i g_{i,i+1})$. For $\alpha = (1, \ldots, 1)$, denote $\psi_{N,\alpha}$ by ψ_N. ⌟

Def. (20.5.0.5) [Global Norm]. Take an embedding $G \hookrightarrow \mathrm{GL}(n)$ over F. Define the norm on $G(\mathbf{A}_F)$ by
$$||g|| = \prod_v \max(|g_{ij}|_v, |g_{ij}^{-1}|_v).$$
Notice in non-Archimedean places $||g||_v = 1$ for $g \in GL(m, \mathcal{O}_v)$, so it is definable. ⌟

Remark (20.5.0.6) [Delete]. The reason to formulate automorphic forms in the Adelic setting:

1: we want a theory that deals with $\mathcal{A}(G, \Gamma)$ for all choices of Γ simultaneously.

2: we want a framework in which the roles of the $(\mathfrak{g}, K)$-action and the $\mathcal{H}(G, \Gamma)$-action are parallel, i.e. so that they are actions of the same kind.

3: To describe the process of attaching an L-function to a classical modular form in terms of representation theory, it is cleanest to use the adelic framework, as demonstrated in Tate's thesis.

4: The questions about the absolute Galois group $\mathrm{Gal}_{\mathbb{Q}}$, like what finite groups are quotients of $\mathrm{Gal}_{\mathbb{Q}}$, or where there extensions of $\mathbb{Q}$ with given ramification conditions, can be understood via automorphic forms. And automorphic forms can be understood via Langlands dual groups. ⌟

1 Automorphic Representations

Admissible Representations and Tensor Product Theorem

Def. (20.5.1.1) [Admissible Representations]. A **smooth representation** of $G(\mathbf{A}_F)$ is defined to be a commuting smooth $G(A_f)$-action and a $(\mathfrak{g}_\infty, K_\infty)$-module structure(15.4.3.5). The category of smooth representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Rep}^{\mathrm{alg}}(G/F)$.

Any $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(G(\mathbf{A}_F))$ induces a representation of $K = K_f \times K_\infty$. Then this representation is called an **admissible representation** iff every vector is K-finite, and for any irreducible representation ρ of K, $\dim V^\rho < \infty$. By(18.1.5.25), it can be checked that this is equivalent to: for any irreducible representation ρ_∞ of K_∞ and an open compact subgroup $U \subset K_f$, $\dim V^{\rho_\infty} \cap V^U < \infty$. The category of admissible representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Rep}^{\mathrm{adm}}(G/F)$. ⌟

Def. (20.5.1.2) [Restricted Tensor Representation]. Given a set of locally compact groups G_v and a.e. their compact subgroups K_v, $(\rho_v, V_v) \in \mathrm{Rep}^{\mathrm{alg}}(G_v), \xi_v^0 \in V_v^{K_v}$ are given for a.e. v, then we can define the **restricted tensor representation**

$$(\rho, V) = \bigotimes_v{}' (\rho_v, V_v, \xi_v^0)$$

of $G(\mathbf{A}_F) = \prod'(G_v, K_v)$ on $\otimes_v' V_v$ by

$$\rho(\otimes_v g_v)(\otimes_v \xi_v) = \otimes_v \rho_v(g_v)\xi_v.$$

⌟

Def. (20.5.1.3) [Global Hecke Algebra]. For $v \in \Sigma_F$, let $\mathcal{H}_{G(F_v)}$ be the Hecke algebras constructed in(18.1.5.12) and(18.9.4.11). As $\mathcal{H}_{G(F_v)}$ has a spherical idempotent $e_v^0 = e_{K_v}$(20.5.1.1), we can define the **global Hecke algebra**

$$\mathcal{H}_{G(\mathbf{A}_F)} = \bigotimes_v{}' (\mathcal{H}_{G(F_v)}, e_v^0).$$

Then by definition of representations in(20.5.1.12) and(18.9.4.12)(18.1.5.16),

$$\mathrm{Rep}^{\mathrm{alg}}(G(\mathbf{A}_F)) = \mathrm{Rep}^{\mathrm{alg}}(\mathcal{H}_{G(\mathbf{A}_F)}).$$

⌟

Thm. (20.5.1.4) [Tensor Product Theorem, Flath]. For $(\rho, V) \in \mathrm{Irr}^{\mathrm{adm}}(G/F)$, there exists uniquely for each $v \in \Sigma_F^\infty$ a $(\rho_v, V_v) \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}_\infty, K_v))$, and for each $v \in \Sigma_F^{\mathrm{fin}}$ a $(\pi_v, V_v) \in \mathrm{Irr}^{\mathrm{alg}}(G(F_v))$ s.t. for a.e. v, V_v contains a non-zero K_v-fixed vector ξ_v^0, and

$$(\rho, V) = \bigotimes{}' (\rho_v, V_v, \xi_v^0).$$

Conversely, any such a restricted tensor product is in $\mathrm{Irr}^{\mathrm{adm}}(G/F)$. ⌟

Proof: By considering the global Hecke algebra, this follows immediately from(20.5.1.3) and(18.9.4.12)(18.1.5.16) □

Cor. (20.5.1.5)[Contragradient Representations]. For any $\rho = \otimes_v \rho_v \in \mathrm{Irr}^{\mathrm{adm}}(G/F)$, we can define the **contragradient** of ρ as $\widehat{\rho} = \otimes_v \widehat{\rho_v}$(18.1.2.7) $\in \mathrm{Irr}^{\mathrm{adm}}(G/F)$. ⌟

Cor. (20.5.1.6)[Irreducible Representations of K].

$$\mathrm{Irr}(K) = \bigotimes_v{}' \mathrm{Irr}(K_v).$$

⌟

Proof: This is similar to the proof of(20.5.1.4). □

Automorphic Representations

Def. (20.5.1.7) [L^2-Space]. Define $L^2(G/F, \omega)$ the space of all measurable functions φ on $G(A)$ that satisfies

$$\varphi(zg) = \omega(z)\varphi(g), \forall z \in Z(A), \quad \varphi(\gamma g) = \varphi(g), \forall \gamma \in G(F)$$

and square integrable module the center:

$$\int_{Z(A)G(F)\backslash G(A)} |\varphi(g)|^2 dg < \infty.$$

Then the right action of $G(A)$ on $L^2(G(F)\backslash G(A), \omega)$ is continuous, by(11.10.2.9). ⌟

Def. (20.5.1.8) [Cuspidality]. A function $\varphi \in L^2(G(F)\backslash G(\mathbf{A}_F), \omega)$ is called **cuspidal** iff for any proper parabolic subgroup $P = MU$, where U is the unipotent radical,

$$\int_{U(F)\backslash U(\mathbf{A}_F)} \varphi(ng)dn = 0$$

a.e. $g \in G(\mathbf{A}_F)$. The closed space of all cuspidal elements in $L^2(G(F)\backslash G(\mathbf{A}_F), \omega)$ is denoted by $L^2_0(G(F)\backslash G(A), \omega)$. $L^2_0(G(F)\backslash G(A), \omega)$ is stable under the right action of $G(A)$.

Thus a function $\varphi \in L^2(GL(n, F)\backslash GL(n, \mathbf{A}_F), \omega)$ is cuspidal iff

$$\int_{M_{r\times s}(F)\backslash M_{r\times s}(A)} \varphi(\begin{bmatrix} I_r & X \\ & I_s \end{bmatrix} g)dX = 0$$

a.e. g for any $r + s = n, 1 < r < n$, as these are the maximal proper parabolic subgroups of $\mathrm{GL}(n)$. ⌟

Def. (20.5.1.9)[Smooth Functions on $G(\mathbf{A}_F)$].

- The space $C^\infty(G(\mathbf{A}_F))$ of **smooth functions on** $G(\mathbf{A}_F)$ is defined to be the restricted tensor product $\bigotimes' C^\infty(G_v)$ w.r.t. $f_{v,0} = \chi_{\mathscr{K}_v}$.
- The space $C_c^\infty(G(\mathbf{A}_F))$ of **compactly supported smooth functions on** $G(\mathbf{A}_F)$ is defined to be the restricted tensor product $\bigotimes' C_c^\infty(G_v)$ w.r.t. $f_{v,0} = \chi_{K_v}$. $C_c^\infty(G(A))$ acts on $L^2(G(F)\backslash G(\mathbf{A}_F), \omega)$.

- $G(\mathbf{A}_F)$ acts on $C^\infty(G(\mathbf{A}_F))$ by right translation, and induces an action of $\mathfrak{g}_\infty$ thus an action of $U(\mathfrak{g}_\infty)$ on it. A function f is called $\mathcal{Z}$-finite if it is contained in a f.d. space that is invariant under the action of $\mathcal{Z}$.
- A **K-finite function** $f \in C^\infty(G(\mathbf{A}_F))$ is a vector that is contained in a f.d. space that is right-invariant under K. Equivalently, it is $\mathcal{K}_\infty$-finite and is right-invariant under an open compact subgroup of $G(A_f)$.
- A function $f \in C^\infty(G(\mathbf{A}_F))$ is said to **have moderate growth** iff $|f(g)| \le C||g||^N$(20.5.0.1) for some constant $C > 0$ and any $g \in G(\mathbf{A}_F)$.
- A function $f \in C^\infty(G(\mathbf{A}_F))$ is said to be **rapidly decreasing** if for any $k \in \mathbb{Z}_+$, $|f(g)| \le C_k||g||^{-k}$ for any $g \in G(\mathbf{A}_F)$ and some constant C_k.

⌟

Def. (20.5.1.10) [Adelic Automorphic Forms]. We denote by $\mathcal{A}(G/F,\omega)$ the space of **adelic automorphic forms** consisting of smooth functions on $G(\mathbf{A}_F)$(20.5.1.9) that satisfies

- $\varphi(zg) = \omega(z)\varphi(g), \forall z \in Z(A), \quad \varphi(\gamma g) = \varphi(g), \forall \gamma \in G(F)$.
- K-finite and $\mathcal{Z}$-finite(20.5.1.9).
- of moderate growth(20.5.1.9).

And the space $\mathcal{A}_0(G/F,\omega)$ of **cusp forms** the automorphic forms that is cuspidal in sense of(20.5.1.8). $\mathcal{A}(G/F,\omega)$ is a $(\mathfrak{g}_\infty, K_\infty)$-module, and $G(A_F^f)$ acts smoothly on it. The subspace $\mathcal{A}_0(G/F,\omega)$ is stable under both actions. ⌟

Prop. (20.5.1.11) [Analytic Properties]. Any automorphic form f is real analytic when restricted to $G(\mathbf{A}_\infty)$, and is of moderate growth.

Any cusp form f is rapidly decreasing. In particular, $f \in L^2_0(G/F)$ if G is semisimple. ⌟

Proof: It is real analytic by(20.1.1.29). The growth condition reduces immediately to the Archimedean case(20.1.3.7). □

Def. (20.5.1.12) [Automorphic Representations]. $\mathcal{A}(G/F,\omega)$ and $\mathcal{A}_0(G/F,\omega)$ afford smooth representations of $GL(n,A)$ by definition(20.5.1.10). So we define an **automorphic representation** to be an irreducible smooth representation of $G(A)$ that can be realized as a quotient of a subrepresentation of $\mathcal{A}(G/F,\omega)$, and an **automorphic cuspidal representation** to be an irreducible smooth representation of $G(\mathbf{A}_F)$ that can be realized as a subrepresentation of $\mathcal{A}_0(G(F)\backslash G(\mathbf{A}),\omega)$. The category of automorphic representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Irr}^{\mathrm{auto}}(G/F,\omega)$. The category of cuspidal representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Irr}^{\mathrm{cusp}}(G/F,\omega)$. ⌟

Remark (20.5.1.13). There is a general method of constructing subrepresnetations of $\mathcal{A}(G(F)\backslash G(A),\omega)$ using Eisenstein series**?**, but no known methods for constructing subrepresnetations of $\mathcal{A}_0(G(F)\backslash G(A),\omega)$. ⌟

Thm. (20.5.1.14) [Automorphic Representations are Admissible, Harish-Chandra].

$$\mathrm{Irr}^{\mathrm{cusp}}(G/F,\omega) \subset \mathrm{Irr}^{\mathrm{auto}}(G/F,\omega) \subset \mathrm{Irr}^{\mathrm{adm}}(G/F).$$

⌟

Proof: Le $V_1 \subset V_2 \subset \mathcal{A}(G(F)\backslash G(A),\omega)$ be submodules s.t $V_2/V_1 \cong \pi$, then we can assume V_2 is generated by an element $f \in V_2\backslash V_1$, because otherwise change V_2 by the submodule V_2' generated by f and V_1 by $V_1 \cap V_2'$.

f is killed by an ideal J_∞ of finite codimension in $\mathcal{Z}_\infty$, and is invariant under the action of a compact open subset $U \subset G(\mathbf{A}_F^f)$. Let

$$G(F)\backslash G(A)/U = \coprod_i \Gamma_i\backslash G(A_\infty)$$

as in(15.4.3.13), then there is an isomorphism of $(\mathfrak{g}_\infty, K_\infty)$-modules

$$\mathcal{A}(G(F)\backslash G(A),\omega,J_\infty)^U \cong \oplus_i \mathcal{A}(\Gamma_i\backslash G(A_\infty),1,\omega_\infty,J_\infty)(20.1.4.10),$$

which is admissible by the fundamental theorem of Harish-Chandra(20.1.4.10). Thus $V_2 \subset \mathcal{A}(G(F)\backslash G(A),\omega,J)^U$ is also admissible. □

2 $\mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$

Main references are [Bum98]Chap3.

Basics

Prop. (20.5.2.1). $GL(n,\mathbf{A}_F)$ is unimodular. ⌟

Proof: This is because $GL(n,F_v)$ is unimodular for any $v \in \Sigma_F$ and because we can calculate the restricted product measure by(14.4.4.5). □

Def. (20.5.2.2) [Congruence Subgroups]. For $N \in \mathbb{Z}_+$, define the congruence subgroup(15.4.2.3) $\mathcal{K}_0(N) \subset GL(2,\mathbf{A}_F^f)$ as follows: $\mathcal{K}_0(N) = \prod_{v\in\Sigma_F^{\mathrm{fin}}} \mathcal{K}_0(N)_v$, where

$$\mathcal{K}_0(N)_v = \begin{cases} GL(2,\mathcal{O}_v) & v \nmid N \\ \mathcal{K}_0(N_v) \subset F_v(18.11.1.8) & v | N \end{cases}$$

⌟

Prop. (20.5.2.3). If $F = \mathbb{Q}$, then the inclusion induces homeomorphisms

$$\Gamma_0(N)\backslash GL(2,\mathbb{R})^+ \cong GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N).$$

$$\Gamma_0(N)\backslash SL(2,\mathbb{R}) \cong GL(2,\mathbb{Q})Z(A)\backslash GL(2,A)/K_0(N)$$

Thus the definition of congruence subgroups(20.2.1.3) are compatible with that of(15.4.3.13) ⌟

Proof: Because $\mathrm{Cl}(\mathbb{Q}) = 1$ and $\det(\mathcal{K}_0(N)) = \prod_{v\in\Sigma_F^{\mathrm{fin}}} \mathcal{O}_v^*$, item3 of(15.4.3.12) shows

$$GL(2,A) = GL(2,\mathbb{Q})GL(2,\mathbb{R})K_0(N) = GL(2,\mathbb{Q})GL(2,\mathbb{R})^+K_0(N),$$

so the map

$$GL(2,\mathbb{R})^+ \to GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N)$$

is surjective. Now if g_∞' and g_∞ has the same image, then $g_\infty' = \gamma g_\infty k_0$, so $g_\infty' = \gamma_\infty g_\infty, \gamma_f = k_0^{-1}$. Then γ_∞ belongs to $\Gamma_0(N)$. Thus there is a bijection

$$\Gamma_0(N)\backslash GL(2,\mathbb{R})^+ \cong GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N).$$

2 follows from 1 by modulo the center. □

Cor. (20.5.2.4). The quotient space $GL(n,F)Z(A)\backslash GL(n,A)$ has finite measure. ⌟

Proof: For the general case, Cf.[Humphreys, Arithmetic Groups, (1980)?].

Because $K_0(N)$ is compact, it suffices to prove that $GL(n,F)Z(A)\backslash GL(n,A)/K_0(N)$ has finite measure(because $GL(n,F)$ and $GL(n,A)$ are both unimodular, the measure is compatible). But this space is homeomorphic to $\Gamma_0(N)\backslash SL(2,\mathbb{R})$, which has finite measure because $\Gamma(1)\backslash SL(2,\mathbb{R})$ does and $\Gamma_0(N)$ is of finite index in $\Gamma(1)$. □

Def. (20.5.2.5) [Global Siegel Sets]. For $c,d>0$, then the global Siegel set $\mathfrak{S}_{c,d}=K_f\times\mathfrak{S}_{c,d,\infty}$??. And denote $\overline{\mathfrak{S}_{c,d}}$ its image in $Z(A)\backslash GL(2,A)$. ⌟

Prop. (20.5.2.6). For c,d suitable chosen, $GL(2,A)=GL(2,F)\mathfrak{S}_{c,d}$. ⌟

Proof: We prove only for $F=\mathbb{Q}$?: This is true for $c\leq\sqrt{3}/2$ and $d\geq 1$ because of the shape of the fundamental domain of $GL(2,\mathbb{R})$ for $SL(2,\mathbb{Z})$(20.2.1.10). □

Prop. (20.5.2.7) [Contragradient Representations]. For $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}\,/\,\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega)$,

- its contragradient $(\widehat{\pi},\widehat{V})\in\mathrm{Irr}^{\mathrm{adm}\,/\,\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega^{-1})$, and $\widehat{V}$ can be chosen to be the space of all functions $g\mapsto\varphi(g^{-t})$.
- if $n=2$, then $\widehat{\pi}\cong\pi\otimes(\omega^{-1}\circ\det)$.

⌟

Proof: It suffices to analyze each place. Notice for cuspidal representations, it suffices to show for finite places, because we can use strong multiplicity one(20.5.3.8).

For admissible case we only prove for $n=2$ and F totally real(the problem is we haven't studied $\mathbb{C}$).?

Let $\widehat{V}$ be the space of functions of the form $\widehat{\varphi}(g)=\varphi(g^{-t})$, then the right action of G on $\widehat{V}$ corresponds back to the restriction of the right action composed with the automorphism $g\mapsto g^{-t}$. Thus the result follows from(18.11.1.15) and its Archimedean analogy for $(\mathfrak{g}_\infty,K_\infty)$-modules(18.9.3.35). □

Spectral Problem

Prop. (20.5.2.8) [Gelfand, Graev and Piatetski-Shapiro]. Let $\varphi\in C_c^\infty(GL(n,A))$, then

- There exists a constant $C(\varphi)$ that for all $f\in L_0^2(GL(n,F)\backslash GL(n,A),\omega)$, we have $||\rho(\varphi)f||_{C(G)}\leq C(\varphi)||f||_2$.
- $\rho(\varphi)$ is a compact operator on $L_0^2(GL(n,F)\backslash GL(n,A),\omega)$.

⌟

Proof: The proof is the same as that of(20.1.4.6), but use global Siegel sets(20.5.2.5), Cf.[Bump, P297]?. □

Cor. (20.5.2.9) [$L_0^2(GL(n,F)\backslash GL(n,A),\omega)$ Totally Decomposable]. The space $L_0^2(GL(n,F)\backslash GL(n,A),\omega)$ decomposes into a Hilbert space direct sum of irreducible invariant subspaces over $GL(n,A)$. ⌟

Proof: The proof is exactly the same as(20.1.4.2), but where we use(20.5.2.8) in place of(20.8.2.1) and lemma?? in place of lemma(18.9.4.1). □

Prop. (20.5.2.10) [Irreducible Cuspidal Representations Admissible]. If $(\pi, V) \in \mathrm{Irr}^{\mathrm{uni}}(GL(n,A))$ is contained in the decomposition of $\mathcal{H} = L_0^2(GL(n,F)\backslash GL(n,A),\omega)$ in(20.5.2.9), then $V^{K-\mathrm{fin}} \subset V$ is dense, $V^{K-\mathrm{fin}} \subset \mathcal{A}_0(GL(n,F)\backslash GL(n,A),\omega) \in \mathrm{Rep}^{\mathrm{alg}}(\mathrm{GL}(n)/F,\omega)$.

In particular,

$$\mathcal{A}_0(GL(n,F)\backslash GL(n,A),\omega) \subset L_0^2(GL(n,F)\backslash GL(n,A),\omega),$$

and

$$\mathcal{A}_0(GL(n,F)\backslash GL(n,A),\omega) = \bigotimes_{\pi\in\mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega)} m_\pi \pi$$

by(20.5.1.11) and(20.5.2.9). ⌟

Proof: This is general by(18.9.4.4), and for the containment in $\mathcal{A}_0$ by a similar argument as in(20.1.4.8) using a similar lemma as lemma(20.1.4.7).

The irreducible smooth $GL(n,A)$-representations are admissible by(20.5.1.14). □

Adelization

Prop. (20.5.2.11) [Global Hecke Algebra]. There are isomorphisms

$$\Gamma_0(N)\backslash G_0(N)/\Gamma_0(N)(20.2.1.6) \cong \prod_{v\in\mathbf{P}\backslash S_f(N)}' K_v\backslash GL(2,\mathbb{Q}_v)/K_v.$$

$$\Gamma_0(N)\backslash G_0(N) \cong \prod_{v\in\mathbf{P}\backslash S_f(N)}' K_v\backslash GL(2,\mathbb{Q}_v)$$

which induces an isomorphism $\mathcal{R}_N \cong \prod_{v\in\mathbf{P}\backslash S_f(N)} \mathcal{H}_{K_v}$ (20.2.2.2)(18.11.1.13). ⌟

Prop. (20.5.2.12) [Adelization of Maass Forms]. Let χ be a Dirichlet character (mod N) and ω be the adelized Hecke character of χ(14.4.4.32), then define a character λ_d of $K_0(N)$(20.5.2.2) by

$$\lambda_d(\begin{bmatrix} a & b \\ c & d\end{bmatrix}) = \prod_{v\in S_f(N)} \omega_v(d_v).$$

By(20.5.2.3) there is a homeomorphism

$$\Gamma_0(N)\backslash GL(2,\mathbb{R})^+ \cong GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N),$$

which induces a map

$$f\mapsto \varphi_f : C^\infty(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi_d|\cdot|^\lambda) \to C^\infty(GL(2,\mathbb{Q})\backslash GL(2,A),\omega|\cdot|^\lambda) : \varphi(\gamma g_\infty k_0) = f(g_\infty)\lambda_d(k_0)$$

and this map identifies K-finiteness, $\mathcal{Z}$-finiteness and moderate growth, thus induces a map

$$\mathcal{A}(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi_d) \to \mathcal{A}(GL(2,\mathbb{Q})\backslash GL(2,A),\omega)$$

compatible with $(\mathfrak{g}_\infty, K_\infty)$-action, and the image are the automorphic forms satisfying $\pi(k_0)\varphi = \lambda(k_0)\varphi$ for $k_0 \in K_0(N)$.

This map also identifies cuspidality, thus it induces a map

$$\mathcal{A}_0(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi_d) \to \mathcal{A}_0(GL(2,\mathbb{Q})\backslash GL(2,A),\omega)$$

⌟

Proof: To show that $\varphi_f(zg) = \omega(z)\varphi_f(g)$ for $z \in A^*$, notice by(14.4.4.30), $Z(A^\times) = Z(\mathbb{Q}^\times)Z(\mathbb{R}_+^\times)(Z(A)\cap K_0(N))$, and for these elements $\varphi_f(zg) = \lambda(z)\varphi_f$, as ω is trivial on $\prod_{v\notin S_f(N)}\mathcal{O}_v^\times$.

It identifies moderate growth because $A^\times = \mathbb{Q}^\times\mathbb{R}_+^\times\prod_{v\nmid\infty}\mathcal{O}_v^\times$ again.

To show cuspidality, notice $x\mapsto \gamma(\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)$ is left-invariant under a if $g^{-1}\begin{bmatrix}1 & a\\ & 1\end{bmatrix}g\in K_0(N)$. but such a is open in A, thus contains some open compact subgroup $U_f\subset A_f$. Notice by strong approximation, $A = \mathbb{Q}\times\mathbb{R}\times U_f$, thus there is an isomorphism $\mathbb{R}/M\cong A/FU_f$. Now let $g = \gamma g_\infty k_0$, then

$$\int_{A/F}\varphi_f(\begin{bmatrix}1 & a\\ & 1\end{bmatrix}g) = C\int_{\mathbb{R}/M}\varphi_f(\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)dx = C\lambda(k_0)\int_0^M f(\gamma^{-1}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}\gamma g_\infty),$$

which vanishes for each g iff f is cuspidal at every cusp. For similar reason, φ_f is of moderate growth iff f is of moderate growth at every cusp. □

Remark (20.5.2.13). Similar isomorphism happens for more general congruence subgroups, for example, we can change $\Gamma_0(N)$ to $\Gamma_1(N)$ and change $K_0(N)$ to

$$U_1(N) = \{\begin{bmatrix}a & b\\ c & d\end{bmatrix}\in \mathrm{GL}(2,\widehat{\mathbb{Z}}) : c\equiv 0(\mathrm{mod}\ \ N), d\equiv 1(\mathrm{mod}\ \ N)\}.$$

⌟

Prop. (20.5.2.14) [Strong Multiplicity One].
- Let f be a cuspidal eigenfunction in $\mathcal{A}_0(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi)$ of a.e. Hecke operators T_p for $p\nmid N$, then φ_f lies in an irreducible subspace of $L_0^2(GL(2,F)\backslash GL(2,A),\omega)$.
- If f, g are cuspidal eigenfunctions for a.e. Hecke operators in $\mathcal{A}_0(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi)$ of a.e. Hecke operators T_p for $p\nmid N$, then $f = g$.

In particular, any Hecke eigenform generates a cuspidal representation. ⌟

Proof: 2: By(20.5.2.9), consider the projection of φ_f to any irreducible cuspidal representation π. By(20.5.2.11), φ_f is an eigenform of the Hecke operator T_p. But it is also eigenvalues of the Hecke operator R_p, But $\mathcal{H}_{\mathbb{Q}_p}$ is generated by T_p, R_p, R_p^{-1} by(20.2.2.10), so π_p is spherical with determined eigenvalues. But then π_v is determined by(3.6.4.12). Then π is determined by strong multiplicity one(20.5.3.8).

1 follows from 2 because if π is a component of $L_0^2(GL(2,F)\backslash GL(2,A),\omega)$ that the projection of φ_f is non-zero, then it has the same Hecke eigenvalue as φ_f, so it must be just φ_f by item2.

Cf.[Bump, P344]. □

Remark (20.5.2.15). WARNING: This is in general not true for groups other than $\mathrm{GL}(n)$. This is related to the theory of L-packets and A-packets.? ⌟

Remark (20.5.2.16) [Adelized Maass Forms]. Notice if f comes from a Maass form, then [G-H11] documented the properties of the adelized Maass form φ_f in detail. ⌟

Ramanujan Conjecture

Conj. (20.5.2.17) [Ramanujan]. If ω is unitary and $\rho = \otimes'\rho_v\in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega)$, then for any $v\in\Sigma_F$, ρ_v is tempered(18.11.6.3). ⌟

Proof: □

Prop. (20.5.2.18). The Ramanujan conjecture(20.5.2.17) implies the Ramanujan-Petersson conjecture(21.3.6.16). ⌟

Proof: The Ramanujan-Petersson conjecture says the eigenvalue λ_p of T_p on f satisfies $|\lambda_p| \leq 2p^{1/2}$. Consider the irreducible cuspidal representation π_f generated by φ_f(20.5.2.14), then T_p is the same as the eigenvalue of the local Hecke algebra T_p on φ_f. But $\pi_{f,p}$ is unramified, thus by(18.11.6.10) it is unitary principal or complementary. But notice if the Satake parameters of $\pi_{f,p}$ are α_i, then $\lambda_p = p^{1/2}(\alpha_1 + \alpha_2)$, Then it suffices to show that $|\alpha_1 + \alpha_2| \leq 2$, which is equivalent to π_p being tempered(18.11.6.10). □

Conj. (20.5.2.19)[Generalized Ramanujan Conjecture]. Let G be a reductive group over a global field F, and $\pi \in \mathrm{Irr}^{\mathrm{cusp},generic}(G/F, \omega)$, then π is tempered. Notice this implies the Ramanujan conjecture, as any $\rho \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega)$ is generic(20.5.3.3). ⌟

Proof: □

Remark (20.5.2.20) [Arthur Conjecture]. In fact, Arthur extends this conjecture further, and explains the extent of failure of the Ramanujan conjecture for irreducible representations in the discrete spectrum of $L^2(G(\mathbb{F})\backslash G(\mathbb{A}))$, as well as the multiplicities in the discrete spectrum. ⌟

3 Whittaker Models

Def. (20.5.3.1)[Whittaker Models]. The notion of **Whittaker model** and **Whittaker functional**, genericness the same as in the local case(18.11.3.1). ⌟

Prop. (20.5.3.2)[Global uniqueness of Whittaker Models]. Let (π, V) be an irreducible admissible representation of $GL(2, A)$, then (π, V) has a Whittaker model w.r.t ψ iff each (π_v, V_v)(20.5.1.4) has a Whittaker model $\mathcal{W}(\pi_v, \psi_v)$. If this is the case, then $\mathcal{W}(\pi, \psi)$ is unique and

$$\mathcal{W}(\pi, \psi) = \bigotimes{}' (W_v, W_v^0)$$

where W_v^0 are the unique spherical function(18.11.5.15) of $\mathcal{W}_v$ normalized s.t. $W_v^0(K_v) = 1$. ⌟

Proof: Let $(\pi, V) = \otimes_v'(\pi_v, V_v)$ w.r.t a.e. spherical vectors ξ_v^0 by tensor product theorem(20.5.1.4), and (π_v, V_v) are spherical a.e. v.

Firstly if every (π_v, V_v) has a Whittaker model, the W in the proposition is truly a Whittaker model: functions in $\mathcal{W}(\pi, \psi)$ are clearly smooth and K-finite, and they have moderate growth because each local part is, and for a.e. v, $\mathcal{W}_v(\pi, \psi)$ is compactly supported on $|x|_v \leq 1$. And there is a canonical isomorphism of V onto $\mathcal{W}(\pi, \psi)$ by letting $(W_\xi)_v = W_v^0$ if $\xi_v = \xi_v^0$ and

$$W_\xi(g) = \prod_v W_{v,\xi_v}(g_v).$$

This is definable because $g_v \in K_v$ for a.e. v thus $W_{v,\xi_v}(g_v) = W_v^0(g_v) = 1$ for a.e. v.

Because the local Whittaker models are all rapidly decreasing, and the spherical Whittaker model vanishes for $|\xi_v|_v > 1$, thus W is also rapidly decreasing, and is a Whittaker model for π.

Secondly if $\mathcal{W}$ is a Whittaker model for (π, V), denote $\xi \mapsto W_\xi$ the isomorphism of V onto $\mathcal{W}$. Notice there exists some $\xi \in V$ that $W_\xi(1) \neq 0$: if $W_\xi(g_\infty g_f) \neq 0$, then $W_{\pi(g_f)\xi}(g_\infty) \neq 0$, and argue the same way as in(20.1.3.4). We may assume $\xi^0 = \otimes_v \xi_v^0$ that $W_{\xi^0}(1) = 1$.

Consider the "pullback" of W to $GL(n,F_v)$ via ξ, then they are clearly Whittaker models for (π_v,V_v) thus unique(15.4.1.5)(20.1.3.3), and also $W_{v,\xi_v^0}(1)=1$. So W_v^0 exists a.e. uniquely. Now we prove W is of the form we said above, this will prove uniqueness.

Then we need to prove

$$W_\xi(g)=\prod_v W_{v,\xi_v}(g_v)$$

We only need to prove for one $\xi=\xi^0$, because $\mathcal{W},\mathcal{W}(\pi_v,\psi_v)$ are both irreducible. And also we can assume $g_v=1, a.e.$, because $(W_\xi)_v(g_v)=W_{v,\xi_v}(g_v)=1$, a.e.. Then we are in the finite case and we can multiply by scalars at f.m. v s.t. this equation is true and nonzero for g. □

Thm. (20.5.3.3) [Fourier Expansion and Existence of Whittaker Models, Shalika]. Given $(\pi,V)\in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega)$, for $\Phi\in V$, define

$$W_\Phi(g)=\int_{\mathrm{Unip}(n,F)\backslash\mathrm{Unip}(n,A)}\Phi(ng)\psi_N(-n)dn,$$

then $GL(n,\mathbf{A}_F)$ acts on these functions, and they form a Whittaker model $\mathcal{W}(\pi,\psi)$. $W_\Phi(g)$ is called the **Fourier-Whittaker coefficients** for Φ.

And we have a Fourier expansion formula:

$$\Phi(g)=\sum_{\gamma\in\mathrm{Unip}(n-1,F)\backslash GL(n-1,F)}W_\Phi(\begin{bmatrix}\gamma&\\&1\end{bmatrix}g),$$

which converges absolutely and uniformly on compact subsets of $GL(n,\mathbf{A}_F)$. ⌟

Remark (20.5.3.4). This is false for some other groups, for the reason that the Fourier inversion may not be true, thus it map happen that all the Fourier coefficients vanish. For example, holomorphic Siegel modular forms on $\mathrm{Sp}(2n)$ don't have Whittaker models. ⌟

Proof: We only prove for $n=2$. For general case, see the beautiful paper[Sha74] of Shlika**?**.

For any $g\in GL(n,A)$, consider $F(n)=\varphi(ng)$ on $N(A)$, then it is a continuous function on $N(F)\backslash N(A)$, and $N(F)\backslash N(A)$ is compact(14.4.4.12), so by Fourier inversion formula(11.10.3.17),

$$F(x)=\sum_{\alpha\in F}C(\alpha)\psi(\alpha x),\quad C(\alpha)=\int_{\mathrm{Unip}(n,F)\backslash\mathrm{Unip}(n,A)}\varphi(\begin{bmatrix}1&x\\&1\end{bmatrix}g)\psi(-\alpha x)dx.$$

Now $C(0)=0$ because φ is cuspidal, and if $\alpha\in F^\times$, as φ is automorphic,

$$\begin{aligned}C(\alpha)&=\int_{\mathrm{Unip}(n,F)\backslash\mathrm{Unip}(n,A)}\varphi(\begin{bmatrix}\alpha&\\&1\end{bmatrix}\begin{bmatrix}1&x\\&1\end{bmatrix}g)\psi(-\alpha x)dx\\&=\int_{A/F}\varphi(\begin{bmatrix}1&\alpha x\\&1\end{bmatrix}\begin{bmatrix}\alpha&\\&1\end{bmatrix}g)\psi(-\alpha x)dx=W_\varphi(\begin{bmatrix}\alpha&\\&1\end{bmatrix}g).\end{aligned}$$

So if we let $x=0$, we get $\Phi(g)=\sum_{\alpha\in F^\times}W_\Phi(\begin{bmatrix}\alpha&\\&1\end{bmatrix}g)$.

Now we show $\{W_\Phi\}$ is Whittaker model: they all satisfies $W_\Phi(ng)=\psi(n)W_\Phi(g)$ by construction, and because $W_{X\varphi}=XW_\varphi$, $\rho(g)W_\varphi=W_{\rho(g)\varphi}$, it is clear that this space is invariant under action of $GL(2,A_f)$ and $(\mathfrak{g}_\infty,K_\infty)$, and also it is of moderate growth in y because φ does(20.5.1.10) and $N(F)\backslash N(A)$ is compact, and it consists of K-finite vectors because V is admissible(20.5.2.10). Finally, the Fourier inversion shows that $\varphi\mapsto W_\varphi$ is non-zero, thus injective. □

Cor. (20.5.3.5) [Cuspidal Forms Decay Rapidly]. Any cuspidal form on $GL(2,\mathbf{A}_F)$ is rapidly decreasing for $|y|\to\infty$.

Moreover, it also decays rapidly when $|y|\to 0$. ⌟

Remark (20.5.3.6). This is proved already in(20.5.1.11). ⌟

Proof: To show it is rapidly decreasing, use the Fourier expansion formula, and the fact the Whittaker model is product of local Whittaker models. Also for $v\in\Sigma_F^{\text{fin}}$, the local Kirillov model is compactly supported(18.11.3.19), and for $v\in\Sigma_F^\infty$, the Whittaker model is rapidly decreasing(20.1.3.3), notice for any $g\in GL(2,A)$, for any C, the number of $a\in K^*$ that $\varphi(\begin{bmatrix}a&\\&1\end{bmatrix}g)\neq 0$ and $|a|_\infty<C$ is bounded by a polynomial of C, thus it is rapidly decreasing.

For $|y|\to 0$, as φ is automorphic, notice

$$\varphi(\begin{bmatrix}y&\\&1\end{bmatrix})=\varphi(w_0\begin{bmatrix}1&\\&y\end{bmatrix}w_0)=\omega(y)(\pi(w_0)\varphi)(\begin{bmatrix}y^{-1}&\\&1\end{bmatrix}).$$

□

Cor. (20.5.3.7). Every local component of a cuspidal representation of $GL(n,A)$ is generic, by(20.5.3.2). ⌟

Prop. (20.5.3.8) [Strong Multiplicity One for $\mathrm{GL}(n)$]. If $(\pi,V),(\pi',V')\in\mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$ satisfy $\pi_v\cong\pi'_v$ a.e. v, then $\pi\cong\pi'$, and $V=V'\subset\mathcal{A}_0(\mathrm{GL}(n,F)\backslash GL(n,\mathbf{A}_F))$. ⌟

Proof: We only prove for $n=2$ and the case π_1,π_2 are isomorphic on Archimedean places**?**. For general n, Cf.[Representations of the Group $GL(n,K)$ where K is a local field, Gelfand-Kazhdan], [Euler Subgroups, in Lie Groups and their Representations, Piatetski-Shapiro(1975)]. For the Archimedean places, Cf.[Base Change for $GL(2)$, Langlands(1980)Lemma3.1]

Firstly if $\pi_v\cong\pi'_v$ for every place v, then their corresponding Whittaker model is the same(multiplied by a scalar) by(20.5.3.2). Then by(20.5.3.3) we have a Fourier expansion formula

$$\varphi(g)=\sum_{\alpha\in F^*}W_\varphi(\begin{bmatrix}\alpha&\\&1\end{bmatrix}g).$$

Thus $V=V'$.

In case that $\pi_v\cong\pi'_v$ only outside a finite set S, we choose functions W_v,W'_v in the local Whittaker model for π_v,π'_v s.t. if $v\notin S$, $W_v=W'_v$ and W_v is the unique spherical function normalized that $W_v(K_v)=1$ a.e. v, and if $v\in S$, they are chosen that

$$F(y)=W_v(\begin{bmatrix}y&\\&1\end{bmatrix})=W'_v(\begin{bmatrix}y&\\&1\end{bmatrix})\in C_c^\infty(F_v^\times),$$

which is possible by(18.11.3.20). And we define

$$\varphi(g)=\sum_{\alpha\in F^*}W(\begin{bmatrix}\alpha&\\&1\end{bmatrix}g),\quad \varphi'(g)=\sum_{\alpha\in F^*}W'(\begin{bmatrix}\alpha&\\&1\end{bmatrix}g),$$
$$W(g)=\prod_v W_v(g_v),\quad W'(g)=\prod_v W'_v(g_v).$$

as in(20.5.3.3).

Then we claim $\varphi=\varphi'$ on $GL(2,A)$: $\varphi\in V,\varphi'\in V'$ are automorphic, thus $\varphi=\varphi'$ on $GL(2,F)GL(2,\mathbf{A}_F^S)$ by continuity, which is just $GL(2,\mathbf{A}_F)$ by weak approximation, so we have a $\varphi\in V\cap V'$, meaning $V=V'$. □

4 Eisenstein Series

References are [Bump, Chap3].

Prop. (20.5.4.1)[Langlands]. For any $\rho \in \mathrm{Irr}^{\mathrm{auto}}(G/F, \omega)$, there exists a parabolic subgroup $P = MN$ and $\sigma \in \mathrm{Irr}^{\mathrm{cusp}}(M/F)$ that π is a subquotient of $I_P(\sigma)$. ⌟

Proof:

□

Remark (20.5.4.2). The pair (M, σ) may not be unique up to conjugacy. It is unique for $GL(n)$, by a theorem of Jacquet-Shalika, but in general it is false. For example, Waldspurger showed for $G = \mathrm{PGSp}(4)$ that there are cuspidal representations π that are abstractly isomorphic to a subquotient of some $I_P(\sigma)$ with σ cuspidal on $M = GL(2)$. These are called **CAP representations**. ⌟

20.6 Overview of the Langlands Program

1 Langlands Program

Main references are [Lan70]. Cf. Arthur's work on stabilization of trance formula, proof of the fundamental lemma by Laumon-Ngo, and inputs from Shin, Morel, Harris-etc..

Def. (20.6.1.1) [Langland Dual Groups]. For any connected reductive group G over a global field F, we want to define a complex analytic group ${}^L G_F$, and for each place $\mathfrak{p}$, a complex analytic group ${}^L G_{F_\mathfrak{p}}$, and complex analytic homomorphisms ${}^L G_{F_\mathfrak{p}} \to {}^L G_F$ defined up to conjugacy. The definition is given in [Lan70]. ⌟

Then for each complex analytic representation σ of ${}^L G_F$ and automorphic representation π of $G_{A(F)}$, we want to define an L-function

$$L(s,\sigma,\pi) = \prod_{\mathfrak{p}} L(s,\sigma_\mathfrak{p},\pi_\mathfrak{p})$$

that is convergent in some right half plane, and

$$L(s,\sigma_\mathfrak{p},\pi_\mathfrak{p}) = \prod_{i=1}^n \frac{1}{1-\alpha_i|\varpi_\mathfrak{p}|^s}$$

for any non-Archimedean plane $\mathfrak{p}$, where $n = \deg(\sigma_\mathfrak{p})$.

Also there is a functional equation

$$L(s,\sigma,\pi) = \varepsilon(s,\sigma,\pi)L(1-s,{}^L\sigma,\pi)$$

with

$$\varepsilon(s,\sigma,\pi) = \prod_{\mathfrak{p}} \varepsilon(s,\sigma_\mathfrak{p},\pi_\mathfrak{p},\psi_{F_\mathfrak{p}})$$

for any non-trivial character ψ of $F\backslash A(F)$, where the product is finite.

Conj. (20.6.1.2). Is it possible to define the local L-functions $L(s,\rho,\pi)$ and the local factors $\varepsilon(s,\rho,\pi,\psi_F)$ at the ramified primes that

$$L(s,\sigma,\pi) = \prod_{\mathfrak{p}} L(s,\sigma_\mathfrak{p},\pi_\mathfrak{p})$$

is meromorphic in the entire complex plane with only a finite number of poles and satisfies the functional equation. ⌟

Conj. (20.6.1.3). Suppose G,G' are reductive groups over the local field F and G is quasi-split and G' is an inner twist of G, then ${}^L G_F = {}^L G'_F$. Is there a correspondence $\mathrm{Irr}(G'_F) \to \mathrm{Irr}(G_F)$ s.t. if $\pi = R(\pi')$, then $L(s,\rho,\pi) = L(s,\rho,\pi')$ for any representation ρ of ${}^L G_F$? ⌟

Conj. (20.6.1.4) [Local Functorial Lifting]. Let G,G' be two quasi-split groups over the local field F. Let G split over K and K' where $F \subset K \subset K'$. Suppose $\varphi : {}^L G'_{K'/F} \to {}^L G_{K/F}$ is a complex analytic homomorphism that makes the diagram

$$\begin{array}{ccc} {}^L G'_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^L G_{K/F} & \longrightarrow & G(K/F) \end{array}$$

commutative, is there a correspondence $r_\varphi : \mathrm{Irr}(G'_F) \to \mathrm{Irr}(G_F)$ that if $\pi = R_\varphi(\pi')$, then for any representation ρ of ${}^L G_F$,

$$L(s,\rho,\pi) = L(s,\rho\circ\varphi,\pi'), \varepsilon(s,\rho,\pi,\psi_F) = \varepsilon(s,\rho\circ\varphi,\pi',\psi_F).$$

Such a correspondence is called a **functorial lifting** of π'. ⌟

Some evidences of(20.6.3.2) is given in[Lan70]P17.

Relation to Artin L-Functions

Let $F \in$ `LField` and $\psi \neq \mathbb{1} \in \chi(F)$. For any representation σ of $W_{K/F}$ we can define a local L-function $L(s,\sigma)$ and local factors $\varepsilon(s,\sigma,\psi_F)$.

If F is a global field and σ is a representation of $W_{K/F}$, then

$$L(s,\sigma) = \prod_{\mathfrak{p}} L(s,\sigma_{\mathfrak{p}}), \quad \varepsilon(s,\sigma) = \prod_{\mathfrak{p}} \varepsilon(s,\sigma_{\mathfrak{p}},\psi_{F_{\mathfrak{p}}})$$

satisfies the functional equation

$$L(s,\sigma) = \varepsilon(s,\sigma)L(1-s,{}^L\sigma).$$

Conj. (20.6.1.5). Suppose G is quasi-split over the local field F and splits over the Galois extension K. Let ${}^L U_K$ be a maximal compact subgroup of ${}^L G_F$. Let K' be a Galois extension of F containing K and let $\varphi : W_{K'/F} \to {}^L U_F$ be a homomorphism that makes the diagram

$$\begin{array}{ccc} W_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^L U_F & \longrightarrow & G(K/F) \end{array}$$

commutative, then there is an irreducible unitary representation $\pi(\varphi)$ of G_F s.t. for any representation σ of ${}^L G_F$, $L(s,\sigma,\pi(\varphi)) = L(s,\sigma\circ\varphi)$, and $\varepsilon(s,\sigma,\pi(\varphi),\psi_F) = \varepsilon(s,\sigma\circ\varphi,\psi_F)$. ⌟

Conj. (20.6.1.6). Suppose G is quasi-split over the local field F and splits over the Galois extension K. Let ${}^L U_K$ be a maximal compact subgroup of ${}^L G_F$. Let K' be a Galois extension of F containing K and let $\varphi : W_{K'/F} \to {}^L U_F$ be a homomorphism that makes the diagram

$$\begin{array}{ccc} W_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^L U_F & \longrightarrow & G(K/F) \end{array}$$

commutative. If $\mathfrak{P}'$ is a prime of K' and $\mathfrak{p} = \mathfrak{P}' \cap F$, then $\varphi_{\mathfrak{p}} = \varphi \circ \alpha_{\mathfrak{p}}$ takes $W_{K'_{\mathfrak{P}'}/F_{\mathfrak{p}}}$ into ${}^L U_{F_{\mathfrak{p}}}$. If $\pi(\varphi) = \otimes_{\mathfrak{p}} \pi(\varphi_{\mathfrak{p}})$, is $\pi(\varphi)$ an automorphic representation? ⌟

Relation to Elliptic Curves

Conj. (20.6.1.7). For $F \in$ `NField` and $E \in \mathcal{E}\mathrm{ll}/F$, for any place $\mathfrak{p}$, there is a representation $\pi(C/F_{\mathfrak{p}})$ of $\mathrm{GL}(2,F_{\mathfrak{p}})$**?**. Is it true that $\pi(C/F) = \otimes_{\mathfrak{p}} \pi(C/F_{\mathfrak{p}})$ is an automorphism representation? ⌟

2 Local Langlands

Archimedean Local Langlands for $\mathrm{GL}(n)$

LLC for $\mathrm{GL}(n)$ **over Function Fields**

References are [G. Laumon, M. Rapoport, U. Stuhler: D-elliptic sheaves and the Langlands correspondence]. [V.G. Drinfeld: Elliptic modules, Mat. USSR Sbornik 23, pp. 561−592 (1974)], [V.G. Drinfeld: Elliptic modules II, Mat. USSR Sbornik 31, pp. 159–170 (1977)].

3 Global Langlands Correspondence

Global Langlands Conjectures

Prop. (20.6.3.1) [Langlands L-function]. Let $F \in$ `GField`, and G a reductive algebraic group over F, (π, V) an automorphic cuspidal representation of $G(A)$, $(\pi, V) = \prod'(\pi_v, V_v)$. Let S be a finite set of primes including the Archimedean ones and places that π_v is ramified or the field Ω/F defining ${}^L G$ is unramified. Let $r : {}^L G \to \mathrm{GL}(m, \mathbb{C})$ be a complex homomorphism, for $v \notin S$, let α_v be the semisimple conjugacy class in ${}^L G_v$ parametrizing π_v, then we define

$$L_v(s, \pi_v, r_v) = \frac{1}{\det(I - q_v^{-s} r_v(\alpha_v))}, \quad L_S(s, \pi, r) = \prod_{v \notin S} L_v(s, \pi_v, r_v)$$

called the **Langlands L-functions** attached to π and r. Langlands proved in [Euler Products, 1971] that such a product is convergent and analytic for $\mathrm{Re}(s)$ sufficiently large. ⌟

Conj. (20.6.3.2) [Global Functorial Lifting]. Suppose G, G' are two quasi-split groups over the global field F. Let G split over K and K' where $F \subset K \subset K'$. Suppose $\varphi : {}^L G'_{K'/F} \to {}^L G_{K/F}$ is a complex analytic homomorphism that makes the diagram

$$\begin{array}{ccc} {}^L G'_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle \varphi} & & \downarrow \\ {}^L G_{K/F} & \longrightarrow & G(K/F) \end{array}$$

commutative. If $\mathfrak{P}'$ is a prime of K', $\mathfrak{P} = \mathfrak{P}' \cap K, \mathfrak{p} = \mathfrak{P}' \cap F$, then φ determines a homomorphism $\varphi_{\mathfrak{p}} : {}^L G'_{K'_{\mathfrak{P}'}/F_{\mathfrak{p}}} \to {}^L G_{K_{\mathfrak{P}}/F_{\mathfrak{p}}}$ that makes the diagram

$$\begin{array}{ccc} {}^L G'_{K'_{\mathfrak{P}'}/F_{\mathfrak{p}}} & \longrightarrow & G(K'_{\mathfrak{P}'}/F_{\mathfrak{p}}) \\ \downarrow{\scriptstyle \varphi_{\mathfrak{p}}} & & \downarrow \\ {}^L G_{K_{\mathfrak{P}}/F_{\mathfrak{p}}} & \longrightarrow & G(K_{\mathfrak{P}}/F_{\mathfrak{p}}) \end{array}$$

commutative. If $\pi' = \otimes_{\mathfrak{p}} \pi'_{\mathfrak{p}}$ is an automorphic representation of G'_F, is it true that $\pi = \otimes_{\mathfrak{p}} R_{\varphi_{\mathfrak{p}}}(\pi'_{\mathfrak{p}})$ is an automorphic representation of G_F? Such an automorphic representation is called a **functorial lifting** or π'. ⌟

Remark (20.6.3.3). This conjecture reduces the conjecture about a general group to the case of $GL(n, F)$, which can be handled, such as by [Zeta Functions of Simple Algebras, Godement/Jacquet]. ⌟

Conj. (20.6.3.4). If(20.6.1.3) is true, if G, G' are defined over the global field F and G is quasi-split and G' is an inner twist of G, suppose $\pi' = \otimes_{\mathfrak{p}}\pi'_{\mathfrak{p}}$ is an automorphic representation of G'_F, is it true that $\pi = \otimes_{\mathfrak{p}}R(\pi'_{\mathfrak{p}})$ is an automorphism representation of G_F? ⌟

Conj. (20.6.3.5). ⌟

Def. (20.6.3.6)[L-Packets]. It is possible that two automorphic representations π and π' of $G(A)$ have the same L-function, and for any reductive group H over F and σ an automorphic representation of $H(A)$ and r_1 a complex analytic representation of ${}^LH$,

$$L_S(s, \pi\otimes\sigma, r\otimes r_1) = L_S(s, \pi'\otimes\sigma, r\otimes r_1).$$

In this case, π, π' are called to be in the same **L-packet**. ⌟

Prop. (20.6.3.7). Any L-packet is finite. And it is conjectured that every L-packet contains a generic representation. ⌟

1 Automorphic Forms on Unitary Groups

Main references are [Automorphic Forms on Unitary Groups, Eischen].

Unitary groups provide a particularly fruitful setting in which to work. Unitary groups have associated Shimura varieties, which provide convenient structure for studying algebraic aspects of automorphic forms (which, in turn, arise as sections of a vector bundle over Shimura varieties). We have substantial results about Galois representations associated to automorphic forms on unitary groups (e.g. [Ski12, Che04, Che09, CH13, Har10]). In addition, we have convenient representations of the L-functions associated automorphic forms on unitary groups, which are useful both for proving analytic properties and for extracting algebraic information (and even p-adic properties, as seen in [EHLS20]). Working with unitary groups has enabled major developments, including a proof of the main conjecture of Iwasawa Theory for GL2 [SU14] and the rationality of special values of certain automorphic L-functions (including [Shi00, Har97, Har08, Har84, Bou15]), as well as progress toward cases of the Bloch−Kato conjecture (including [SU06, Klo09, Klo15, Wan19]), and the Gan−Gross−Prasad conjecture (many recent developments, including [Xue14, Xue19, Zha14, Liu14, Yun11, JZ20, He17, BP20, BPLZZ21]).

2 Quaternionic Modular Forms

Main references are [Modular Forms on Exceptional Groups, Pollack].

3 Weil Representations

We use notations as in3.

Def. (20.7.3.1) [Heisenberg Group of $O(V)$]. Let F be a local or finite field of characteristic$\neq 2$, (V, B) a quadratic space over F of dimension n, $O(V) = O(V, B)$. Then the **Heisenberg group** H is the group $V \times V \times F$ with the group law

$$(v_1^*, v_1, x_1)(v_2^*, v_2, x_2) = (v_1^* + v_2^*, v_1 + v_2, x_1 + x_2 + B(v_2, v_1^*) - B(v_1, v_2^*)).$$

Let $\psi : F \to \mathbb{C}$ a non-trivial character. We may identify V with V^* via the pairing $(v, v^*) \mapsto \psi(-2B(v, v^*))$. Then the group $A(V)$(11.10.3.20) is $V \times V \times \mathbb{T}$ with multiplication

$$(v_1^*, v_1, t_1)(v_2^*, v_2, t_2) = (v_1^* + v_2^*, v_1 + v_2, t_1 t_2 \psi(-2B(v_1, v_2^*))).$$

Then there is a surjective homomorphism $\tau : H \to A(V) : (v^*, v, x) \mapsto (v^*, v, \psi(x)\psi(-B(v, v^*)))$.

$A(V)$ acts on $L^2(G)$: $(\rho(v^*, v, t)\Phi)(u) = t\psi(-2B(u, v^*))\Phi(u + v)$(11.10.3.21), and this induces an action π of H on $L^2(G)$: $(\rho(v^*, v, x)\Phi)(u) = t\psi(-2B(u, v^*))\Phi(u + v)$.

$SL(2,F)$ acts on H: $\begin{bmatrix} a & b \\ c & d \end{bmatrix}(v_1, v_2, x) = (av_1 + bv_2, cv_1 + dv_2, x)$, and acts on $A(V)$: $\begin{bmatrix} a & b \\ c & d \end{bmatrix}(v_1, v_2, t) = (av_1 + bv_2, cv_1 + dv_2, t\psi(-acB(v_1, v_1) - bdB(v_2, v_2)))$, these two actions are compatible with τ.

$O(V)$ acts on H: $g(v_1, v_2, x) = (gv_1, gv_2, x)$, and a similar action on $A(V)$, compatible with τ.

Recall the Fourier transform on V w.r.t. the pairing $(v, v^*) \mapsto \psi(-2B(v, v^*))$. ⌟

Prop. (20.7.3.2). There exists a unitary projective representation ω_1 of $Sp(2n, B)$ on $L^2(V)$ that for the subgroup $SL(2,F) \subset Sp(2n, B)$,

- For $g \in SL(2,F), h \in H$, $\omega_1(g)\pi(h)\omega_1(g)^{-1} = \pi(g(h))$.
- $(\omega_1(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\Phi)(v) = \psi(xB(v,v))\Phi(v)$.
- $(\omega_1(\begin{bmatrix} a & \\ & a^{-1} \end{bmatrix})\Phi)(v) = |a|^{d/2}\chi(a)\Phi(av)$, where $\chi(a)$ is any element that $|\chi(a)| = 1$.
- $\omega_1(w_1)\Phi = \gamma(B)\widehat{\Phi}$, where $\gamma(B)$ is any element that $|\gamma(B)| = 1$.

and there is a unitary representation ω_2 of $O(V)$ on $L^2(V)$ that

- $\omega_2(k)\pi(h)\omega_2(k)^{-1} = \pi(k(h))$.
- $(\omega_2(k)\Phi)(v) = \Phi(k^{-1}v)$.
- ω_2 commutes with ω_1.

where π is a Schrödinger representation of $A(V)$ on $L^2(V)$(11.10.3.21). ⌟

Proof: Because the action of $Sp(2n, B)$ on $A(V)$ is in $B_0(V)$, thus by(11.10.3.21), there are unitary automorphisms of $L^2(G)$ that

$$\omega_1(g)\pi(h)\omega_1(g)^{-1} = \pi(g(h)).$$

Now to check the properties of ω, it suffices to check this equation for $h = (v, 0, 1)$ or $(0, v, 1)$ because these elements generate $A(V)$, using the fact ρ action on $L^2(V)$ is irreducible(11.10.3.21).**?**

For $O(V)$, just verify directly. □

Prop. (20.7.3.3)[$\dim V$ **Even Case**]**.** If F is a local or finite field of characteristic$\neq 2$, V has dimension $2n$, and if we define $\Delta = (-1)^n \det(B) \in F^*/(F^*)^2$, $\chi : F^* \to \{\pm 1\}$ the quadratic character $a \mapsto (\Delta, a)_F$(14.5.5.8), and $\gamma(B)$ as defined in(14.5.5.9), then the projection representation of $SL(2,F)$ in(20.7.3.2) is a true representation.

It suffices to check the relations(3.1.5.8). Use(14.5.5.14) to show that $\gamma(B)^2 = \chi(-1)$. And it suffices to show that

$$w_1 \begin{bmatrix} a^{-1} & \\ & a \end{bmatrix} \begin{bmatrix} 1 & -a \\ & 1 \end{bmatrix} w_1 \begin{bmatrix} 1 & -a^{-1} \\ & 1 \end{bmatrix} \Phi = \begin{bmatrix} 1 & a \\ & 1 \end{bmatrix} w_1 \Phi$$

The LHS equals $\gamma(B)^2|a|^{-n}\mathcal{F}(\Phi * F_{-a^{-1}B})$, which by(14.5.5.9) and(14.5.5.13) equals $\gamma(B)\mathcal{F}(\Phi)F_{aB}$, which is just the RHS. ⌟

Conj. (20.7.3.4)[**Theta Correspondence(Special Case)**]**.** Let ω be the action of $SL(2,F) \times O(V)$ on $L^2(V)$ as in(20.7.3.3) and(20.7.3.2), then its smooth part $C_c^\infty(V)$ is a smooth representation ω_∞. Let π_1 be an irreducible admissible representation of $SL(2,F)$, π_2 an irreducible admissible representation of $O(V)$, they are said to **correspond** iff there exists a non-zero intertwining operator $\omega_\infty \to \pi_1 \otimes \pi_2$.

Then each π_1 can corresponds to at most one π_2, and vise versa. ⌟

Proof: This is proved for non-Archimedean local fields of odd residue characteristic by Waldspurger(1990). □

Def. (20.7.3.5)[Setup for Dihedral Weil Representation]. Let F be local or finite field, and E be a 2-dimensional commutative semisimple algebra over F, then $E = F \oplus F$ and F embeds diagonally, called the **split case**; or E is the unique quadratic extension of F, called the **anisotropic case**. Let the automorphism of E given by

$$x \mapsto \overline{x} : \begin{cases} \overline{(\xi, \eta)} = (\eta, \xi), & E = F \oplus F \\ \text{The non-trivial Galois automorphism}, & E \text{ is a field} \end{cases}.$$

Let $\mathrm{tr}(x) = x + \overline{x}, N(x) = x\overline{x}$. Let $E_1^* = \{x \in E^* | N(x) = 1\}$.

There is an embedding ι of E into $GO(E) \subset GL(2, F)$: for $E = F \oplus F$, it embeds diagonally, and for E a field, E embeds by left action on itself. Notice $\overline{\iota(x)(\overline{y})} = \iota(\overline{x})(y)$, thus $GO(E) \cong E^* \rtimes \{\}$**?**.

Let ψ be a character of E^* that is non-trivial on E_1^*. ⌟

Prop. (20.7.3.6)[Howe Duality of Dihedral Representations]. Let ψ be a character of E^*, then by(18.1.1.12), ψ extends to a representation of $GO(E)$ iff $\psi(x) = \psi(\overline{x})$, which is equivalent to $\psi(x) = 1$ on E_1^*, by Hilbert's theorem90 or direct inspection. Then by(18.1.1.12), in the other case, $\mathrm{ind}_{E^*}^{GO(E)} \psi$ is an irreducible representation of $GO(E)$, and Howe duality predicts an irreducible smooth representation of $GL(2, F)$. In case E is a field or F is finite, we can construct this representation directly, in(20.7.3.7) and(18.6.10.8). ⌟

Prop. (20.7.3.7) [Dihedral Representations]. Let E/F be a quadratic extension of non-Archimedean local fields, then E is a quadratic space over F by the norm form, and let ξ be a quasi-character of E^* that doesn't factor through the norm map $N : E^* \to F^*$. Let $U_{\xi,\psi}$ be the space of functions $\Phi \in C_c^\infty(E)$ that satisfy

$$\Phi(yv) = \xi(y)^{-1}\Phi(v), \quad \forall y \in E^*, N(y) = 1,$$

and let $\chi : F^* \to \{\pm 1\}$ be the quadratic character attached to the extension E/F(14.6.2.14), and let $GL(2, F)_+$ be the subgroup of $GL(2, F)$ that the determinants are norms from E, which is an open normal subgroup of index2, then there exists an irreducible admissible representation $\omega_{\xi,\psi}$ of $GL(2, F)_+$ on $U_{\xi,\psi}$ s.t.

$$(\omega_{\xi,\psi}(\begin{bmatrix} a & \\ & 1 \end{bmatrix})\Phi)(v) = |a|^{1/2}\xi(b)\Phi(bv), \quad \forall b \in E^*, N(b) = a \in F^*$$

$$(\omega_{\xi,\psi}(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\Phi)(v) = \psi(xN(v))\Phi(v)$$

$$(\omega_{\xi,\psi}(\begin{bmatrix} a & \\ & a^{-1} \end{bmatrix})\Phi)(v) = |a|\chi(a)\Phi(av)$$

$$(\omega_{\xi,\psi}(w_1)\Phi) = \gamma(N)\widehat{\Phi}.$$

Then the representation ω_ξ of $GL(2, F)$ induced from this representation of $GL(2, F)_+$ is irreducible and cuspidal. ⌟

Remark (20.7.3.8). For F with odd residue characteristic, this dihedral representation is the only cuspidal representation of $GL(2,F)$, by Tunnell 1978 or 1979.**?** ⌟

Proof: Notice in this case, the character χ defined in(20.7.3.3) is the same as the quadratic character corresponding to E/F: let $E = F(\sqrt{D})$, then $N_{E/F} = \langle 1, -D\rangle$, thus $(a,D)_F = 1$ iff $\langle a, D, -1\rangle$ is universal iff a is represented by $\langle 1, -D\rangle$, which is equivalent to $a \in N_{E/F}(E^*)$. Then by(20.7.3.3), we have an action of $SL(2,F)$ on $L^2(E)$, and we can extend it to $GL(2,F)_+$ satisfying all these equations(**?** by direct verification). And it can be verified $U_{\xi,\psi}$ is stable under this action.

We show this action is smooth: Every $\varphi \in U_{\xi,\psi}$ is stable under some $K(\mathfrak{p}^n)$ for n large: By(18.11.1.9), it suffices to prove it is stable under $N_-(\mathfrak{p}^n), T(\mathfrak{p}^n)$ and $N(\mathfrak{a})$. By action of w_1, it suffices to show it is stable under the latter two. But this is clear from the equations above.

Similarly, to show it is admissible, it suffices to show for any ideal $\mathfrak{a}$, the space of functions fixed by $N(\mathfrak{a})$ and $N_-(\mathfrak{a})$ is of f.d.: It is clear from equation2 that if φ is fixed by $N(\mathfrak{a})$, then there is a fractional ideal $\mathfrak{a}'$ that $\mathrm{Supp}(\varphi) \subset N^{-1}(\mathfrak{a}')$. Similarly for $\mathcal{F}(\varphi)$. These two conditions means φ has bounded support and fixed by some open subgroup, these functions are f.d..

To show $\omega_{\xi,\psi}$ and ω_ξ are irreducible: Let $B_1(F)_+$ be the subgroup of $B_1(F)$ consisting of matrices $\{\begin{bmatrix} a & b \\ & 1\end{bmatrix} | a \in N_{E/F}(E^*)\}$, let $\mathcal{K}_+$ the restriction of $\omega_{\xi,\psi}$ to $B_1(F)_+$. Define a map

$$\Lambda : C_c^\infty(N(E^*)) \to \mathcal{K}_+ : (\Lambda\varphi)(v) = \xi(v)^{-1}|N(v)|^{-1/2}\varphi(N(v)),$$

then this is an isomorphism, and is $B_1(F)$-invariant, where $B_1(F)$ acts on $C_c^\infty(N(E^*))$ as in(18.11.3.15). Thus by Mackey decomposition(18.1.5.42),

$$\mathrm{res}_{B_1(F)} \mathrm{ind}_{GL(2,F)_+}^{GL(2,F)} \omega_{\xi,\psi} \cong \mathrm{ind}_{B_1(F)_+}^{B_1(F)} \omega_{\xi,\psi} \cong \mathrm{ind}_{N(F)}^{B_1(F)} \psi,$$

which is irreducible by(18.11.3.16). thus ω_ξ is irreducible, thus also does $\omega_{\xi,\psi}$.

A byproduct of the above argument is that ω_ξ is cuspidal. □

4 Gan-Gross-Prasad Conjecture

Main References are [Background on the Gan-Gross-Prasad Conjecture, David Schwein].

20.8 Trace Formulae

Main references are [Introductory notes on the trace formula, Lapid], [Trace formula, Whitehouse] and [Trace Formula, Arthur].

1 Introduction

Remark (20.8.1.1). Delete this subsection. ⌟

The trace formula was introduced by Selberg in his seminal work. Selberg mostly developed the trace formula for quotients of the hyperbolic plane by a Fuchsian group Γ of the first kind (both in the co-compact and the non co-compact case). One of his original motivations and applications was to show the existence of Maass forms with respect to $\Gamma = SL(2, Z)$. It was subsequently vastly generalized by Arthur in the context of adelic quotients $G(F)\backslash G(A)$ of a reductive group G over a number field F. Arthur's main driving force was the functoriality conjectures of Langlands.

Selberg's trace formula is a far-reaching non-commutative generalization of the Poisson summation formula. It underlines a duality between geometric and spectral objects.

2 Trace Formulae

Trace Formula for Compact Quotient

Prop. (20.8.2.1). Consider the right action of G on $L^2(\Gamma\backslash G,\chi)$(20.1.1.17), let $\varphi \in C_c^\infty(G)$, then φ can act on $L^2(\Gamma\backslash G,\chi)$ by(11.8.3.24), and:

- $\rho(\varphi)$ is an integration operator, in particular Hilbert-Schmidt and compact. And $\mathrm{Im}(\rho(\varphi)) \subset C^\infty(\Gamma\backslash G,\chi)$.
- If $\varphi(g^{-1}) = \overline{\varphi(g)}$, then $\rho(\varphi)$ is self-adjoint.
- If $\varphi(k_\theta g) = e^{-tk\theta}\varphi(g)$, then $\mathrm{Im}(\rho(\varphi)) \subset C^\infty(\Gamma\backslash G,\chi,k)$.

Compare with(20.8.2.4). ⌟

Proof: These follows from(20.8.2.4). □

Cor. (20.8.2.2). Let H be a nonzero closed G-subrepresentation of $L^2(\Gamma\backslash G,\chi)$, then H decomposes as $\oplus_k H^k$ w.r.t. action of $SO(2,\mathbb{R})$. And if $H^k \neq 0$, then Δ has a nonzero eigenvector in $H^k \cap C^\infty(\Gamma\backslash G,\chi)$. ⌟

Proof: The decomposition is clear from(11.10.4.3). It's left to show Δ has an eigenvalue in $H_k \cap C^\infty(\Gamma\backslash G,\chi)$. By lemma(18.9.4.1) above, for $f_0 \in H^k$, there is a $\varphi \in C_c^\infty(G)$ s.t. $\rho(\varphi)f_0 \neq 0$, and $\varphi(k_\theta g) = e^{-ik\theta}\varphi(g)$. So(20.8.2.1) shows $\rho(\varphi)$ maps H into $H^k \cap C^\infty(\Gamma\backslash G,\chi)$ and induces a compact self-adjoint operator on H^k. So we can choose a f.d. eigenspace of it. Notice Δ commutes with the action $\rho(\varphi)$, so Δ fixes this eigenspace, thus it has an eigenvalue on $H_k \cap C^\infty(\Gamma\backslash G,\chi)$. □

Prop. (20.8.2.3)[$L^2(\Gamma\backslash G)$ Totally Decomposable]. Let G be a unimodular locally compact topological group and $\Gamma \subset G$ be a discrete subgroup that $\Gamma\backslash G$ is compact, $\chi \in \widehat{\Gamma}$, then the space $L^2(\Gamma\backslash G,\chi)$ decomposes as

$$L^2(\Gamma\backslash G,\chi) = \bigoplus_{\pi\in\widehat{G}} m_\pi V_\pi$$

that each m_π is finite. ⌟

Proof: Let Σ be the set of sums of irreducible invariant subspaces of $L^2(\Gamma\backslash G,\chi)$ that is mutually orthogonal. then choose by Zorn's lemma a maximal one in Σ, and we prove the orthogonal complement $H=0$ otherwise we construct an irreducible subspace of H.

Let $f\neq 0\in H$, choose by(18.9.4.1) and(20.8.2.1) a $\varphi\in C_c(G)$ that $\rho(\varphi)$ is compact self-adjoint and $\rho(\varphi)f\neq 0$. So $\rho(\varphi)$ has a non-zero eigenvalue and the eigenspace L is of f.d..

Let L_0 be a minimal nonzero subspace of L that is an intersection of L with a nonzero closed invariant subspace of $\mathcal{H}$, and let V be the intersection of all closed invariant subspaces W of H that $L_0=L\cap W$. We show V is irreducible, if not, then $V=V_1\cap V_2$, and if $0\neq f_0\in L_0$, then $f_0=f_1+f_2$ and both f_1,f_2 are eigenfunctions of $\rho(\varphi)$ of eigenvalue λ. Now if $f_1\neq 0$, then by minimality, $V_1\cap L=L_0$.

The finiteness of m_π follows from the fact that $\rho(f)$ is Hilbert-Schmidt for every $f\in C_c(G)$(20.8.2.4). □

Prop. (20.8.2.4). If $\Gamma\subset G$ is a discrete subgroup that $\Gamma\backslash G$ is compact, consider the right action of G on $L^2(\Gamma\backslash G)$(11.10.2.9), let $\varphi\in C_c(G)$, then φ can act on $L^2(\Gamma\backslash G,\chi)$ by(11.8.3.24), and:

- $\rho(\varphi)$ is an integration operator, in particular Hilbert-Schmidt and compact.
- If $\varphi(g^{-1})=\overline{\varphi(g)}$, then $\rho(\varphi)$ is self-adjoint.

⌟

Proof: 1:

$$(\rho(\varphi)f)(g)=\int_G f(h)\varphi(g^{-1}h)dh=\int_{\Gamma\backslash G_1}\sum_{\gamma\in\Gamma}f(\gamma h)\varphi(g^{-1}\gamma h)dh=\int_{\Gamma\backslash G_1}f(h)K_\varphi(g,h)dh$$

where

$$K_\varphi(g,h)=\sum_{\gamma\in\Gamma}\varphi(g^{-1}\gamma h).$$

Because φ is compactly supported, this is a smooth function in g and h, in particular square integrable on $\Gamma\backslash G$ compact. And $\rho(\varphi)(f)(g)$ is smooth in g because $f\in L_1(\Gamma\backslash G_1,\chi)$ as $\Gamma\backslash G_1$ is compact, and $K(g,h)$ is smooth in g.

2 is easy. □

Prop. (20.8.2.5) [Trace of $\rho(f)$]. If $\varphi=\varphi_1*\varphi_2$ where $\varphi_i\in C_c(\Gamma\backslash G)$, then $\rho(\varphi)=\rho(\varphi_1)\rho(\varphi_2)$(11.8.3.24) and hence a trace class(11.9.5.7). And its integral kernel is

$$K_\varphi(x,y)=\int_{\Gamma\backslash G}K_{\varphi_1}(x,z)K_{\varphi_2}(z,y)dz.$$

and

$$\operatorname{tr}\rho(f)=\int_{\Gamma\backslash G}K_\varphi(x,x)dx=\int_{\Gamma\backslash G}\int_{\Gamma\backslash G}K_{\varphi_1}(x,y)K_{\varphi_2}(y,x)dxdy.$$

⌟

Proof: This follows from(11.9.5.10). □

Cor. (20.8.2.6) [the Geometric Side of Trace Formula]. If G is unimodular, let $f=f_1*f_2$, $c(\gamma)$ be a representative for the conjugacy classes of Γ, then

$$\operatorname{tr}(\rho(f))=\sum_{\gamma\in c(\Gamma)}\int_{\Gamma_\gamma\backslash G}f(x^{-1}\gamma x)dx.$$

And if G_γ is unimodular for every $\gamma \in \Gamma$, then

$$\operatorname{tr}(\rho(f)) = \sum_{\gamma \in c(\Gamma)} V(\Gamma_\gamma \backslash G_\gamma) \int_{G_\gamma \backslash G} f(x^{-1}\gamma x) dx.$$

┘

Proof:

$$K_f(x,x) = \sum_{\gamma \in \Gamma} f(x^{-1}\gamma x) = \sum_{\gamma \in c(\Gamma)} \sum_{\delta \in \Gamma_\gamma \backslash \Gamma} f(x^{-1}\delta^{-1}\gamma\delta x),$$

so we have

$$\int_{\Gamma \backslash G} K_f(x,x) dx = \int_{\Gamma \backslash G} \sum_{\gamma \in c(\Gamma)} \sum_{\delta \in \Gamma_\gamma \backslash \Gamma} f(x^{-1}\delta^{-1}\gamma\delta x) = \sum_{\gamma \in c(\Gamma)} \int_{\Gamma_\gamma \backslash G} f(x^{-1}\gamma x) dx.$$

□

Cor. (20.8.2.7) [Trace Formula for $\Gamma \backslash G$ Compact]. Let G be a unimodular locally compact topological group and $f = f_1 * f_2$ where $f_i \in C_c(G)$, and Γ be a discrete subgroup of G with $\Gamma \backslash G$ compact and G_γ is unimodular for every $\gamma \in \Gamma$, then $\rho(f)$ is a trace class with

$$\sum_{\pi \in \widehat{G}} m_\pi \operatorname{tr}(\pi(f)) = \operatorname{tr}(\rho(f)) = \sum_{\gamma \in c(\Gamma)} V(\Gamma_\gamma \backslash G_\gamma) \int_{G_\gamma \backslash G} f(x^{-1}\gamma x) dx.$$

┘

Proof: Follows from(20.1.4.2) and(20.8.2.6). □

Lemma (20.8.2.8). Let $G = GL(2,\mathbb{R}), K = SL(2,\mathbb{R})$, $\Gamma \backslash G$ be compact, ρ be the principal series $P(\lambda, 0)$(18.9.4.15) of G, and $s = \frac{1}{2}(s_1 - s_2 + 1), \lambda = s(1-s), \mu = (s_1 + s_2)$, then for any $f \in C_c^\infty(K \backslash G/K)$, $\rho(f) \in V_\rho^K$, which has dimension1, so f is a trace class and

$$\operatorname{tr}(\rho(f)) = \int\int f(\begin{bmatrix} e^{u/2} & x \\ 0 & e^{-u/2} \end{bmatrix}) e^{\frac{us}{2}} du dx.$$

┘

Proof: The trace of $\rho(f)$ is just the scalar by which $\rho(f)$ acts on a non-zero vector of ρ^K. Take $\varphi \in \rho^K \subset H(s_1, s_2, 0)$ normalized that $\varphi(I) = 1$, then

$$(\rho(f)\varphi)(I) = \int_G f(g)\varphi(g) dg = \int_K \int_A \int_N f(ank)\varphi(ank) dA dN d\theta = \int_A \int_N f(an)\varphi(an) dA dN$$

□

20.9 Modular Galois Representations

This section concerns automorphy and modularity of global Galois Representations.

Notation (20.9.0.1).
- Let $(F, \mathcal{O}_F) \in$ `NField`.

⌟

1 Galois Representation attached to Automorphic Forms

Prop. (20.9.1.1) [Representation Associated to a Cusp Form, Eichler-Shimura]. For any newform $f \in S_k(\Gamma_1(N))$, let $\mathcal{O}_f$ be the ring generated by the coefficients of f, then there exists a Galois representation

$$\rho_f : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \mathcal{O}_f).$$

⌟

Proof: □

Automorphic Galois Representations

Def. (20.9.1.2) [Automorphic Galois Representations]. An **automorphic Galois representation** is a Galois representation of $\mathrm{Gal}_{\mathbb{Q}}$ on a p-local field that is attached to an automorphic representation of $\mathrm{GL}(n, \mathbf{A}_F)$ for some $F \in$ `NField` via the global Langlands conjecture. ⌟

Def. (20.9.1.3) [Modular Galois Representations]. A continuous irreducible representation $\mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \overline{\mathbb{F}}_p)$ or $\mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, K)$, where $K \in p$-`NField` is called a **modular Galois representation** if it arises from a newform as in(20.9.1.1). ⌟

Def. (20.9.1.4) [Modular Galois Representations]. Let A be a $\mathbb{Z}_p$-algebra and $\rho : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, A)$ be a representation, then ρ is called a **modular Galois representation** if there exists some $N > 0$ and a homomorphism $\mathrm{pr} : T'(N) \to A$(where $T'(N) = \mathbb{Z}[T_\ell, \langle d \rangle] \subset \mathrm{End}(S_2(\Gamma_1(N)))$, $\ell \in \mathbf{P} \backslash \{p\}, d \in (\mathbb{Z}/(N))^*$) s.t. ρ is unramified outside Np, and for $\ell \nmid pN$,

$$\mathrm{tr}(\rho(\mathrm{Frob}_\ell)) = \mathrm{pr}(T_\ell), \quad \det(\rho(\mathrm{Frob}_\ell)) = \mathrm{pr}(\langle \ell \rangle)\ell.$$

? ⌟

Conj. (20.9.1.5) [Langlands-Fontaine-Mazur]. Any geometric representation of Gal_F is automorphic(20.9.1.2). ⌟

Remark (20.9.1.6). This is very likely to imply Fontaine-Mazur conjecture(20.9.5.2). ⌟

Level-Lowering

Cor. (20.9.1.7) [Level-Lowering, Ribet]. Let $p, \ell \in \mathbf{P}, N \in \mathbb{Z}_+, \ell \nmid N$, and $f \in S_2^{\mathrm{new}}(\Gamma_0(N\ell))$. Suppose that $\overline{\rho}_{f,p}$ is irreducible and one of the following is true:
- $\overline{\rho}_{f,p}$ is unramified at ℓ,
- $\ell = p$ and $\overline{\rho}_{f,p}$ is flat at p.

Then there exists a $g \in S_2(\Gamma_0(N))$ s.t. $\overline{\rho}_{g,p} \cong \overline{\rho}_{f,p}$. ⌟

Proof: Cf.[Fermat's last theorem, Chap7]. □

Potential Modularity

Remark (20.9.1.8). A potential modularity result is a result that says certain representation of $\mathrm{Gal}_{\mathbb{Q}}$ comes from geometry when restricting to Gal_F for some $F \in \mathtt{NField}$. Cf.[Remarks on a Conjecture of Fontaine and Mazur, Taylor]. ⌟

2 Geometric Galois Representations

Def. (20.9.2.1) [Geometric Representations]. For $F \in \mathtt{NField}, p \in \mathbf{P}$, $(\rho, V) \in \mathrm{Rep}_{\overline{\mathbb{Q}_p}}(\mathrm{Gal}_F)$ is called a **geometric representation** if it satisfies

- For a.e. $v \in \Sigma_F^{\mathrm{fin}}$, ρ_v is unramified.
- For any $v \in S(p)$, the representation ρ_v is deRham(18.4.4.10).

It is called a **genuine geometric representation** if it is isomorphic to the subquotient of some $\mathrm{H}^r_{\text{ét}}(X_{\overline{F}}, \mathbb{Q}_p)(m)$ where $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}/F$ and $m \in \mathbb{Z}$. ⌟

Prop. (20.9.2.2) [Change of Fields]. Let $E/F \in \mathtt{NField}$ be a field extension, then geometric representations are stable under res^L_K and Ind^L_K. ⌟

Proof: □

Compatible Systems

Prop. (20.9.2.3) [Compatible System of adic Representations]. For $E, F \in \mathtt{NField}, n \in \mathbb{Z}_+$, an E-rational n-dimensional **weakly compatible system of Galois representations** of Gal_F is a collection

$$\mathcal{R} = \{R_{\ell,\iota}\}_{\ell \in \mathbf{P}, \iota \in \mathrm{Hom}(E, \overline{\mathbb{Q}_\ell})},$$

where $R_{\ell,\iota}$ are semisimple ℓ-adic Galois representations

$$R_{\ell,\iota} : \mathrm{Gal}_F \to \mathrm{GL}(n, \overline{\mathbb{Q}_\ell}),$$

which satisfy the following conditions:

1. There is a multiset of integers H-T$(\mathcal{R})$ s.t. for any (ℓ, ι), the restriction $R_{\ell,\iota}|_{\mathrm{Gal}_{\mathbb{Q}_\ell}}$ is deRham and H-T$(R_{\ell,\iota}|_{\mathrm{Gal}_{\mathbb{Q}_\ell}}) =$ H-T$(\mathcal{R})$.
2. There exists a finite set $S \subset \Sigma_F^{\mathrm{fin}}$ s.t. if $v \notin S$, then $\mathrm{WD}_v(R_{\ell,\iota})$ is unramified for all (ℓ, ι).
3. For a.e. $v \in \Sigma_F^{\mathrm{fin}}$, there is an F-semisimple WD-representation $\mathrm{WD}_v(\mathcal{R}) \in \mathfrak{wd}^n_E(W_{F_v})$ s.t. for all (ℓ, ι),
$$\mathrm{WD}_v(R_{\ell,\iota})^{F\text{-ss}} \sim \mathrm{WD}_v(\mathcal{R}) \otimes_{E,\iota} \overline{\mathbb{Q}_\ell}.$$

Moreover,

- $\mathcal{R}$ is called a **strongly compatible system of adic representations** if condition3 holds for any $v \in \Sigma_F$.
- $\mathcal{R}$ is called **odd/irreducible/geometric** if each $R_{\ell,\iota}$ is.
- $\mathcal{R}$ is called **pure of weight** $w \in \mathbb{Z}$ if for a.e. $p \in \mathbf{P}$ and eigenvalues α_i of $\mathfrak{wd}_p(\mathcal{R})$, $|\alpha_i| \in \overline{\mathbb{Q}}$, and
$$|\iota(\alpha_i)|^2 = p^w.$$

- $\mathcal{R}$ is called a **genuinely geometric system** if there exists an $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{Q}$ and $i \in \mathbb{N}, j \in \mathbb{Z}$ and a subspace
$$W \subset H_{\text{Betti}}(X, \overline{\mathbb{Q}}(j))$$
s.t. for any (ℓ, ι), $W \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell$ is $\mathrm{Gal}_\mathbb{Q}$-invariant and realizes $R_{\ell,\iota}$.

⌟

Conj. (20.9.2.4).
- If $\rho : \mathrm{Gal}_\mathbb{Q} \to \mathrm{GL}(n, \overline{\mathbb{Q}}_\ell)$ be a continuous semisimple representation unramified at a.e. places and deRham at p, then ρ is a part of a weakly compatible system.
- Any weakly compatible system is strongly compatible.
- Any irreducible strongly compatible system $\mathcal{R}$ is geometric and pure of weight $\frac{2}{\dim \mathcal{R}} \sum_{h \in \text{H-T}(\mathcal{R})} h$.

⌟

3 Modularity Lifting

Thm. (20.9.3.1) [Modularity Lifting, Taylor-Wiles/Khare-Wintenberger]. Assume $p \in \mathbf{P}$ and $\overline{\rho} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{GL}(2, \overline{\mathbb{F}_p})$ is a continuous modular Galois representation, and
- $\mathrm{Im}(\overline{\rho})$ is non-solvable if $p = 2$,
- $\overline{\rho}|_{\mathbb{Q}(\zeta_p)}$ is absolutely irreducible if $p > 2$.

Then ρ is also modular if:
- $(p = 2)$ and ρ is an odd lift of $\overline{\rho}$ to a 2-adic representation that is
  - a.e. unramified,
  - crystalline of weight 2 at 2, or semistable of weight 2 at 2 and $k(\overline{\rho}) = 4$,
- $(p > 2)$ and ρ is a lift of $\overline{\rho}$ to a p-adic representation that is crystalline of weight $k \in [2, p+1]$ at p, or pot.semistable of weight 2 at p,

⌟

Proof: Cf.[Khare-Wintenberger 2].**?** □

4 Serre's Modularity Conjecture

References are [K-W09b], [K-W09c] and [Diamond, F.: The Taylor-Wiles construction and multiplicity one. Invent. Math. 128(2), 379–391 (1997)], [Fujiwara, K.: Deformation rings and Hecke algebras in the totally real case], [Khare, C., Wintenberger, J.-P.: On Serre's conjecture for 2-dimensional mod p representations of $\mathrm{Gal}(\overline{\mathbb{Q}}/\mathbb{Q})$], [Kisin, M.: Modularity of 2-adic Barsotti-Tate representations. Invent. Math. (2009)], [Kisin, M.: Moduli of finite flat group schemes, and modularity. Ann. Math], [Edixhoven, Serre's Conjecture, in Fermat's Last Theorem].

Notation (20.9.4.1).
- For $N \in \mathbb{Z}_+$, let $Q(N)$ be a maximal prime factor of N(and $Q(1) = 1$).
- Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and $\overline{\rho} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{GL}(2, \overline{\mathbb{F}_p})$ be a continuous representation.

⌟

Def. (20.9.4.2) [Artin Conductor and Weights of $\overline{\rho}$]. $k(\overline{\rho}), N(\overline{\rho})$. Cf.[Serre, Modular Representations, Section1.2, 2]**?**. ⌟

Thm. (20.9.4.3) [Serre's Modularity Conjecture, Khare-Kisin-Wintenberger]. Any odd smooth absolutely irreducible representation $\overline{\rho}$(such a representation is said to be of **Serre-type**) is modular(20.9.1.3). ⌟

Proof: Cf.[Khare-Wintenberger]Thm9.1**?** □

Lemma (20.9.4.4). Serre's modularity conjecture(20.9.4.3) is true for the following two cases:

- $p \neq 2$ and $2 \nmid N(\overline{\rho})$.
- $p = 2$ and $k(\overline{\rho}) = 2$.

⌟

Proof: (D_0)(20.9.4.8) follows from the truth of (L_r)(20.9.4.7) for each r. Then the assertion follows from(20.9.4.8) and (D_0). □

Lemma (20.9.4.5). Let $\rho : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \mathcal{O})$ be a continuous odd irreducible representation s.t.

- $\overline{\rho}$ has non-solvable image, and $\overline{\rho}$ is modular.
- ρ is of weight 2, a.e. unramified, and potentially crystalline at p.

Then ρ is modular. ⌟

Proof: Cf.[Khare-Wintenberger]Hypothesis H.**?** □

Def. (20.9.4.6) [Locally Good Dihedral Reoresentations]. $\ell \in \mathbf{P} \backslash \{p\}$ is called a **good dihedral prime** for $\overline{\rho}$ if

- $\overline{\rho}|_{I_\ell}$ is of the form $\begin{bmatrix} \psi & \\ & \psi^\ell \end{bmatrix}$, where $\psi \neq \mathbb{1} \in \chi(I_\ell)$ is of order a power of an odd prime t, s.t. $t | \ell + 1$, and $t > \max(Q(\frac{N(\overline{\rho})}{q^2}), 5, p)$.
- $q \equiv 1 (\mathrm{mod}\ 8)$, and $q \equiv 1 (\mathrm{mod}\ r)$ for any $r \leq \max(Q(\frac{N(\overline{\rho})}{q^2}), p) \in \mathbf{P}$.

If there exists a good dihedral prime q for $\overline{\rho}$, then $\overline{\rho}$ is called **locally good-dihedral** or q-dihedral. ⌟

Lemma (20.9.4.7). For $r \in \mathbb{Z}_+$, consider the following statements:

(L_r) : If $\overline{\rho}$ is of Serre-type(20.9.4.3) and satisfies

- $\overline{\rho}$ is locally good-dihedral(20.9.4.6),
- $k(\overline{\rho}) = 2$ or $p \neq 2$,
- $N(\overline{\rho})$ is odd and divisible by at most r different primes.

Then $\overline{\rho}$ is modular.

(W_r) : If $\overline{\rho}$ is of Serre-type and satisfies

- $\overline{\rho}$ is locally good-dihedral(20.9.4.6),
- $k(\overline{\rho}) = 2$,
- $N(\overline{\rho})$ is odd and divisible by at most r different primes.

Then $\overline{\rho}$ is modular.

Then

- (W_1) is true.
- (Killing ramification in weight 2)(L_r) implies (W_{r+1}).
- (Reduction to weight 2)(W_r) implies (L_r).

In particular, by induction spirally, all $(L_r),(W_r)$ are true. ⌟

Proof: Cf.[Khare-Wintenberger]Thm3.1, 3.2, 3.3.?

2: As L_r clearly implies W_r, it suffices to consider the case $N(\overline{\rho})$ has exactly $r+1$ different primes. Suppose $q\in\mathbf{P},\overline{\rho}$ is q-dihedral, and $s\in\mathbf{P},s|N(\overline{\rho}),s\neq q$. □

Lemma (20.9.4.8) [Level-Rising]. For $r\in\mathbb{N}$, if the following:

(D_r) $\overline{\rho}$ is modular If $\overline{\rho}$ is of Serre-type and satisfies

- $\overline{\rho}$ is locally good-dihedral,
- $p\in\mathbf{P}\setminus\{2\}$,
- $2^{r+1}\nmid N(\overline{\rho})$.

is true, then we have: $\overline{\rho}$ is modular if $\overline{\rho}$ is of Serre-type and satisfies

- $k(\overline{\rho})=2$ or $p\neq 2$ or $r\neq 0$,
- $2^{r+1}\nmid N(\overline{\rho})$,

⌟

Proof: Cf.[Khare-Wintenberger]Thm3.4.? □

Thm. (20.9.4.9) [Compatible Lifting]. Suppose $\overline{\rho}$ is of Serre-type s.t.

- (if $p=2$)$\overline{\rho}$ has non-solvable image,
- (if $p\neq 2$)$k(\overline{\rho})\in[2,p+1]$ and $\overline{\rho}|_{\mathbb{Q}(\mu_p)}$ is absolutely irreducible.

Then $\overline{\rho}$ lifts to an E-rational almost strictly compatible, irreducible, odd Galois representation of $\mathrm{Gal}_{\mathbb{Q}}$ satisfying the following:

-

⌟

<u>**Applications**</u>

5 Conjectures

Prop. (20.9.5.1)[Properties of Étale Cohomologies]. Let $F\in\mathtt{NField}$ and $X\in\mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}^d/F,p\in\mathbf{P}$.

- (E5): If $v\notin\Sigma_F^p$ and X has good reduction at v, then $\mathrm{H}^i_{\text{ét}}(X,\mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}}\in\mathrm{Rep}^{\mathrm{ur}}_{\mathbb{Q}_p}(\mathrm{Gal}_{F_v})$, and
$$P_{v,X}(T)=\det(1-\mathrm{Frob}_v T|\mathrm{H}^i_{\text{ét}}(X,\mathbb{Q}_p))\in\mathbb{Z}[T]$$
is independent of p prime to v. And all roots of $P_{v,X}(T)$ in $\mathbb{C}$ has absolute value $q_v^{-i/2}$.
- (E6): Genuine geometric representations are geometric. And for $v\in\Sigma_F^p$, if X has good reduction at v, $\mathrm{H}^i_{\text{ét}}(X,\mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}}$ is even crystalline.
- (E7): There is a cycle map
$$\eta_\ell:\mathrm{CH}^i(X)\to(\mathrm{H}^{2i}_{\text{ét}}(X,\mathbb{Q}_\ell)(i))^{\mathrm{Gal}_K}.$$
and for $P\in X(K)$, $\eta_\ell(P)\neq 0\in(\mathrm{H}^{2d}_{\text{ét}}(X,\mathbb{Q}_p)(d))^{\mathrm{Gal}_K}$.

And there are some open conjectures:

- (EC1)[Semisimplicity of Frobenius]: Suppose X has good reduction on v,
  - If $v\notin\Sigma_F^p$, then Frob_v acts semi-simply on $H^i(X,\mathbb{Q}_p)$.
  - if $v\in\Sigma_F^p$, then Frob_v acts semi-simply on $D_{\mathrm{crys}}(H^i(X,\mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}})$.

- (EC2)[Grothendieck-Serre]: $H^i(X, \mathbb{Q}_p)$ is a semisimple Gal_F-representation.
- (EC3)[Tate's Conjecture]: η_ℓ is surjective. There are variant of this conjecture:
  There is a decomposition $H^i(X(\mathbb{C}), \overline{\mathbb{Q}}) = \oplus M_j$ as $\overline{\mathbb{Q}}$-vector spaces s.t.
  - For any $\ell \in \mathbf{P}$ and an embedding $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$, $M_j \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell$ is a minimal $\mathrm{Gal}_{G_{\mathbb{Q}_p}}$-stable $\overline{\mathbb{Q}}_\ell$-space.
  - There are Weil-Deligne representations $WD_p(W_j)$ over $\overline{\mathbb{Q}}$ s.t. for any $\ell \in \mathbf{P}$ and an embedding $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$,
  $$WD_p(M_j) \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell \cong WD_p(M_j \otimes_{\overline{\mathbb{Q}},\iota}, \overline{\mathbb{Q}}_\ell).$$
  - There are motivic weights H-T(M_j) s.t. for any $\ell \in \mathbf{P}$ and $\iota : \mathbb{Q} \hookrightarrow \mathbb{Q}_\ell$,
  $$\text{H-T}(M_j \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell) = \text{H-T}(M_j).$$
  and for any $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{C}$,
  $$\dim_{\mathbb{C}}(M_j \otimes_{\overline{\mathbb{Q}},\iota} \mathbb{C}) \cap H^{a,i-a}(X(\mathbb{C}), \mathbb{C})$$
  equals the multiplicity of a in H-T(M_j).

⌟

Conj. (20.9.5.2) [Fontaine-Mazur]. For $F \in \texttt{NField}$, any irreducible geometric representation is genuine geometric(20.9.2.1). ⌟

Proof: Emerton and Kisin proved the two-dimensional case, Cf.[The Fontaine-Mazur conjecture for GL(2), Kisin], [Emerton, Local-Global Compatibility in the p-adic Langlands Programme for $\mathrm{GL}(2)_{\mathbb{Q}}$]**?**. □

Remark (20.9.5.3). It follows from proper base change(8.4.3.1) and(8.4.7.36)(17.11.2.1) that any such cohomology group satisfies the requirement.

This conjecture is very strong, for example, the étale cohomology of smooth proper varieties are known to satisfy many good properties, like Weil conjecture, and Fontaine-Mazur conjecture implies that those properties can be derived via linear algebra data.

The local version of this conjecture is known to be false. ⌟

Def. (20.9.5.4) [Algebraic Representations]. $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$ is called an **algebraic representation** if
$$P_{v,X}(T) = \det(1 - \mathrm{Frob}_v T | H^i(X, \mathbb{Q}_p)) \in \overline{\mathbb{Q}}[T].$$
And it is moreover called **pure of weight** w if for a.e. $v \in \Sigma_F$, eigenvalues of $\rho(\mathrm{Frob}_v)$ are all Weil integers of weight w. And w is called the **motivic weight** of V. ⌟

Prop. (20.9.5.5). If $F_0 \subset F$ is a subfield, and $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ is pure of weight w, then if $W = \mathrm{Ind}_{\mathrm{Gal}_F}^{\mathrm{Gal}_{F_0}}(V)$, W is also pure of weight w. ⌟

Proof: **?** □

Prop. (20.9.5.6) [Total Hodge-Tate Weights]. For a geometric representation $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$, for each $v \in \Sigma_F^v$, there are Hodge-Tate weights associated to v. For $k \in \mathbb{Z}$, define

$$m_k(V) = \sum_{v \in \Sigma_F^p} [F_v : \mathbb{Q}_p] m_k(V|_{\mathrm{Gal}_{F_v}}),$$

called the **total Hodge-Tate weights** of V. Then it satisfies:

- $\sum_{k\in\mathbb{Z}} m_k(V) = [F : \mathbb{Q}] \dim V$.
- For a subfield $F_0 \subset F$, if $W = \mathrm{Ind}_{\mathrm{Gal}_F}^{\mathrm{Gal}_{F_0}}(V)$, then $m_k(V) = m_k(W)$.?
- If V is pure of weight w, then

$$w[F : \mathbb{Q}] \dim V = 2 \sum_{k\in\mathbb{Z}} m_k \cdot k.$$

⌟

Proof: 1 is clear.

2: ?

3: By item2 and(20.9.5.5), it suffices to show for $F = \mathbb{Q}$. Secondly, it suffices to show for $\det V$, it has motivic weight $w \dim V$ and for each $v \in \Sigma_F^p$ the unique Hodge-Tate weights equal to the sum of Hodge-Tate weights of V. Then we may assume it has weight 0 by Tate twist because Hodge-tensoring by $\mathbb{Q}_p(k)$ increases both sides by $-2k$.

Then by Sen's theory, $V|_{\mathrm{Gal}_{\mathbb{Q}_p}}$ is potentially unramified. Let χ be the Hecke character attached to V, then its kernel contains an open subgroup $U_p \subset \mathbb{Z}_p^\times$, and also by small circle argument, it contains an open subgroup $U^p \subset \prod_{\ell\neq p} \mathbb{Z}_\ell^\times$, and it also contains $\mathbb{R}_+^\times$ by(14.6.3.27). But notice $\mathbf{I}_{\mathbb{Q}}^* / \mathbb{Q}^\times U_p U^p \mathbb{R}^\times$ is finite. Thus it is an Artin representation, and has motivic weight 0(20.9.5.4), □

Prop. (20.9.5.7) [Symmetry of Hodge-Tate Weights]. If the Tate conjecture(20.9.5.1) is true, then for any genuine geometric representation V pure of weight w,

- $m_k = m_{w-k}$.
- If $w \in 2\mathbb{Z}$, let $m_{w/2}^{\pm}(V)$ be defined by

$$m_{w/2}^+(V) + m_{w/2}^-(V) = m_{w/2}(V)$$

$$m_{w/2}^+(V) - m_{w/2}^-(V) = (-1)^{w/2}(\dim V^{\mathsf{c}=\mathrm{id}} - \dim V^{\mathsf{c}=-\mathrm{id}}).$$

  Then $m_{w/2}^{\pm}(V) \in \mathbb{N}$.
- For a subfield $F_0 \subset F$, $m_{w/2}^{\pm}(V) = m_{w/2}^{\pm}(\mathrm{Ind}_{\mathrm{Gal}_F}^{\mathrm{Gal}_{F_0}}(V))$.

⌟

Polarized Representations

Def. (20.9.5.8) [Polarized Representations]. V is called a **polarized Galois representation** if $V^\vee \cong V(w)$ for some $w \in \mathbb{Z}$. w is called the weight of the polarization. If V is polarized and pure, then the motivic weight equals the polarization weight, so there will be no confusion. ⌟

Prop. (20.9.5.9). If $F/\mathbb{Q}$ is Galois, and V, V' are two irreducible geometric representation of Gal_F s.t. $L(V; s) = L(V'; s)$, then $V' \cong V$. ⌟

Proof: This is because $L(V;s)$ determines $WD_v(V)$ for all v that is unramified. Thus also determines V by Chebotarev density theorem**?**. □

Example (20.9.5.10) [Polarized Representations].

- Any 1-dimensional representation is polarized.
- $V_p(A)$ of an Abelian variety is polarized of weight 1.
- Representations attached to a classical modular eigenform in $S_{2k}(\Gamma_0(N))$ is polarized of weight $2k-1$.
- For an irreducible polarized representation of $\mathrm{Gal}_{\mathbb{Q}}$ of dimension 2, its weight is odd iff V is odd.

⌟

Proof: **?** □

21 L-Functions

21.1 Eisenstein Series

1 Non-Holomorphic Eisenstein Series

References are [Bump, Chap3] and [Diamond]Chap4.10.

Def. (21.1.1.1)[Non-Holomorphic Eisenstein Series]. The **non-holomorphic Eisenstein series** of weight s is defined to be

$$E^*(z,s)=\frac{1}{2}L_{\mathbb{R}}(2s)\sum_{(m,n)\neq 0\in\mathbb{Z}^2}\frac{(\mathrm{Im}(z))^s}{|mz+n|^{2s}}=L_{\mathbb{R}}(2s)\sum_{\gamma\in\overline{\Gamma_\infty}\backslash\overline{\Gamma(1)}}(\mathrm{Im}(\gamma(z)))^s$$

It is absolutely convergent for $\mathrm{Re}(s)>1$, and is automorphic for $\Gamma(1)$(20.1.1.11). ⌟

Prop. (21.1.1.2)[Fourier Expansion of $E(z,s)$]. The Fourier coefficients of $E(z,s)$ is of the form

$$E^*(z,s)=\sum_{n=-\infty}^{\infty}a_n(y,s)e^{2\pi irx},$$

where

$$a_0(y,s)=\Lambda(2s)y^s+\Lambda(2-2s)y^{1-s}$$

and for $n\neq 0$,

$$a_n(y,s)=2|n|^{-s+1/2}\sigma_{2s-1}(|n|)\sqrt{y}K_{s-1/2}(2\pi|n|y),$$

where $K_{s-1/2}(z)$ is the K-Bessel function(11.6.3.1). In particular,

$$E^*(z,s)=\Lambda(2s)y^s+\Lambda(2-2s)y^{1-s}+4\sqrt{y}\sum_{n\in\mathbb{Z}_+}n^{\frac{1}{2}-s}\sigma_{2s-1}(n)K_{s-\frac{1}{2}}(2\pi ny)\cos(2\pi nx)$$

⌟

Proof:

$$a_r(y,s)=\int_0^1 E^*(x+iy,s)e^{-2\pi irx}dx=\int_0^1\frac{1}{2}\pi^{-s}\Gamma(s)\sum_{(m,n)\neq 0\in\mathbb{Z}^2}\frac{y^s}{|mz+n|^{2s}}e^{-2\pi irx}dx.$$

The term with $m=0$ only contributes to a_0, and equals $\pi^{-s}\Gamma(s)\zeta(2s)y^s$. For the rest we may assume $m>0$ by symmetry, then they contributes to

$$\pi^{-s}\Gamma(s)y^s\sum_{m=1}^{\infty}\sum_{n=-\infty}^{\infty}\int_0^1[(mx+n)^2+m^2y^2]^{-s}e^{-2\pi irx}dx$$

$$= \pi^{-s}\Gamma(s)y^s \sum_{m=1}^{\infty} \sum_{n \mod m} \int_{-\infty}^{\infty} [(mx+n)^2 + m^2y^2]^{-s} e^{-2\pi i r x} dx$$
$$= \pi^{-s}\Gamma(s)y^s \sum_{m=1}^{\infty} m^{-2s} \sum_{n \mod m} e^{2\pi i r n/m} \int_{-\infty}^{\infty} (x^2+y^2)^{-s} e^{-2\pi i r x} dx$$

Notice $\sum_{n \mod m} e^{2\pi i r n/m} = \begin{cases} m & m|r \\ 0 & \text{otherwise} \end{cases}$, thus the calculation reduces to(11.6.3.5). □

Prop. (21.1.1.3) [Functional Equation]. $E^*(z,s)$ has meromorphic continuation to all $s \in \mathbb{C}$, and it is analytic except at $s=1$ or $s=0$, where the residue at $s=1$ is $1/2$ for any z, and it satisfies the functional equation

$$E^*(z,s) = E^*(z,1-s).$$

and $E(x+\mathrm{i}\,y,s) = O(y^\sigma)$ for $y \to \infty$, where $\sigma = \max(\mathrm{Re}(s), 1-\mathrm{Re}(s))$. ⌟

Proof: This follows from the Fourier expansion of $E^*(z,s)$(21.1.1.2). Each term $a_r(y,s)$ has analytic extension to all s, except that a_0 has simple poles at $s=0$ and $s=1$ by(21.4.2.5)(the pole at $s=1/2$ was neutralized). And the functional equation and the convergence is clear from the properties of K-Bessel functions(11.6.3.2). For the residue, it suffices to show the residue of $\pi^{-s/2}\Gamma(s/2)\zeta(s)$ at 0 is -1(21.4.2.5). □

Prop. (21.1.1.4) [Kronecker's First Limit Formula].

$$2E^*(z,s) = \frac{1}{s-1} + \gamma_0 - \log(4\pi y|\eta(z)|^4) + O(s-1).$$

And a similar formula is true for $s=0$, by the functional equation(21.1.1.3). ⌟

Proof: Cf.[Kronecker's First Limit Formula, Revisited]. □

Prop. (21.1.1.5) [Eisenstein Series of Mixed Type]. The **Eisenstein series of mixed type** is defined to be

$$E_{k,s}(z) = \sum_{(m,n)\in\mathbb{Z}^2\setminus(0,0)} \frac{y^s}{(mz+n)^k|mz+n|^{2s}}, k \in \mathbb{Z}, s \in \mathbb{C}.$$

Then

$$R_k(y^{k/2}E_{k,s}(z)) = (k+s)y^{(k+2)/2}E_{k+2,s}(z).$$

and $y^{k/2}E_{k,s}(z)$ is a Maass form in (z) of weight k. Its better to consult the paper https://arxiv.org/abs/1803.08210 for the Fourier expansion of $E_{k,s}$. ⌟

Proof:

$$((z-\bar{z})\frac{\partial}{\partial z} + k/2)[\frac{(\frac{z-\bar{z}}{2i})^{s+k/2}}{(mz+n)^{s+k}(m\bar{z}+n)^s}]$$
$$= (z-\bar{z})(\frac{\frac{s+k/2}{2i}(\frac{z-\bar{z}}{2i})^{s-1+k/2}(mz+n)^{s+k} - (\frac{z-\bar{z}}{2i})^{s+k/2}m(s+k)(mz+n)^{s+k-1}}{(m\bar{z}+n)^s(mz+n)^{2s+2k}}) + \frac{k}{2}\frac{(\frac{z-\bar{z}}{2i})^{s+k/2}}{(mz+n)^{s+k}(m\bar{z}+n)^s}$$
$$= \frac{(\frac{z-\bar{z}}{2i})^{s+k/2}}{(mz+n)^{s+k+1}(m\bar{z}+n)^s}[(s+k/2)(mz+n) - (z-\bar{z})m(s+k) + \frac{k}{2}(mz+n)]$$

$$= (k+s)\frac{(\frac{z-\bar{z}}{2i})^{s-1+(k+2)/2}}{(mz+n)^{s+k+1}(m\bar{z}+n)^{s-1}}$$
$$= (k+s)y^{(k+2)/2}E_{k+2,s-1}(z)$$

□

Prop. (21.1.1.6) [Rankin-Selberg]. Let $\varphi \in C^\infty(\Gamma(1)\backslash\mathscr{H})$ be decreasing rapidly along $y \to \infty$ and $\varphi(z) = \sum_{n\in\mathbb{Z}} \varphi_n(y)e^{2\pi inx}$ be its Fourier expansion. Call φ_0 the constant term of φ. Consider the Mellin transform

$$M(s,\varphi_0) = \int_0^\infty \varphi_0(y)y^s\frac{dy}{y}(11.11.2.16), \quad \Lambda(s,\varphi_0) = \Lambda(2s)M(s-1,\varphi_0).$$

As $\varphi(s,\varphi_0)$ is bounded as a function on y and decay rapidly, $M(s,\varphi)$ is absolutely convergent for $\mathrm{Re}(s) > 0$.

Then

$$\Lambda(s,\varphi_0) = \int_{\Gamma(1)\backslash\mathscr{H}} E^*(z,s)\varphi(z)\frac{dxdy}{y^2}$$

and thus has a meromorphic continuation to all s and satisfies a functional equation, with at most simple poles at $s = 0$ or 1,

$$\mathrm{Res}_{s=1}\Lambda(s,\varphi_0) = \frac{1}{2}\int_{\Gamma(1)\backslash\mathscr{H}} \varphi(z)\frac{dxdy}{y^2}.$$

⌟

Proof: Using(21.1.1.1),

$$\begin{aligned}\int_{\Gamma(1)\backslash\mathcal{H}} \varphi(z)\frac{dxdy}{y^2} &= \Lambda(2s)\sum_{\gamma\in\overline{\Gamma_\infty}\backslash\overline{\Gamma(1)}}\int_{\overline{\Gamma(1)}\backslash\mathcal{H}}(\mathrm{Im}(\gamma(z)))^s\varphi(\gamma(z))\frac{dxdy}{y^2}\\ &= \Lambda(2s)\int_{\Gamma_\infty\backslash\mathcal{H}}\mathrm{Im}(z)^s\varphi(z)\frac{dxdy}{y^2}\\ &= \Lambda(2s)\int_0^\infty y^{s-1}\int_0^1\varphi(x+\mathrm{i}\,y)dx\frac{dy}{y}\\ &= \Lambda(2s)\int_0^\infty \varphi_0(y)y^{s-1}\frac{dy}{y}\\ &= \Lambda(s,\varphi_0)\end{aligned}$$

The assertion about the meromorphic continuation and the residue follows from the equation above and(21.1.1.3). □

Weil Representations

Thm. (21.2.1.1) [Weil L-Factors]. For any local field K and a non-trivial additive character ψ of K, there exists a group homomorphism

$$\varepsilon(\cdot,\psi):K_0(\mathfrak{wd}(W_K))\to\mathbb{C}^\times$$

that satisfy

- For a quasi-character χ, $\varepsilon(\chi,\psi)$ agrees with local factor given by Tate thesis.
- If E/F is a finite extension, and ρ is a representation of W_E, then

$$\varepsilon(\operatorname{ind}_{W_E}^{W_F}\rho,\psi_F)=\lambda(E/F,\psi_F)^{\dim\rho}\varepsilon(\rho,\psi_F\circ\operatorname{tr}_{E/F}).$$

⌟

Proof: Cf.[Functional Equation for Artin L-Functions, Langlands] and [Tate, Number Theoretical Background]. □

Def. (21.2.1.2) [Weil-Deligne L-Factors]. Let $K\in p\text{-}\mathtt{NField}$ and $\rho=(\rho_0,N)\in\mathfrak{wd}(W_K)$, we define

- the conductor $\mathfrak{f}(\rho)=\mathfrak{f}(\rho_0)+\dim(V^{I_K}/\ker(N)^{I_K})$, where $\mathfrak{f}(\rho_0)$ is the Artin conductor(18.3.2.16).
- the local L-factor

$$L(\rho,s)=\det(1-q^{-s}\operatorname{Frob}_\kappa\,|\ker(N)^{I_K})^{-1}.$$

- the local ε-factor

$$\varepsilon(\rho,s,\psi)=q^{-(c(\rho)+n(\psi)\dim V)s}\det(-\varphi|V^{I_K}/\ker(N)^{I_K})\varepsilon(\rho',\psi).$$

⌟

Prop. (21.2.1.3). $\varepsilon(\rho\otimes\omega_s,\psi)=q^{-(c(\rho)+n(\psi)\dim V)s}\varepsilon(\rho,\psi)$. ⌟

Proof: □

Artin L-Functions

Def. (21.2.1.4) [Local Artin L-Factors]. For a Galois extension $L/F \in$ NField and $\rho \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, the local L-factors(21.2.1.2) are:

$$L_v(F,\rho;s) = \begin{cases} (\det(1-||v||^{-s}\rho(\varphi_{\mathfrak{P}/\mathfrak{p}})|V^{I_{\mathfrak{P}}}))^{-1} & , v\in\Sigma_F^{\mathrm{fin}} \\ L_{\mathbb{C}}(s)^{\chi(1)} & , v\in\Sigma_F^{\mathbb{C}} \\ L_{\mathbb{R}}(s)^{n_+}\cdot L_{\mathbb{R}}(s+1)^{n_-} & , v\in\Sigma_F^{\mathbb{R}}\text{(21.3.3.1)} \end{cases}$$

where in the case $v\in\Sigma_F^{\mathrm{fin}}$, $\mathfrak{P}$ is a prime over $\mathfrak{p}=\mathfrak{p}_v$, and in the case $v\in\Sigma_F^{\mathbb{R}}$, let $\mathfrak{p}=\mathfrak{p}_v,\mathfrak{P}$ be any place of L over $\mathfrak{p}$, and let $\mathfrak{c}_{\mathfrak{P}}$ be the generator of $\mathrm{Gal}(L_{\mathfrak{P}}/F_{\mathfrak{p}})$, then

$$n_+ = \frac{\chi(1)+\chi(\mathfrak{c}_{\mathfrak{P}})}{2},\quad n_- = \frac{\chi(1)-\chi(\mathfrak{c}_{\mathfrak{P}})}{2}.$$

⌟

Prop. (21.2.1.5)[Functoriality of Artin L-Factors]. For a Galois extension of global fields L/F and $(\rho,V)\in\mathrm{Rep}(\mathrm{Gal}(L/F)), v=v_{\mathfrak{p}}\in\Sigma_F$, The Artin L-factors(21.2.1.4) satisfy the following functorial properties:

- $L_v(F,\mathbb{1};s) = L_v(\mathbb{1};s)$**?**.
- For $\rho,\rho'\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, $L_v(F,\rho\oplus\rho';s) = L_v(F,\rho;s)L_v(F,\rho';s)$.
- For Galois extensions $L'/L/K$ and $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, $L(L'/F,\rho;s) = L(L/F,\rho;s)$.
- If $F\subset M\subset L$, $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/M))$, then $L_{\mathfrak{p}}(F,\mathrm{Ind}_{\mathrm{Gal}(L/F)}^{\mathrm{Gal}(L/M)}(\rho);s) = \prod_{\mathfrak{q}|\mathfrak{p}} L_{\mathfrak{q}}(M,\rho;s)$.

⌟

Proof: **?**

1, 2, 3 are clear.

For 4: Let $G=\mathrm{Gal}(L/F), H=\mathrm{Gal}(L/M)$, for any $\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}$, let $\{\mathfrak{q}_1,\ldots,\mathfrak{q}_r\}=S(\mathfrak{p})\subset\Sigma_M^{\mathrm{fin}}$, and take $\mathfrak{P}_i\in\Sigma_L^{\mathrm{fin}}$ over $\mathfrak{q}_i$. Let G_i, I_i be the decomposition and inertia groups of $\mathfrak{P}_i/\mathfrak{p}$, then $H_i=G_i\cap H, I_i'=I_i\cap H$ are the decomposition and inertia groups of $\mathfrak{P}_i/\mathfrak{q}_i$. Denote f_i the inertia degree of $\mathfrak{q}_i/\mathfrak{p}$. Let $(\rho,W)\in\mathrm{Rep}(\mathrm{Gal}(L/M)), (\rho',V)=\mathrm{Ind}_{\mathrm{Gal}(L/F)}^{\mathrm{Gal}(L/M)}(\rho)\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, then it suffices to show that

$$\det(1-\varphi_{\mathfrak{P}_1/\mathfrak{p}}T|V^{I_1}) = \prod_{i=1}^r \det(1-\varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i}T^{f_i}|W^{I_i'}).$$

If $\mathfrak{P}_i=\tau_i^{-1}(\mathfrak{P}_1)$, then we can take $\varphi_{\mathfrak{P}_i/\mathfrak{p}}=\tau_i^{-1}\varphi_{\mathfrak{P}/\mathfrak{p}}\tau_i, I_i=\tau_i^{-1}I\tau_i$, then

$$\det(1-\varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i}T^{f_i}|W^{I_i'}) = \det(1-\varphi_{\mathfrak{P}_1/\mathfrak{p}}^{f_i}T^{f_i}|W^{I_1\cap\tau_i H\tau_i^{-1}}),$$

and $f_i=(G_i:H_iI_i)=(G_1:(G_1\cap\tau_iH\tau_i^{-1})I_1)$.

Let σ_{ij} be a representative of $G_1/(G_1\cap\tau_iH\tau_i^{-1})$, then because $G/H=\cup_i G_i/H_i$, $\{\sigma_{ij}\tau_i\}_{ij}$ is a representative of G/H. Then

$$V=\oplus_i(\bigoplus_j \sigma_{ij}\tau_i W),$$

and $V_i=\bigoplus_j\sigma_{ij}\tau_iW=\mathrm{Ind}_{G_1\cap\tau_iH\tau_i^{-1}}^{G_1}(\tau_iW)$ is a G_1-module. So

$$\det(1-\varphi_{\mathfrak{P}_1/\mathfrak{p}}T|V^{I_1}) = \prod_{i=1}^r\det(1-\varphi_{\mathfrak{P}_1/\mathfrak{p}}T|V_i^{I_1})$$

Then it suffices to prove for each i,

$$\det(1-\varphi_{\mathfrak{P}_1/\mathfrak{p}}T|V_i^{I_1})=\det(1-\varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i}T^{f_i}|W^{I_i'}).$$

Notice

$$V_i^{I_1}=\Big(\mathrm{Ind}_{G_1\cap\tau_iH\tau_i^{-1}}^{G_1}(\tau_iW)\Big)^{I_1}=\mathrm{Ind}_{H_i}^{G_i}W^{I_i'}(18.1.5.40)=\bigoplus_{i=0}^{f_i-1}\varphi_{\mathfrak{P}_i/\mathfrak{p}}^{i}W^{I_i'},$$

so the assertion follow easily from this. □

Def. (21.2.1.6) [Artin L-Functions]. Let $L/F\in$ `GField` be Galois, and $(\rho,V)\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, the **Artin L-function** of ρ is defined to be the Euler product of local L-factors(21.2.1.4)

$$L(F,\rho;s)=\prod_{v\in\Sigma_F^{\mathrm{fin}}}L_v(F,\rho;s).$$

This L-function also only depends on F but not L, as we will see in(21.2.1.7).

And also define the **completed Artin L-function** as the function

$$\Lambda(F,\rho;s)=\prod_{v\in\Sigma_F}L_v(F,\rho;s).$$

⌟

Prop. (21.2.1.7) [Functoriality of Artin L-Functions]. Let $L/F\in$ `GField` be Galois and $(\rho,V)\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, The L-functions satisfy the following functorial properties:

- $L(F,\mathbb{1};s)=\zeta(F;s)$(21.4.3.1).
- For $\rho,\rho'\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, $L(F,\rho\oplus\rho';s)=L(F,\rho;s)L(F,\rho';s)$.
- For Galois extensions $L'/L/K$ and $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, $L(L'/F,\rho;s)=L(L/F,\rho;s)$.
- If $F\subset M\subset L$, $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/M))$, then $L(F,\mathrm{Ind}_{\mathrm{Gal}_M}^{\mathrm{Gal}_F}(\rho);s)=L(M,\rho;s)$.

⌟

Proof: These follow from(21.2.1.5). □

Cor. (21.2.1.8). For a finite Galois extension L/F,

$$\zeta(L;s)=\zeta(F;s)\cdot\Big(\prod_{\rho\neq\mathbb{1}\in\mathrm{Irr}(\mathrm{Gal}(L/F))}L(F,\rho;s)^{\chi_\rho(1)}\Big)$$

⌟

Prop. (21.2.1.9) [Artin L-Functions and Weber L-Functions]. Let $L/F\in$ `GField` be Abelian and Galois with conductor $\mathfrak{f}$, and $\chi\in\chi(\mathrm{Gal}(L/F))$, composing with the Artin symbols(14.6.4.26), we get a character $\widetilde{\chi}:C_F/C^{\mathfrak{f}}\cong J^{\mathfrak{f}}/P^{\mathfrak{f}}\to\mathrm{Gal}(L/F)\xrightarrow{\chi}\mathbb{C}^\times$, which is a Dirichlet character. Then we have

$$L(F,\chi;s)=\prod_{\mathfrak{p}\in S}\frac{1}{1-\chi(\varphi_{\mathfrak{P}/\mathfrak{p}})(N\mathfrak{p})^{-s}}L(F,\widetilde{\chi};s)(21.4.2.3),$$

where $S=\{\mathfrak{p}\in S_f(\mathfrak{f})|\chi(I_{\mathfrak{P}})=1\}$. Moreover, if χ is injective, then $S=\varnothing$. ⌟

Proof: S are the primes that are ramified in L/F and $\mathbb{C}(\chi)^{I_{\mathfrak{P}}}\neq 0$. □

Functional Equations

Prop. (21.2.1.10) [Functional Equations, Brauer]. By Brauer theorem(18.1.3.33) and(18.1.3.33), the Artin L-functions can be written as products and inverses of Weber L-functions(21.4.2.3) and f.m. L-factors. In particular, they can be extended meromorphically to all $s \in \mathbb{C}$ and satisfies a functional equation(21.4.2.5). But the ε-factor remains mysterious**?**.

More explicitly, for a Galois extension of global fields L/F and $(\rho, V) \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, the completed Artin L-function satisfies a functional equation

$$\Lambda(F, \rho; s) = \varepsilon(\rho; s)\Lambda(\rho^\vee; 1 - s),$$

where

$$\varepsilon(\rho) = w(\rho)\Big(|d_F|^{\chi_\rho(1)}||\mathfrak{f}(F, \rho)||\Big)^{1/2-s} \text{(18.3.2.16)}$$

and $w(\rho)$ is a root number, which satisfies $|w(\rho)| = 1$. ⌟

Proof: Cf.[Algebraic Number Theory, Neukirch].**?** □

Conj. (21.2.1.11)[Artin]. If $F \in \texttt{GField}$ and $(\rho, V) \in \mathrm{Rep}^{\mathrm{fd}}(\mathrm{Gal}_F)$ satisfies $V^{\mathrm{Gal}_F} = 0$, then $L(F, \rho; s)$ is an entire function w.r.t. $s \in \mathbb{C}$. ⌟

Proof: □

Remark (21.2.1.12). The Artin conjecture is true if $\mathrm{Im}(\rho)$ is solvable, as we can reduce to Abelian case, and use(21.2.1.9) and(21.4.2.5). ⌟

Thm& Conj.Cor. (21.2.1.13) [Langlands-Tunnell]. ⌟

Artin-Weil L-Functions

Cf.[On the Functional Equation of the Artin L-Functions, Langlands].

2 Galois L-Functions

Def. (21.2.2.1) [L-Functions]. Given an isomorphism $\iota : \overline{\mathbb{Q}}_p \hookrightarrow \mathbb{C}$, for any $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$, define the global L-function as

$$L(\iota V; s) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} L(\iota\, \mathrm{WD}_p(V); s) \text{(21.2.1.2)}.$$

⌟

Prop. (21.2.2.2). By Chebotarev density theorem, $L(\iota V; s)$ determines $\mathrm{WD}_p(V)$ and thus V up to F-semisimplification. ⌟

Proof: **?** □

Prop. (21.2.2.3). Situation as in(21.2.2.1),

- $L(V(n); s) = L(V; s + n)$.
- If $F_0 \subset F$ is a subfield, $W = \mathrm{Ind}_{\mathrm{Gal}_K}^{\mathrm{Gal}_{K_0}}(V)$, then $L(V; s) = L(W; s)$.
- If V is S-pure of weight w, then $L_S(V; s)$ converges absolutely for $\mathrm{Re}\, s > w/2 + 1$.

- If V is pure of weight w, then $L(V;s)$ is meromorphic for $\mathrm{Re}\, s > w/2+1$ and has no zeros there.

⌟

Proof: 1 is easy.
2: ?
3: Compare with the Dedekind zeta function(21.3.2.1).
4: clear. □

Conj. (21.2.2.4) [Holomorphy]. Situation as in(21.2.2.1), if V is geometric and pure of weight w, then it is totally pure. In particular, it is holomorphic for $\mathrm{Re}\, s > w/2+1$. ⌟

Proof: ?. This should be a consequence of Fontaine-Mazur conjecture and Tate's conjecture. □

Conj. (21.2.2.5) [Meromorphic Extension]. If V is geometric and pure of weight w, then
- $L(V;s)$ admits a meromorphic continuation to all $s\in\mathbb{C}$, and essentially bounded on vertical strips.
- $L(V;s)\neq 0$ for $\mathrm{Re}(s) > w/2+1$.
- If V is irreducible, then $L(V;s)$ has no poles, expect when $V\cong \mathbb{Q}_p(n)$, then it has a simple pole at $s=-n+1$.
- $L(V;w/2+1)\neq 0$.

⌟

Proof: □

Remark (21.2.2.6). This is true when V is automorphic, by Jacquet-Shalika method. ⌟

Conj. (21.2.2.7) [Grand RH Hypothesis]. If V is geometric and pure of weight w, then $L(V;s)$ has no zeros on $\mathrm{Re}\, s > (w+1)/2$. ⌟

Proof: □

Def. (21.2.2.8) [Completed L-Functions]. If V is geometric and pure of weight w, define

$$L_\infty(V;s) = \Gamma_{\mathbb{R}}(s-w/2)^{m^+_{w/2}}.\Gamma_{\mathbb{R}}(s-w/2+1)^{m^-_{w/2}}.\prod_{k\in\mathbb{Z},k<w/2}\Gamma_{\mathbb{C}}(s-k)^{m_k}.$$

and define the **root number at** ∞

$$w_\infty(\rho) = \mathrm{i}^{m^-_{w/2}}.\Big(\prod_{k<w/2}\mathrm{i}^{m_k}\Big)^{2w+1}$$

and the Artin conductor $\mathfrak{f}(\rho)$(18.3.2.16), and the completed L-function

$$\Lambda(V;s) = L(\iota V;s)L_\infty(V;s).$$

and the **root number**

$$w(\iota\rho) = w_\infty(\rho)\prod_{p\in\mathbf{P}} w(\mathrm{WD}_p(\rho);\psi_p)$$

where $\iota\psi_p(x) = e^{-2\pi\,\mathrm{i}\,x}$. ⌟

Prop. (21.2.2.9). If $V \in \mathrm{Rep}_{\overline{\mathbb{Q}}_\ell}(\mathrm{Gal}_\mathbb{Q})$ is geometric and pure of weight w, then

- $L_\infty(V(n); s) = L_\infty(V; s+n)$.
- $L_\infty(V(n); s)$ has a pole of order $\sum_{0\leq k<w/2} m_k + m^+_{w/2}$ at $s = 0$.
- If Tate's conjecture(20.9.5.1) holds, then $m^\pm_{w/2} \geq 0$, so $L_\infty(V(n); s)$ has no zeros.

⌟

Proof: Only 1 deserves a proof: It suffices to prove for $n = 1$. If $w \notin 2\mathbb{Z}$ this is clear. If $w \in 2\mathbb{Z}$, notice Tate twists change weights by 2, so it is also odd, and $(-1)w'/2 = -(-1)^{w/2}$. But also the twist changes the action of c by -1 in(20.9.5.7), so the assertion follows. □

Conj. (21.2.2.10) [Functional Equations]. If V is geometric and pure of weight w, then

$$\Lambda(V; s) = w(V)N(V)^{(w+1)/2-s}\Lambda(V^\vee; 1-s).$$

where $N(V)$ is the conductor of V**?**. ⌟

Proof: □

Remark (21.2.2.11). This is true for V automorphic, by Jacquet-Shalika method.**?** ⌟

Conj.Cor. (21.2.2.12). For a geometric representation polarized of weight w(20.9.5.8), there should be a functional equation

$$\Lambda(V; 1+w-s) = \varepsilon(V; s)\Lambda(V; s).$$

⌟

Proof: □

3 Hasse-Weil L-Functions

References are [Zeta Functions in Algebraic Geometry, Mustata].

Zeta-Functions over Finite Fields

Def. (21.2.3.1) [Zeta-Functions]. Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{ft}}/\mathbb{F}_q$, then its **zeta-function** is defined to be the power series

$$Z(X; T) = \exp(\sum_{n\geq 1} \#X(\mathbb{F}_{q^n})\frac{T^n}{n}) \in \mathbb{Q}[[T]].$$

Notice that we can get the information of number of rational points of X by the formula

$$\#X(\mathbb{F}_{q^n}) = \frac{1}{(n-1)!}\frac{d^n}{dT^n}\log Z(X; T)|_{T=0}.$$

⌟

Prop. (21.2.3.2) [Euler Product]. there is an Euler product formula for $Z(X; T)$ by(17.2.2.2)(17.2.2.3):

$$Z(X; T) = \prod_{x \text{ closed in } X} \frac{1}{1 - T^{\deg(x)}}.$$

⌟

Thm. (21.2.3.3) [Rationality of Zeta Functions, Dwork]. Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and $X \in \mathcal{S}\mathrm{ch}^{\mathrm{ft}}/\mathbb{F}_q$, then $Z(X;T) \in \mathbb{Q}(T)$. ⌟

Proof: Cf.[Zeta Functions in Algebraic Geometry, Mustata]**?**. Does this follows from Weil conjecture? □

Thm. (21.2.3.4) [Weil Conjecture1949, Weil/Deligne1974/Laumon]. Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}\mathcal{V}\mathrm{ar}^n/\mathbb{F}_q$, then

1. (Riemann Hypothesis): $Z(X;T)$ is of the form
$$Z(X;T) = \frac{P_1(X;T)P_3(X;T)\dots P_{2n-1}(X;T)}{P_0(X;T)P_2(X;T)\dots P_{2n}(X;T)}$$
s.t.
   - $P_0(X;T) = 1-T$,
   - $P_{2n}(X;T) = 1-q^nT$,
   - For $0 \le i \le 2n$, $P_i(X;T) \in \mathbb{Z}[T]$,
   - For $0 \le i \le 2n$, $P_i(X;T) = \prod_{j\le k}(1-\alpha_{ij}T)$, where each $\alpha_{ij} \in \mathrm{Weil}(q^{i/2})$ is a q-Weil number of weight i(14.4.1.13).
   - $\deg(P_i(X;T))$ is called the **i-th Betti number** of X, and $\deg P_i(X;T) = \deg P_{2n-i}(X;T)$.
2. (Functional Equation):
$$Z(X;\frac{1}{q^nT}) = \pm q^{n\chi/2}T^\chi Z(X;T),$$
where χ is a Euler character $\Delta\cdot\Delta = \sum_{i=0}^{2n}(-1)^i\deg P_i(X;T)$. Notice that $n\chi/2 \in \mathbb{Z}$.
3. If $R \subset \mathbb{C}$ is a f.g. $\mathbb{Z}$-algebra, $\mathfrak{p} \in \mathrm{Spec}(R)$ s.t. $R/\mathfrak{p} \cong \mathbb{F}_q$, and there exists $\mathcal{X} \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}/R$ s.t. $\mathcal{X}_{\kappa(\mathfrak{p})} \cong X$, then $\deg(P_i(X;T))$ equals the i-th Betti number of $\mathcal{X}_{\mathbb{C}}^{\mathrm{an}}$.
4. $\chi(X) = \Delta_X \cdot \Delta_X$.

⌟

Proof: 1: It follows from trace formula(17.2.2.6) that
$$Z(X;T) = \frac{P_1(X;T)P_3(X;T)\dots P_{2n-1}(X;T)}{P_0(X;T)P_2(X;T)\dots P_{2n}(X;T)} = \frac{P(T)}{Q(T)},$$
where the roots α_{ij} of $P_i(X;T)$ are algebraic integers satisfying $|\iota(\alpha_{ij}^{-1})| = q^{-i/2}$ by Deligne's purity theorem(17.2.6.5). Thus $P_i(X;T) \in \mathbb{Q}[T]$ because it is in $\overline{\mathbb{Q}}[T]$ and also it is stable under $\mathrm{Gal}_{\mathbb{Q}}$, as their roots are distinguished by their ι-values.

Moreover, by Euler product(21.2.3.2), $Z(X;T) \in \mathbb{Z}[[T]]$, so it follows from(9.5.1.16) that $P(T), Q(T) \in \mathbb{Z}[T]$.

Notice by Poincaré duality(8.4.7.51), $\mathrm{H}^{2n}_{\text{ét}}(X;\mathbb{Q}_\ell(n)) \cong \mathrm{H}^0_{\text{ét}}(X;\mathbb{Q}_\ell)^\vee$, thus F_X^* acts on $\mathrm{H}^0_{\text{ét}}(X;\mathbb{Q}_\ell)$ by id and acts on $\mathrm{H}^{2n}_{\text{ét}}(X,\mathbb{Q}_\ell)$ by q^n. Thus $P_0(X;T) = 1-T$, $P_{2n}(X;T) = 1-q^nT$.

2: Apply(3.5.14.1) to $H^i = \mathrm{H}^i_{\text{ét}}(X;\mathbb{Q}_\ell)$, trace map and perfect pairing given by Poincaré duality(8.4.7.51) and $\varphi_i = q^{-i/2}F_X^*$. Notice $\varphi_{2n} = \mathrm{id}$ by item2. Now(3.5.14.1) says $\varphi_i^{-1} = \varphi_{2d-i}^t$. Then
$$\{\frac{q^{i/2}}{\alpha_{ij}}\}_j = \{\frac{\alpha_{2n-i,j}}{q^{(2n-i)/2}}\}_j$$

where we are counting multiplicity. Thus for $i\neq d$, we can assume $\alpha_{ij}\alpha_{2n-i,j}=q^n$, and for $i=d$, suppose there are $N_\pm$ many $\alpha_{d,j}=\pm q^{n/2}$, and the other $\alpha_{d,j}$ comes in pair: $\alpha_{d,j}\alpha_{d,b_d-j}=0$. Then

$$Z(X;\frac{1}{q^nT})=\prod_i(1-\alpha_{ij}/(q^nT))^{(-1)^{i+1}}=\prod_i(1-\frac{1}{\alpha_{2n-i,j}T})^{(-1)^{i+1}}=Z(X;T)\cdot q^{n\chi/2}(-1)^{N_+}.$$

Moreover, if n is odd, then $b_i=b_{d-i}$, and χ is even, so $d\chi/2\in\mathbb{Z}$.
3: These follow from the trace formula(17.2.2.6) and(8.4.7.35).
4: By(8.10.2.2),

$$\Delta_X\cdot\Delta_X=(\mathrm{cyl}_{X\times X}(\Delta_X),\mathrm{cyl}_{X\times X}(\Delta_X))=\sum_{i=0}^{2d}\mathrm{tr}(\mathrm{id}\,|\mathrm{H}^i_{\text{ét}}(X))=\chi(X).$$

□

Cor. (21.2.3.5) [Invariance of Characteristic Polynomial with ℓ]. It follows from the proof above that P_i is determined by X, and it is also the characteristic polynomial of $\mathrm{Fr}_{\overline{X}}$ on $\mathrm{H}^i_{\text{ét}}(X,\mathbb{Q}_\ell)$ for any $\ell\in\mathbf{P}\backslash\,\mathrm{char}\,k$, so the latter is independent of ℓ chosen. ⌟

Points Counting

Thm. (21.2.3.6) [Deligne's Estimate]. ⌟

Proof: □

Cor. (21.2.3.7) [Weil Bound]. For $X\in\mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}\mathcal{V}\mathrm{ar}^1/\mathbb{F}_q$, by Weil conjecture(21.2.3.4),

$$|\#X(\mathbb{F}_{q^n})-q^n-1|=|\sum_j\alpha_{1j}|\leq 2g(X)q^{n/2}.$$

⌟

Thm. (21.2.3.8) [Ihara/Drinfeld-Vladut]. For $p\in\mathbf{P},q\in 2^{\mathbb{Z}_+}$, let $A(q)=\overline{\lim}_{g(X)\to\infty}\frac{\#X(\mathbb{F}_q)}{g(X)}$, where the limit is taken over all smooth proper curves over $\mathbb{F}_q$. Then $A(q)\leq\sqrt{q}-1$.
And if $q\in 2^{\mathbb{Z}_+}$, then $A(q)=\sqrt{q}-1$. ⌟

Proof: Let α_{1j} as in(21.2.3.4), $\omega_i=\alpha_{1i}q^{-1/2}$, then $|\omega_i|=1$ and inversion induces an automorphism of $\{\omega_i\}$. Then by(21.2.3.7), for any $r\in\mathbb{Z}_+$,

$$N=\#X(\mathbb{F}_q)\leq\#X(\mathbb{F}_{q^r})=q^r+1-q^{r/2}\sum_i\omega_i^r.$$

And notice

$$0\leq|1+\omega_i+\ldots+\omega_i^r|^2=(r+1)+\sum_{j=1}^r(r+1-j)(\omega_i^j+\omega_i^{-j}),$$

So

$$\begin{aligned}2g(X)(r+1)&\geq-\sum_i\sum_{j=1}^r(r+1-j)(\omega_i^j+\omega_i^{-j})=-2\sum_{j=1}^r(r+1-j)(\sum_i\omega_i^j)\\&\geq N\sum_{j=1}^r(r+1-j)q^{-j/2}-\sum_{j=1}^r(r+1-j)(\alpha^j+\alpha^{-j})\end{aligned}$$

Thus

$$\frac{N}{g(X)} \le (\sum_{j=1}^{r} \frac{r+1-j}{r+1} q^{-j/2})^{-1} \cdot (1 + \frac{1}{g} \sum_{j=1}^{r} \frac{r+1-j}{r+1} (\alpha^j + \alpha^{-j}))$$

Taking limit $g \to \infty$,

$$\frac{N}{g(X)} \le (\sum_{j=1}^{r} \frac{r+1-j}{r+1} q^{-j/2})^{-1}.$$

And taking limit $r \to \infty$ gives

$$\frac{N}{g(X)} \le (\sum_{j=1}^{r} q^{-j/2})^{-1} = \sqrt{q} - 1.$$

For the last assertion, See[Ihara].**?** □

Thm. (21.2.3.9) [Lang-Weil Estimate]. Cf.[Zeta function in algebraic geometry, Mustata]. ⌟

Proof: □

Hasse-Weil L-Functions

Prop. (21.2.3.10) [Hasse-Weil L-Functions]. Let $F \in \texttt{GField}$ and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}\mathcal{V}\mathrm{ar}/F$, the **Hasse-Weil L-function** of X is defined to be

$$L(X, s) = \prod_{v \in \Sigma_F^0} Z(\mathcal{X}_v, q^{-s}),$$

where for v s.t. $\mathcal{X}_v$ has good reduction, $Z(\mathcal{X}_v, T) = Z(\mathcal{X}_{k_v}, T)$ in(21.2.3.1), and for bad places v, it needs to be defined otherwise.**?** ⌟

Prop. (21.2.3.11). Let $l_1, \ldots, l_N$ be linear forms in r-variables with rational coefficients, then

$$\sum_{x \in \mathbb{Z}^r} \frac{1}{l_1(x) \ldots l_N(x)} \in \mathbb{Q}\pi^N$$

if it is convergent. ⌟

Proof: □

Def. (21.2.3.12) [Hasse-Weil L-Functions]. For $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}\mathcal{V}\mathrm{ar}/\mathbb{Q}, \ell \in \mathbf{P}$, there is some $N \in \mathbb{Z}_+, \ell | N$ s.t. X has a model $\mathcal{X}/\mathbb{Z}[\frac{1}{N}]$. Choose an embedding Then we can define a a partial zeta function

$$\zeta_N(X; s) = \prod_{p \nmid N} \Big(\prod_{x \in |X_p|_0} (1 - p^{-s \deg(x)})^{-1} \Big),$$

then by Grothendieck-Lefschetz formula,

$$\zeta_N(X; s) = \prod_{i=0}^{2 \dim X} L_N(\iota H^i(X, \overline{\mathbb{Q}}_\ell); s)^{(-1)^i}.$$

Thus it is natural to define the **Hasse-Weil L-function**

$$\zeta(X;s) = \prod_{i=0}^{2\dim X} L(\iota H^i(X,\overline{\mathbb{Q}}_\ell);s)^{(-1)^i}.$$

and the completed L-function

$$\Lambda(X;s) = \prod_{i=0}^{2\dim X} \Lambda(\iota H^i(X,\overline{\mathbb{Q}}_\ell)l;s)^{(-1)^i}.$$

┘

Example (21.2.3.13).
- $L(\operatorname{Spec}\mathbb{Q};s) = \zeta(s)$.
- For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$,
$$L(E;s) = \frac{\zeta(s)\zeta(s-1)}{L(h^1E;s)}(21.2.6.2).$$

┘

Conj. (21.2.3.14) [Functional Equations]. Motivated by Poincaré duality and(21.2.2.10), situation as in(21.2.3.12), $\zeta(X;s)$ should have a meromorphic extension to the whole plane, and satisfies a functional equation of the form

$$\Lambda(X;s) = \varepsilon(s)\Lambda(X, 1+\dim X - s).$$

┘

Proof: □

Remark (21.2.3.15). This is true for elliptic curves, by [BCDT]. ┘

4 Motivic L-Functions

Main references are [Del79] and [Zag94].

Def. (21.2.4.1) [Motivic L-Functions]. Use the fact the Grothendieck motives over a finite field is a Tannakian category**?**, we can define L-functions for any motives over a number field. Such an L-function is called a **motivic L-function**. ┘

Conj. (21.2.4.2) [Properties]. The motivic L-functions are conjectured to satisfy the following properties:

Algebraicity: There are Dirichlet series expansions: $L(s) = \sum_{n\geq 1} a_n n^{-s}$ for $\mathrm{Re}(s)$ large, where $\{a_n\} \in F$ for some number field F.

Euler Product: There are Euler product expansions: $L(s) = \prod_{p\in\mathbf{P}} \Phi_p(p^{-s})$ where $\max_{p\in\mathbf{P}}\{\deg\Phi_p\} < \infty$. In particular, $n \mapsto a_n$ is multiplicative.

Functional Equation: There is a γ-factor

$$\gamma(s) = A^s \cdot \prod_i \Gamma(\frac{1}{2}(s+m_i))$$

where $A \in \mathbb{C}^*, m_i \in \mathbb{Z}$, s.t. $\zeta(s) = \gamma(s)L(s)$ satisfies a functional equation

$$\zeta(s) = w\zeta(h-s)$$

where $w = \pm 1$ called the **sign of functional equation** and $h \in \mathbb{Z}_+$. And in this way, $L(s)$ extends to a meromorphic function on $\mathbb{C}$ with only f.m. poles.

Local Riemann Hypothesis: The zeros of $\Phi_p(p^{-s})$ lie on the line $\mathrm{Re}(s) = \frac{k-1}{2}$.

Riemann Hypothesis: The zeros of $L(s)$ are either integers or lie on the line $\mathrm{Re}(s) = \frac{k-1}{2}$.

Special Values: A **critical point for** $L(s)$ is an integer $m \in \mathbb{Z}$ s.t. neither m nor $h - m$ is a pole of $L(s)$. Then for a critical point m for $L(s)$, the **critical value** $L(m) = A(m)\Omega(m)$, where $A(m)$ is a reasonable algebraic number and $\Omega(m) \in \mathbb{P}$ is a reasonable period number.

Central Special Values: If $h = 2m, m \in \mathbb{Z}$, then m is called a **central value** of $L(s)$, and in this case, $A(m)$ is a square times a simple factor.

⌟

Proof: □

Conj. (21.2.4.3) [Big Automorphy Conjecture]. Every motivic L-function comes from a automorphism representation. ⌟

Proof: □

5 0-Dimensional Motives

6 Abelian Motives

Elliptic Curves

Def. (21.2.6.1) [L-Factors]. ⌟

Def. (21.2.6.2) [Motivic L-Function of Elliptic Curves]. Let F be a global field F and $E \in \mathcal{E}\mathrm{ll}/F$, the motivic h^1 L-function is defined to be

$$L(h^1E, s) = \prod_{v \in \Sigma_F^0} L(h^1E_v, s)$$

where $L(E_v, s)$ is defined to be

- $L(E_v, s) = (1 - a_v q_v^{-s} + q_v^{1-2s})^{-1}$ as in(21.2.6.1), where $a_v = q_v + 1 - \#\widetilde{E}_v(\kappa_v)$, if E has good reduction at v.
- $(1 - q_v^{-s})^{-1}$ if E has split multiplicative reduction at v.
- $(1 + q_v^{-s})^{-1}$ if E has non-split multiplicative reduction at v.
- 1 if E has additive reduction at v.

Notice that in all cases we have $L(E_v, 1) = q_v/\#\widetilde{E}_{\mathrm{sm}}(\kappa_v)$. ⌟

Prop. (21.2.6.3) [Tate-Faltings]. If $E, E' \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ s.t. $L_E(s) = L_{E'}(s)$, then E, E' are isogenous. ⌟

Proof: Cf.[Milne, Elliptic Curves, Thm5.4.1]. □

Thm. (21.2.6.4) [Analytic Continuation]. For $F \in \texttt{NField}$ and $E \in \mathcal{E}\mathrm{ll}/F$, according to(21.2.3.14), the L-function $L(E,s)$(21.2.6.2) should have an analytic continuation an entire function on $s \in \mathbb{C}$, and satisfies a functional equation relating its value at s and $2-s$.

If $F = \mathbb{Q}$, let

$$\Lambda(E,s) = N_E^{s/2}(2\pi)^{-s}\Gamma(s)L(E,s)$$

be the completed L-function, where $N_{E/\mathbb{Q}}$ is the conductor, then it satisfies the functional equation:

$$\Lambda(E,s) = w_E\Lambda(E,2-s)$$

where $w_E = \pm 1$ is called the **sign of functional equation of** E. ⌟

Proof: By modularity theorem(19.4.2.6), $L(E;s) = L(f;s)$ for some normalized Hecke eigenform $f \in S_2(\Gamma_0(N_E))$. So the assertion follows from(21.3.6.21). Notice $g = f[w_N]_k = -w_E f$(19.4.2.8). □

7 Zeta Functions of Shimura Varieties

8 Tamagawa Number Conjecture(Bloch-Kato)

References are [A note on Height Pairings, Tamagawa Numbers and the Birch and Swinnerton-Dyer Conjecture, Bloch].

Conj. (21.2.8.1) [Tamagawa Number Conjecture]. Let $F \in \texttt{NField}$ and $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/F$, suppose that $G(F)$ is discrete in $G(\mathbf{A}_F)$, then

$$\tau(G) = \frac{\#\operatorname{Pic}(G)_{\mathrm{tor}}}{\#\text{Ш}(G)}.$$

Moreover, $\operatorname{ord}_{s=1} L(s) \le 0$, and $r = 0$ iff $\operatorname{Vol}(G(A_F)/G(F)) < \infty$. ⌟

Invariants of Moduli Spaces

Prop. (21.2.9.1). Volumes and Euler characteristics of moduli spaces are often expressible by special values of ζ-functions. ⌟

Proof: □

Def. (21.2.9.2)[Witten ζ-Functions]. Because of the appearance in physics(Verlinde formula), people are interested in certain moduli spaces of vector bundles on curves.

Witten gave a formula expressing the volume of these moduli spaces in terms of special values of **Witten ζ-functions**:

Let $\mathfrak{g}$ be a semisimple f.d. Lie algebra, define

$$\zeta_g(s) = \sum_{\rho \in \mathrm{Rep}(\mathfrak{g})} \frac{\dim(\rho)^s}{}?$$

⌟

Prop. (21.2.9.3). A consequence of Witten's formula(21.2.9.2) is:

$$\zeta_{\mathfrak{g}}(2m) \in \mathbb{Q}\pi^{2rm}, m \in \mathbb{Z}_+$$

where r is the number of positive roots of $\mathfrak{g}$. ⌟

Multiple ζ-Values

Cf.[Zag94].

21.3 L-Functions Attached to Automorphic Representations

Main references are [Bum98], [Cog00] and [Gelbart-Shahidi, Analytic Properties of Automorphic L-Functions].

Notation (21.3.0.1).

- Use notations defined in Adelic Automorphic Representations.
- Use notations defined in Archimedean L-Factors.
- Fix a global field F.
- Fix an additive character $\psi = \otimes' \psi_v : \mathbf{A}_F / F \to \mathbb{C}^\times$.
- Fix a linear algebraic group $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/F$ with center Z, and let $\mathcal{K} \subset G(\mathbf{A}_F)$ be a hyperspecial compact subgroup(15.4.3.2).
- Fix a central character $\omega : Z(\mathbf{A}_F)/Z(F) \to \mathbb{C}^\times$. Notice if $G = \mathrm{GL}(2)$, ω is just a Hecke character.

┘

1 Introduction

Remark (21.3.1.1) [Delete]. According to https://mathoverflow.net/questions/44657/principal-l-functions-on-gln, there are several ways to attach L-functions to a cusp form on $\mathrm{GL}(n)$ with functional equations:

1. Godement-Jacquet: In the spirit of Tate's thesis, take a cusp form f on $G = \mathrm{GL}(n)$ (and f' in the dual representation) and a Schwartz-Bruhat function Φ on $\mathrm{Mat}(n, \mathbf{A}_F)$ and integrate
$$\int_{Z(\mathbf{A}_F)G(F)\backslash G(\mathbf{A}_F)} \langle \pi(g)f, f'\rangle \Phi(g) |\det(g)|^s dg.$$
For this, Cf.[G-H11]Chap11.
2. Rankin-Selberg: Take a cusp form f on $G = \mathrm{PGL}(n)$ (and f' in the dual representation) and a specific Eisenstein series on $\mathrm{PGL}(n^2)$ and integrate
$$\int_{Z(\mathbf{A}_F)(G\times G)(F)\backslash (G\times G)(\mathbf{A}_F)} E(g_1, g_2) f(g_1) f'(g_2) \mathrm{d}g_1 \mathrm{d}g_2,$$
where Z is the center of $\mathrm{PGL}(n^2)$. For this, Cf.[Bum98] and [Goldfeld].
3. Explicit Eulerian integral(Jacquet-Shapiro-Shalika): Take a cusp form f on $\mathrm{GL}(n)$ and f' on $\mathrm{GL}(m)$ with $n > m$, integrate
$$\int_{GL(m,F)\backslash GL(m,\mathbf{A}_F)} Pf(g) f'(g) |\det(g)|^{s-1/2} \mathrm{d}g.$$
where P is the projection operator brilliantly designed s.t. this integral resolves to the product of Whittaker models for f and f'. For this, Cf.[Cog00] and [Analytic Theory of L-functions for $GL(n)$].
4. Eisenstein series(Langlands-Shahidi):

┘

L-Functions for $\mathrm{GL}(n)$

Prop. (21.3.1.2). To $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n)/\mathbb{Q})$, we can associate:

-

⌟

2 Tate's thesis(Godement-Jacquet for $\mathrm{GL}(1)$)

Main references are [Poo15], [R-V99] and [Tat65].

Lemma (21.3.2.1) [Dedekind Zeta Function]. For a global field F, the **Dedekind zeta function** is defined by

$$\zeta(F;s) = \prod_{\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}} \frac{1}{1-||\mathfrak{p}||^{-s}}.$$

It converges absolutely for $\mathrm{Re}(s) > 1$. Notice if $F \in \mathtt{FField}$, then

$$\zeta(F;s) = \sum_{\mathfrak{a}\in\mathrm{Ideal}(\mathcal{O}_F)} \frac{1}{||\mathfrak{a}||^s}$$

⌟

Proof: It suffices to show $\prod_{\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}} \frac{1}{1-||\mathfrak{p}||^{-\sigma}} < +\infty$ for $\sigma > 1$.

If F is a number field, let $d = [F:\mathbb{Q}]$, this is bounded by

$$\prod_p (1-p^{-\sigma})^{-d} = (\sum_{n\geq 1} n^{-\sigma})^d < \infty.$$

If F is a function field, let the number of irreducible polynomial modulo p be N_n, then use the same method, it suffices to prove the convergence of

$$\prod_{\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}} \frac{1}{1-\frac{1}{(N\mathfrak{p})^\sigma}} = \prod_{n\geq 1}(\frac{1}{1-q^{-n\sigma}})^{N_n}.$$

This is convergent iff $\sum_{n\geq 1} N_n q^{-n\sigma}$ is convergent(11.4.3.8), but the latter is bounded by

$$\sum_{n\geq 1} q^n q^{-n\sigma} = \sum_{n\geq 1} q^{-n(\sigma-1)} < \infty.$$

□

Def. (21.3.2.2) [Zeta Functions]. If $\Phi \in \mathcal{S}(F)$ and χ is a Hecke character of F, $s \in \mathbb{C}$, the **global zeta function** is defined to be

$$\zeta(\chi,\Phi;s) = \int_{\mathbf{I}_F} \Phi(\mathfrak{a})\chi(\mathfrak{a})|\mathfrak{a}|^s d^\times \mathfrak{a}.$$

When $\Phi = \otimes_v \Phi_v$ is a pure tensor,

$$\zeta(\chi,\Phi;s) = \prod_{v\in\Sigma_F} \zeta_v(s,\chi_v,\Phi_v) = \prod_{v\in\Sigma_F} \int_{F_v^\times} \Phi_v(x)\chi_v(x)|x|_v^s d^\times x$$

Where the **local zeta functions** $\zeta_v(\chi_v,\Phi_v;s)$ converge to a holomorphic function for $\mathrm{Re}(s) > 0$ and the integral is absolutely convergent for $\mathrm{Re}(s) > 1$. ⌟

Proof: For the local zeta function: Φ_v is rapidly decreasing, thus it suffices to integrate the part where $|x|_v < 1$. Then Φ_v is bounded on this compact region, thus it suffices to evaluate $\int_{|x|_v\leq 1} |x|_v^s \mathrm{d}^\times x < \infty$ for $\mathrm{Re}(s) > 0$, which can be done case by case.

To show the global integral converges, notice the local integrals is the same as the local L-factors for a.e. $v \in \Sigma_F$ by(21.3.2.3), so we can use Fubini and notice that $\prod_v L(\chi_v; s)$ converges by comparison with the Dedekind zeta function(21.3.2.1). □

Prop. (21.3.2.3) [Unramified Factors]. For any place v that unramified in the sense of(14.4.5.19) and $\Phi_v = \mathbb{1}_{\mathcal{O}_v}$,

$$\zeta_v(\chi_v, \Phi_v; s) = L(\chi_v; s) = (1 - \chi_v(\varpi)||\mathfrak{p}||^{-s})^{-1}\text{(21.3.3.1)}.$$

⌟

Proof: Notice the a.e. $v \in \Sigma_F$ satisfies v that unramified in the sense of(14.4.5.19) and $\Phi_v = \mathbb{1}_{\mathcal{O}_v}$, and for such a v,

$$\zeta_v(\chi_v, \Phi_v; s) = \sum_{k\in\mathbb{N}} \int_{v(x)=k} \chi_v(x)|x|_v^s d^\times x = \sum_{k\in\mathbb{N}} (\chi_v(\varpi_v)||v||^{-s})^k = (1 - \chi_v(\varpi)||v||^{-s})^{-1}.$$

□

Prop. (21.3.2.4) [Global Functional Equation]. The global zeta function(21.3.2.2) can be extended to a meromorphic function for all s, and it has poles iff $\chi(x) = |x|^\lambda$ for some $\lambda \in \mathrm{i}\,\mathbb{R}$. In which case, it only has poles at

$$s = \begin{cases} -\lambda, 1-\lambda & , F \in \texttt{NField} \\ -\lambda + \frac{2\pi n\,\mathrm{i}}{\log(\# F_0)}, 1 - \lambda + \frac{2\pi n\,\mathrm{i}}{\log(\# F_0)} & , F \in \texttt{FField} \end{cases}$$

with respectively residue $-kf(0)$ and $kf^\vee(0)$, where $k = V(\mathbf{I}_F^1/F^\times)$(14.4.5.20), and essentially bounded on the vertical strips away from the poles. And we have functional equations

$$\zeta(\chi, \Phi; s) = \zeta(\chi^{-1}, \Phi^\vee; 1-s).$$

⌟

Proof: Consider the exact sequence

$$1 \to \mathbf{I}_F^1 \to \mathbf{I}_F \to |\,\mathbf{I}_F\,| \to 1.$$

Let $\mathbf{I}_F^t$ be the inverse image of $t \in |\,\mathbf{I}_F\,|$, where $|\,\mathbf{I}_F\,| = \mathbb{R}_+$ or $q^{\mathbb{Z}}$, with Haar measure dt/t or $\log q$ times the counting measure(also denoted dt/t), and choose Haar measure $d^\times x$ on each I_F^t compatible with $d^\times \mathfrak{a}$ and dt/t. In particular, if $|a_t| = t$,

$$\int_{|I_F|} \int_{I_F^1} \Phi(a_t x)\chi(a_t x) t^s d^\times x \frac{dt}{t} = \int_{I_F} \Phi(\mathfrak{a})\chi(\mathfrak{a})|\mathfrak{a}|^s d^\times \mathfrak{a}.$$

Then the measure $d^\times x$ and the counting measure on $F^\times$ induces a measure $d^\times x$ on $I_F^1/F^\times$, in particular, for any $f \in C(C_F)$, we have

$$\int_{I_F^t/F^\times} f(x) d^\times x = \int_{I_F^1/F^\times} f(a_t x) d^\times x = \int_{I_F^1/F^\times} f(\frac{a_t}{x}) d^\times x = \int_{I_F^{1/t}/F^\times} f(\frac{1}{x}) d^\times x. \qquad (\star)$$

Denote $\zeta_t(\chi,\Phi;s)=\int_{I_F^t}\Phi(x)\chi(x)|x|^s d^\times x$, then

$$\zeta(\chi,\Phi;s)=\int_0^1\zeta_t(\chi,\Phi;s)\frac{dt}{t}+\int_1^\infty\zeta_t(\chi,\Phi;s)\frac{dt}{t}=J+I$$

where if $|I_F|=q^{\mathbb{Z}}$ the value at 1 is counted half-half at this two part. Now for the I-part, if $\mathrm{Re}(s)$ is smaller, it is smaller, thus I extends to a holomorphic function to all $s\in\mathbb{C}$. For the J-part, by lemmas(21.3.2.6)(21.3.2.5),

$$\begin{aligned}J&=\int_0^1\zeta_{1/t}(\widehat{\Phi},\chi^{-1};1-s)\frac{dt}{t}+[\int_0^1(k\widehat{\Phi}(0)(\frac{1}{t})^{1-s}-k\Phi(0)t^s)\frac{dt}{t}]\delta_{c,|\cdot|}\\&=\int_1^\infty\zeta_t(\widehat{\Phi},\chi^{-1};1-s)\frac{dt}{t}+[\int_0^1(k\widehat{\Phi}(0)t^{s-1}-k\Phi(0)t^s)\frac{dt}{t}]\delta_{c,|\cdot|}\\&=I(\chi,\Phi;s)+I(\chi^{-1},\widehat{\Phi};1-s)+k\delta_{c,|\cdot|}[\int_0^1(\widehat{\Phi}(0)t^{s-1}-\Phi(0)t^s)\frac{dt}{t}]\end{aligned}$$

So it can be extended, and the final part is

$$\frac{k\widehat{f}(0)}{s-1}-\frac{kf(0)}{s}$$

when F is number field, and when F is function field, it equals

$$k\log q[\widehat{f}(0)(-\frac{1}{2}+\sum_{n=0}^\infty(q^{-n})^{s-1})-f(0)(-\frac{1}{2}+\sum_{n=0}^\infty(q^{-n})^s)]=\frac{k\log q}{2}(\widehat{f}(0)\frac{1+q^{1-s}}{1-q^{1-s}}+f(0)\frac{1+q^s}{1-q^s}).$$

Now clearly $\zeta(\chi,\Phi;s)=\zeta(\chi^{-1},\widehat{\Phi};1-s)$, and it has the desired residues at 1 and $|\cdot|$. □

Lemma (21.3.2.5). $\int_{\mathbf{I}_F^t/F^\times}\chi(x)|x|^s d^\times x=kt^s$ if $\chi=\mathbb{1}$ and 0 otherwise. ⌟

Proof: $\int_{\mathbf{I}_F^t/F^\times}\chi(x)|x|^s d^\times x=\chi(a_t)t^s\int_{\mathbf{I}_F^1/F^\times}\chi(x)d^\times x$, $\mathbf{I}_F^t/F^\times$ is compact(14.4.4.21) and χ is trivial on $\mathbf{I}_F^1/F^\times$ iff $\chi=\mathbb{1}$, thus we can use(11.10.1.14). □

Lemma (21.3.2.6). $\zeta_t(\chi,\Phi;s)+\Phi(0)\int_{\mathbf{I}_F^t/F^\times}\chi(x)|x|^s d^\times x=\zeta_{1/t}(\widehat{\Phi},\chi^{-1};1-s)+\widehat{\Phi}(0)\int_{I_F^{1/t}/F^\times}\chi(x)|x|^s d^\times x$. ⌟

Proof:

$$\begin{aligned}\zeta_t(\chi,\Phi;s)+\Phi(0)\int_{I_F^t/F^\times}\chi(x)|x|^s d^\times x&=\int_{\mathbf{I}_F^t/F^\times}(\sum_{a\in F^\times}\Phi(ax))\chi(ax)|ax|^s d^*x+\int_{\mathbf{I}_F^t/F^\times}\Phi(0)\chi(x)|x|^s d^\times x\\&=\int_{\mathbf{I}_F^t/F^\times}(\sum_{a\in F}\Phi(ax))\chi(x)|x|^s d^*x\\(14.4.5.22)&=\int_{\mathbf{I}_F^t/K^\times}\frac{1}{|x|}(\sum_{a\in K}\widehat{\Phi}(a/x))\chi(x)|x|^s d^*x\\(\text{by }\star)&=\int_{\mathbf{I}_F^{1/t}/F^\times}(\sum_{a\in F}\widehat{\Phi}(ay))|y|\chi^{-1}(y)|y|^{-s}d^*y\\&=\zeta_{1/t}(\widehat{\Phi},\chi^{-1};1-s)+\widehat{f}(0)\int_{\mathbf{I}_F^{1/t}/F^\times}\chi(x)|x|^s d^\times x\end{aligned}$$

□

Local Functional Equations

Lemma (21.3.2.7). For any $\Phi_v, \Psi_v \in \mathcal{S}(F_v)$, $\chi_v \in (F_v^\times)^\vee$, $s \in \mathbb{C}$,

$$\frac{\zeta_v(\chi_v, \Phi_v; s)}{\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)} = \frac{\zeta_v(\chi_v, \Psi_v; s)}{\zeta_v(\chi_v^{-1}, \widehat{\Psi}_v; 1-s)}.$$

⌟

Proof: ?

$$\zeta(f,c)\zeta(\widehat{g},\overline{c}) = \int_{K^\times} f(\alpha)c(\alpha)\int_{K^\times} \widehat{g}(\beta)c^{-1}(\beta)|\beta|d\beta = \int\int f(\alpha)\widehat{g}(\beta)c(\alpha\beta^{-1})|\beta|d\alpha d\beta$$

by Fubini.

$$= \int\int f(\alpha)\widehat{g}(\alpha\beta)c(\beta^{-1})|\alpha\beta|d\alpha d\beta = \int(\int f(\alpha)\widehat{g}(\alpha\beta)|\alpha|d\alpha)|\beta|c(\beta^{-1})d\beta$$

And notice

$$\int_{K^\times} f(\alpha)\widehat{g}(\alpha\beta)|\alpha|d\alpha = C\cdot\int_{K^+\setminus\{0\}} f(\xi)\widehat{g}(\xi\beta)d\xi = C\cdot\int_{K^+}\int_{K^+} f(\xi)g(\eta)e^{-2\pi i\Lambda(\xi\beta\eta)}d\eta d\xi$$

which is clearly symmetric in f and g. So the conclusion follows. □

Prop. (21.3.2.8) [Local Functional Equations]. For any $\Phi_v \in \mathcal{S}(F_v), \chi_v \in (F_v^\times)^\vee$, the local zeta function $\zeta_v(\chi_v, \Phi_v; s)$(21.3.2.2) can be extended to a meromorphic function to all $s \in \mathbb{C}$ that is analytic for $\mathrm{Re}(s) > 0$, and there is a function $\gamma_v(\chi_v, \psi_v; s)$, meromorphic for s and independent of f, such that

$$\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s) = \gamma_v(\chi_v, \psi_s; s)\zeta_v(\chi_v, \Phi_v; s).$$

⌟

Proof: By(21.3.2.2), both $\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)$ and $\zeta_v(\chi_v, \Phi_v; s)$ are holomorphic in $0 < \mathrm{Re}(s) < 1$, so we define $\gamma(\chi_v, \psi_s; s)$ in this region, and try to extend it. Now(21.3.2.7) shows this is invariant of Φ_v, so we can take any Φ_v we want. Notice if $\Phi_v = 0$ on a nbhd of 0, then $\zeta_v(\chi, \Phi_v; s)$ is entire. Then because Fourier transform preserves $\mathcal{S}(F_v)$(14.4.5.11), we can take Φ_v to be 0 around 0 or $\widehat{\Phi}_v$ to be 0 around 0, then $\gamma_v(\chi_v, \psi_v; s)$ is analytic on both $\mathrm{Re}(s) > 0$ and $\mathrm{Re}(s) < 1$. □

Prop. (21.3.2.9). Let $v \in \Sigma_F^{\mathrm{fin}}$ and $\mathrm{Re}(s) < 1$, then for $N \in \mathbb{Z}_+$ sufficiently large,

$$\gamma_v(s, \chi_v, \psi_v) = \int_{\mathfrak{p}^{-N}} |x|^{-s}\chi_v^{-1}(x)\psi_v(x)dx.$$

⌟

Proof: In(21.3.2.8), take $\Phi_v = \mathbb{1}_{1+\mathfrak{p}^N}$, then $\widehat{\Phi}_v = \mathbb{1}_{\mathfrak{p}^{-N}} \cdot \psi_v$. □

Prop. (21.3.2.10).

- $\gamma(1-s, \chi^{-1}, \psi) = \chi(-1)/\gamma(s, \chi, \psi)$.
- $\rho(\overline{c}) = c(-1)\overline{\rho(c)}$

⌟

Proof: 1:

$$\zeta(f,c)=\rho(c)\zeta(\widehat{f},\widehat{c})=\rho(c)\rho(\widehat{c})\zeta(\widehat{\widehat{f}},c)=\rho(c)\rho(\widehat{c})c(-1)\zeta(f,c)$$

2:

$$\zeta(f,c)=\rho(c)\zeta(\widehat{f},\widehat{c}),\quad \overline{\zeta(f,c)}=\zeta(\overline{f},\overline{c})=\rho(\overline{c})\zeta(\widehat{\overline{f}},\widehat{\overline{c}})$$

And

$$\widehat{\overline{f}}(\xi)=\int\overline{f}(\eta)e^{-2\pi i\Lambda(\xi\eta)}d\eta=\overline{\int f(\eta)e^{2\pi i\Lambda(\xi\eta)}d\eta}=\overline{\widehat{f}}(-\xi)$$

so

$$\rho(\overline{c})\zeta(\widehat{\overline{f}},\widehat{\overline{c}})=\rho(\overline{c})c(-1)\zeta(\overline{\widehat{f}},\overline{\widehat{c}})=\rho(\overline{c})c(-1)\overline{\zeta(\widehat{f},\widehat{c})}$$

Thus $\rho(\overline{c})=c(-1)\overline{\rho(c)}$. □

Cor. (21.3.2.11). Because when $\sigma(c)=\frac{1}{2}$, $\widehat{c}=\overline{c}$**??**, we have $|\rho(c)|=1$ in this case. ⌟

3 Weber L-Functions(GL(1) Case)

Def. (21.3.3.1) [Local L-Factors]. Given a Hecke character χ, for $v\in\Sigma_F$, the local L-factor for $v\in\Sigma_F$ and $s\in\mathbb{C}$ is defined to be

$$L(\chi_v;s)=\begin{cases}(1-\chi_v(\varpi)||\mathfrak{p}||^{-s})^{-1} & v\in\Sigma_F^{\text{fin}},\chi_v\text{ unramified}\\ 1 & v\in\Sigma_F^{\text{fin}},\chi_v\text{ ramified}\\ L_{\mathbb{R}}(s+\nu+\varepsilon)(11.6.1.13) & v\in\Sigma_F^{\mathbb{R}},\chi_v(x)=|x|^\nu\operatorname{sgn}(x)^\varepsilon,\nu\in\mathrm{i}\,\mathbb{R},\varepsilon\in\{0,1\}\\ L_{\mathbb{C}}(s+\nu+\frac{|k|}{2})(11.6.1.13) & v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{Z}\end{cases}$$

⌟

Prop. (21.3.3.2)[Local L-Factors are the Common Divisors]. Situation as in(21.3.2.8), $\frac{\zeta_v(\chi_v,\Phi_v;s)}{L(\chi_v;s)}$ is entire for any $\Phi_v\in\mathcal{S}(F_v)$, and if $v\in\Sigma_F^{\text{fin}}$, it is a rational function of $||v||^{-s}$.

Moreover, if we take

$$\Phi_v(x)=\begin{cases}\mathbb{1}_{1+\mathfrak{c}(\chi_v)} & ,v\in\Sigma_F^{\text{fin}}\\ x^\varepsilon e^{-\pi x^2} & ,v\in\Sigma_F^{\mathbb{R}},\chi_v(x)=|x|^\nu\operatorname{sgn}(x)^\varepsilon,\nu\in\mathrm{i}\,\mathbb{R},\varepsilon\in\{0,1\}\\ \pi^{-1}\overline{x}^k e^{-2\pi|x|_v} & ,v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{N}\\ \pi^{-1}x^{-k}e^{-2\pi|x|_v} & ,v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{Z}_-.\end{cases}$$

then

$$\frac{\zeta_v(\chi_v,\Phi_v;s)}{L(\chi_v;s)}=\begin{cases}d^\times\alpha_v(\mathcal{O}^*) & ,v\in\Sigma_F^{\text{fin}},\chi_v\text{ unramified}\\ d^\times\alpha_v(1+\mathfrak{c}(\chi_v)) & ,v\in\Sigma_F^{\text{fin}},\chi_v\text{ ramified}\\ 1 & ,v\in\Sigma_F^\infty\end{cases}$$

In particular, they can all be non-zero constants. ⌟

Proof: For $v\in\Sigma_F^{\text{fin}}$,

$$\zeta_v(\chi_v,\Phi_v;s)=\sum_{k\in\mathbb{Z}}||v||^{ks}\int_{v(x)=-k}\Phi_v(x)\chi_v(x)d^\times x$$

As $\Phi_v\in C_c^\infty(F_v)$, the summand is 0 for k large. And for k small, $\Phi_v(x)$ is constant. If χ_v is ramified, then these terms are 0, thus it is a polynomial in $||\mathfrak{p}||^{-s}$, and for χ_v unramified, the these terms are a geometric series, which is easily seen to be a rational function of $||\mathfrak{p}||^{-s}$, and has the same pole as $L(\chi_v;s)$(21.3.3.1).

For $v\in\Sigma_F^{\mathbb{R}}$, the poles of $\zeta_v(\chi_v,\Phi_v;s)$ are the same as poles of $\int_{|x|\leq 1}\Phi_v(x)\chi_v(x)|x|^s dx$, because $\int_{|x|\geq 1}\Phi_v(x)\chi_v(x)|x|^s dx$ is convergent for any $s\in\mathbb{C}$. For the former, we can write Φ_v as a sum of an odd function and an even function. Only the part with the same parity of χ_v will be non-zero, and for that part, by(11.4.3.5), its poles are all simple and are poles of $L(\chi_v;s)$(21.3.3.1).

For $v\in\Sigma_F^{\mathbb{C}}$, if $\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{Z}$,

$$\zeta_v(\chi_v,\Phi_v;s)=\frac{1}{2\pi}\int_0^\infty\int_0^{2\pi}r^{2v+2s}e^{ik\theta}\Phi_v(re^{i\theta})d\theta\frac{dr}{r}=\int_0^\infty r^{2v+2s}\varphi(r)\frac{dr}{r},$$

where

$$\varphi(r)=\frac{1}{2\pi}\int_0^{2\pi}e^{ik\theta}\Phi_v(re^{i\theta})d\theta.$$

Suppose $\Phi_v(x)=\sum_{n,m\in\mathbb{N}}a(n,m)x^n\overline{x}^m$, then $\varphi(r)=\sum_{m-n=k}a(n,m)r^{m+n}$. Thus by(11.4.3.5), its pole are $\{s|2s+2v-(|k|+2l)\}$, which are all simple and are poles of $L(\chi_v;s)$(21.3.3.1).

For the last assertion, we need direct calculations, Cf.[Tate's Thesis]P320**?**. □

Prop. (21.3.3.3)[Local ε-Factors]. Situation as in(21.3.2.8), there exists a non-vanishing holomorphic function $\varepsilon_v(\chi_v,\psi_v)$ that

$$\frac{\zeta_v(\chi_v^{-1},\widehat{\Phi}_v;1-s)}{L(\chi_v^{-1};1-s)}=\varepsilon_v(\chi_v,\psi_v;s)\frac{\zeta_v(\chi_v,\Phi_v;s)}{L(\chi_v;s)}.$$

and $\frac{\zeta_v(\chi_v,\Phi_v)}{L_v(\chi_v;s)}$ is holomorphic. Moreover, $\varepsilon_v(\chi_v,\psi_v;s)$ is of the form ab^s for $a\in\mathbb{C}^*,b\in\mathbb{R}$. And $\varepsilon(\chi_v,\psi_v)=1$ if v is unramified in the sense of(14.4.5.19). ⌟

Proof: Such an $\varepsilon_v(\chi_v,\psi_v;s)$ exists by(21.3.2.8). It is holomorphic and non-vanishing by(21.3.3.2) as both $\frac{\zeta_v(\chi_v^{-1},\widehat{\Phi}_v;1-s)}{L(\chi_v^{-1};1-s)}$ and $\frac{\zeta_v(\chi_v,\Phi_v;s)}{L(\chi_v;s)}$ are holomorphic and for any $s_0\in\mathbb{C}$, Φ_v can be chosen to make either one of them non-vanishing at s_0.

To show it is of the form ab^s: If $v\in\Sigma_F^{\mathrm{fin}}$, it is a rational function in $||\mathfrak{p}||^{-s}$ with no zeros or poles, so it must be of the form ab^s. And if v is unramified, then we can take $\Phi_v=\mathbb{1}_{\mathcal{O}_{F,v}},\Phi_v^\vee=\mathbb{1}_{\mathcal{O}_{F,v}}$ by(14.4.5.5), and both sides are 1 by(21.3.2.3).

If $v\in\Sigma_F^\infty$, then we can take Φ_v defined in(21.3.3.2) to do the calculation to show it directly(**?**Cf.[Tate's Thesis]):

$$\Phi_v^\vee(x)=\begin{cases}||\mathfrak{c}(\psi_v)^{-1}\mathfrak{c}(\chi_v)||.d\mu_v(\mathcal{O}_{F_v}).\mathbb{1}_{\mathfrak{c}(\psi_v)\mathfrak{c}(\chi_v)^{-1}}.\psi_v^{-1} & ,v\in\Sigma_F^{\mathrm{fin}}\\ \mathrm{i}^\varepsilon\cdot x^\varepsilon e^{-\pi x^2} & ,v\in\Sigma_F^{\mathbb{R}},\chi_v(x)=\mathrm{sgn}(x)^\varepsilon,\varepsilon\in\{0,1\}\\ \mathrm{i}^k\cdot\pi^{-1}x^k e^{-2\pi|x|_v} & ,v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{N}\\ \mathrm{i}^{-k}\cdot\pi^{-1}\overline{x}^{-k}e^{-2\pi|x|_v} & ,v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{Z}_-.\end{cases}$$

So it follows from(21.3.3.2) that

$$\varepsilon_v(\chi_v,\psi_v;s)=\begin{cases}\text{Cf.[Tate's Thesis]}\,\mathbf{?} & ,v\in\Sigma_F^{\mathrm{fin}}\\ \mathrm{i}^\varepsilon & ,v\in\Sigma_F^{\mathbb{R}}\\ \mathrm{i}^{|n|} & ,v\in\Sigma_F^{C}\end{cases}$$

□

Remark (21.3.3.4). The local ε-factor is calculable using the special function Φ_v, theoretically. ⌟

Prop. (21.3.3.5) [Global Hecke L-Functions]. For a Hecke character $\chi = \prod_v \chi_v$ on F and $s \in \mathbb{C}$, we define the **global Hecke L-function** and **completed Hecke L-function** as

$$L(\chi; s) = \prod_{v \in \Sigma_F^{\text{fin}}} L(\chi_v; s), \quad \Lambda(\chi; s) = \prod_v L(\chi_v; s)(21.3.3.1)$$

which converges for $\operatorname{Re} s > 1$ and has a meromorphic continuation to all $s \in \mathbb{C}$.

Also, we can define the **global ε-factor** for χ as

$$\varepsilon(\chi; s) = \prod_v \varepsilon_v(\chi_v, \psi_v; s).$$

All but f.m. of the product equals 1 by(21.3.3.3), and they are of the form ab^s, so $\varepsilon(s, \chi)$ is also of the form ab^s, where $a \in \mathbb{C}^*, b \in \mathbb{R}_+$. In particular, it is holomorphic and non-vanishing. The fact $\varepsilon(s, \chi)$ is independent of ψ can be seen from(21.3.3.6). ⌟

Prop. (21.3.3.6) [Meromorphic Extension of Hecke L-Functions]. For a Hecke character χ,

- $L(\chi; s)$ has meromorphic continuation to all s, and there is a functional equation

  $$\Lambda(\chi; s) = \varepsilon(\chi; s)\Lambda(\chi^{-1}; 1 - s),$$

  where $\varepsilon(\chi; s)$ is of the form $ab^s, a \in \mathbb{C}^\times, b \in \mathbb{R}_+$.
- $L(\chi; s)$ has poles iff $\chi(x) = |x|^\lambda$ for some $\lambda \in \mathrm{i}\,\mathbb{R}$. In this case,
  - If $F \in \mathtt{NField}$, then it only has simple poles at $s = 1 - \lambda$, with residue $-k||\mathfrak{d}_F||^{1/2}$.
  - If $F \in \mathtt{FField}$, it has poles at $s = -\lambda + \frac{2\pi n\,\mathrm{i}}{\log(\#F_0)}, 1 - \lambda + \frac{2\pi n\,\mathrm{i}}{\log(\#F_0)}$, with respectively residue $-k||\mathfrak{d}_F||^{1/2}$ and k, where $k = V(\mathbf{I}_F^1/F^\times)$(14.4.5.20),
- $L(\chi; s)$ is essentially bounded on the vertical strips away from the poles.
- If $F \in \mathtt{NField}$, then $L(\mathbb{1}; s)$ has a zero of order $r_1 + r_2 - 1$ at $s = 0$.

⌟

Proof: The functional equation follows from the definition of local ε-factors(21.3.3.3) and(21.3.2.4). To show it is essentially bounded on vertical strips, use

$$\frac{\Lambda(\chi; s)}{\zeta(\chi, \Phi; s)} = \prod_{v \in \Sigma_F} \frac{L(\chi_v; s)}{\zeta_v(\chi_v, \Phi_v; s)}$$

where we can take Φ_v s.t. each fraction is of the form ab^s, and a.e. term is 1, by(21.3.3.3). Then $L(\chi; s)$ is essentially bounded on vertical strips because $\zeta(\chi, \Phi; s)$ does(21.3.2.4).

To find the poles and residues, choose Φ_v as in (21.3.3.2), then $\zeta(\chi, \Phi; s)$ is a constant multiple of $\Lambda(\chi; s)$, and the poles and residues of can be read from that of $\zeta(\chi, \Phi; s)$. Then we use(21.3.2.4), the assertion about poles follows.

Then it suffices to calculate for $\chi = 1$: we use the standard character on $\mathbf{A}_F$, then we calculate $\Phi_v(0) = \pi^{-r_2}$ and $\Phi_v^\vee(0) = ||\mathfrak{d}_v||^{-1/2}\pi^{-r_2}$, by(21.3.3.3) and(14.4.5.5). Thus we can use properties of the infinite L-factors(11.6.1.13). □

Def. (21.3.3.7) [Root Number]. The number $w(\chi) = \varepsilon(\chi; \frac{1}{2})$ is called the **root number** of χ. Then it satisfies $|w(\chi)| = 1$, and $w(\chi) \in \{\pm 1\}$ if χ is real. ⌟

4 Godement-Jacquet Theory

Main references are [G-J72].

5 Rankin-Selberg Methods on GL(2) × GL(2)

References are [Automorphic Forms on GL(2), Jacquet, 1972].

Def. (21.3.5.1) [Intro, Rankin-Selberg Method]. Delete this**?**. Converse theorems like(21.3.6.18), shows that a possible method of proving the existence of an automorphic form is to prove by any method the functional equations of sufficiently many of the the L-series attached to it. One of the most powerful methods of doing this is the **Rankin-Selberg method**, which seeks to represent an L-function as an integral of one or more automorphic forms against an Eisenstein series, itself a type of automorphic form. ⌟

Conj. (21.3.5.2) [Rankin-Selberg L-function]. For a global field F, assume the Langlands functoriality, for any $\pi_1 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$ and $\pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(m)/F)$, their product $\pi_1 \times \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)\times\mathrm{GL}(m)/F)$, and there is a tensor product map $\otimes : \mathrm{GL}(n)\times\mathrm{GL}(m) \to \mathrm{GL}(mn)$, which by functorial lifting(20.6.3.2) gives us an automorphic representation $\pi_1 \boxtimes \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(mn)/F)$, whose L-function is denoted by $L(s, \pi \times \pi')$ And for a finite set S of places of F large enough,

$$L_S(s, \pi_1 \times \pi_2) = \prod_{v\notin S}\prod_{i=1}^{n}\prod_{j=1}^{m}\frac{1}{1-\alpha_i(\pi_{1,v})\beta(\pi_{2,v})q_v^{-s}}$$

called the (partial)**Rankin-Selberg L-function** of π_1, π_2. Here are some examples:

- $\pi_1 = \pi, \pi_2 = \widehat{\pi}$, then for some S, then

$$L_S(s, \pi \times \widehat{\pi}) = \prod_{v\notin S}\prod_{1\le i,j\le n}\frac{1}{1-\alpha_i(\pi_v)\alpha_j^{-1}(\pi_v)q_v^{-s}}.$$

  In this case, this is the functorial lifting of

$$\mathrm{GL}(n) \to \mathrm{GL}(n)\times\mathrm{GL}(n) \to \mathrm{GL}(2n) : g \mapsto (g, g^{-t}) \mapsto g\otimes g^{-t}$$

  by(20.5.2.7), which is isomorphic to the conjugation action of $\mathrm{GL}(n)$ on $\mathrm{Mat}(n)$. This action decomposes as a trivial action and a n^2-1-dimensional representation Ad^0. Thus there should be a decomposition

$$L_S(s, \pi \times \widehat{\pi}) = \zeta_{F,S}(s)L_S(s, \pi, \mathrm{Ad}^0)$$

  where $\zeta_{F,S}(s)$ is the partial zeta function on F.

- $\pi_1 = \pi = \pi_2$, then for some S, then

$$L_S(s, \pi \times \widehat{\pi}) = \prod_{v\notin S}\prod_{1\le i,j\le n}\frac{1}{1-\alpha_i(\pi_v)\alpha_j(\pi_v)q_v^{-s}}.$$

  In this case, this is the functorial lifting of

$$GL(n) \to GL(n)\times GL(n) \to GL(2n) : g \mapsto (g, g) \mapsto g\otimes g$$

by(20.5.2.7), which decomposes as a $\frac{1}{2}n(n+1)$-dimensional symmetric square representation Sym^2, and a $\frac{1}{2}n(n-1)$-dimensional exterior square representation $\wedge^2$. Thus there should be a decomposition

$$L_S(s,\pi\times\widehat{\pi}) = L_S(s,\mathrm{Sym}^2\pi)L_S(s,\wedge^2\pi),$$

where $L_S(s,\mathrm{Sym}^2\pi)$ and $L_S(s,\wedge^2\pi)$ are called the **symmetric square L-functions** and **exterior square L-functions** of π.

There are two Rankin-Selberg constructions of exterior square L-functions, which can be found in [Jacquet, H. and J. Shalika, Exterior square L-functions, in Automorphic Forms, Shimura Varieties and L-functions II, 1990] and [Bump, D. and S. Friedberg, The "exterior square" automorphic L-functions on GL(n), 47-65 in part 2 of Gelbart, Howe and Sarnak (1990)]. The construction of symmetric square L-functions can be found in [Bump, D. and D. Ginzburg, Symmetric square L-functions on GL(r), Annals of Math. 136 (1992)]. ⌟

Prop. (21.3.5.3). For $\pi_1\in\mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F,\omega_1),\pi_2\in\mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F,\omega_2)$, by tensor product theorem(20.5.1.4), we can fix a finite set $\Sigma_F^\infty\subset S\subset\Sigma_F$ that any $v\notin S$ is unramified for both π_1,π_2 in the sense of(21.3.6.1). Let $\alpha_i(v),\beta_i(v)$ be the Stake parameters of $\pi_{1,v},\pi_{2,v}$, then $\pi_1\cong\widehat{\pi}_2$ iff the Rankin-Selberg L-function(21.3.5.2)

$$L_S(s,\pi_1\times\pi_2)=\prod_{v\notin S}\prod_{1\le i,j\le 2}\frac{1}{1-\alpha_i(v)\beta_i(v)}$$

has a pole at $s=1$. ⌟

Proof: Cf.[Bump, Chap3.8]. □

Rankin-Selberg for Modular Forms

Notation (21.3.5.4).

- Use notations on Eisenstein series as in Eisenstein Series.

⌟

Prop. (21.3.5.5)[Convolution of Cusp Forms]. If $f(z)=\sum A(n)q^n\in S_k(\Gamma(1))$, $g(z)=\sum B(n)q^n\in M_k(\Gamma(1))$, define

$$L(f\times g;s)=\zeta(2s-2k+2)\sum A(n)B(n)n^{-s},\quad \Lambda(f\times g;s)=(2\pi)^{-2s}\Gamma(s)\Gamma(s-k+1)L(f\times g;s),$$

then $L(s,f\times g)$ is absolutely convergent for s large, $\Lambda(s,f\times g)$ has a meromorphic continuation to all s, analytic except for at most simple poles at $s=k$ or $s=k-1$, and it satisfies a functional equation

$$\Lambda(s,f\times g)=\Lambda(2k-1-s,f\times g).$$

and the residue of Λ at $s=k$ is $\frac{1}{2}\pi^{1-k}(f,g)$(20.2.1.20).

Moreover, if f,g are Hecke eigenforms, let

$$1-A(p)X+p^{k-1}X^2=(1-\alpha_1(p)X)(1-\alpha_2(p)X),$$
$$1-B(p)X+p^{k-1}X^2=(1-\beta_1(p)X)(1-\beta_2(p)X),$$

then $L(s,f\times g)$ has an Euler product formula

$$L(s,f\times g)=\prod_p\prod_{i=1}^2\prod_{j=1}^2\frac{1}{1-\alpha_i(p)\beta_j(p)p^{-s}}.$$

⌟

Proof: We may assume f, g are Hecke eigenforms(20.2.2.12), so $A(n), B(n)$ are real. Let $\varphi(z) = f(z)\overline{g(z)}y^k$, then φ satisfies the condition of the Rankin-Selberg method(21.1.1.6), thus we calculate

$$\varphi_0(y) = \int_0^1 f(x+iy)\overline{g(x+iy)}y^k dx = \sum_{n=0}^{\infty}\int_{m=0}^{\infty}\int_0^1 A(n)B(n)e^{2\pi i(n-m)x}e^{-2\pi(n+m)y}y^k dx$$
$$= \sum_{n=0}^{\infty} A(n)B(n)e^{-4\pi ny}y^k$$

and

$$M(s,\varphi_0) = \sum_{n=0}^{\infty} A(n)B(n)\int_0^{\infty} e^{-4\pi ny}y^{s+k}\frac{dy}{y} = (4\pi)^{-s-k}\Gamma(s+k)\sum_{n=0}^{\infty} A(n)B(n)n^{-s-k}$$

and

$$\Lambda(s,\varphi_0) = 4^{-s-k+1}\pi^{-2s-k+1}\Gamma(s)\Gamma(s+k-1)\zeta(2s)\sum_{n=1}^{\infty} A(n)B(n)n^{-s-k+1}.$$

Thus

$$\Lambda(s-k+1,\varphi_0) = \pi^{k-1}\Lambda(s, f\times g),$$

and the assertion follows from(21.1.1.6). The residue is also clear.

The Euler product formula follows from(9.5.2.3) applied to $z = p^{-s}$ for all $p \in \mathbf{P}$. □

Remark (21.3.5.6) [Averaged Ramanujan Conjecture]. By the Ramanujan conjecture(21.3.6.16), for any cuspidal form $f = \sum a(n)q^n$, $L(s,f) = \sum a_n n^{-s}$ is convergent for $\mathrm{Re}(s) > \frac{k+1}{2}$. But we can prove this directly: as $\sum a_n^2 n^{-s}$ is convergent for $\mathrm{Re}(s) > k$, and $|a(n)| \leq \max(n^{\frac{k-1}{2}}, n^{-\frac{k-1}{2}}|a(n)|^2)$. ⌟

Waldspurger's Theorem

Cf.[Explicit application of Waldspurger's theorem].

Thm. (21.3.5.7) [Waldspurger]. Let χ be a character, $k \in 2\mathbb{Z}$ and $\varphi \in S_{k-1}(N,\chi^2)$, then there exists a function A_φ on $\mathbb{N}^{sc}$ s.t. for $t \in \mathbb{N}^{sc}$,

$$A_\varphi(t)^2 = L(\varphi\otimes\chi_0^{-1}\chi_t, \frac{k-1}{2})\varepsilon(\chi_0^{-1}\chi_t, \frac{1}{2}).$$

⌟

Proof: Cf.[Explicit application of Waldspurger's theorem]. □

6 Eulerian Integrals on GL(2) × GL(1)

Main references are [Cog00] and[Bum98].

Def. (21.3.6.1) [Unramified Places]. Let (π, V) be an irreducible cuspidal representation, given a pure cuspidal form $\varphi \in V$ and a Hecke character ξ of F, we call a place v of F **unramified** iff $v \in \Sigma_F^{\mathrm{fin}}$, the conductor of ψ_v is $\mathcal{O}_v$ and the conductor of ξ_v is $\mathcal{O}_v^*$, π_v is a spherical principal series.

This condition is true for a.e. v by(20.5.3.2) and(20.5.3.3). ⌟

Def. (21.3.6.2) [Zeta Functions for $\mathrm{GL}(2)\times\mathrm{GL}(1)$]. Given $(\pi, V)\in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F,\omega)$, ξ a Hecke character, for any $\Phi\in V$, consider the zeta integral

$$\zeta(\Phi,\xi;s)=\int_{C_F}\Phi(\begin{bmatrix} y & \\ & 1\end{bmatrix})|y|^{s-1/2}\xi(y)d^\times y$$

It is absolutely convergent by(20.5.3.5) and(14.4.4.21).

If $\Phi=\otimes\Phi_v$ is a pure tensor, the zeta integral equals

$$\int_{I_F}W_\Phi(\begin{bmatrix} y & \\ & 1\end{bmatrix})|y|^{s-1/2}\xi(y)d^\times y=\prod_v\int_{F_v^\times}W_{v,\Phi_v}(\begin{bmatrix} y_v & \\ & 1\end{bmatrix})|y_v|^{s-1/2}\xi_v(y_v)d^\times y_v=\prod_v\zeta_v(\Phi_v,\xi_v;s)$$

where each **local zeta functions** $\zeta_v(s,\Phi_v,\xi_v)$ converges absolutely to a holomorphic function for $\mathrm{Re}(s)>1/2$, and the integral is absolutely convergent when $\mathrm{Re}(s)>3/2$, using(11.10.1.38). ⌟

Proof: We analyze the integrand for the local zeta integrals:

For non-Archimedean case, the integrand is compactly supported on(18.11.3.19), and because π_v is unitary, use(18.11.4.23) and(18.11.6.10) to analyze the Kirillov model of π_v, we see the integral converges absolutely for $\mathrm{Re}(s)>1/2$.

For Archimedean case, the W_φ decays rapidly for $|y|\to\infty$, and for $|y|\to 0$, by(20.1.3.2), it is bounded by $|y|^{-1/2}$, thus it also converges absolutely for $\mathrm{Re}(s)>1/2$.

By(21.3.6.3), the local factor is the same as the local L-factor a.e. v, and $|\alpha_i|<||v||^{1/2}$ by(18.11.6.10), thus it converges for $\mathrm{Re}(s)>3/2$ by comparison with the Dedekind Zeta function(21.3.2.1). □

Prop. (21.3.6.3) [Unramified Factors]. If v is unramified in the sense of(21.3.6.1) and Φ_v is the spherical function in π_v normalized s.t. $W_{v,\Phi_v}(1)=1$, then for $\mathrm{Re}(s)>1/2$(thus all, as they are both meromorphic),

$$\zeta_v(\Phi_v,\xi_v;s)=L(\pi_v,\xi_v;s)(21.3.6.10).$$

⌟

Proof: With the unramified hypothesis, there is an explicit formula for W_v in terms of the Satake parameters α_1,α_2(18.11.5.15): if $\mathrm{ord}_v(y)=m$, then

$$W_v(\begin{bmatrix} y & \\ & 1\end{bmatrix})=\begin{cases}||v||^{-m/2}\frac{\alpha_1^{m+1}-\alpha_2^{m+1}}{\alpha_1-\alpha_2} & m\geq 0\\ 0 & \text{otherwise}\end{cases}.$$

$$\begin{aligned}\zeta_v(W_v,\xi_v;s)&=\sum_{m=0}^\infty||v||^{-m/2}\frac{\alpha_1^{m+1}-\alpha_2^{m+1}}{\alpha_1-\alpha_2}||v||^{m/2-ms}\xi(\varpi_v)^m\\&=\frac{1}{(1-\alpha_1\xi(\varpi_v)||v||^{-s})(1-\alpha_2\xi(\varpi_v)||v||^{-s})}=L(\pi_v,\chi_v;s)\end{aligned}$$

□

Prop. (21.3.6.4) [Global Functional Equation]. In spite of the convergence problem of the product of local zeta integrals, the global zeta integral is absolutely convergent for any s as W_Φ decay rapidly**?**. Moreover, because Φ is automorphic, we have

$$\zeta(\Phi,\xi;s)=\int_{C(F)}\Phi(w_1\begin{bmatrix} y & \\ & 1\end{bmatrix})|y|^{s-1/2}\xi(y)d^\times y$$

$$
\begin{aligned}
&= \int_{C(F)} \Phi(\begin{bmatrix} 1 & \\ & y \end{bmatrix} w_1)|y|^{s-1/2}\xi(y)d^\times y \\
&= \int_{C(F)} (\pi(w_1)\Phi)(\begin{bmatrix} y & \\ & 1 \end{bmatrix})|y|^{-s+1/2}(\xi\omega)^{-1}(y)d^\times y \\
&= \zeta(\pi(w_1)\Phi, \xi^{-1}\omega^{-1}; 1-s)
\end{aligned}
$$

⌟

Local Functional Equation

Prop. (21.3.6.5) [Local Zeta Function]. Let K be a p-adic local field and $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm},generic}(\mathrm{GL}(2,K))$, if we identify V with its Kirillov model, then for any $\varphi \in V$, quasi-character ξ of $K^\times$, the local Zeta integral $\zeta(\Phi,\xi;s)$(21.3.6.2) is absolutely convergent for $\mathrm{Re}(s)$ sufficiently large, and defines a holomorphic function there. And it has a meromorphic continuation to all s. In fact,

$$\zeta(\Phi,\xi;s) = p_{\varphi,\xi}(q^{-s})L(\pi,\xi;s), \quad p_{\Phi,\xi} \in \mathbb{C}[X,X^{-1}].$$

Moreover, Φ can be chosen s.t. $p_{\Phi,\xi} = 1$. ⌟

Proof: This is by direct calculation: If V is cuspidal, then $V = C_c^\infty(K^\times)$ by(18.11.3.20). If V is not cuspidal, then by(18.11.4.20) it is $\pi(\chi_1,\chi_2)$ or $\sigma(\chi_1,\chi_2)$, whose elements are known(18.11.4.22)(18.11.4.23). For $\mathrm{Re}(s)$ sufficiently large, the $|t| > \mathfrak{q}^{-k}$ part can contribute to any $p(q^{-s})$ for $p \in \mathbb{C}[q^s, q^{-s}]$ with degree$\leq k-1$, and the $|t| \leq q^{-k}$ part is of the form

$$\int_{\mathfrak{p}^k\setminus\{0\}} (\chi_i\xi)(y)|y|^s d^\times y = \sum_{n\geq k}((\chi\xi)(\varpi)q^{-s})^n \int_{\mathcal{O}^*}(\chi_i\xi)(y)d^\times y = C\frac{\alpha_i^k q^{-ks}}{1-\alpha_i q^{-s}},$$

where $C \neq 0$ iff $\chi_i\xi$ is unramified, or of the form

$$\int_{\mathfrak{p}^k\setminus\{0\}} v(y)(\chi_i\xi)(y)|y|^s d^\times y = \sum_{n\geq k} n((\chi\xi)(\varpi)q^{-s})^n \int_{\mathcal{O}^*}(\chi_i\xi)(y)d^\times y = C\frac{\alpha_i^k q^{-ks}}{(1-\alpha_i q^{-s})^2},$$

where $C \neq 0$ iff $\chi_i\xi$ is unramified.

Clearly $p_{\varphi,\xi}$ can be chosen to be 1 if we choose the compactly supported part of φ suitably. □

Prop. (21.3.6.6) [Local Functional Equations]. The local zeta integral $\zeta_v(\Phi_v,\xi_v;s)$, defined in(21.3.6.2) has a meromorphic continuation to all s, and there exists a meromorphic function $\gamma_v(x,\pi_v,\xi_v,\psi_v)$ s.t.

$$\zeta_v(\pi_v(w_1)\Phi_v, \xi_v^{-1}\omega_v^{-1}; 1-s) = \gamma_v(\pi_v,\xi_v,\psi_v;s)\zeta_v(\Phi_v,\xi_v;s).$$

⌟

Proof: This follows by similar method as the proof of(21.3.2.8) and by evaluating $\gamma_v(\pi_v,\xi_v,\psi_v;s)$ explicitly, using methods of Weil representation parallel to the proof of(21.3.6.8), Cf.[Jacquet-Langlands(1970), P37].?

There are easier way to prove this when $v \in \Sigma_F^{\mathrm{fin}}$: We show that both sides are linear functionals on $\Phi \in V$ that satisfies

$$L(\pi(\begin{bmatrix} y & \\ & 1 \end{bmatrix})\varphi) = \xi^{-1}(y)|y|^{-s+1/2}L(\varphi).$$

This is true for RHS by a change of variable and analytic continuation(21.3.6.5), and then also true for LHS.

Thus for general s, (18.11.3.22) shows two sides differ by a scalar $\gamma(s,\pi,\xi,\psi)$. By(21.3.6.5), for general s, both sides can be non-zero, thus $\gamma(s,\pi,\xi,\psi)$ is non-zero, and thus a meromorphic function of s. □

Prop. (21.3.6.7) [Gamma Factor Determines Representations]. For $(\pi_1,V_1),(\pi_2,V_2) \in \mathrm{Irr}^{\mathrm{adm},generic}(GL(2,K))$, if $\gamma(s,\pi_1,\xi,\psi)=\gamma(s,\pi_2,\xi,\psi)$ for any quasi-character ξ of $K^\times$, then $\pi_1\cong\pi_2$. ⌟

Proof: Identify V_i with their Kirillov models, and let $V_0=V_1\cap V_2$. Then it suffices to show that $\pi_1(w_1),\pi_2(w_1)$ acts the same on V_0: This is because V_0 contains $C_c^\infty(K^*)$, and $B(K)$ action on V_1,V_2 are the same by(18.11.3.15), and $GL(2,F)$ is generated by $B(F)$ and w_1. Then $V_0=V_1=V_2$ as they are irreducible representations.

For $\varphi\in V$, let $\varphi_i=\pi_i(w_1)\varphi$, then it suffices to show $\varphi_1(1)=\varphi_2(1)$: For other a,

$$\varphi_i(a)=(\pi_i(\begin{bmatrix}a&\\&1\end{bmatrix}\begin{bmatrix}&1\\-1&\end{bmatrix})\varphi)(1)=(\pi_i(\begin{bmatrix}&1\\-1&\end{bmatrix}\begin{bmatrix}1&\\&a\end{bmatrix})\varphi)(1)$$

and $\pi_1(\begin{bmatrix}1&\\&a\end{bmatrix})\varphi=\pi_2(\begin{bmatrix}1&\\&a\end{bmatrix})\varphi$.

For $n\in\mathbb{Z}$, let

$$F_\xi(n)=\int_{\mathfrak{q}^{-n}\backslash\mathfrak{q}^{-n+1}}(\varphi_1(y)-\varphi_2(y))\xi(y)d^\times y,$$

then $F_\xi(0)$ only depends on the restriction of ξ to $\mathcal{O}^*$, and $F_\xi(0)=0$ for all but f.m. characters ξ of $\mathcal{O}^*$: $\varphi_1-\varphi_2$ is a locally constant function that is fixed by $U\subset\mathcal{O}^*$, so in order $F_\xi(0)\neq 0$, at least ξ should be trivial on U, and there are f.m. such characters. Thus the hypothesis of Fourier transform on $\mathcal{O}^*$ is satisfied(11.10.3.24) and

$$\varphi_1(1)-\varphi_2(1)=\sum_{\xi\in(\mathcal{O}^*)^\wedge}F_\xi(0).$$

The hypothesis and the functional equation(21.3.6.6) shows $Z(s,\varphi_1,\xi)=Z(s,\varphi_2,\xi)$ for any quasi-character ξ of F^*, so

$$\sum_n F_\xi(n)q^{-sn}=Z(s,\varphi_1,\xi)-Z(s,\varphi_2,\xi)=0$$

and $F_\xi(n)=0$ for n sufficiently small, thus $F_\xi(n)=0$ for all n. In particular, $F_\xi(0)=0$, for any ξ. □

Prop. (21.3.6.8) [Gamma Factor Commutes with Parabolic Induction]. If $(\pi,V)=\mathcal{B}(\chi_1,\chi_2)$ is irreducible, then

$$\gamma(s,\mathcal{B}(\chi_1,\chi_2),\xi,\psi)=\gamma(s,\xi\chi_1,\psi)\gamma(s,\xi\chi_2,\psi).$$

⌟

Remark (21.3.6.9). For the compatibility of the gamma factor with parabolic inductions in the GL(n) case, Cf.[Jacquet, H., I. Piatetski-Shapiro and J. Shalika, Rankin-Selberg Convolutions, Am. J. Math., 105 (1981b), 367-464.] or [Jacquet, H. and J. Shalika, Rankin-Selberg Convolutions: Archimedean Theory]. ⌟

Proof: Cf.[Bump, P548].**?** This uses the concrete realization of the Whittaker model of $\mathcal{B}(\chi_1,\chi_2)$ as a quotient of the Weil representation in the split case. □

Jacquet-Langlands L-Functions($\mathrm{GL}(2)\times\mathrm{GL}(1)$ **Case)**

Def. (21.3.6.10) [Local L-Factors for $\mathrm{GL}(2)$**].** Given $\pi\in\mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F,\omega)$, for $v\in\Sigma_F^{\mathrm{fin}}$, the local L-factor is defined to be

$$L(\pi_v;s)=\begin{cases}1 & ,v\in S_{\mathrm{cusp}}(\pi)\\ \frac{1}{(1-\alpha_1q^{-s})(1-\alpha_2q^{-s})}\text{(18.11.5.2)} & ,\pi_v=\pi(\chi_1,\chi_2)\\ \frac{1}{1-\alpha_2q^{-s}} & ,\pi_v=\sigma(\chi_1,\chi_2),\quad \chi_1\chi_2^{-1}=|\cdot|^{-1}\end{cases}$$

It follows from(18.11.4.20) and(18.11.4.2) that any irreducible representation of $GL(2,F_v)$ is one of the form above. Also when ξ is a quasi-character of $F^\times$, define

$$L(\pi_v,\xi_v;s)=L(\pi_v(\xi_v);s).$$

⌟

Prop. (21.3.6.11) [L-Factors as the Common Divisors]. Situation as in(21.3.6.6), $\frac{\zeta_v(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)}$ is entire for any Φ_v,ξ_v, and if $v\in\Sigma_F^{\mathrm{fin}}$, then it is a rational function of $||v||^{-s}$.

Moreover, for each (π_v,V_v), we can take specific $\Phi_v\in V_v$**?** s.t. $\frac{\zeta_v(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)}$ is of the form ab^s for $a\in\mathbb{C}^\times,b\in\mathbb{R}_+$. ⌟

Proof: Cf.[Jacquet-Langlads, GL(2)]. □

Prop. (21.3.6.12) [Local ε-Factors]. Situation as in(21.3.6.6), there exists a non-vanishing holomorphic function $\varepsilon_v(\pi_v,\xi_v,\psi_v;s)$ s.t.

$$\frac{\zeta(\pi(w_1)\Phi_v,\xi_v^{-1};1-s)}{L_v(\widehat{\pi_v},\xi_v^{-1};s)}=\varepsilon_v(\pi_v,\xi_v,\psi_v;s)\frac{\zeta(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)},$$

and $\frac{Z(s,\Phi,\xi)}{L_v(s,\pi_v,\xi_v)}$ is holomorphic. Moreover, $\varepsilon_v(s,\pi_v,\xi_v,\psi_v)$ is of the form ab^s for $a\in\mathbb{C}^*,b\in\mathbb{R}$. And $\varepsilon_v(s,\pi_v,\xi_v,\psi_v)=1$ if v is unramified in the sense of(21.3.6.1). ⌟

Proof: Such a meromorphic $\varepsilon_v(\pi_v,\xi_v,\psi_v;s)$ exists by(21.3.6.6). It is holomorphic and non-vanishing by the same reason as in(21.3.3.3) as both $\frac{\zeta(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)}$ and $\frac{\zeta(\pi(w_1)\Phi_v,\xi_v^{-1};1-s)}{L_v(\widehat{\pi_v},\xi_v^{-1};s)}$ are holomorphic by(21.3.6.11) and for any $s_0\in\mathbb{C}$, Φ_v can be chosen to make either one of them non-vanishing at s_0. To show it is of the form ab^s: If $v\in\Sigma_F^{\mathrm{fin}}$, it is a rational function in $||v||^{-s}$ with no zeros or poles, so it must be of the form ab^s. And if v is unramified, then we can let Φ_v be the spherical function in π_v normalized s.t. $W_{v,\varphi_v}(1)=1$, then $\pi(w_1)\Phi_v$ is the normalized spherical function of $\widehat{\pi}_v$. Then by(14.4.5.5), both sides are 1 by(21.3.6.3).

If $v\in\Sigma_F^\infty$, then we can take Φ_v as in(21.3.6.11) to do the calculation to show it directly, Cf.[Jacquet-Langlads, GL(2)].**?**. □

Prop. (21.3.6.13) [Global L-Functions for $\mathrm{GL}(2)\times\mathrm{GL}(1)$**].** Define

$$L(\pi,\xi;s)=\prod_{v\in\Sigma^{\mathrm{fin}}}L_v(\pi_v,\xi_v;s),\quad \Lambda(\pi,\xi;s)=\prod_v L_v(\pi_v,\xi_v;s)\quad \varepsilon(\pi,\xi;s)=\prod_v\varepsilon_v(\pi_v,\xi_v,\psi_v;s)$$

Then $\varepsilon(\pi,\xi;s)$ is independent of ψ, and $L(s,\pi,\xi)$ satisfies a functional equation

$$\Lambda(\pi,\xi;s)=\varepsilon(\pi,\xi;s)\Lambda(\widehat{\pi},\xi^{-1};s)$$

⌟

Proof: This follows from(21.3.6.12) and(21.3.6.4). □

Prop. (21.3.6.14) [Non-Vanishing on $\mathrm{Re}(s)=1$**].** For $\pi\in\mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$, $L(\pi;s)\neq 0$ on the line $\mathrm{Re}(s)=1$. ⌟

Proof: Cf.[A Non-Vanishing Theorem for Zeta Functions of $\mathrm{GL}(n)$, Jacquet-Shalika(1976)]. □

Modular Forms

Prop. (21.3.6.15) [Trivial Bound]. If $f\in S_k(\Gamma(N))$, suppose $f(z)=\sum_{n\geq 0}a_n e^{2\pi inz/N}$, then $|a_n|=O(n^{k/2})$. ⌟

Proof: $a_n=\int_0^N f(x+iy)e^{-2\pi in(x+iy)/N}dx$ for any y, so let $y=N/n$, then $a_n=\int_0^N f(x+iN/n)e^{-2\pi inx/N}dx$. As f is a cusp modular form, $(\mathrm{Im}(z))^{k/2}|f(z)|$ is cuspidal automorphic function, thus bounded on $\mathcal{H}$, thus $|a_n|\leq C(N/n)^{\frac{k}{2}}$. □

Thm. (21.3.6.16) [Ramanujan-Petersson Conjecture]. Let f be a cuspidal Hecke eigenform of weight k for $\Gamma(1)$, then for any prime p, $|a_p(f)|\leq 2p^{(k-1)/2}$. ⌟

Proof: By(20.2.2.12) this means the eigenvalue λ_p of f w.r.t. T_p satisfies $|\lambda_p|\leq 2p^{1/2}$. This is a consequence of Weil conjecture and modularity**?**. □

Def. (21.3.6.17) [L-functions associated to Modular Forms]. Each $f\in M_k(\Gamma_1(N))$ has an associated L-functions: if $f=\sum_{n=0}^\infty a_n q^n$, define

$$L(s,f)=\sum_{n=1}^\infty a_n n^{-s}.$$

⌟

Prop. (21.3.6.18) [Functional Equations of Modular Forms, Hecke]. Let $a_0,a_1,\ldots$ be a sequence of complex numbers s.t. $a_n=O(n^M)$ for some integer M. Given $\lambda>0,k>0,C=\pm 1$, write

$$\varphi(s)=\sum_{n=1}^\infty a_n n^{-s},\quad \Phi(s)=(\frac{2\pi}{\lambda})^{-s}\Gamma(s)\varphi(s),\quad f(z)=\sum_{n=0}^\infty a_n e^{2\pi inz/\lambda}.$$

Then the following conditions are equivalent:

- The function $\Lambda(s)=\Phi(s)+\frac{a_0}{s}+\frac{Ca_0}{k-s}$ can be analytically continued to a holomorphic function of the whole plane which is bounded on vertical strips, and it satisfies the functional equation
$$\Phi(s)=C\Phi(k-s).$$
- In the upper half plane, f satisfies the functional equation
$$f(-1/z)=C(z/i)^k f(z).$$

⌟

Proof: Notice first

$$\int_0^\infty e^{-2\pi nt/\lambda}t^s\frac{dt}{t}=(\frac{2\pi}{n\lambda})^{-s}\int_0^\infty e^{-t}t^s\frac{dt}{t}=(\frac{2\pi}{n\lambda})^{-s}\Gamma(s).$$

Thus for $\mathrm{Re}(s)$ large,

$$\Phi(s)=\int_0^\infty(f(it)-a_0)t^s\frac{dt}{t}=\int_1^\infty(f(it)-a_0)t^s\frac{dt}{t}+\int_1^\infty(f(\frac{i}{t})-a_0)t^{-s}\frac{dt}{t}.$$

If 2 holds, then $f(\frac{i}{t})=Ct^kf(it)$, and

$$\begin{aligned}\Phi(s)&=\int_1^\infty(f(it)-a_0)t^s\frac{dt}{t}+\int_1^\infty(Ct^kf(it)-a_0)t^{-s}\frac{dt}{t}\\&=\int_1^\infty(f(it)-a_0)t^s\frac{dt}{t}+C\int_1^\infty(f(it)-a_0)t^{k-s}\frac{dt}{t}+\int_1^\infty(Ct^{k-s}a_0-t^{-s}a_0)\frac{dt}{t}.\end{aligned}$$

The first two integral is absolutely convergent for any s and then can be extended to an analytic function of the whole plane, and the final term equals

$$-(\frac{a_0}{s}+\frac{Ca_0}{k-s})$$

when $\mathrm{Re}(s)$ is large, so it can be extended to a meromorphic function on the whole plane. And $\Phi(s)=\Phi(k-s)$ follows easily from the equation above. Also it is bounded on vertical strips because it attain maximum at the real axis.

Conversely, first notice it suffices to prove for real $y>0$,

$$f(\frac{\mathrm{i}}{y})=Cy^kf(\mathrm{i}\,y)$$

because this implies these two holomorphic functions on $\mathcal{H}$ coincide on the imaginary axis, so they must be equal. Notice

$$\int_0^\infty(f(iy)-a_0)y^s\frac{dy}{y}=\Phi(s)$$

converges absolutely for $\mathrm{Re}(s)$ sufficiently large, so for $\sigma>0$ sufficiently large, Mellin inversion formula(11.11.2.16) shows

$$\begin{aligned}f(iy)-a_0&=\frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Phi(s)y^{-s}ds=\frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Phi(k-s)y^{-s}ds\\&=\frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\Lambda(k-s)-\frac{Ca_0}{s}-\frac{a_0}{k-s})y^{-s}ds\end{aligned}$$

Notice $\Phi(\sigma+it)$ decays exponentially for fixed $\sigma=\alpha$ sufficiently large, because of the Stirling formula(11.6.1.12), and for $\sigma=\beta$ sufficiently small, $\Phi(s)=C\Phi(k-s)$ also shows $\Phi(\sigma+it)$ decays exponentially. And also $\frac{Ca_0}{\sigma+it}+\frac{a_0}{k-\sigma-it}=O(t^{-1})$ for $\sigma=\alpha$ or β, so $\Lambda(\sigma+it)=O(t^{-1})$ for σ large or small, and also the hypothesis shows Λ is bounded on the strip $\alpha<\mathrm{Re}(z)<\beta$, thus by(11.4.5.7), $\Lambda(\sigma+it)\to 0$ for $t\to 0$ and σ in any compact set. So we can move the integration of $\Lambda(s)$ to the left or to the right. Then

$$f(iy)-a_0=\frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\Lambda(k-s)-\frac{Ca_0}{s}-\frac{a_0}{k-s})y^{-s}ds$$

$$
\begin{aligned}
&= \frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty} y^{-k}\Lambda(s)y^s ds - \frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\frac{a_0}{s}+\frac{Ca_0}{k-s})y^{-s}ds\\
&= \frac{Cy^{-k}}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Phi(s)y^s ds + \frac{Cy^{-k}}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\frac{a_0}{s}+\frac{Ca_0}{k-s})y^s ds + \frac{1}{2\pi i}\int_{k-\sigma+i\infty}^{k-\sigma-i\infty}(\frac{a_0}{k-s}+\frac{Ca_0}{s})y^{s-k}ds\\
&= Cy^{-k}(f(\frac{i}{y})-a_0)+\frac{y^{-k}}{2\pi i}\int_\gamma(\frac{Ca_0}{s}+\frac{a_0}{k-s})y^s ds\\
&= Cy^{-k}f(\frac{i}{y}) - Ca_0y^{-k}+y^{-k}(Ca_0-a_0y^k) = Cy^{-k}f(\frac{i}{y})-a_0
\end{aligned}
$$

So we are done. □

Def. (21.3.6.19)[L-Functions associated to $S_k(1)$]. Let $a_1, a_2, \ldots$ be a sequence of complex numbers such that $a_n = O(n^M)$ for some $M > 0$. Let

$$L(s) = \sum a_n n^{-s}, \quad \Lambda(s) = L_{\mathbb{C}}(s)L(s), \quad f(z) = \sum a_n e^{-2\pi i nz}.$$

More generally, let $m > 0$ and χ a primitive character mod m, then we define **twisted L-function** as

$$L(f,\chi;s) = \sum a_n\chi(n)n^{-s}, \quad \Lambda(f,\chi;s) = L_{\mathbb{C}}(s)L(f,\chi;s)$$

Notice if $f(x) \in S_k(\Gamma(1))$, and $\pi_f \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/\mathbb{Q})$ corresponding to f via(20.5.2.12), then

$$L(f,\chi;s) = L(\pi_f,\chi;s).$$

⌟

Prop. (21.3.6.20) [Converse Theorem(Correspondence for $\Gamma(1)$)]. If $f \neq 0 \in S_k(\Gamma(1))$(so $2|k$), then $\Lambda(f;s)$(21.3.6.19) has analytic continuation to all $s \in \mathbb{C}$, is bounded on vertical strips, and satisfies a functional equation

$$\Lambda(s,f) = (-1)^{k/2}\Lambda(k-s,f).$$

Conversely, let $a_0, a_1, \ldots$ be a sequence of complex numbers that $a_n = O(n^M)$ for some $M > 0$. Let $f(s), L(s), \Lambda(s)$ be defined in(21.3.6.19) and $\Lambda(f;s)$ has analytic continuation to all s and satisfies the above functional equation, then $f(z) \in S_k(\Gamma(1))$.

Moreover, in this case, f is a normalized Hecke eigenform(20.2.2.12) iff $L(s,f)$ has as Euler product formula

$$L(s) = \prod_p (1 - a_p p^{-s} + p^{k-1-2s})^{-1}$$

for s sufficiently large, where $1 - a_s X + p^{k-1}X^2 = (1-aX)(1-\overline{a}X)$, where $|a| = p^{\frac{k-1}{2}}$. ⌟

Proof: The first part is a direct consequence of(21.3.6.18). Notice a_n is bounded by polynomials in n by(21.3.6.15).

When s is large, the Euler product is absolutely convergent, thus it suffices to compare the coefficients. By(20.2.2.12) and(20.2.2.10), f being a normalized Hecke eigenform is equivalent to

$$\begin{cases} c_m c_n = c_{mn}, & (m,n) = 1\\ c_p c_{p^n} = c_{p^{n+1}} + p^{2k-1}c_{p^{k-1}} \end{cases}$$

which is equivalent to

$$(1 - a_p X + p^{k-1}X^2)(\sum_{r=0}^\infty a_{p^r}X^r) = 1.$$

□

Prop. (21.3.6.21) [Functional Equation associated to $S_k(N,\psi)$]. Notation as in(21.3.6.19). If $f(z)\in S_k(N,\psi)$(20.2.1.16). Let w_N be the Fricke involution(20.2.1.4), and notice $\psi(a_\gamma)=\overline{\psi(d_\gamma)}$, so

$$f[w_N]_k[\gamma]_k=f[w_N\gamma w_N^{-1}]_k[w_N]_k=\overline{\psi(d)}f[w_N].$$

Thus $g=f[w_N]_k\in S_k(N,\overline{\psi})$.

Now if

$$f(z)=\sum a_n e^{2\pi\mathrm{i}nz/N},g(z)=\sum b_n e^{2\pi\mathrm{i}nz/N},$$

and χ is a primitive character mod D, define $L(s,f,\chi),L(s,g,\overline{\chi}),\Lambda(s,f,\chi),\Lambda(s,g,\overline{\chi})$ as in(21.3.6.19), then $\Lambda(s,f,\chi)$ extends to an analytic function for all $s\in\mathbb{C}$, and there are functional equations

$$\Lambda(f,\chi;s)=\mathrm{i}^k\,\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}(D^2N)^{-s+k/2}\Lambda(g,\overline{\chi};k-s),\tag{21.1}$$

where $\tau(\chi)$ is the Gauss sum of χ(17.3.3.3).

In particular, if $D=1$(and thus $\chi=\mathbb{1}$), then

$$\Lambda(f;s)=\mathrm{i}^k\,N^{-s+k/2}\Lambda(g;k-s).\tag{21.2}$$

⌟

Proof: Let

$$f_\chi(z)=\sum\chi(n)a_nq^n,\quad g_{\overline{\chi}}(z)=\sum\overline{\chi(n)}b_nq^n.$$

Use(17.3.3.7) on $f_\chi(z)$, we get

$$f_\chi=\frac{\chi(-1)\tau(\chi)}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\overline{\chi(m)}f[\begin{bmatrix}D&m\\&D\end{bmatrix}]_k$$

Now

$$\begin{aligned}f_\chi[\begin{bmatrix}&-1\\D^2N&\end{bmatrix}]_k=f_\chi[\begin{bmatrix}&-1/DN\\D&\end{bmatrix}]_k&=\frac{\chi(-1)\tau(\chi)}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\overline{\chi(m)}g[w_N^{-1}]_k[\begin{bmatrix}D&m\\&D\end{bmatrix}]_k[\begin{bmatrix}&-1/DN\\D&\end{bmatrix}]_k\\&=\frac{\chi(-1)\tau(\chi)}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\overline{\chi(m)}g[\begin{bmatrix}D&-r\\-Nm&s\end{bmatrix}\begin{bmatrix}D&r\\&D\end{bmatrix}]_k\end{aligned}$$

where (r,s) are integers chosen that $Ds-rNm=1$. Thus $\overline{\chi(m)}=\chi(-N)\chi(r)$, and because $g\in M_k(N,\overline{\psi})$,

$$f_\chi[\begin{bmatrix}&-1\\D^2N&\end{bmatrix}]_k=\frac{\chi(N)\tau(\chi)}{D}\sum_{r\in(\mathbb{Z}/D\mathbb{Z})^*}\chi(r)\psi(D)g[\begin{bmatrix}D&r\\&D\end{bmatrix}]_k.$$

Compare this with the formula

$$g_{\overline{\chi}}=\frac{\chi(-1)\tau(\overline{\chi})}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\chi(m)g[\begin{bmatrix}D&m\\&D\end{bmatrix}]_k,$$

we get

$$f_\chi[\begin{bmatrix}&-1\\D^2N&\end{bmatrix}]_k=\chi(-N)\psi(D)\frac{\tau(\chi)}{\tau(\overline{\chi})}g_{\overline{\chi}}=\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}g_{\overline{\chi}}\text{(17.3.3.4)(17.3.3.6)}.\tag{21.3}$$

Now similar to the proof of(21.3.6.18),

$$\Lambda(s,f,\chi)=\int_0^\infty f_\chi(iy)y^s\frac{dy}{y}.$$

So when $\mathrm{Re}(s)$ is large,

$$\begin{aligned}\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\Lambda(s,g,\overline{\chi})&=\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_0^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\\&=\int_0^{D\sqrt{N}}(D^2N)^{-k/2}(iy)^{-k}f_\chi(\frac{1}{-D^2Niy})y^s\frac{dy}{y}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\\&=\int_{D\sqrt{N}}^\infty(D^2N)^{k/2}t^ki^{-k}f_\chi(it)(D^2Nt)^{-s}\frac{dt}{t}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\\&=i^{-k}(D^2N)^{k/2-s}\int_{D\sqrt{N}}^\infty f_\chi(it)t^{k-s}\frac{dt}{t}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\end{aligned}$$

Both integral are absolutely convergent for any s. And similarly when $\mathrm{Re}(s)$ is small,

$$\begin{aligned}i^{-k}(D^2N)^{k/2-s}\Lambda(k-s,f,\chi)&=i^{-k}(D^2N)^{k/2-s}\int_0^\infty f_\chi(it)t^{k-s}\frac{dt}{t}\\&=i^{-k}(D^2N)^{k/2-s}\int_{D\sqrt{N}}^\infty f_\chi(it)t^{k-s}\frac{dt}{t}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\end{aligned}$$

Thus we get the desired result. □

Cor. (21.3.6.22). As $f[w_N^2]_k=(-1)^kf$, if $f\in S_k(\Gamma_1(N))$ satisfies $f[w_N]_k=cf$, $c=\varepsilon i^k$, $\varepsilon=\pm1$, then

$$N^{s/2}\Lambda(s,f)=\varepsilon(-1)^kN^{(k-s)/2}\Lambda(k-s,f).$$

so $\mathrm{ord}_{1/2}(L(s,f))$ is even if $\varepsilon=(-1)^k$ and odd if $\varepsilon=(-1)^{k+1}$.

In particular, if $N=1$ and $k\equiv 2 \mod 4$, $L(1/2,f)=0$.

It is conjectured that $L(1/2,f)\neq 0$ if $4|k$, Cf.[Modular Forms, Ribet] P148.**?** ⌟

Prop. (21.3.6.23) [Converse Theorem, Weil]. Let $N>0$ and ψ a character mod N. Suppose a_n,b_n are two sequence of complex numbers that $|a_n|,|b_n|=O(n^M)$ for some positive integer M. If $(D,N)=1$ and χ is a primitive character mod D, let

$$L_1(s,\chi)=\sum\chi(n)a_nn^{-s},\quad L_2(s,\overline{\chi})=\sum\overline{\chi(n)}b_nn^{-s}.$$

and $\Lambda_i(s,\chi_i)=L_\mathbb{C}(s)L_i(s,\chi_i)$.

Now if for D equals to a.e. p and any primitive character mod D, $\Lambda_i(s,\chi)$ has analytic continuation to all s, are bounded on vertical strips, and satisfy the functional equation

$$\Lambda_1(s,\chi)=\mathrm{i}^k\,\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}(D^2N)^{-s+k/2}\Lambda_2(k-s,\overline{\chi}),$$

where $\tau(\chi)$ is the Gauss sum of χ(17.3.3.3), then $f(z)=\sum a_ne^{2\pi\mathrm{i}nz}\in M_k(N,\psi)$. ⌟

Proof: Let
$$f_\chi(z) = \sum \chi(n)a_n q^n, \quad g_{\overline{\chi}}(z) = \sum \overline{\chi(n)} b_n q^n.$$
We first show equation21.3 holds. As in the proof of(21.3.6.18), it suffices to show the functional equation it is true on the positive imaginary axis. If $\sigma = \mathrm{Re}(s)$ is sufficiently large, then
$$\int_0^\infty f_\chi(iy)y^s \frac{dy}{y} = \Lambda_1(s,\chi)$$
so by Mellin inversion formula
$$f_\chi(iy) = \frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty} \Lambda_1(s,\chi)y^{-s}ds = i^k\chi(N)\psi(-D)\frac{\tau(\chi)^2}{D}\frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(D^2N)^{-s+k/2}\Lambda_2(k-s,\overline{\chi})ds$$

Same argument of Phragmén-Lindelöf principle as in proof of(21.3.6.18) shows $\Lambda_2(\sigma+it,\overline{\chi})$ converges to 0 for $t\to\infty$, uniformly on any compact subset, so we can move the integral horizontally and make a change of variable $s\mapsto k-s$ to get
$$\begin{aligned} f_\chi(iy) &= i^k\chi(N)\psi(-D)\frac{\tau(\chi)^2}{D}(D^2N)^{-k/2}y^{-k}\frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Lambda_2(k-s,\overline{\chi})(D^2Ny)^s ds \\ &= i^k\chi(N)\psi(-D)\frac{\tau(\chi)^2}{D}(D^2N)^{-k/2}y^{-k}g_{\overline{\chi}}(\frac{i}{D^2Ny}) \end{aligned}$$
which is equivalent to21.3.

The rest is to manipulate 2×2 matrices and use(20.1.1.10) to show that $g\in M_k(N,\overline{\psi})$, Cf.[Bump, P62]**?**. □

Remark (21.3.6.24). For $\Gamma(1)$, the function only requires one functional equation, and we used the fact $\Gamma(1)$ is generated by S and T. But $\Gamma_0(N)$ is not generated by two elements, so we must assume functional equations for the twists $L(s,f,\chi)$ also. ⌟

⌟

Proof:

□

Prop. (21.4.1.8). Let $ax^2+bxy+cy^2$ be a primitive definite quadratic form of discriminant $D<0$, and let $\mathscr{S}=\{p\in\mathbf{P}|p=ax^2+bxy+cy^2,\exists x,y\in\mathbb{Z}\}$, then $\mathscr{S}$ has Dirichlet density

$$\delta(\mathscr{S})=\begin{cases}\frac{1}{\mathrm{cl}(D)} & ,ax^2+bxy+cy^2 \text{ is properly equivalent to its opposite}\}\\ \frac{1}{\mathrm{cl}(D)} & ,\text{otherwise}\end{cases}.$$

⌟

Proof: Cf.[Cox13]P170. □

2 Dirichlet-Weber L-Functions

References are [Mil20].

Def. (21.4.2.1)[Partial L-Functions]. If $\mathfrak{m}$ is a modulus for F, $\mathcal{R}\subset\mathrm{Cl}_{\mathfrak{m}}(F)$ be an ideal class. Define the **partial L-function**

$$\zeta(F,\mathcal{R};s)=\sum_{\mathfrak{a}\in\mathcal{R}}\frac{1}{||\mathfrak{a}||^s}.$$

⌟

Prop. (21.4.2.2). Situation as in(21.4.2.1), $\zeta(F,\mathcal{R};s)$ is analytic for $\mathrm{Re}(s)>1-1/N$ except a simple pole at $s=1$, where it has residue $g_{\mathfrak{m}}$ depending only on $\mathfrak{m}$. ⌟

Proof: Cf.[Class Field Theory, Milne]. □

Prop. (21.4.2.3) [Weber L-Functions]. If $\mathfrak{m}$ is a modulus for F, $\chi : \mathrm{Cl}_{\mathfrak{m}}(F) \to \mathbb{C}^\times$ a Dirichlet character for F, then the **Weber L-function** attached to χ is defined to be the Euler product

$$L(F,\chi;s) = \prod_{\mathfrak{p}\nmid\mathfrak{m}} \frac{1}{1-\chi(\mathfrak{p})||\mathfrak{p}||^{-s}} = \sum_{(\mathfrak{a},\mathfrak{m})=1} \frac{\chi(\mathfrak{a})}{||N\mathfrak{a}||^s} = \sum_{\mathcal{R}\in\mathrm{Cl}_{\mathfrak{m}}(F)} \chi(\mathcal{R})\zeta(F,\mathcal{R};s).$$

Thus by(21.4.2.2), $L(K,\chi;s)$ is analytic for $\mathrm{Re}(s) > 1-1/N$, except for possibly a simple pole at $s=1$. And for $\chi \neq 1$, it is in fact analytic at $s=1$, as the residues cancelled out. ⌟

Def. (21.4.2.4) [Dirichlet L-Functions]. For $F=\mathbb{Q}$, the characters of $\mathrm{Cl}_{\mathfrak{m}}(\mathbb{Q})$ are just Dirichlet characters χ(14.4.4.32), thus the Weber L-function is

$$L(s,\chi) = \sum_{n=1}^\infty \frac{\chi(n)}{n^s},$$

where $\mathrm{Re}\, s > 1$. Called the **Dirichlet L-function** attached to χ. ⌟

Prop. (21.4.2.5)[Functional Equation for Dirichlet L-Functions]. Let χ be a Dirichlet character with $\chi(-1) = (-1)^\varepsilon$ where $\varepsilon = 0$ or 1, then

$$\Lambda(\chi;s) = L_{\mathbb{R}}(s+\varepsilon)L(\chi;s),$$

is the Hecke L-function attached to the Hecke character corresponding to χ(14.4.4.32)(21.3.3.5). Thus $L(s,\chi)$ can be extended to a meromorphic function for all $s\in\mathbb{C}$, and it has simple poles at $s=0,1$ when $\chi=1$, and analytic otherwise. When $\chi=1$, by(21.4.3.2),

$$\mathrm{res}_{s=1} L(1;s) = 1.$$

Moreover, there are functional equations

$$\Lambda(\chi;s) = (-\mathrm{i})^\varepsilon \tau(\chi) N^{-s} \Lambda(\chi^{-1};1-s)\text{(17.3.3.3)},$$

In other words,

$$\varepsilon(\chi;s) = (-\mathrm{i})^\varepsilon \tau(\chi) N^{-s}.$$

⌟

Proof: Cf.[Bum98]P10. □

Prop. (21.4.2.6). Let χ be a Dirichlet character modulo N, then

$$\begin{aligned} L(\chi;1) &= \frac{-\tau(\chi)}{N} \sum_{n\in\mathbb{Z}/(N)} \chi^{-1}(n)\log(1-e^{-2\pi\mathrm{i}\,n/N}) \\ &= \begin{cases} \frac{\tau(\chi)}{N^2}\pi\,\mathrm{i}\sum_{n\in\mathbb{Z}/(N)}\chi^{-1}(n)n & ,\chi(-1)=-1 \\ \frac{-\tau(\chi)}{N}\sum_{n\in\mathbb{Z}/(N)}\chi^{-1}(a)\log|1-e^{-2\pi\mathrm{i}\,n/N}| & ,\chi(-1)=1 \end{cases} \end{aligned}$$

⌟

Proof: Use Fourier transform**?**. □

Prop. (21.4.2.7). If $F\in \mathtt{NField}$ and $\chi \neq \mathbb{1}$ is a Hecke character on F, then $L(\chi;1+\mathrm{i}\,t) \neq 0$ for any $t\in\mathbb{R}$. ⌟

Proof: Cf.[GTM186, P289].?

We prove for $F=\mathbb{Q}$ and $\chi=1$: If ζ has a zero at $x+\mathrm{i}\,y$ for $y\neq 0$, then by(21.4.2.5), $\zeta(s)$ has a simple pole at $s=1$ and holomorphic at $s=x+2\,\mathrm{i}\,y$. But by(21.4.2.8)

$$\lim_{x\to 0^+}|\zeta(x)^3\zeta(x+\mathrm{i}\,y)^4\zeta(x+2\,\mathrm{i}\,y)|\geq 1,$$

contradiction. □

Lemma (21.4.2.8) [Mertens]. For $x,y\in\mathbb{R}$ with $x>1$, $|\zeta(x)^3\zeta(x+\mathrm{i}\,y)^4\zeta(x+2\,\mathrm{i}\,y)|\geq 1$. ⌟

Proof: For $s=x+\mathrm{i}\,y$,

$$\log|\zeta(s)|=-\sum_{p\in\mathbf{P}}\log|1-p^{-s}|=-\sum_{p\in\mathbf{P}}\mathrm{Re}\log(1-p^{-s})=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{\mathrm{Re}(p^{-ns})}{n},$$

so

$$\log|\zeta(x+\mathrm{i}\,y)|=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{\cos(ny\log p)}{np^{nx}}.$$

So

$$\begin{aligned}\log|\zeta(x)^3\zeta(x+\mathrm{i}\,y)^4\zeta(x+2\,\mathrm{i}\,y)|&=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{3+4\cos(ny\log p)+\cos(2ny\log p)}{np^{nx}}\\&=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{2(\cos(ny\log p)+1)^2}{np^{nx}}\geq 0\end{aligned}$$

□

Estimates

Prop. (21.4.2.9) [Louboutin]. Let χ be a Dirichlet character modulo $N>1$, then

$$|L(\chi;1)|\leq\begin{cases}\frac{1}{2}\log N+0.009 & .\chi(-1)=1\\ \frac{1}{2}\log N+0.716 & ,\chi(-1)=-1\end{cases}.$$

⌟

Proof: Cf.[S. Louboutin, Majorations explicites de $|L(1,\chi)|$]. □

Remark (21.4.2.10). It is easy to show that $|L(\chi;1)\leq\log(N)+C$:

$$\begin{aligned}|L(\chi;1)|&\leq|\sum_{n\leq N}\frac{\chi(n)}{n}|+|\sum_{n>N}\frac{\chi(n)}{n}|\\&\leq\sum_{n\leq N}\frac{1}{n}+\Big|\int_N^\infty(\sum_{N<n\leq t}\chi(n))\frac{\mathrm{d}t}{t^2}\Big|\\&\leq 1+\int_1^{N-1}\frac{\mathrm{d}t}{t}+\frac{1}{N}\max_X|\sum_{N<n\leq t}\chi(n)|\\&<\log N+1+\frac{\varphi(N)}{N}\end{aligned}$$

⌟

Thm. (21.4.2.11) [Zhang]. If χ is a real primitive Dirichlet character modulo $D > 1$, then there exists an absolute effectively computable constant $c_1 > 0$ s.t.

$$L(\chi;1) > C(\log D)^{-2022}$$

⌟

Proof: Cf.[Yitang Zhang, Discrete mean estimates and the Landau-Siegel zero]. □

Cor. (21.4.2.12). If χ is a real primitive Dirichlet character modulo $D > 1$, then there exists an absolute effectively computable constant $c_1 > 0$ s.t.

$$L(\sigma,\chi) \neq 0, \quad \sigma > 1 - c_2(\log D)^{-2024}.$$

⌟

Proof: **?** □

Cor. (21.4.2.13) [Siegel]. Let χ be a real primitive Dirichlet character modulo $N > 1$, then for any $\varepsilon > 0$, there exists $C(\varepsilon) > 0$ s.t.

$$L(1,\chi) \geq \frac{C(\varepsilon)}{q^\varepsilon}.$$

⌟

Proof: There is a direct proof of this theorem in**??** and [A simple proof of Siegel's theorem via Mellin's transform]. □

3 Riemann L-Functions

Def. (21.4.3.1) [Riemann L-Functions]. $\zeta(F;s) = L(F,\mathbb{1};s)$ is called the **Riemann L-function** for F. Also denote

$$\zeta(s) = \zeta(\mathbb{Q};s), \quad \Lambda(s) = \Lambda(\mathbb{Q},\mathbb{1};s) = L_\mathbb{R}(s)\zeta(s)\text{(11.6.1.13)}.$$

By(21.4.2.5), $\zeta(s)$ extends to a meromorphic function for all $s \in \mathbb{C}$ with a simple pole at $s = 1$. And there is a functional equation

$$\Lambda(s) = \Lambda(1-s).$$

⌟

Thm. (21.4.3.2) [Class Number Formula, Dirichlet]. By(21.3.3.6)(14.4.5.20),

$$\operatorname{res}_{s=1}\zeta(F;s) = \frac{2^{r_1}(2\pi)^{r_2}}{w(F)\sqrt{|d_F|}}\operatorname{cl}(F)\operatorname{Reg}(F)$$

where $w(F) = \#\mu(F)$, and $\operatorname{Reg}(F)$ is the regulator of F(14.4.1.27). In particular,

$$\operatorname{res}_{s=1}\zeta_\mathbb{Q}(s) = 1.$$

⌟

Prop. (21.4.3.3) [Dirichlet's Class Number Formula for Quadratic Fields]. Let $\mathcal{K} = \mathbb{Q}(\sqrt{D})$ be a quadratic field with discriminant D, and χ_D the (real)Dirichlet character associated to K, and $\varepsilon = 0$(resp. 1) if $\mathcal{K}$ is real(resp. complex), then

- The root number of χ_D(21.3.3.7) is given by

$$W(\chi_D)=\frac{\tau(\chi)}{\sqrt{|D|}}(-1)^{\varepsilon}\in\{\pm 1\}\in\{-1,1\},$$

- if $D<0$, then

$$\mathrm{cl}(\mathcal{K})=\frac{w(\mathcal{K})\sqrt{|D|}}{2\pi}L(\chi_D;1)=\frac{w(\mathcal{K})\,\mathrm{i}}{2|D|}\cdot\frac{\tau(\chi_D)}{\sqrt{|D|}}\cdot\sum_{a\in\mathbb{Z}/(D)}\chi(a)=\frac{w(\mathcal{K})W(\chi_D)\,\mathrm{i}}{2D}\cdot\sum_{a\in\mathbb{Z}/(D)}\chi(a)a.$$

⌟

Proof: For 1: Cf. [GTM 218]P305-306, Ex.14-15.?
For 2, in this case $r_1=0, r_2=1$, so $\mathrm{Reg}(\mathcal{K})=1$, and the rest follows from(21.2.1.8)(21.4.2.5)(21.4.2.6) and item1. □

Prop. (21.4.3.4) [Kronecker's First Limit Formula].

$$\zeta(s)=\frac{1}{s-1}+\gamma_0+O(s-1).$$

⌟

Proof: Cf.[Kronecker's First Limit Formula, Revisited]. This can be deduced from(21.1.1.4).? □

Remark (21.4.3.5). This is related to the the averaged Colmez's conjecture?. ⌟

Relation to Summations

Def. (21.4.3.6) [von Mangoldt Function]. The **von Mangoldt function** is defined to be

$$\Lambda:\mathbb{Z}_+\to\mathbb{R}:\Lambda(n)=\begin{cases}\log p & ,p\in\mathbf{P},n\in p^{\mathbb{Z}_+}\\ 0 & ,\text{otherwise}\end{cases}.$$

⌟

Def. (21.4.3.7) [Chebyshev Functions]. For $X\in\mathbb{R}_+$, define the first **Chebyshev function**

$$\vartheta(X)\triangleq\sum_{p\in\mathtt{Prime},p\leq X}\log p$$

and the second **Chebyshev function**

$$\psi(X)\triangleq\sum_{n\in\mathbb{Z}_+,n\leq X}\Lambda(n)(21.4.3.6).$$

Notice $\psi(X)\geq\vartheta(X)$. ⌟

Prop. (21.4.3.8). For $\mathrm{Re}(s)>1$,

$$-\frac{\zeta'(s)}{\zeta(s)}=\sum_{n\in\mathbb{Z}_+}\Lambda(n)n^{-s}.$$

⌟

Proof: ? □

Prop. (21.4.3.9). Let $g\in C^\infty(\mathbb{R})$ s.t. $e^{\beta x}g(x)\in\mathcal{S}$ for any $\beta\in\mathbb{R}_+$, then for any $\beta\in\mathbb{R}_{>1}$,

$$\sum_{n\in\mathbb{Z}_+}\Lambda(n)g(\log n)=-\frac{1}{2\pi\mathrm{i}}\int_{\mathrm{Re}(z)=\beta}\frac{\zeta'}{\zeta}(s)\mathcal{L}(g)(-s)\mathrm{d}s.$$

⌟

Proof: Cf.[Larry Guth]P79. □

Cor. (21.4.3.10). Situation as in(21.4.3.9), for $\sigma\in(0,1),T\in\mathbb{R}_+$, denote $\mathrm{Box}(\sigma,T)$ the open rectangular $\{s=x+\mathrm{i}\,y|\sigma<x<\beta,|y|<T\}$, and the arc

$$\gamma_{\sigma,T}=(\beta,-T)\longrightarrow(\sigma,-T)\longrightarrow(\sigma,T)\longrightarrow(\beta,T).$$

Then by residue formula,

$$\sum_{n\in\mathbb{Z}_+}\Lambda(n)g(\log n)=\int e^x g(x)\mathrm{d}x-\sum_{\rho\in\mathrm{Zero}(\zeta)\cap\mathrm{Box}(\sigma,T)}\int e^{\rho x}g(x)\mathrm{d}x-\frac{1}{2\pi\mathrm{i}}\int_{\gamma_{\sigma,T}}\frac{\zeta'}{\zeta}\mathcal{L}g(-s)\mathrm{d}s.$$

⌟

Estimates

Thm. (21.4.3.11). For $s\in\mathbb{C}$ with $\mathrm{Re}(s)>0$,

$$|\zeta(s)-\frac{1}{s-1}|\leq\frac{|s|}{\mathrm{Re}(s)}.$$

⌟

Proof: Cf.[Larry Guth]P87. □

Prop. (21.4.3.12)[Bounding Numbers of Zeros]. For ε, there exists $C(\varepsilon)\in\mathbb{R}_+$ s.t. for any $T\in\mathbb{R}_+$,

$$\#\,\mathrm{Zero}(\zeta)\cap\mathrm{Box}(\varepsilon,T)\leq C(\varepsilon)T\log T(21.4.3.10).$$

⌟

Proof: Cf.[Larry Guth]P87. □

Prop. (21.4.3.13). For any $\varepsilon>0$, there exists constant $C_\varepsilon>0$ s.t. $|\zeta(s)|^{-1}\leq C_\varepsilon|t|^\varepsilon$, where $s=\sigma+\mathrm{i}\,t,\sigma\geq1,|t|\geq1$. ⌟

Proof:

□

Prop. (21.4.3.14). There exists $C\in\mathbb{R}_+$ s.t. if $s=\sigma+\mathrm{i}\,t\in\mathbb{C}$ where $\sigma>1/4$ and $|t|>1$, then $|\zeta(s)|\leq C|s|$. ⌟

Proof: Cf.[Larry Guth]P92. □

Prop. (21.4.3.15). Given $\varepsilon \in \mathbb{R}_+$, then there exists $C(\varepsilon) \in \mathbb{R}_+$ s.t. for any $s \in \mathbb{C}$ with $\mathrm{Re}(s) > \varepsilon$,

$$\Big|\frac{\zeta'}{\zeta}(s) - \sum_{\rho \in \mathrm{Zero}(\zeta)} \frac{1}{s-\rho}\Big| \leq C(\varepsilon)\log(2+|\tau|).$$

⌟

Proof: Cf.[Larry Guth]P87.**?** □

Cor. (21.4.3.16). For $\varepsilon \in \mathbb{R}_+$ and $\tau \in \mathbb{R}$ with $|\tau| > 1$,

$$\mathrm{Re}(-\frac{\zeta'}{\zeta}(1+\varepsilon+\mathrm{i}\,\tau)) \leq O(\log|\tau|).$$

And if $\rho = 1-\delta+\mathrm{i}\,\tau$ is a zero of $\zeta(s)$, then

$$\mathrm{Re}(-\frac{\zeta'}{\zeta}(1+\varepsilon+\mathrm{i}\,\tau)) \leq -\frac{1}{\varepsilon+\delta} + O(\log|\tau|).$$

⌟

Proof: These follow from the fact that for a zero ρ of ζ and $s \in \mathbb{C}$ s.t. $\mathrm{Re}(s)$, we have $\mathrm{Re}(-\frac{1}{s-\rho}) < 0$.
□

Thm. (21.4.3.17) [Vinogradov]. There exists $c, C \in \mathbb{R}_+$ s.t. if $\beta, \tau \in \mathbb{R}$ satisfies $\beta > 1 - \frac{c}{\log^{2/3}(2+|\tau|)}$, then

$$|\zeta(\beta+\mathrm{i}\,\tau)| \leq C\log(2+|\tau|).$$

⌟

Proof: Cf.[Larry Guth]P101. □

Thm. (21.4.3.18) [Zero-Free Region, Vinogradov]. There exists $c \in \mathbb{R}_+$ s.t. if $\beta, \tau \in \mathbb{R}$ and

$$\beta > \frac{c}{\log^{2/3}(2+|\tau|)\log\log|\tau|},$$

then $\zeta(\beta+\mathrm{i}\,\tau) \neq 0$. ⌟

Proof: Cf.[Larry Guth]P97**?** and P101. □

Lemma (21.4.3.19). For $\sigma \in \mathbb{R}_{>1}$ and $\tau \in \mathbb{R}$,

$$\mathrm{Re}\Big(3\frac{-\zeta'}{\zeta}(\sigma) + 4\frac{-\zeta'}{\zeta}(\sigma+\mathrm{i}\,\tau) + \frac{-\zeta'}{\zeta}(\sigma+2\,\mathrm{i}\,\tau)\Big) \geq 0.$$

⌟

Proof: It follows from(21.4.3.8) that the LHS equals

$$\sum_{n\in\mathbb{Z}_+}\frac{\Lambda(n)}{n^\sigma}(3+4\cos(\tau\log n)+\cos(2\tau\log n)) = \sum_{n\in\mathbb{Z}_+}\frac{\Lambda(n)}{n^\sigma}2(1+\cos(\tau\log n))^2 \geq 0.$$

□

4 Sieve Theory

Thm. (21.4.4.1) [Iwaniec]. There are infinitely many primes $p \in \texttt{Prime}$ of the form $p = x^2 + y^4, x, y \in \mathbb{Z}_+$. ⌟

Proof: □

Numbers Represented by Homogenous Forms

Thm. (21.4.4.2) [Fermat/Jacobi]. For $n \in \mathbb{Z}_+$, let $r_2(n) = \#\{(x, y) \in \mathbb{Z} | x^2 + y^2 = n\}$, then $r(n) \neq 0$ iff $2 | v_p(n)$ for any $p \equiv 3 (\bmod\ 4)$. Moreover,

$$r_2(n) = 4\Big(\#\{d \in \mathbb{Z}_+, d|n, d \equiv 1 (\bmod\ 4)\} - \#\{d \in \mathbb{Z}_+, d|n, d \equiv 3 (\bmod\ 4)\}\Big).$$

⌟

Proof: $1 + \sum_{n \in \mathbb{Z}_+} r_2(n) e^{2\pi i n\tau} = \theta^2(\tau) \in \mathrm{MF}_1(\Gamma_0(4), \chi_4)$ by(20.2.1.29), and also

$$G_{4,\chi_4} = 1 + \sum_{n \in \mathbb{Z}_+} \Big(\sum_{d \in \mathbb{Z}_+, d|n} \chi_4(d) \Big) e^{2\pi i \tau} \in \mathrm{MF}_1(\Gamma_0(4), \chi_4)(20.2.4.10).$$

But $\dim \mathrm{MF}_1(\Gamma_1(4)) \leq 1$ by(20.2.3.17), so we can compare coefficients. □

Thm. (21.4.4.3) [Lagrange]. For $n \in \mathbb{Z}_+$, let $r_4(n) = \#\{(x, y) \in \mathbb{Z} | x^2 + y^2 = n\}$, then $r_4(n)$ equals 8 times the sum of positive divisors of n that are not multiples of 4.

In particular, any $n \in \mathbb{Z}_+$ is a sum of four squares. ⌟

Proof: Calculate $\theta^4(\tau) \in \mathrm{MF}_2(\Gamma_0(4))$, where $\dim \mathrm{MF}_2(\Gamma_0(4)) = 2$.?Cf.[Modular Forms 1-2-3]P27. □

Thm. (21.4.4.4) [Heath-Brown]. There are infinitely many primes $p \in \texttt{Prime}$ of the form $p = x^3 + 2y^3, x, y \in \mathbb{Z}_+$. ⌟

Proof: □

5 Primes in Arithmetic Progressions

Def. (21.4.5.1) [Prime Counting Functions]. For $N \in \mathbb{Z}_+, a \in (\mathbb{Z}/(N))^*, X \in \mathbb{R}_+$, define

$$\pi(X; N, a) = \#\{p \in \texttt{Prime} : p \leq X, p \equiv a (\bmod\ N)\}.$$

And $\pi(X; 1, 1)$ is also denoted by $\pi(X)$. ⌟

Def. (21.4.5.2) [Normalized Prime Counting Function]. The **normalized prime counting function** π_0 is defined to be the function $\pi_0 : \mathbb{R} \to \mathbb{R}_+$:

$$\pi_0(X) = \lim_{h \to 0} \frac{1}{2}(\pi(X + h) + \pi(X - h)).$$

⌟

Thm. (21.4.5.3) [Merten's Theorem]. For $X \in \mathbb{R}_+$,

- $$|\sum_{p\in\mathbf{P},p\leq X}\frac{\log p}{p}-\log X|\leq 2.$$

- $$\lim_{X\to\infty}\Big(\sum_{p\in\mathbf{P},p\leq X}\frac{1}{p}-\log\log X\Big)=M,$$
  where $M\approx 0.26$ is called the **Meissel–Mertens constant**.

- $$\lim_{X\to\infty}\Big(\sum_{p\in\mathbf{P},p\leq X}\log(1-\frac{1}{p})+\log\log X\Big)=\gamma.$$

⌟

Proof: Cf.https://terrytao.wordpress.com/2013/12/11/mertens-theorems/. □

Prop. (21.4.5.4) [Chebyshev]. $\pi(X)\sim\frac{X}{\log X}$ iff $\psi(X)\sim X$. ⌟

Proof: As $0\leq\psi(X)\leq\pi(X)\log(X)$, $\frac{\psi(X)}{X}\leq\frac{\pi(X)\log(X)}{X}$. Also for any $\varepsilon\in\mathbb{R}_+$,

$$\psi(X)\geq\sum_{p\in\mathtt{Prime},X^{1-\varepsilon}<p\leq X}\log p\geq(1-\varepsilon)\log(X)(\pi(X)-\pi(X^{1-\varepsilon})),$$

so

$$\frac{\psi(X)}{X}\leq\frac{\pi(X)\log(X)}{X}\leq(\frac{1}{1-\varepsilon})\frac{\psi(X)}{X}+\frac{\log(X)}{X^{\varepsilon}}.$$

So the theorem follows. □

Lemma (21.4.5.5) [Chebyshev]. For $X\geq 1$, $\vartheta(X)\leq(4\log 2)X$. ⌟

Proof:

$$2^{2n}=(1+1)^{2n}\geq\binom{2n}{n}\geq\prod_{n<p<2n,p\in\mathbf{P}}p,$$

so

$$\vartheta(2n)-\vartheta(n)\leq 2n\log 2.$$

From this the assertion easily follows. □

Lemma (21.4.5.6). Define the function $\Phi(s)=\sum_{p\in\mathbf{P}}p^{-s}\log p$, then $(\mathcal{L}\vartheta(e^t))(s)=\Phi(s)/s$. Thus $\Phi(s)$ is holomorphic on $\mathrm{Re}(s)>1$ by(11.11.2.17) and(21.4.5.5), and $\Phi(s)-\frac{1}{s-1}$ extends to meromorphic functions on $\mathrm{Re}(s)>1/2$ and holomorphic on $\mathrm{Re}(s)\geq 1$. ⌟

Proof: By(2.6.3.2) there are infinitely many primes. For $n\in\mathbb{Z}_+$, let p_n be the n-th smallest prime number, then the function $\vartheta(e^t)$ is constant on $(\log p_n,\log p_{n+1})$, and

$$\int_{\log p_n}^{\log p_{n+1}}e^{-st}\vartheta(e^t)\mathrm{d}t=\vartheta(p_n)\int_{\log p_n}^{\log p_{n+1}}e^{-st}\mathrm{d}t=\vartheta(p_n)\frac{p_n^{-s}-p_{n+1}^{-s}}{s}.$$

Thus

$$(\mathcal{L}\vartheta(e^t))(s)=\int_0^\infty e^{-st}\vartheta(e^t)\mathrm{d}t=\frac{1}{s}\sum_{n\in\mathbb{Z}_+}\vartheta(p_n)(p_n^{-s}-p_{n+1}^{-s})=\frac{1}{s}\sum_{n\in\mathbb{Z}_+}p_n^{-s}\log p_n=\frac{\Phi(s)}{s}.$$

For the last assertion, notice

$$-\frac{\zeta'(s)}{\zeta(s)}=(-\log\zeta(s))'=(\sum_{p\in\mathbf{P}}\log(1-p^{-s}))'=\sum_{p\in\mathbf{P}}\frac{\log p}{p^s-1}=\Phi(s)+\sum_{p\in\mathbf{P}}\frac{\log p}{p^s(p^s-1)},$$

And $\sum_{p\in\mathbf{P}}\frac{\log p}{p^s(p^s-1)}$ is absolutely convergent and holomorphic for $\mathrm{Re}(s)>1/2$, and $\frac{\zeta'(s)}{\zeta(s)}$ has a simple pole with residue 1 by(21.4.3.1). So the assertion follows. □

Prop. (21.4.5.7). For $X\in\mathbb{R}_{>17}$,

$$\frac{X}{\log X}<\pi(X)<1.25506\frac{X}{\log X}.$$

⌟

Proof: [ROSSER and L. SCHOENFELD, Approximate formulas for some functions of prime numbers, Ill. J. Math. 6(1962), 64-94.]Thm2? □

Thm. (21.4.5.8) [Brun–Titchmarsh]. For any $X\in\mathbb{R}_+,N\in\mathbb{Z}_+,a\in(\mathbb{Z}/(N))^*$ s.t. $N\le X$,

$$\pi(X;N,a)\le\frac{2X}{\varphi(N)\log(X/N)}.$$

In particular, $\pi(X)\le 2X/\log X$. ⌟

Proof:

□

Thm. (21.4.5.9) [Prime Number Theorem, Hadamard-Vallée-Poussin1896/Siegel-Walfisz]. For any $A\in\mathbb{R}_+$,

$$\pi(X;N,a)=\frac{1}{\varphi(N)}\,\mathrm{Li}(X)+O_A(\frac{X}{\exp(A\sqrt{\log X})}),X\to\infty$$

holds when $(a,N)=1$ and $N\le(\log X)^A$. ⌟

Proof: ?

We only prove that $\pi(X)\sim\frac{X}{\log X},X\to\infty$: This follows from(21.5.1.4) and(21.4.5.4).

The function $H(t)=\vartheta(e^t)e^{-t}-1$ is piecewise continuous and bounded by(21.4.5.5), and $(\mathcal{L}H)(s)=\frac{\Phi(s+1)}{s+1}-\frac{1}{s}$(21.4.5.6) extends to a holomorphic function on $\mathrm{Re}(s)\ge 0$. Then by(11.11.2.18), the integral

$$\int_0^\infty H(t)\mathrm{d}t=\int_0^\infty(\vartheta(e^t)e^{-t}-1)\mathrm{d}t=\int_1^\infty\frac{\vartheta(x)-x}{x^2}\mathrm{d}x$$

converges. Then by(11.3.2.14), $\vartheta(X)\sim X$, and so $\pi(X)\sim\frac{X}{\log X}$ by(21.4.5.4). □

Def. (21.4.5.10)[Restrictions on N]. Let $\mathscr{B}$ be the set of numbers $B\in(0,1)$ s.t. there exists $D_B\in\mathbb{N}$ s.t. when $X\in\mathbb{R}_+$ is large, there exists a set $\mathscr{D}_B(X)$ of at most D_B many integers bigger than $\log X$, s.t. for any $Y\in\mathbb{R}_+,N\in\mathbb{Z}_+$, $N\le\min(x^B,y/x^{1-B})$ and $a\in(\mathbb{Z}/(N))^*$,

$$\pi(y;N,a)\ge\frac{\pi(y)}{2\varphi(N)},$$

unless N divides one one of the numbers in $\mathcal{D}_B(X)$.

Also denote $B_{\pi,1}$ the supremum of numbers B s.t. there exists $D_B \in \mathbb{N}$ s.t. when $X \in \mathbb{R}_+$ is large, there exists a set $S_B(X)$ of at most D_B many integers bigger than $\log X$ s.t. for any $N \in \mathbb{Z}_+$, $N \leq X^B$,

$$\pi(X; N, 1) \geq \frac{\pi(X)}{2\varphi(N)},$$

unless N divides one one of the numbers in $S_B(X)$. Then it is clear that $(0, B_{\pi,1}) \subset \mathcal{B}$. ⌟

Prop. (21.4.5.11). $(0, 5/12) \in \mathcal{B}$. ⌟

Proof: [Alford-Granville-Pomerance, Carmichael numbers]. □

Thm. (21.4.5.12). For $m \in \mathbb{Z}_+$, $\tau(m) = 2^{(1+o(1))\log m/\log\log m}$ as $m \to \infty$.

This is the best bound, because one can prove that there exists $c \in \mathbb{R}_+$ s.t. there are infinitely many $m \in \mathbb{Z}_+$ with more than $2^{c\log m/\log\log m}$ many divisors d s.t. $d+1 \in \mathbf{P}$. ⌟

Proof: □

Prop. (21.4.5.13). For any $A \in \mathcal{A}$**?** and $\varepsilon, \delta \in \mathbb{R}_+$, there exist numbers $\eta_{\varepsilon,\delta}, D_{\varepsilon,\delta}$ s.t. for any X sufficiently large, there is a set $\mathcal{D}_{\varepsilon,\delta}(x)$ of integers in of cardinality$\leq D_{\varepsilon,\delta}$, s.t. every element of $\mathcal{D}_{\varepsilon,\delta}$ is bigger than $\log X$, and at most one of them is bigger than $X^{\eta_{\varepsilon,\delta}}$, and

$$|\vartheta(Y; N, a) - \frac{y}{\varphi(d)}| \leq \varepsilon\frac{y}{\varphi(d)}$$

for any $N \in \mathbb{Z}_+, Y \in \mathbb{R}_+, a \in (\mathbb{Z}/(N))^*$ s.t. N is not divisible by elements of $\mathcal{D}_{\varepsilon,\delta}(x)$, and $1 \leq d \leq \min(X^{1/A-\delta}, Y/X^{1-1/A+\delta})$. ⌟

Proof: Cf.[AGP94]P712.**?** □

Prop. (21.4.5.14). Suppose $B \in \mathcal{B}$(21.4.5.10), then for any X large and $L \in \mathbb{Z}_+$ s.t. L is square-free not divisible by any prime exceeding $X^{(1-B)/2}$, and

$$\sum_{p \in S(L)} \frac{1}{p} \leq (1-B)/32,$$

there exists $k \in \mathbb{Z}_+, k \leq X^{1-B}, (k, L) = 1$ s.t.

$$\#\{d \in \mathbb{Z}_+ : d|L, dk+1 \leq X, dk+1 \in \mathbf{P}\} \geq \frac{2^{-D_B-2}}{\log X}\#\{d \in \mathbb{Z}_+ : d|L, 1 \leq d \leq X^B\}.$$

⌟

Proof: Cf.[AGP94]P715.**?** □

Elliott-Halberstam Conjecture

Conj. (21.4.5.15) [Elliott-Halberstam]. For $N \in \mathbb{Z}_+$ and $X \in \mathbb{R}_+$, let

$$\mathrm{Err}(X; N) = \max_{(a,N)=1} |\pi(X; N, a) - \frac{\pi(X)}{\varphi(N)}|.$$

Then for any $\theta \in (0, 1)$ and $A \in \mathbb{R}_+$, there exists a constant $C \in \mathbb{R}_+$ s.t.

$$\sum_{1 \leq N \leq X^\theta} \mathrm{Err}(X; N) \leq C\frac{X}{\log^A X}.$$

⌟

Thm& Conj.Cor. (21.4.5.16) [Bombieri-Vinogradov]. The Elliott-Halberstam conjecture is true for $\theta < 1/2$. ⌟

Proof: □

Green-Tao Theorem

Thm. (21.4.5.17) [Green-Tao]. $\mathbf{P}$ contains arithmetic progressions of any length. In fact, if $A \subset P$ is a subset with positive natural upper density, then A contains arithmetic progressions of any length. ⌟

Proof: Cf.[Green-Tao]. Notice this is a consequence of the Erdös-Turán conjecture(25.6.2.7). □

Sophie-Germain Primes

Def. (21.4.5.18) [Sophie-Germain Primes]. A **Sophie-Germain prime** is a prime $p \in \texttt{Prime}$ s.t. $2p + 1$ is also a prime. ⌟

Conj. (21.4.5.19) [Sophie-Germain Primes Conjecture]. Let C_2 be the twin-prime constant?, then

$$\#\{p \in \mathbf{P} | p \leq m, 2p + 1 \in \texttt{Prime}\} \sim 2C_2 \frac{X}{\log X}, \quad X \to \infty.$$

⌟

Proof: □

6 Gaps between Primes

Small Gaps between Primes

Conj. (21.4.6.1) [Cramer]. The largest gap between consecutive primes$\leq X$ is $\Theta((\log X)^2)$. ⌟

Proof: □

Def. (21.4.6.2). For $Y, Y \in \mathbb{R}_+$, let $\pi(X|Y)$ be the cardinality of primes p s.t. $p \leq X$, and $p - 1$ is free of prime divisors exceeding Y. ⌟

Def. (21.4.6.3). Let E_π denote the supremum of numbers $E \in (0, 1)$ s.t. there exists $\gamma_1(E) \in \mathbb{R}_+$ s.t. $\pi(X|X^{1-E}) \geq \gamma_1(E)\pi(X)$ for $X \in \mathbb{R}_+$ sufficiently large. ⌟

Prop. (21.4.6.4). $E_\pi > 0$, and if $E \in (0, 1)$ has the property stated in(21.4.6.3), then so does $E + \varepsilon$ for some $\varepsilon \in \mathbb{R}_+$. ⌟

Proof: For the first assertion, Cf.[Erdos]?,

For the second assertion, for X large,

$$\pi(X|X^{1-E'}) \geq \pi(X|X^{1-E}) - \sum_{p \in \mathbf{P}, x^{1-E'} \leq p < x^{1-E}} \pi(X; p, 1)$$

$$(21.4.6.3) \geq \gamma_1(E)\pi(X) - \sum_{p \in \mathbf{P}, x^{1-E'} \leq p < x^{1-E}} \frac{2X}{\varphi(p)\log(X/p)}$$

$$\begin{aligned}(21.4.5.7) \geq \gamma_1(E)\frac{X}{\log X} &- \sum_{p\in\mathbf{P}, x^{1-E'}\leq p<x^{1-E}} \frac{2X}{E(p-1)\log X} \\ &= \frac{X}{\log X}\Big(\gamma_1(E) - \frac{2}{E}\sum_{p\in\mathbf{P}, x^{1-E'}\leq p<x^{1-E}}\frac{1}{p-1}\Big) \\ (21.4.5.3) &= \frac{X}{\log X}\Big(\gamma_1(E) - \frac{2}{E}\log\frac{1-E}{1-E'} + o(1)\Big)\end{aligned}$$

This shows that when E' is sufficiently closed to E, when X is large, E' also satisfies the property stated in(21.4.6.3). □

Conj. (21.4.6.5). $E_\pi = 1$. ⌟

Proof: □

Prop. (21.4.6.6) [Friedlander]. $1-(2\sqrt{e})^{-1}\leq E_\pi$. ⌟

Proof: [FRIEDLANDER, Shifted primes without large prime factors]. □

Prop. (21.4.6.7). $B_{\pi,1}\leq E_\pi$(21.4.5.10). ⌟

Proof: Cf.[AGP94]P720**?**. □

Carmichael Numbers

Def. (21.4.6.8) [Carmichael Numbers]. $n\in\mathbb{Z}_+$ is called a **Carmichael number** if $n\notin\mathbf{P}$ and $n|a^n-a$ for any $a\in\mathbb{Z}$. For $X\in\mathbb{R}_+$, let $\mathrm{Car}(X)$ denote the cardinality of Carmichael numbers not exceeding X. ⌟

Thm. (21.4.6.9) [Korselt]. For $n\in\mathbb{Z}_+$, $n|a^n-a$ for all $a\in\mathbb{Z}$ iff n is square-free and $p-1|n-1$ for any $p\in\mathbf{P}, p|n$. ⌟

Proof: Suppose n is a Carmichael number. Then n is square-free: For $p|n$, let $n=p^kn'$, then $(1+p)^{p^kn'}\equiv 1+p(\mathrm{mod}\ p^k)$, but $p^{k+1}|(1+p)^{p^kn'}-1$, so $p^k|p$, and $k=1$. And let g be a primitive root for p, then $g^n\equiv g(\mathrm{mod}\ n)$, thus $p-1|n-1$.

The converse is obvious. □

Cor. (21.4.6.10). Any Carmichael number $n\in\mathbb{Z}_+$ is odd, and has at least three prime divisors. ⌟

Proof: If n is even, because n is square-free(21.4.6.9), n has an odd prime divisor $p\in\mathbf{P}$, so $p-1|n-1$, contradiction. If $n=pq$, then $p-1|pq-1, q-1|pq-1$, thus $p-1|q-1|p-1$, and $p=q$, contradiction. □

Thm. (21.4.6.11) [Alford-Granville-Pomerance]. For each $E\in\mathcal{E}$(21.4.6.3) and $B\in\mathcal{B}$(21.4.5.10), then $\mathrm{Car}(X)\geq X^{EB}$ for X sufficiently large. ⌟

Proof: Because of(21.4.6.4), it suffices to show that $\mathrm{Car}(X)\geq X^{EB-\varepsilon}$ for any $\varepsilon\in\mathbb{R}_+$ and X sufficiently large.

□

Cor. (21.4.6.12) [Alford-Granville-Pomerance/Harman]. $(0,1-(2\sqrt{e})^{-1})\subset\mathcal{E}$(21.4.6.6), and $(0,5/12)\in\mathcal{B}$ by(21.4.5.11), so $\mathrm{Car}(X)>X^{2/7}$ for X sufficiently large. In fact, Harman proved that $\mathrm{Car}(X)>X^{1/3}$ for X sufficiently large. ⌟

Large Gaps between Primes

Conj. (21.4.6.13) [Cramér].

$$\lim_{n\to\infty} \frac{p_{n+1} - p_n}{\log^2 p_n} = 1.$$

⌟

Proof: □

Conj.Cor. (21.4.6.14) [Oppermann]. For any $n \in \mathbb{Z}_{\geq 2}$,

$$\pi(n^2 - n) < \pi(n^2) < \pi(n^2 + n).$$

⌟

Thm& Conj.Cor. (21.4.6.15) [Montgomery/Huxley/Baker-Harman-Pintz]. There exists an effectively constant $x_0 \in \mathbb{R}_+$ s.t. for any $X \in (x_0, \infty)$, $\mathtt{Prime} \cap [X - X^{0.525}, X] \neq \varnothing$. ⌟

Proof: □

7 Circle Method

8 Goldbach Problem

Conj. (21.4.8.1) [Goldbach]. For any $m \in \mathbb{Z}_{\geq 2}$, $2m$ is a sum of two prime numbers.

Hardy-Littlewood even conjectures that the number of representations of $2m$ is

$$N_2(2m) \sim 4 \prod_{q \in \mathtt{Prime}_{\geq 3}} (1 - \frac{1}{(q-1)^2}) \cdot \prod_{p \in \mathtt{Prime}_{\geq 3}, p | n} (\frac{p-1}{p-2}) \cdot \frac{m}{\log^2 m}.$$

⌟

Proof: □

Thm& Conj.Cor. (21.4.8.2) [Ternary Goldbach Conjecture, Vinogradov]. For any $k \in \mathbb{Z}_{\geq 3}$, $2k + 1$ is a sum of three primes. ⌟

Proof: ? □

9 Hardy-Littlewood Conjectures

Conj. (21.4.9.1) [Hardy-Littlewood Conjecture N]. There are infinitely many primes $p \in \mathtt{Prime}$ of the form $p = x^3 + y^3 + z^3$.

Moreover, for $X \in \mathbb{R}_+$, if $P(X)$ is the number of triples (x, y, z) s.t. $x^3 + y^3 + z^3 \in \mathtt{Prime} \cap [0, X]$, then

$$P(X) \sim \Gamma(\frac{4}{3})^3 \cdot \prod_{q \in \mathtt{Prime}, q \equiv 1 (\mathrm{mod}\ 3)} (1 - \frac{A_q}{q^2}) \cdot \frac{X}{\log X},$$

where $A_q \equiv 1 (\mathrm{mod}\ 3)$ and $4q = A_q^2 + 27 B_q^2$. ⌟

10 Prime Ideals

Def. (21.4.10.1) [Prime Ideal Counting Functions]. For $F \in \texttt{NField}$, let

$$\pi(X; F) = \#\{\mathfrak{p} \in \Sigma_F^{\text{fin}} : ||\mathfrak{p}|| \le X\}$$

⌟

Thm. (21.4.10.2) [Prime Ideal Theorem, Landau]. For $F \in \texttt{NField}$, there exists $c_F \in \mathbb{R}_+$ s.t.

$$\pi(X; F) = \mathrm{Li}(X) + O(\frac{X}{\exp(c_F\sqrt{\log X})}).$$

⌟

Proof: □

11 Others

Prop. (21.4.11.1). For any $p \in \mathbf{P}_{\ge 5}$, there exists $P \in \mathbf{P}, \ell \in \mathbf{P}_{\ge 3}, m, r \in \mathbb{Z}_+$ s.t. $P > p$, $\ell^r || (P-1)$, $\ell^r = 2m+1$, and

$$\frac{P}{p} \le \frac{2m+1}{m+1} - \frac{m}{m+1} \cdot \frac{1}{p}.$$

⌟

Proof: Cf.[Serre's Modularity Conjecture, the Level One Case]P582. □

Conj. (21.4.11.2) [Artin's Conjecture on Primitive Roots]. For any $n \in \mathbb{Z}_+ \setminus (\mathbb{Z}_+)^2$, there exists $A(n) > 0.35 \in \mathbb{R}_+$ s.t.

$$\#\{p \in \mathbf{P} | p \le X, \mathrm{ord}_p(n) = p-1\} \sim A(n)\frac{X}{\log X}, \quad X \to \infty$$

⌟

Proof: □

Prop. (21.4.11.3) [Fouvry]. There exists $C \in \mathbb{R}_+$ s.t. when $X \in \mathbb{R}_+$ is large,

$$\#\{\ell \in \mathbf{P} | \ell \le X, P_{\max}(\ell - 1) \ge \ell^{0.668}\} \ge C\frac{X}{\log X}.$$

⌟

Proof: Cf.[Fouvry, Théoréme de Brun-Titchmarsh; applicationau théoréme de Fermat], and [Baker and Harman, The Brun-Titchmarsh Theorem on average]. □

Cor. (21.4.11.4). When $n \in \mathbb{Z}_+$ is large, there exists $r \in \mathbb{Z}_+, r \le \log^3 n$ that $\mathrm{ord}_r(n) > \log^2 n$. ⌟

Proof: Notice by(21.4.11.3), for any $\varepsilon \in \mathbb{R}_+$, when n is large, there exists at least $\Omega(\log^{3+\frac{\varepsilon}{2}} n)$ primes $\ell \in \mathbf{P}$ s.t. $P_{\max}(\ell - 1) \ge \ell^{2/3}$ and $\log^2 n < \ell < \log^{3+\varepsilon} n$. Then $\mathrm{ord}_\ell(n) \ge \log^2 n$ or $\ell | n^k + 1$ for some $k \le \log^{1+\frac{\varepsilon}{3}} n$. The latter case happens only for $O(\log^{3+\frac{2\varepsilon}{3}} n)$ many ℓ. So we can find some $\ell < \log^{3+\varepsilon} n$ s.t. $\mathrm{ord}_r(n) \ge \log^2 n$. □

21.5 Riemann Conjecture

References are [Ivic, Aleksandar The Riemann zeta-function. The theory of the Riemann zeta-function with applications. A Wiley-Interscience Publication. John Wiley & Sons, Inc., New York, 1985. xvi+517 pp. ISBN: 0-471-80634-X].

1 Distribution of Primes

Thm. (21.5.1.1) [Riemann-Mangoldt Formula]. Define

$$f(X) = \pi_0(X) + \frac{1}{2}\pi_0(X^{\frac{1}{2}}) + \frac{1}{3}\pi_0(X^{\frac{1}{3}}) + \ldots,$$

then by Möbius inversion,

$$\pi_0(X) = \sum_n \frac{\mu(n)}{n} f(X^{\frac{1}{n}}) = f(X) - \frac{1}{2}f(X^{\frac{1}{2}}) + \frac{1}{3}f(X^{\frac{1}{3}}) - \ldots.$$

Then there is a **Riemann-Mangoldt formula**

$$f(X) = \mathrm{li}(X) - \sum_\rho \mathrm{li}(X^\rho) - \log 2 + \int_X^\infty \frac{\mathrm{d}t}{t(t^2-1)\log t}.$$

⌟

Proof: ? □

Def. (21.5.1.2). For $X \in \mathbb{R}_+$, define $\mathrm{Err}(X) = \psi(X) - X$(21.4.3.7). ⌟

Prop. (21.5.1.3). The Riemann conjecture is equivalent to the following:

- $|\pi(X) - \mathrm{Li}(X)| = \widetilde{O}(X^{1/2})$.
- $\mathrm{Err}(X) = \widetilde{O}(X^{1/2})$(21.5.1.2).

⌟

Proof: This should follows from the Riemann-Mangoldt formula(21.5.1.1)?. □

Thm. (21.5.1.4) [Vinogradov]. $\mathrm{Err}(X) = O(Xe^{-C(\log X)^{3/5}(\log\log X)^{-1/5}})$. ⌟

Proof: We only prove that there exists $c \in \mathbb{R}_+$ s.t. $\mathrm{Err}(X) = O(Xe^{-C\log^{1/2} X})$:

Cf.[Larry Guth]. The assertion follows from(21.4.3.18). The same argument should work if we use the bigger zero-free region. □

1 Statements

References are [BSD65].

Elliptic Curves

Conj. (21.6.1.1) [Birch-S.Dyer]. Let $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F$, and $L(E,s)$ be the L-function of E(21.2.6.2), then

- $\#Ш(E) < \infty$, $\mathrm{rank}(E/F) = \mathrm{rank}_{\mathrm{an}}(E/F) = r$, and
- $$L^\dagger(E;1) = \frac{2^{r_2}\Omega\langle\prod_{v\in\Sigma_F^{\mathrm{fin}}} c_v\rangle\langle\prod_{v\in\Sigma_F^{\mathrm{fin}}}|\omega/\omega_{E,v}|_v\rangle}{\sqrt{|d_K|}}\cdot\#Ш(E/K)\cdot\frac{\mathrm{Reg}(E/K)}{(\#E(K)_{\mathrm{tor}})^2},$$

where

- r_2 is the number of complex places of K,
- $\mathrm{Reg}(E/F)$ is the regulator of $E(F)/E(F)_{\mathrm{tor}}$ w.r.t the Neron-Tate height pairing on $E(F)$(15.13.1.7),
- c_v are the local Tamagawa numbers,
- ω is a non-zero global exterior differential form,
- $\Omega = \prod_{v\in\Sigma_F^\infty}\int_{E(F_v)}|\omega|_v$,
- $\omega_{E,v}$ are the Néron differentials on E_v.

⌟

Proof: □

Conj. (21.6.1.2) [p-Parts of the Birch-S.Dyer Conjecture]. ⌟

Prop. (21.6.1.3) [Nekovar]. The parity conjecture holds for elliptic curves over a totally real number field K if $Ш(E/K)$ is finite. ⌟

Proof: □

Abelian Varieties

Conj. (21.6.1.4) [Functional Equation Conjecture]. Let F be a number field, $A \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^g/F$, then

- the zeta function $Z(A,s)$**?** extends to an entire function on $s\in\mathbb{C}$, and satisfies the functional equation
$$Z(A,s) = w_A Z(A,2-s),$$
where $w_A = \pm 1$ is called the **sign of functional equation of** A, and
- $w_A = w = \prod_{v\in\Sigma_F} w_v$, where w_v is the local root number of A/K at v.

⌟

Proof: □

Conj. (21.6.1.5) [Birch-S.Dyer-Tate]. Let $F \in \mathtt{NField}, A \in \mathcal{A}b\mathcal{V}ar^g/K$, let $L(A,s)$ be the L-function of A(21.2.6.2), then

- $L(A,s)$ extends to an entire function on $s \in \mathbb{C}$, $\#\text{Ш}(A) < \infty$, $\mathrm{rank}(A/F) = \mathrm{rank}_{\mathrm{an}}(A/F) = r$,
-
$$L^\dagger(A;1) = \frac{2^{gr_2}\Omega_A(\prod_{v\in\Sigma_K^0} c_v)(\prod_{v\in\Sigma_K^0}|\omega/\omega_{A,v}|_v)}{\sqrt{|d_K|}^g} \cdot \#\text{Ш}(A/K) \cdot \frac{\mathrm{Reg}(A/K)}{\#A(K)_{\mathrm{tor}}\#\widehat{A}(K)_{\mathrm{tor}}},$$

where

- r_2 is the number of complex places of F,
- $\mathrm{Reg}(A/F)$ the regulator of the Neron-Tate height pairing $A(K)/A(K)_{\mathrm{tor}} \times \widehat{A}(K)/\widehat{A}(K)_{\mathrm{tor}} \to \mathbb{R}$(15.13.1.7),
- c_v the local Tamagawa numbers,
- ω a non-zero global g-form,
- $\Omega_A = \prod_{v\in\Sigma_F^\infty}\int_{A(F_v)}|\omega|_v$,
- $\omega_{A,v}$ is a Néron differential on A_v.

⌟

Proof: □

Remark (21.6.1.6).

- The BSDT conjecture has been verified numerically for some elliptic curves over number fields, some Jacobians of genus 2 curves and (up to square) a few Jacobians of higher genus curves.
- BSDT conjecture implies BSD conjecture(21.6.1.1), as any $E \in \mathcal{E}ll/K$ is an Abelian variety of dimension 1, and $E \cong \widehat{E}$ canonically.

⌟

Prop. (21.6.1.7). If the BSDT conjecture holds for all Abelian varieties over $\mathbb{Q}$, then it holds for all Abelian varieties over any number fields. ⌟

Proof: Cf.[The Arithmetic of Abelian Varieties, Milne].**?** □

Conj. (21.6.1.8) [Parity Conjecture]. Let K be a number field and $A \in \mathcal{A}b\mathcal{V}ar/K$, then $\mathrm{rank}_{an}(A/K) \equiv \mathrm{rank}(A/K) \mod 2$. This is a consequence of BSDT conjecture(21.6.1.5). ⌟

2 Low Rank Cases

References are [Kolyvagin's Conjecture And Patched Euler Systems In Anticyclotomic Iwasawa Theory, Naomi] andhttp://www.math.columbia.edu/~chaoli/docs/KolyvaginConjecture.html.

We use notations in6.

Thm. (21.6.2.1) [Rank 0 Case]. For $E \in \mathcal{E}ll/\mathbb{Q}$ and $\ell \in \mathbf{P}$, there are implications:

- $\mathrm{rank}(E/\mathbb{Q}) = 0, \#\text{Ш}[\ell^\infty] < \infty \Rightarrow \mathrm{rank}_\ell(E/\mathbb{Q}) = 0$.
- $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 0 \Rightarrow \mathrm{rank}(E/\mathbb{Q}) = 0, \#\text{Ш}[\ell^\infty] < \infty$.

- $\mathrm{rank}_\ell(E/\mathbb{Q}) = 0 \Rightarrow \mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 0$ if $\ell \geq 3$ is good ordinary for E and $\overline{\rho}_{E,\ell} : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{Aut}(E[\ell])$ surjective.

⌟

Proof: 1 is trivial.
2 is the work of Gross-Zagier and Kolyvagin.?
3 is the work of Skinner-Urban(2000s)?. □

Prop. (21.6.2.2). If $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 0$, the p-part of the BSD formula(21.6.1.2) is know for $p \geq 3$ under similar hypothesis by work of Kato(2000s) and Skinner-Urban on the Iwasawa main conjecture for elliptic curves.? ⌟

Rank 1 Case

References are [Weil Zhang, Selmer groups and the divisibility of Heegner points (2013)] and [the Birch and Swinnerton-Dyer Formula for Elliptic Curves of Analytic Rank One].

Thm. (21.6.2.3) [Rank 1 Case]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $p \in \mathbf{P}$, there are implications:

- $\mathrm{rank}(E/\mathbb{Q}) = 1, \#Ш[p^\infty] < \infty \Rightarrow \mathrm{rank}_p(E/\mathbb{Q}) = 1$.
- $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 1 \Rightarrow \mathrm{rank}(E/\mathbb{Q}) = 1, \#Ш[p^\infty] < \infty$.
- $\mathrm{rank}_p(E/\mathbb{Q}) = 1 \Rightarrow \mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 1$ if $p \geq 5$ is good ordinary for E and $\overline{\rho}_{E,p} : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{Aut}(E[p])$ surjective with some mild ramification conditions.

⌟

Proof: 1 is trivial.
2 is the work of Gross-Zagier(21.8.2.2) and Kolyvagin(21.8.3.10).
3 follows from(21.8.3.14). □

Cor. (21.6.2.4). As a corollary of(21.6.2.1) and(21.6.2.3), [Bhargava-Skinner-Zhang] proved that at least 66% of Elliptic curves over $\mathbb{Q}$ satisfy the rank part of the BSD conjecture(21.6.1.1)? ⌟

Prop. (21.6.2.5). Under the hypothesis of(21.8.3.12), if $\mathrm{rank}_p(E/\mathbb{Q}) = 1$, then the p-part of the ⌟

Prop. (21.6.2.6). If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N satisfies $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 1$, $p \in \mathbf{P}\backslash\{2,3\}$ and $\overline{\rho}_{E,p}$ is surjective and ramifies at any $\ell \in \mathbf{P}$ s.t. $v_\ell(N) = 1$, then the p-part of the BSD formula(21.6.1.2) holds. ⌟

Proof: Cf, [Weil Zhang, Selmer groups and the divisibility of Heegner points (2013)]. or http://www.math.columbia.edu/~chaoli/docs/KolyvaginConjecture.html. □

3 over Function Fields

Prop. (21.6.3.1) [Artin-Tate]. The BSD conjecture hold for an elliptic curve over a function field F iff $Ш(E/F)$ is finite. ⌟

Proof: □

4 Motivic B-S.D Conjectures

Prop. (21.6.4.1) [Motivic B-S.D conjectures]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, consider the motive $h^1(E)$, then

$$L(E,s) = Z(h^1(E),s).$$

More generally, if we consider L-functions of the form

$$L_3(E,s) = \prod_p L(E_{\mathbb{F}_{p^3}},s).$$

Then there exists a motive $M \in M_{\mathrm{num}}(\mathbb{Q})$ s.t.

$$h^1(E)\otimes h^1(E)\otimes h^1(E) = 3h^1E(-1)\oplus M,$$

and

$$L_3(E,s) = Z(M,s).$$

⌟

Proof: □

21.7 Special Values of L-Functions

Main references are[Del79], [Conrad BSD notes], [Remarks on special values of L-functions, Scholl], [nLab].

1 Deligne Conjecture

Prop. (21.7.1.1). If $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{Q}$ and $M = h^i(X)(m)$, then $M^\vee \cong h^i(X)(i-m)$, i.e. it is polarized of weight $i-2m$**?**. ⌟

Proof: **?** Let $\eta \in h^2$ be a hyperplane section, then

$$H^{2d}(X)(d) \cong H^{2d}(\mathbb{P}^N)(d) = (\eta(1))^{\otimes d} \cong 1.$$

There is a pairing

$$h^i(X)(m) \times h^{2d-i}(X)(d-m) \to h^{2d}(X)(d),$$

and also an isomorphism

$$h^i(X)(i-m) \xrightarrow{\cup \eta^{d-i}} h^{2d-i}(X)(d-m).$$

□

Def. (21.7.1.2)[Critical Values]. For $M \in \mathrm{Mot}(\mathbb{Q})$, $m \in \mathbb{Z}$ is called a **critical value** for M if neither $L_\infty(M;s)$ nor $L_\infty(M^\vee;1-s)$ has a pole at $s=m$. M is called a **critical motive** if 0 is critical for M. ⌟

Prop. (21.7.1.3). M is critical iff the Betti realization satisfies

- $\mathrm{Real}_{\mathrm{Betti}}(M)^{p,q} = 0$ unless $p=q$ or $p<0\leq q$ or $q<0\leq p$.
- c acts on $\mathrm{Real}_{\mathrm{Betti}}(M)^{p,p}$ by -1 if $p \geq 0$, and 1 if $p<0$.

⌟

Deligne's Periods

Prop. (21.7.1.4)[Deligne's Periods]. We assume that $M \in \mathrm{Mot}(\mathbb{Q})$ is pure of weight w, and $\mathsf{c} = \pm 1$ on $M^{w/2,w/2}$ if $w \in 2\mathbb{Z}$. Notice these hypothesis are satisfied when M is critical.

Define

$$d(M) = \dim_{\mathbb{Q}} \mathrm{Real}_{\mathrm{Betti}}(M), \quad d^\pm(M) = \dim_{\mathbb{Q}} \mathrm{Real}_{\mathrm{Betti}}(M)^{\mathsf{c}=\pm 1},$$

And also the eigenvalue decomposition of c^* on $\mathrm{Real}_{\mathrm{Betti}}(M)$:

$$\mathrm{Real}_{\mathrm{Betti}}(M) = \mathrm{Real}_{\mathrm{Betti}}(M)^+ \oplus \mathrm{Real}_{\mathrm{Betti}}(M)^-.$$

Then it follows from(8.10.3.16) that

$$I_{\mathrm{dR}}(\mathrm{Real}_{\mathrm{Betti}}(M)^+ \otimes \mathbb{R}) \subset \mathrm{Real}_{\mathrm{dR}}(M), \quad I_{\mathrm{dR}}(\mathrm{Real}_{\mathrm{Betti}}(M)^- \otimes \mathbb{R}) \subset \mathrm{i}\,.\,\mathrm{Real}_{\mathrm{dR}}(M).$$

There are filtration steps $\mathrm{Fil}^\pm \subset \mathrm{Real}_{\mathrm{dR}}(M)$ of the deRham filtration s.t.

$$\mathrm{Fil}^\pm \mathrm{Real}_{\mathrm{dR}}(M) \otimes \mathbb{C} = I_{\mathrm{dR}}(\oplus_{p>q} \mathrm{Real}_{\mathrm{Betti}}(M)^{p,q} \oplus (\mathrm{Real}_{\mathrm{Betti}}(M)^{w/2,w/2})^{\mathsf{c}=\pm 1}).$$

Then we can define

$$\mathrm{Real}_{\mathrm{dR}}(M)^\pm = \mathrm{Real}_{\mathrm{dR}}(M)/\,\mathrm{Fil}^\mp \mathrm{Real}_{\mathrm{dR}}(M).$$

Since $\mathrm{Real}_{\mathrm{Betti}}(M)^{p,q} = \overline{\mathrm{Real}_{\mathrm{Betti}}(M)^{q,p}}$, the space $\mathrm{Real}_{\mathrm{Betti}}(M)^{\pm}$ lies (anti)diagonally, so the following maps

$$I^{\pm} : \mathrm{Real}_{\mathrm{dR}}(M)^{\pm} \otimes \mathbb{C} \subset \mathrm{Real}_{\mathrm{dR}}(M) \otimes \mathbb{C} \xrightarrow{I_{\mathrm{dR}}} \mathrm{Real}_{\mathrm{dR}}(M) \otimes \mathbb{C} \twoheadrightarrow \mathrm{Real}_{\mathrm{dR}}(M)^{\pm} \otimes \mathbb{C}$$

are isomorphisms.

Then because of the $\mathbb{Q}$-structure on $\mathrm{Real}_{\mathrm{dR}}(M)^{\pm}$ and $\mathrm{Real}_{\mathrm{dR}}(M)^{\pm}$, we have that

$$c^{\pm}_{\mathrm{Del}}(M) = \det(I^{\pm}) \in \mathbb{C}^{\times}/\mathbb{Q}^{\times}$$

are well-defined, called the **Deligne periods** of M(if both sides are $\{0\}$, let $c^{\pm}_{\mathrm{Del}}(M) = 1$). In fact, from the argument above, we see that $I^{\pm}$ are real, so in fact $c^{\pm}_{\mathrm{Del}} \in \mathbb{R}^{\times}/\mathbb{Q}^{\times}$. ⌟

Conj. (21.7.1.5) [Deligne]. Let $M \in \mathrm{Mot}(\mathbb{Q})$ be critical, then

$$L(M; s) \sim_{\mathbb{Q}} c^{+}_{\mathrm{Del}}(M) \in \widehat{\mathbb{P}}(21.7.1.4).$$

⌟

Proof: Cf.[Deligne, Values of L-functions] for the assertion that $c^{+}_{\mathrm{Del}}(M) \in \widehat{\mathbb{P}}$. □

Example (21.7.1.6) [Tate Modules]. For the Tate module $\mathbb{Q}(r)$, $\mathsf{c}^* = (-1)^r$ on $\mathrm{Real}_{\mathrm{Betti}}(\mathbb{Q}(n))$, so it follows from(8.10.3.15) that

$$c^{\varepsilon}(\mathbb{Q}(r)) = \begin{cases} (2\pi\,\mathrm{i})^r & ,\varepsilon = (-1)^r \\ 1 & ,\varepsilon = (-1)^{r-1} \end{cases}.$$

And $\mathbb{Q}(r)$ is critical iff $L_\infty(\mathbb{Q}) = \Gamma_{\mathbb{R}}(s)$ is holomorphic at both $r, 1-r$, and this is the case when $r \in 2\mathbb{Z}_+$ or $r \in 1 - 2\mathbb{Z}_+$. The Deligne's conjecture is true in this case, by(21.7.4.1). ⌟

General Coefficients

2 Beilinson-Bloch Conjecture

References are [Blo00], [Bei85], [Beilinsen, Higher regulators of modular curves, Applications of algebraic K-theory to algebraic geometry and number theory, Part I, II], [Iwasawa theory for the symmetric square of an elliptic curve, Flach], [Nekovar, Beilinson's Conjecture, in Motives, 537-570], [Algebraic K-Theory and Special Values of L-Functions: Beilinson's Conjecture].

Notation (21.7.2.1).

- Denote $m = i + 1 - n$.
- We assume that
  - the Euler product for $L(h^i(X); s)$ converges absolutely for $\mathrm{Re}(s) > i/2 + 1$.
  - $L(h^i(X); s)$ meromorphically extends to the whole plane, and possible poles can occur only when i is even and $s = i/2 + 1$.
  - $L(h^i(X); i/2 + 1) \neq 0$.
  - $\Lambda(h^i(X); s)$ has a functional equation

$$\Lambda(h^i(X); i + 1 - s) = \varepsilon(h^i(X); s)\Lambda(h^i(X); s).$$

⌟

Prop. (21.7.2.2). By(12.10.3.8), if $m < \frac{i+1}{2}$, there is an exact sequence

$$0 \to \operatorname{Fil}^n H^i_{\text{Betti}}(X, \mathbb{R}) \to H^i_{\text{Betti}}(X, \mathbb{R}(n-1))^{\mathsf{c}^* = (-1)^{n-1}} \to H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n)) \to 0.$$

⌟

Prop. (21.7.2.3). If the functional equation and

$$\dim_{\mathbb{R}} H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n)) = \begin{cases} \operatorname{ord}_{s=m} L(h^i(X), s) & , m < \frac{i}{2} \\ \operatorname{ord}_{s=m} L(h^i(X), s) - \operatorname{ord}_{s=m+1} L(h^i(X), s) & , m = \frac{i}{2} \end{cases}.$$

Notice if $m < i/2$, $H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n)) = \{0\}$ iff $h^i(X)(m)$ is critical(21.7.1.2). ⌟

Proof: Cf.[Schneider's notes, P5].? □

Prop. (21.7.2.4) [Beilinson's Periods]. If $h^i(X)(m)$ is critical, then $H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n)) = 0$, and the determinant c_{Bei} of the isomorphism

$$\operatorname{Fil}^n H^i_{\text{Betti}}(X, \mathbb{R}) \to H^i_{\text{Betti}}(X, \mathbb{R}(n-1))^{\mathsf{c}^* = (-1)^{n-1}}$$

satisfies $c_{\text{Bei}}(h^i(X)(m)) = c_{\text{Del}}(h^i(X)(m)) \in \mathbb{R}^\times/\mathbb{Q}^\times$. ⌟

Proof: Cf.[Deligne's conjecture, in Rapoports' notes, P42]?. □

<u>**Beilinson's Regulator Maps**</u>

Remark (21.7.2.5) [Beilinson't Regulator]. If $m < (i+1)/2$, then by(21.7.2.2), there is an isomorphism

$$\det \operatorname{Fil}^n H^i_{\text{Betti}}(X, \mathbb{R}) \otimes_{\mathbb{R}} \det H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n)) \to \det H^i_{\text{Betti}}(X, \mathbb{R}(n-1))^{\mathsf{c}^* = (-1)^{n-1}},$$

and $\operatorname{Fil}^n H^i_{\text{Betti}}(X, \mathbb{R})$ and $H^i_{\text{Betti}}(X, \mathbb{R}(n-1))$ has natural $\mathbb{Q}$-structures. So if $\det H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n))$ has a $\mathbb{Q}$-structure, then we can construct a $c_{\text{Bei}}(h^i(X)(m)) \in \mathbb{R}^\times/\mathbb{Q}^\times$. ⌟

Def. (21.7.2.6) [Beilinson's Regulator]. There is a regulator map(8.11.0.4)(8.11.0.6)

$$\begin{array}{ccccc} & (K_{2n-i-1}(X_{\mathbb{Z}})_{\mathbb{Q}})^{(n)} & & (K_{2n-i-1}(X_{\mathbb{R}})_{\mathbb{Q}})^{(n)} & \\ & \| & & \| & \\ r^{i+1}_X : & H^{i+1}_{\text{Mot}}(X, \mathbb{Q}(n))_{\mathbb{Z}} & \longrightarrow & H^{i+1}_{\text{Mot}}(X, \mathbb{Q}(n))_{\mathbb{R}} & \xrightarrow{\text{ch}_{2n-i-1}} H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n)). \end{array}$$

⌟

Conj. (21.7.2.7) [Beilinson].

- If $w < -2$, then
  - $r_{\mathbb{R}} : H^{i+1}_{\text{Mot}}(X, \mathbb{Q}(n))_{\mathbb{Z}} \otimes \mathbb{R} \to H^{i+1}_{\text{Del}}(X/\mathbb{R}, \mathbb{R}(n))$(21.7.2.6) is an isomorphism.

– the determinant of the isomorphisms(21.7.2.2)

$$\begin{aligned}&\det \mathrm{Fil}^n H^i_{\mathrm{Betti}}(X,\mathbb{R})\otimes_{\mathbb{R}} \det(H^{i+1}_{\mathrm{Mot}}(X,\mathbb{Q}(n))_{\mathbb{Z}}\otimes\mathbb{R}) \xrightarrow{\mathrm{id}\otimes\det(r_{\mathbb{R}})}\\ &\det \mathrm{Fil}^n H^i_{\mathrm{Betti}}(X,\mathbb{R})\otimes_{\mathbb{R}} \det H^{i+1}_{\mathrm{Del}}(X/\mathbb{R},\mathbb{R}(n)) \to\\ &\det H^i_{\mathrm{Betti}}(X,\mathbb{R}(n-1))^{\mathsf{c}^*=(-1)^{n-1}}\end{aligned}$$

equals $L^\dagger(M;0)\in\mathbb{R}^\times/\mathbb{Q}^\times$.

- If $w=-2$, then $s=0$ may be a pole, and Tate conjecture predicts**?** that

$$-\operatorname{ord}_{s=0} L(M;0) = \dim_{\mathbb{Q}} N^{n-1}(X),$$

where $N^{n-1}(X)=\mathrm{CH}^{n-1}(X)/\mathrm{CH}^{n-1}(X)_0$, and $\mathrm{CH}^{n-1}(X)_0$ is the subgroup of homologically trivial cycle. In this case, there is also a cycle class map

$$r' : N^{n-1}(X)\to H^{i+1}_{M_\infty}(X_{\mathbb{R}},\mathbb{R}(n))\textbf{?},$$

and

– $(r\otimes r')\otimes\mathbb{R} : C_1\otimes\mathbb{R}\oplus N^{n-1}(X)\otimes\mathbb{R}\to H^{i+1}_{M_\infty}(X_{\mathbb{R}},\mathbb{R}(n))$ is an isomorphism.

– $L^\dagger(M,0)=\det(r\otimes r')\in\mathbb{R}^\times/\mathbb{Q}^\times$.

⌟

Def. (21.7.2.8) [Polylogarithm]. For $s\in\mathbb{Z}_+$, the power series

$$\mathrm{Li}_s(z)=\sum_{n\geq 1}\frac{z^n}{n^s}$$

converges absolutely for $|z|<1$ and can be analytically continued to a multi-valued function on $\mathbb{C}\backslash\{1\}$, called the **Polylogarithm function**. ⌟

Proof: In fact, $\mathrm{Li}_1(z)=-\log(1-z)$, and $\mathrm{Li}_{s+1}(z)=\int_0^z \mathrm{Li}_s(t)\frac{dt}{t}$. □

Def. (21.7.2.9) [Bloch-Wigner Dilogarithm]. The function

$$D(z)=\mathrm{Im}\left(\mathrm{Li}_2(z)+\log|z|\log(1-z)\right),\quad z\in\mathbb{C}(21.7.2.8)$$

is a real-valued function on $\mathbb{C}$, called the **Bloch-Wigner dilogarithm**. ⌟

Proof: Cf.[Blo00]P44. □

Height Pairings

Conj. (21.7.2.10) [Beilinson]. If $w=-1$, then M must be critical by drawing diagram, and

- There is a non-degenerate **Beilinson height paring**

$$h:\mathrm{CH}^n(X)_0\otimes \mathrm{CH}_0^{\dim X+1-n}\to\mathbb{R},$$

- and $\operatorname{ord}_{s=0}L(M;s)=\dim_{\mathbb{Q}}\mathrm{CH}^n(X)_0$.
- $L^\dagger(M;0)=c^+_{\mathrm{Del}}(M)\det(h)\in\mathbb{R}^\times/\mathbb{Q}^\times$.

⌟

Proof: □

3 Fontaine-Perrion.Riou Conjecture

Cf.[Fontaine-Perrion.Riou]**?**.

4 Examples

$\mathbb{A}^1$ Case

Prop. (21.7.4.1). For $k \in \mathbb{Z}_+$, $\zeta(2k) = \frac{B_{2k}}{(2k)!}(2\pi)^{2k}$. In particular, by(9.5.1.12),

$$\zeta(2) = \frac{\pi^2}{6}, \quad \zeta(4) = \frac{\pi^4}{90}, \quad \zeta(6) = \frac{\pi^6}{945}, \quad \zeta(8) = \frac{\pi^8}{9450}.$$

⌟

Proof: Because

$$\cot(z) = i + \frac{2i}{e^{2iz} - 1},$$

$$z\cot(z) = 1 - \sum_{k=1}^{\infty} B_{2k}\frac{2^{2k}z^{2k}}{(2k)!}$$

where B_k are Bernoulli numbers(9.5.1.12). But also

$$z\cot(z) = 1 - 2\sum_{k=1}^{\infty}\zeta(2k)\frac{z^{2k}}{\pi^{2k}}.$$

by(11.4.3.11), thus the assertion follows. □

Cor. (21.7.4.2). For $k \in \mathbb{Z}_+$, $\zeta(1-2k) = (-1)^k\frac{B_{2k}}{2k}$. ⌟

Proof: **?** □

Prop. (21.7.4.3) [Leibniz Formula for π].

$$1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \ldots = \frac{\pi}{4}.$$

⌟

Proof: Use the arctan integration formula. □

Thm. (21.7.4.4) [Borel1972]. For $F \in \texttt{NField}$ and $m \in \mathbb{Z}_{>1}$, let

$$d_m = \mathrm{ord}_{s=1-m}\,\zeta_F(s) = \begin{cases} r_2 & ,m \in 2\mathbb{Z} \\ r_1 + r_2. & ,m \in 2\mathbb{Z}+1 \end{cases}.$$

Then

$$\dim_{\mathbb{Q}} K_{2m-1}(\mathcal{O}_F)_{\mathbb{Q}} = d_m$$

⌟

Proof: □

Prop. (21.7.4.5) [Comparison of Beilinson and Bloch's Regulator Maps]. Cf.[Rapoport, Comparison]. ⌟

Conj. (21.7.4.6) [Bloch Conjecture for Fields]. For a number field F, mapping the higher K-groups $K_{2i-1}(F)$ to a lattice with covolume $\zeta_F(m)$ via higher regulator maps. And the regular maps are made from m-th polylogarithm functions(21.7.2.8), so $\zeta_F(m)$ can be expressed by combinations of m-th polylogarithm functions of elements in F.

For example:

$$\zeta_{\mathbb{Q}(\sqrt{5})}(3) = \frac{24}{25\sqrt{5}}\operatorname{Li}_3(1)[\operatorname{Li}_3(\alpha) + \operatorname{Li}_3(-\alpha) + \frac{1}{2}(\log(\alpha))^3 - \frac{\pi^2}{6}\log(\alpha)], \alpha = \frac{\sqrt{5}-1}{2}.$$

This makes the numerical calculation of higher K-groups possible. ⌟

Proof: ? □

Remark (21.7.4.7). $m = 2$ case is proved by Bloch-Suslin-Merkuriev, $m = 3$ case is proved by Goncharov. ⌟

Elliptic Curve case

Def. (21.7.4.8) [Elliptic Dilogarithm]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{C}$ with complex parametrization $\mathbb{C}^\times/q^{\mathbb{Z}}$, define the **elliptic dilogarithm**:

$$D_q : \mathbb{C}^\times/q^{\mathbb{Z}} \to \mathbb{R} : z \mapsto \sum_{n\in\mathbb{Z}} D(q^n z)(21.7.2.9).$$

And it extends linearly to a map $Z_1(E) \to \mathbb{R}$. ⌟

Prop. (21.7.4.9) [Bloch]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{C}$, define

$$F : R(E)^\times \otimes R(E)^\times \to \mathbb{R} : f \otimes g \mapsto D_q(\sum m_i n_j [b_j - a_i]),$$

where $f, g \in R(E)^*$ with divisor $(f) = \sum m_i a_i, (g) = \sum n_j b_j$. Then F is additive, and

$$D(f \otimes (1-f)) = 0.$$

In particular, F factors through $R(E)^* \otimes R(E)^*/\{f \otimes (1-f)\} = K_2(R(E))$.

Thus, there is a composition $r_E : K_2(E) \to K_2(R(E)) \to \mathbb{R}$, called the (higher)**regulator map**. ⌟

Proof: □

Thm. (21.7.4.10) [Beilinson-Bloch]. Le $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with complex parametrization $E(\mathbb{C}) \cong \mathbb{C}^\times/q^{\mathbb{Z}}$, then there exists a $\mathrm{Gal}_{\mathbb{Q}}$-invariant divisor P on E s.t. $D_q(P) \sim_{\mathbb{Q}^\times} L(E,2)/\pi$(21.7.4.8). ⌟

Proof: □

Thm. (21.7.4.11) [Weak Beilinson Conjecture, Beilinson-Bloch]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$. Situation as in(21.7.2.1), we consider the motive $h^1(E), i = 1, m = 1, n = 2$. Then $H^1_{\mathrm{Betti}}(E, \mathbb{R}(1))^{c^*=-1} \cong H^2_{\mathrm{Del}}(E/\mathbb{R}, \mathbb{R}(n))$ by(21.7.2.2).

Then there exists $\Phi \in H^2_{\mathrm{Mot}}(E_{\mathbb{Z}}, \mathbb{Q}(2))$ and $\Phi \in H^1_{\mathrm{Betti}}(E, \mathbb{Q}(1))^{c^*=-1}$ s.t.

$$r_{\mathrm{Del}}(\Phi) = L^\backprime(E,0)\Phi.$$

⌟

Proof: Cf.[Beilinson, Higher regulators of modular curves] and [Beilinson's Conjecture for elliptic curves with complex multiplication, Deninger-Wingberg]. □

Modular Curve case

Notation (21.7.4.12).
- Use notation as in Modular Curves.
- Denote $\Omega^1(M^c) = \varinjlim_K \Omega^1(M_K^c)$.

⌟

Prop. (21.7.4.13). Denote $\{\mathcal{O}^*(M_K), \mathcal{O}^*(M_K)\}$ the $\mathbb{Q}$-subspace of $H^2_{\mathrm{Mot}}(M_K, \mathbb{Q}(2))$ generated by the symbols $\{u, v\}$ with $u, v \in \mathcal{O}^*(M_K) \otimes \mathbb{Q} = H^1_{\mathrm{Mot}}(M_K, \mathbb{Q}(1))$.

Denote

$$\mathcal{Q}_K = H^2_{\mathrm{Mot}}(M_K^c, \mathbb{Q}(2)) \cap \{\mathcal{O}^*(M_K), \mathcal{O}^*(M_K)\},$$
$$\mathcal{P}_K = \cup K' \subset K\, \mathrm{Nm}_{K'/K}(\mathcal{Q}_{K'}) \subset H^2_{\mathrm{Mot}}(M_K^c, \mathbb{Q}(2)).$$

⌟

Prop. (21.7.4.14). By [Langlands, Modular Forms and l-adic Representations], The action of $GL(\mathbf{A}_f)$ on $\Omega^1(M^c)$ gives rise to a decomposition

$$\Omega^1(M) = \bigoplus_\pi V_\pi.$$

⌟

Proof: ? □

Thm. (21.7.4.15) [Beilinson's Conjecture for Modular Curves].
- $r_{\mathbb{R}}(\mathcal{P}_K)$(21.7.2.7) $= H^2_{\mathrm{Del}}(M_K^c/\mathbb{R}, \mathbb{R}(2)) = H^1_{\mathrm{Betti}}(M_K^c(\mathbb{R}), \mathbb{R}(1))$, thus giving a $\mathbb{Q}$-structure on $H^2_{\mathrm{Del}}(M_K^c, \mathbb{R}(2))$.
- Let g be the genus of M_K^c, then

$$\det r_{M_K^c}(\mathcal{P}_K) = L^{(g)}(H^1(M_K^c), 0) \cdot \det H^1_{\mathrm{Betti}}(M_K^c(\mathbb{R}), \mathbb{Q}(1)).$$

- $\mathcal{P}_K \subset H^2_{\mathrm{Mot}}(M_K^c, \mathbb{Q}(2))_{\mathbb{Z}}$.

⌟

Proof: This follows from(21.7.4.16), Cf.[Scholl, P8].? □

Thm. (21.7.4.16).
- For $u, v \in \mathcal{O}^*(M_K) \otimes \overline{\mathbb{Q}}$,

$$\int_{M_K(\mathbb{C})} \log|u| \overline{\mathrm{d}\log v} \wedge \omega \in \overline{\mathbb{Q}}.\Big(2\pi\,\mathrm{i}\, c^+(\pi) L'(\pi^\vee, 0)\Big) \in \overline{\mathbb{Q}} \otimes \mathbb{C}.$$

- For some choice of K, $\omega \in V_\pi^K$ and $u, v \in \mathcal{O}^*(M_K) \otimes \overline{\mathbb{Q}}$, the integral is non-zero.

⌟

Proof: Cf.[Scholl, Thm1.3.2].? □

Thm. (21.7.4.17). For χ s.t. $L(\pi\otimes\chi;1)\in(\overline{\mathbb{Q}}\otimes\mathbb{C})^\times$,

$$c^+(\pi)L'(\pi^\vee;0)\sim_{\overline{\mathbb{Q}}^\times}\frac{L(\pi;2)L(\pi\otimes\chi;1)}{L(\omega_\pi\chi;2)}.$$

⌟

Proof: Cf.[Scholl, Thm2.3].**?** □

Prop. (21.7.4.18). Situation as in(21.7.4.16),

$$\int_{M(\mathbb{C})}\log|u|\overline{\mathrm{d}\log v}\wedge\omega=\int_{M_K(\mathbb{C})}\mathcal{E}_\varphi(z,g;1)\overline{\eta}_\xi\wedge\omega.$$

⌟

21.8 Heegner Points

References are [Gross−Zagier formula and arithmetic fundamental lemma, Wei Zhang], [Gross-Zagier Formula notes], [Heegner Points and Representation Theory, Gross], [Gross–Zagier Revisited, Conrad]. [Moduli of Elliptic Curves, James Parson], [Heegner points and derivatives of L-series, Gross/Zagier]. http://math.columbia.edu/~yihang/GZSeminar.html.

1 Heegner Points

Def. (21.8.1.1) [Heegner Conditions]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $F/\mathbb{Q}$ an imaginary quadratic extension with $(d_F, N) = 1$ and associated quadratic character $\eta_F : (\mathbb{Z}/d_F)^\times \to \{\pm 1\}$. Then the **Heegner condition** is the hypothesis that every prime factor of N splits in F. ⌟

Prop. (21.8.1.2). In the Heegner situation(21.8.1.1), the sign of functional equation for E(21.2.6.4) $w_E = -1$**?**, thus $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q})$ is odd and the BSD conjecture(21.6.1.1) predicts $\mathrm{rank}(E/\mathbb{Q})$ is odd, so at least it has a non-torsion rational point. ⌟

Def. (21.8.1.3) [Heegner Points]. In the Heegner situation(21.8.1.1), there exists an ideal $\mathcal{N} \subset \mathcal{O}_F$ of conductor N. Then for any $n \in \mathbb{Z}_+$, $\mathcal{O}_n = \mathbb{Z} + n\mathcal{O}_F$ is an order of $\mathcal{O}_F$ of conductor n. Thus for $(n, N) = 1$,

$$\mathbb{C}/\mathcal{O}_F \to \mathbb{C}/(\mathcal{O}_F \cap \mathcal{N})^{-1}$$

is an isogeny of degree N, thus defines a point $x_n \in X_0(N)$, by moduli characterization**?**, called a **Heegner point**. Then by theory of complex multiplication**?**, x_n is defined over the ring class field F_n corresponding to the open compact subgroup $(\mathcal{O}_n \otimes \widehat{\mathbb{Z}})^\times \subset A_F^\times$. ⌟

Proof: □

Def. (21.8.1.4) [Heegner Points]. In the Heegner situation(21.8.1.1), using the modular parametrization $\varphi_E : X_0(N) \to E$ over $\mathbb{Q}$(19.4.2.6), $y_n = \varphi_E(x_n) \in E(K_n)$. In particular, define $y_F = \mathrm{tr}_{F_1/F}(y_1) \in E(F)$, called the (principal)**Heegner point of** E. ⌟

Prop. (21.8.1.5). The Heegner point $y_F \in E(F)$ is uniquely defined up to sign and torsion. ⌟

Proof: □

2 Gross-Zagier Formula

Thm. (21.8.2.1) [Gross-Zagier]. In the Heegner situation(21.8.1.1),

$$L'(E/F;1) = \frac{\int_{E(\mathbb{C})} \omega \wedge \overline{\omega}}{|d_F|^{1/2}} \cdot \frac{1}{c^2} \cdot \langle y_F, y_F \rangle_{\text{N-T}}$$

⌟

Proof: □

Cor. (21.8.2.2). If $\mathrm{rank}_{\mathrm{an}}(E/F) = 1$, then the Heegner point y_F is non-torsion, by(15.13.1.5). And if $\mathrm{rank}_{\mathrm{an}}(E/F) = 1$, y_F is torsion. ⌟

3 Kolyvagin's Work

Main references are [Gro89], [Finiteness of $E(\mathbb{Q})$ and Ш$(E/\mathbb{Q})$ for a subclass of Weil curves, Kolyvagin], [Finiteness of the Shafarevich-Tate group and the group of rational points for some modular abelian varieties, Kolyvagin-Yu] and [Euler Systems, Kolyvagin].

Def. (21.8.3.1) [Kolyvagin Primes]. In the Heegner situation(21.8.1.1), let $p \in \mathbf{P}$, a **Kolyvagin prime** ℓ for E is a prime $\ell \in \mathbf{P}\backslash S(Npd_F)$ s.t. ℓ is inert in F and $p|\ell+1, p|a_{\ell,E}$. Equivalently, Frob_ℓ is in the conjugacy class of $\mathsf{c} \in \mathrm{Gal}(F(E[p])/F)$**?**. So by Chebotarev density theorem, the set of Kolyvagin primes has positive Dirichlet density.

For a Kolyvagin prime ℓ, $M(\ell) = \min\{v_p(\ell+1), v_p(a_{\ell,E})\}$ is called the **Kolyvagin index** of ℓ.

A product of distinct Kolyvagin primes is called a **Kolyvagin number** for E. The set of Kolyvagin numbers is denoted by Λ_E. For a Kolyvagin number n, define the **Kolyvagin index** of n as $M(n) = \min_{\ell|n}\{M(\ell)\}$. ⌟

Prop. (21.8.3.2). In the Heegner situation(21.8.1.1), let ℓ be a Kolyvagin prime for E, then

$$\mathrm{Gal}(F_\ell/F_1) \cong \mathrm{Pic}(\mathcal{O}_\ell)/\,\mathrm{Pic}(\mathcal{O}_F) \cong \mathbb{Z}/(\ell+1) = \langle\sigma\rangle.$$

⌟

Proof: □

Def. (21.8.3.3) [Kolyvagin Derivative]. In the situation(21.8.3.1), let ℓ be a Kolyvagin prime for E, define the **Kolyvagin derivative** $D_\ell = \sum_{i=1}^{\ell} i\sigma^i \in \mathbb{Z}[\mathrm{Gal}(F_\ell/F_1)]$. Then $(\sigma-1)D_\ell = \ell+1-\mathrm{tr}_\ell$. ⌟

Prop. (21.8.3.4). In the situation(21.8.3.1), for $\ell \in \Lambda_E \cap \mathbf{P}$ and Heegner point $y_\ell \in E(F_\ell)$, $D_\ell y_\ell \in E(F_\ell)/p^M E(F_\ell) \subset H^1(F_\ell, E[p^M])$ is invariant under the action of $\mathrm{Gal}(F_\ell/F_1)$.

Thus for any $n \in \Lambda_E$ and $M \leq M(n)$, $D_n y_n \in H^1(F_n, E[p^M])$ is invariant under the action of $\mathrm{Gal}(F_\ell/F_1) \cong \prod_{\ell|n} G_\ell$, thus descends to an element in $H^1(F_1, E[p^M]) \cong H^1(F_n, E[p^M])^{\mathrm{Gal}(F_n,F_1)}$ by Hochschild-Serre spectral sequence(8.7.1.13) and the fact $E[p^M](K_n) = 0$**?** ⌟

Proof: By(21.8.3.3), it suffices to show that $(\sigma-1)D_\ell y_\ell = (\ell+1-\mathrm{tr}_\ell)y_\ell \in p^M E(F_1)$: This follows from the definition(21.8.3.1) and the fact $\mathrm{tr}_\ell\, y_\ell$ is just the Hecke operator action T_ℓ on y_1, which maps to $a_\ell y_1 \in E(F_1)$**?** □

Def. (21.8.3.5) [Kolyvagin Systems]. In the situation(21.8.3.1), for $n \in \Lambda_E$, define the **Kolyvagin cohomology classes**

$$c_M(n) = \sum_{s \in \mathrm{Gal}(F_1/F)} sD_n y_n \in H^1(F, E[p^M]), \quad M \leq M(n).$$

The collection of cohomology classes

$$\kappa = \{c_M(n) \in H^1(F, E[p^M]) | n \in \Lambda_E, M \in \mathbb{Z}_+, M \leq M(n)\}$$

is called a **Kolyvagin system** of E. ⌟

Def. (21.8.3.6) [p-Divisibility]. In the situation(21.8.3.1), for $r \in \mathbb{N}$, denote Λ_r to be the subset of Λ_E consisting of numbers with exactly r prime factors, and define $\mathcal{M}_r \in [0,\infty]$ to be the maximal integer s.t. $p^{\mathcal{M}_r}|c_M(n)$ for any $n \in \Lambda_r, M \leq M(n)$. ⌟

Prop. (21.8.3.7) [Order of Kolyvagin Systems]. In the situation(21.8.3.1), $\mathcal{M}_0 \geq \mathcal{M}_1 \geq \ldots \geq 0$.

In particular, we can define $\mathcal{M}_\infty = \lim_{r\to\infty} \mathcal{M}_r$. Clearly, $\mathcal{M}_\infty = \infty$ iff $\kappa = 0$. The **vanishing order of** κ is the minimal r s.t. $\mathcal{M}_r \neq \infty$, denoted by $\operatorname{ord}\kappa$. ⌟

Proof: □

Prop. (21.8.3.8). $\mathcal{M}_0$ is just the p-divisibility of the Heegner point y_F. In particular, $\mathcal{M}_0 < \infty$ iff y_F is non-torsion?. ⌟

Thm. (21.8.3.9) [Kolyvagin]. Let $\operatorname{ord}\kappa < \infty$, then

- $\mathrm{Sel}^{p^\infty}(E/F)$ is contained in the subgroup of $H^1(F, E[p^\infty])$ generated by κ.
- $\mathrm{rank}_p^{w_E(-1)^{\operatorname{ord}\kappa+1}}(E/F) = \operatorname{ord}\kappa + 1, \mathrm{rank}_p^{w_E(-1)^{\operatorname{ord}\kappa}}(E/F) = \operatorname{ord}\kappa - d$ and $d \in 2\mathbb{N}$.
- Let
$$\widetilde{Ш}(E/F)[p^\infty]^{\operatorname{ord}\kappa+1} = (\bigoplus_{i\geq 1} \mathbb{Z}/(p^{a_i}))^2, \quad \widetilde{Ш}(E/F)[p^\infty]^{\operatorname{ord}\kappa} = (\bigoplus_{i\geq 1} \mathbb{Z}/(p^{b_i}))^2,$$
where $(a_i), (b_i)$ is non-increasing, then
$$a_i = \mathcal{M}_{\operatorname{ord}\kappa+2i-1} - \mathcal{M}_{\operatorname{ord}\kappa+2i}, \quad b_{d+i} = \mathcal{M}_{\operatorname{ord}\kappa+2i-2} - \mathcal{M}_{\operatorname{ord}\kappa+2i-1}.$$

In particular, $\#\widetilde{Ш}(E/F)[p^\infty]^{\operatorname{ord}\kappa+1} \geq p^{\mathcal{M}_{\operatorname{ord}\kappa} - \mathcal{M}_\infty}$, with equality iff $d = 0$. ⌟

Proof: □

Cor. (21.8.3.10). If $\operatorname{ord}\kappa = 0$, i.e. y_F is non-torsion(21.8.3.8), then $d = 0$, and $r(E/\mathbb{Q}) = 1, \#Ш(E/K) < \infty$. ⌟

<u>**Kolyvagin's Conjecture**</u>

Conj. (21.8.3.11) [Kolyvagin]. Let $p \in \mathbf{P}\backslash\{2\}$ s.t. $\overline{\rho}_{E,p}$ is surjective, then $\kappa \neq \{0\}$. Equivalently, $\mathcal{M}_\infty < \infty$. ⌟

Thm. (21.8.3.12) [Zhang]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N and $p \geq 5$ is good ordinary and $\overline{\rho}_{E,p}$ is surjective and ramifies at every prime $\ell \in \mathbf{P}$ s.t. $v_\ell(N) = 1$, then $\mathcal{M}_\infty = 0$. In particular, Kolyvagin's conjecture(21.8.3.11) is true. ⌟

Remark (21.8.3.13). There are results that generalize this. ⌟

Cor. (21.8.3.14). Under the hypothesis of(21.8.3.12), if $\mathrm{rank}_p(E/\mathbb{Q}) = 1$, then $r_{\mathrm{an}}(E/\mathbb{Q}) = r(E/\mathbb{Q}) = 1$, and $\#Ш(E/\mathbb{Q}) < \infty$. ⌟

Proof: Cf.[Wei Zhang]. □

4 p-adic Gross-Zagier Formula

References are [Heegner points and a p-adic Gross-Zagier formula].

5 Waldspurger's Period Formula

6 Higher Gross-Zagier over Function Fields, Yun-Zhang

Remark (21.8.6.1). The formula relates arbitrary order central derivative of the base change L-function of an unramified automorphic representation of $PGL(2)$ over a function field to the self-intersection number of a certain algebraic cycle on the moduli stack of Shtukas. ⌟

21.9 (Arithmetic)Gan-Gross-Prasad Conjecture

References are [Wei, More Arithmetic Fundamental Lemma Conjectures: The Case Of Bessel Subgroups].

1 Introduction

The GGP conjecture is a generalization of the the Gross-Zagier formula to higher dimensional varieties. It concerns the central derivative of the L-function and special cycles of Shimura varieties.

AGGP conjecture has applications to the Beilinson-Bloch conjecture, which is a generalization of the BSD conjecture.

2 restriction Problems

Conj. (21.9.2.1) [Local Restriction Problems]. Let K be a local field with an involution σ, $K_0 = K^\sigma$. Let $V \in \mathcal{V}\mathrm{ect}\,/K$ with a non-degenerate sesqui-linear form. Let $G(V)$ be the identity component of the subgroup of $GL(V_{k_0})$ preserving this form.

There are natural non-degenerate subspace $W \subset V$, there will be a subgroup $H \subset G(W) \times G(V)$ containing the diagonally embedded subgroup $G(W)$, and a unitary representation ν of H?.

The **local restriction problem** is to determine for each $\pi \in \mathrm{Irr}(G)$, the number

$$d(\pi) = \dim \mathrm{Hom}_H(\pi|_H \otimes \overline{\nu}, \mathbb{1}).$$

⌟

Def. (21.9.2.2)[Arithmetic Periods]. Let F be a global field and G a reductive group over F, $H \subset G$ an algebraic subgroup, $Z = Z(G) \cap H$. Denote $[H] = Z(A_F)H(F)\backslash H(A_F)$. For $\chi \in \widehat{H(A_F)}$, denote the (twisted)**automorphic L-period map**:

$$l_{H,\chi} : \mathcal{A}_0(G/F) \to \mathbb{C} : \varphi \mapsto \int_{[H]} \chi(h)\varphi(h)dh.$$

(? Convergence). ⌟

3 Statements

References are [Symplectic Local Root Numbers, Central Critical L-Values, And Restriction Problems In The Representation Theory Of Classical Groups, Gan-Gross-Prasad].

Conj. (21.9.3.1). ⌟

4 Arithmetic Fundamental Lemma

Jacquet−Rallis proposed an approach using relative trace formula to attack the unitary case of Gan−Gross−Prasad conjecture. The fundamental lemma is proved by Yun.

Later Wei Zhang proposed an analogous approach using the arithmetic fundamental lemma, equality between certain intersection numbers and the first derivatives of some relative orbital integrals, and is not proved yet.

21.10 Colmez Conjecture

Conj. (21.10.0.1) [Colmez]. Let (F,Φ) be a CM number field and $A\in \mathcal{A}b\mathcal{V}ar/F$ is a CM with type $(\mathcal{O}_F,\Phi)$ with good reduction $\mathcal{A}/\mathcal{O}_F$. Let $\alpha\in\wedge^g\Omega_{\mathcal{A}}$ be a Néron differential that is everywhere non-vanishing, and ⌟

Chowla-Selberg Formulas

Def. (21.10.0.2) [Epstein Zeta Functions]. For a positive-definite quadratic form $Q(X,Y)=aX^2+bXY+cY^2\in\mathbb{Z}[X,Y]$, the **Epstein zeta function** $\zeta_Q(s)$ is defined to be

$$\zeta_Q(s)=\frac{1}{2}\sum_{(m,n)\in\mathbb{Z}^2\backslash(0,0)}\frac{1}{Q(m,n)^{-s}}.$$

⌟

Thm. (21.10.0.3) [Chowla-Selberg Formula]. For a positive-definite quadratic form $Q(X,Y)=aX^2+bXY+cY^2\in\mathbb{Z}[X,Y]$ with discriminant $d=b^2-4ac<0$,

$$\begin{aligned}Z_Q(s)&=a^{-s}\zeta(2s)+a^{-s}\sqrt{\pi}\frac{\Gamma(s-1/2)}{\Gamma(s)}\zeta(2s-1)k^{1-2s}\\&+\frac{4a^{-s}k^{-s+1/2}}{\pi^{-s}\Gamma(s)}\sum_{n\in\mathbb{Z}_+}n^{s-1/2}\sigma_{1-2s}(n)K_{s-1/2}(2\pi n\frac{\sqrt{d}}{2a})\cos(n\pi b/a).\end{aligned}$$

⌟

Proof: □

Prop. (21.10.0.4) [Chowla-Selberg Formula]. Let $\mathcal{K}$ be an imaginary quadratic field with discriminant D and $f\in\mathbb{Z}_+$. For any proper ideals $\mathfrak{a}\in\mathrm{Cl}(\mathcal{O}_{\mathcal{K},f})$(14.4.1.48), denote

$$F(\mathfrak{a})=\Delta(\mathfrak{a})\Delta(\mathfrak{a}^{-1}),$$

then

$$\prod_{\mathfrak{a}\in\mathrm{Pic}(\mathcal{O}_{\mathcal{K},f})}F(\mathfrak{a})=\Big(\frac{2\pi}{f^2|d_{\mathcal{K}}|}\Big)^{12\,\mathrm{cl}(\mathcal{O}_{\mathcal{K},f})}\prod_{a=1}^{|d_{\mathcal{K}}|-1}\Big(\Gamma\Big(\frac{a}{|d_{\mathcal{K}}|}\Big)^{6\chi(a)\#\mu(\mathcal{K})}\Big)^{\mathrm{cl}(\mathcal{O}_{K,f})/\mathrm{cl}(\mathcal{K})}\cdot\Big(\prod_{p\in\mathtt{Prime},p|f}p^{12e(p)}\Big)^{\mathrm{cl}(\mathcal{O}_{\mathcal{K},f})},$$

where $\chi(a)=\left(\frac{d_{\mathcal{K}}}{a}\right)$ and

$$e(p)=\frac{(1-p^{-n})(1-\chi(p))}{(1-p^{-1})(p-\chi(p))}.$$

Notice that $6e(p)\,\mathrm{cl}(\mathcal{O}_{K,f})\in\mathbb{Z}$ by(14.4.3.7).

In particular, for $f=1$,

$$\prod_{\mathfrak{a}\in\mathrm{Cl}(\mathcal{K})}F(\mathfrak{a})=\Big(\frac{2\pi}{|d_{\mathcal{K}}|}\Big)^{12\,\mathrm{cl}(\mathcal{K})}\prod_{a=1}^{|d_{\mathcal{K}}|-1}\Gamma\Big(\frac{a}{|d_{\mathcal{K}}|}\Big)^{6\chi(a)\#\mu(\mathcal{K})},$$

⌟

Proof: Cf.[N-T91] and [Elliptic Functions, Weil]. □

1 Averaged Colmez Conjecture

References are [On Faltings heights of abelian varieties with complex multiplication, Xinyi Yuan].

22 Iwasawa Theory

22.1 Euler Systems

Cf.[Rub00], [Rub96], [Kat04] and [Scholl].

Notation (22.1.0.1).

- Fix $p \in \mathbf{P}$, $F \in \texttt{NField}$.
- For each modulus $\mathfrak{m}$ of F, let $F(\mathfrak{m})$ be the maximal p-extension of F inside the ray class field $F_{\mathfrak{m}}$, and $\Gamma_{\mathfrak{m}} = \mathrm{Gal}(F(\mathfrak{m})/F(1))$.
- Fix $T \in \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_F), V = T \otimes_{\mathbb{Z}_p} \mathbb{Q}_p, W = V/T = T \otimes_{\mathbb{Z}_p} (\mathbb{Q}_p/\mathbb{Z}_p)$.
- Suppose T is unramified outside f.m. places of F.
- WARNING: notations in this section may subject to change.**?**

⌟

1 Local Cohomologies

This subsection should be moved to somewhere else.

Prop. (22.1.1.1). If $p \in \mathbf{P}, K \in \text{p-}\texttt{Field}, \ell \in \mathbf{P} \setminus \{p\}$, and $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_\ell}(\mathrm{Gal}_K)$, then

$$\dim H^1_{\mathrm{ur}}(K,V) = V^{\mathrm{Gal}_K}, \quad \dim\Big(H^1(K,V)/H^1_{\mathrm{ur}}(K,V)\Big) = \dim H^2(K,V).$$

⌟

Proof: Cf.[Rubin, P5]. □

Prop. (22.1.1.2). Suppose $K \in \texttt{Field}$ and K_∞/K is an infinite p-extension, $T \in \mathrm{Rep}^{\mathrm{fg}}_{\mathbb{Z}_p}(\mathrm{Gal}_K)$, then

$$\varprojlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} T^{\mathrm{Gal}_L} = 0,$$

where the transition maps are norm maps. ⌟

Proof: Define $T_0 = \varinjlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} T^{\mathrm{Gal}_L} \subset T$, so T_0 is also f.g. over $\mathbb{Z}_p$. Then $T_0 = T^{\mathrm{Gal}_{L_0}}$ for some $K \subset_{\mathrm{fin}} L_0$. Then

$$\varprojlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} T^{\mathrm{Gal}_L} = \varprojlim_{L_0 \subset_{\mathrm{fin}} L \subset K_\infty} T_0 = 0.$$

□

Prop. (22.1.1.3). If $\ell \in \mathbf{P} \setminus \{p\}$, $\mathbb{Q}_\ell \subset_{\text{fin}} K$, and K_∞ is the unique $\mathbb{Z}_p$-extension of K. Suppose $\{c_L\} \in \varprojlim_{K \subset_{\text{fin}} L \subset K_\infty} H^1(L,T)$, then for any L, $c_L \in H^1_{\text{ur}}(L,T)$. ⌟

Proof: K_∞/K is unramified**?**, so for any $K \subset_{\text{fin}} L \subset K_\infty$, there is an exact sequence

$$0 \to H^1_{\text{ur}}(L,T) \to H^1(L,T) \to H^1(I_K,T)^{\text{Gal}_K}.$$

But $H^1(I_K,T)$ is f.g. over $\mathbb{Z}_p$ by [Rubin, B.2.7]**?**, so taking limit of these exact sequences, we get

$$\varprojlim_{K \subset_{\text{fin}} L \subset K_\infty} H^1_{\text{ur}}(L,T) = \varprojlim_{K \subset_{\text{fin}} L \subset K_\infty} H^1(L,T)$$

by(22.1.1.2). □

Cor. (22.1.1.4). Let F_∞ be an $\mathbb{Z}_p^d$-extension of F, $F \subset_{\text{fin}} L \subset F_\infty$, and $v \in \Sigma_L^p$ has infinite decomposition group in $\text{Gal}(F_\infty/F)$. Suppose

$$\{c_L\} \in \varprojlim_{F \subset_{\text{fin}} L \subset F_\infty} H^1(L,T),$$

then $(c_L)_v \in H^1_{\text{ur}}(F_\lambda,T)$. In particular, this applies to $L = F$. ⌟

Proof: Cf.[Rubin, P155]. □

Cor. (22.1.1.5). If $\Sigma \subset \Sigma_F$ is a finite set of places containing all primes of F s.t. T is ramified, and all primes over p, and all primes whose decomposition group in $\text{Gal}(F_\infty/F)$ is finite, then

$$\varprojlim_{F \subset_{\text{fin}} L \subset F_\infty} H^1(L,T) = \varprojlim_{F \subset_{\text{fin}} L \subset F_\infty} H^1(F_\Sigma/L,T).$$

⌟

Proof: Cf.[Rubin, P155]. □

2 Selmer Groups

Def. (22.1.2.1) [Selmer Local Conditions]. For $F \in \texttt{NField}, v \in \Sigma_F^p$, denote

$$H^1_f(F_v,V) = H^1_{\text{ur}}(F_v,V) = \ker\Big(H^1(F_v,V) \to H^1(F_v^{\text{ur}},V)\Big) = H^1(F_v^{\text{ur}}/F_v, V^{I_v})(8.7.1.13)$$

And for places of F over p, fix a choice of invariant subspaces $H^1_s(F,V) \subset H^1(F_v,V)$.

Then we can define for any $v \in \Sigma_{\text{cycl}_{p,n}(\mathbb{Q})}$,

$$H^1_f(F_v,W) \subset H^1(F_v,W), \quad H^1_f(F_v,T) \subset H^1(F_v,T)$$

the image and inverse image of $H^1_f(F_v,V)$ under the maps on cohomologies induced by the exact sequence

$$0 \to T \to V \to W \to 0.$$

Next, for any $v \in \Sigma_F$, denote

$$H^1_s(F_v,T) = H^1(F_v,T)/H^1_f(F_v,T)$$

$$\text{loc}_v^s(T) : H^1(F,T) \to H^1_s(F_v,T)$$

and similarly for W. ⌟

Prop. (22.1.2.2). For $v \in \Sigma_F^p$,

- $H^1_f(F_v, W) = H^1_{\text{ur}}(F_v, W)_{\text{div}}$.
- $H^1_{\text{ur}}(F_v, T) \subset H^1_f(F_v, T)$ has finite index, and $H^1_s(F_v, T)$ is torsion-free.
- Let $\mathcal{W} = W^{I_v}/(W^{I_v})_{\text{div}}$ be finite, then there are natural isomorphisms
$$H^1_f(F_v, W)/H^1_{\text{ur}}(F_v, W) \cong \mathcal{W}/(\text{Frob}_v - 1)W, \quad H^1_{\text{ur}}(F_v, T)/H^1_f(F_v, T) \cong \mathcal{W}^{\text{Frob}_v = 1}.$$
- If T is unramified at v, then
$$H^1_f(F_v, W) = H^1_{\text{ur}}(F_v, W), \quad H^1_{\text{ur}}(F_v, T) = H^1_f(F_v, T)$$

⌟

Proof: 1, 2, 4 follow from 3. For 3, Cf.[Rubin, P6]**?**. □

Def. (22.1.2.3) [Selmer Groups]. Situation as in(22.1.2.1), define
$$\text{Sel}(F, W) = \ker\Big(H^1(F, W) \xrightarrow{\text{loc}^s(W)} \bigoplus_{v \in \Sigma_F} H^1_s(F_v, W)\Big).$$

Moreover, if Σ is a finite set of places, then we can define
$$\text{Sel}^\Sigma(F, W) = \ker\Big(H^1(F, W) \to \bigoplus_{v \notin \Sigma} H^1_s(F_v, W)\Big).$$
$$\text{Sel}_\Sigma(F, W) = \ker\Big(\text{Sel}^\Sigma(F, W) \to \bigoplus_{v \in \Sigma} H^1(F_v, W)\Big).$$

⌟

Def. (22.1.2.4) [Hypothesis]. Situation as in(22.1.2.1), assume for all the time that the choices $H^1_f(F_p, V)$ and $H^1_f(F_p, V^D)$ satisfy:

- $H^1_f(\text{cycl}_{p,n}(\mathbb{Q}_p), V)$ and $H^1_f(\text{cycl}_{p,n}(\mathbb{Q}_p), V^D)$ are orthogonal complements under the cup product pairing
$$H^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V) \times H^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V^D) \to H^2(\text{cycl}_{p,n}(\mathbb{Q}_p), \mathbb{Q}_p(1)) = \mathbb{Q}_p.$$ **?**
- For $m \geq n$,
$$\text{cor}^{\text{cycl}_{p,m}(\mathbb{Q}_p)}_{\text{cycl}_{p,n}(\mathbb{Q})} H^1_f(\text{cycl}_{p,m}(\mathbb{Q}), V) \subset H^1_f(\text{cycl}_{p,n}(\mathbb{Q}_p), V).$$
$$\text{res}^{\text{cycl}_{p,n}(\mathbb{Q}_p)}_{\text{cycl}_{p,m}(\mathbb{Q})} H^1_f(\text{cycl}_{p,n}(\mathbb{Q}), V) \subset H^1_f(\text{cycl}_{p,m}(\mathbb{Q}_p), V).$$

⌟

Prop. (22.1.2.5) [Selmer Group of Elliptic Curves]. If $T = T_p(E), W = E[p^\infty]$ where $E \in \mathcal{E}\text{ll}/\mathbb{Q}$, and define
$$H^1_f(\mathbb{Q}_{n,p}, V) = \text{Im}\Big(E(\mathbb{Q}_{n,p}) \otimes \mathbb{Q}_p \hookrightarrow H^1(\mathbb{Q}_{n,p}, V)\Big),$$
then $\text{Sel}(\mathbb{Q}_n, W) = \text{Sel}^{p^\infty}(E/\mathbb{Q}_n)$(15.13.6.9)(15.13.6.4) is the classical Selmer group. ⌟

Proof: For $v \in \Sigma^p_{\mathbb{Q}_n}$, by(15.11.4.16), $\#E(\mathbb{Q}_{n,v})[p^\infty] < \infty$, so $E(\mathbb{Q}_{n,v}) \otimes (\mathbb{Q}_p/\mathbb{Z}_p) = 0$. And also by(22.1.1.1),
$$\dim H^1_f(\mathbb{Q}_{n,v}, V_p(E)) = \dim V_p(E)^{\text{Gal}_{\mathbb{Q}_{n,v}}} = 0,$$
because $\#E(\mathbb{Q}_{n,v})[p^\infty] < \infty$. So
$$H^1_f(\mathbb{Q}_{n,v}, W) = \text{Im}\Big(E(\mathbb{Q}_{n,v}) \otimes (\mathbb{Q}_p/\mathbb{Z}_p) \to H^1(\mathbb{Q}_{n,v}, W)\Big)$$
for any place v. Thus the assertion follows from the definitions(22.1.2.1)(15.13.6.4). □

Selmer Groups over F_∞

Def. (22.1.2.6). Define Λ_p-modules22.2

$$\mathrm{Sel}(F_\infty, W) = \varinjlim_{F\subset_{\mathrm{fin}} F'\subset F_\infty} \mathrm{Sel}(F', W), \quad X_\infty = \mathrm{Hom}(\mathrm{Sel}(F_\infty, W^D), \mathbb{Q}_p/\mathbb{Z}_p),$$

$$H^1_\infty(F, T) = \varprojlim_{F\subset_{\mathrm{fin}} F'\subset F_\infty} H^1(F', T), \quad H^1_{\infty,s}(F_p, T) = \varprojlim_{F\subset_{\mathrm{fin}} F'\subset F_\infty} H^1_s(F', T).$$

where the transition maps are induced by restriction and corestriction maps(22.1.2.4). Then they are f.g. Λ_p-modules**?**.

Similarly define

$$\mathrm{Sel}_{S(p)}(F_\infty, W) = \varinjlim_{F\subset_{\mathrm{fin}} F'\subset F_\infty} \mathrm{Sel}_{S(p)}(F', W), \quad X_{\infty,S(p)} = \mathrm{Hom}(\mathrm{Sel}_{S(p)}(F_\infty, W^D), \mathbb{Q}_p/\mathbb{Z}_p).$$

⌟

Prop. (22.1.2.7). There is an exact sequence

$$0 \to H^1_{\infty,s}(F_p, T)/\operatorname{loc}^s_{\infty,S(p)}(H^1_\infty(F, T)) \to X_\infty \to X_{\infty,S(p)} \to 0.$$

⌟

Proof: Cf.[Rubin, P29].**?** □

Poitou-Tate Duality

Prop. (22.1.2.8) [Poitou-Tate Duality]. Let $m \in \mathbb{Z}^\times, \Sigma_0 \subset \Sigma \subset \Sigma_F$ be two finite set of places, then

- There are exact sequences

$$0 \to \mathrm{Sel}^{\Sigma_0}(F, W[m]) \to S^\Sigma(F, W[m]) \xrightarrow{\operatorname{loc}^s_{\Sigma,\Sigma_0}} \bigoplus_{v\in\Sigma\setminus\Sigma_0} H^1_s(F_v, W[m])$$

$$0 \to \mathrm{Sel}_\Sigma(F, W[m]) \to S^{\Sigma_0}(F, W[m]) \xrightarrow{\operatorname{loc}^f_{\Sigma,\Sigma_0}} \bigoplus_{v\in\Sigma\setminus\Sigma_0} H^1_f(F_v, W[m])$$

- $\mathrm{Im}(\operatorname{loc}^s_{\Sigma,\Sigma_0})$ and $\mathrm{Im}(\operatorname{loc}^f_{\Sigma,\Sigma_0})$ are orthogonal w.r.t. the pairing $\sum_{v\in\Sigma\setminus\Sigma_0}\langle -, -\rangle_v$.
- There is an isomorphism

$$\mathrm{Sel}_{\Sigma_0}(F, W^D[m])/\mathrm{Sel}_\Sigma(F, W^D[m]) \cong \mathrm{Hom}_{\mathbb{Z}_p}(\mathrm{Coker}(\operatorname{loc}^s_{\Sigma,\Sigma_0}), \mathbb{Z}_p/(m)).$$

⌟

Proof: 1 is clear, and 3 follows from 2. For 2, Cf.[Rubin, P17].**?** □

Remark (22.1.2.9). When Σ is large, we can make $\mathrm{Sel}_\Sigma(F, W^D[m]) = 0$, then $\#\mathrm{Sel}_{\Sigma_0}(F, W^D[m]) = \#\mathrm{Coker}(\operatorname{loc}^s_{\Sigma,\Sigma_0})$. So if we can construct enough element in $S^\Sigma(F, W[m])$, then we bound $\mathrm{Sel}_{\Sigma_0}(F, W^D[m])$. And this can be done by Kolyvagin's derivative construction4 applied to Euler classes. ⌟

Cor. (22.1.2.10). There is an isomorphism

$$\mathrm{Sel}(F, W^D)/\mathrm{Sel}_{S(p)}(F, W^D) \cong \mathrm{Hom}_{\mathbb{Z}_p}(\mathrm{Coker}(\operatorname{loc}^s_{S(p)}), \mathbb{Q}_p/\mathbb{Z}_p).$$

⌟

3 Euler Systems

Def. (22.1.3.1) [Euler Systems]. Suppose $F \in \texttt{NField}, p \in \mathbf{P}$ and F_∞/F is an $\mathbb{Z}_p^d$-extension s.t. no finite place of F splits completely(This is satisfies if F_∞ contains the cyclotomic $\mathbb{Z}_p$-extension of F**?**). Suppose

- $\mathcal{K}$ is an Abelian extension of F containing F_∞ and $F(\mathfrak{p})$ for any $\mathfrak{p} \in \Sigma_F^{\mathrm{fin}}$,
- $\mathcal{N}$ is an ideal of F divisible by p and all finite places that T is ramified(22.1.0.1).

Then an **Euler system** for $(T, \mathcal{K}, \mathcal{N})$ is a collection of cohomology classes

$$\mathbf{c} = \{\mathbf{c}_{F'} \in H^1(F', T) : F \subset_{\mathrm{fin}} F' \subset \mathcal{K}\}$$

satisfying

$$\mathrm{cor}_{F''/F'}(\mathbf{c}_{F''}) = \Big(\prod_{\mathfrak{q}\in\Sigma(F''/F')} P_{\mathfrak{q}}(||\mathfrak{q}||^{-1}\,\mathrm{Frob}_{\mathfrak{q}}^{-1})\Big)(\mathbf{c}_{F'}),$$

where $\Sigma(F''/F')$ is the set of finite places of F not dividing $\mathcal{N}$ that is ramified in F'' but not in F'.

And an Euler system for (T, F_∞) is any Euler system for such $(T, \mathcal{K}, \mathcal{N})$. ⌟

Example (22.1.3.2) [Euler Systems for $\mathbb{Q}$]. For $N \in \mathbb{Z}_+$, let $\mathcal{R}(N)$ be the set of square-free integers r s.t. $(r, N) = 1$, and $\mathbb{Q}_\infty$ be the cyclotomic $\mathbb{Z}_p$-extension of $\mathbb{Q}$, then an Euler system $\mathbf{c}$ for $(T, \mathbb{Q}_\infty)$ is a collection of cohomology classes

$$\mathbf{c}_{\mathbb{Q}_n(\mu_r)} \in H^1(\mathbb{Q}_n(\mu_r); T)$$

s.t. for any $r \in \mathcal{R}(N), \ell \in \mathbf{P}, r\ell \in \mathcal{R}(N)$ and $m \geq n \in \mathbb{N}$,

$$\mathrm{cor}_{\mathbb{Q}_n(\mu_{r\ell})/\mathbb{Q}_n(\mu_r)}(\mathbf{c}_{\mathbb{Q}_n(\mu_{r\ell})}) = P_\ell(\ell^{-1}\,\mathrm{Frob}_\ell^{-1})(\mathbf{c}_{\mathbb{Q}_n(\mu_r)}).$$

⌟

Def. (22.1.3.3). If $\mathbf{c}$ is an Euler system, denote $\mathbf{c}_{F,\infty}$ the corresponding element in $H^1_\infty(F, T)$, and the ideal

$$\mathrm{ind}_{\Lambda_p}(\mathbf{c}) = \{\varphi(\mathbf{c}_{F,\infty}) : \varphi \in \mathrm{Hom}_{\Lambda_p}(H^1_\infty(F, T), \Lambda_p)\} \subset \Lambda_p.$$

and also

$$\mathrm{ind}_{\mathbb{Z}_p}(\mathbf{c}) = \sup\{n : \mathbf{c}_F \in p^n H^1(F, T) + H^1(F, T)_{\mathrm{tor}}\}.$$

⌟

Twisting by Characters

Prop. (22.1.3.4) [Twisting Cohomology Groups]. For any extension of number fields $L/F \in \texttt{NField}$, denote $H^1_\infty(L, T) = \varprojlim_{F \subset_{\mathrm{fin}} F' \subset F_\infty} H^1(F'L, T)$, $L_\infty = LK_\infty$. Then for any character $\rho : \mathrm{Gal}(L_\infty/K) \to \mathbb{Z}_p^*$ and $S(p) \subset \Sigma \subset \Sigma_F$, then there are Gal_K-isomorphisms

$$H^1_\infty(L, T)(\rho) \cong H^1_\infty(L, T(\rho)), \quad \mathrm{Sel}_\Sigma(L_\infty, W)(\rho) \cong \mathrm{Sel}_\Sigma(L_\infty, W(\rho)).$$

⌟

Proof: Cf.[Rubin, P91].**?** □

Prop. (22.1.3.5). Suppose $\mathbf{c}$ is an Euler system for $(T,\mathcal{K},\mathcal{N})$, and $\rho:\mathrm{Gal}(F_\infty/F)\to\mathbb{Z}_p^*$ is a character with fixed field L and conductor $\mathfrak{f}$, then for any field $F\subset_{\text{fin}}F'\subset\mathcal{K}$, denote by $\mathbf{c}^\rho_{F'}\in H^1(F,T(\chi))$ the image of $\mathbf{c}_{F'L}(\rho)$ under the map

$$H^1(F'L,T)(\rho)\xrightarrow{\text{cor}}H^1(F',T(\rho)).$$

Then $\{\mathbf{c}^\rho_{F'}\}$ form an Euler system for $(T(\rho),\mathcal{K},\mathfrak{f}p^\infty\mathcal{N})$. ⌟

Proof: Cf.[Rubin, P30, 93].? □

4 Kolyvagin Derivatives

Def. (22.1.4.1) [Kolyvagin Primes]. Suppose $F\subset_{\text{fin}}F'\subset F_\infty, m\in\mathbb{Z}_+$, define $\mathcal{R}_{F',m}\subset\mathcal{R}(\mathcal{N})$ to be the set of products of primes $\mathfrak{q}$ of F s.t.

- $m|[F(\mathfrak{q}):F(1)]$,
- $P_\mathfrak{q}(||\mathfrak{q}||^{-1})/m\in\mathbb{Z}_p$,
- $\mathfrak{q}$ splits completely in $F'(1)/F$.

⌟

Def. (22.1.4.2) [Kolyvagin Derivatives]. For any $\mathfrak{q}\in\Sigma_F^p$, $\Gamma_\mathfrak{q}=\mathrm{Gal}(F(\mathfrak{q})/F(1))$ is canonical isomorphic to a cyclic group with generator $\sigma_\mathfrak{q}$(?, [Rubin, P62]). Define

$$D_\mathfrak{q}=\sum_{i=0}^{\#\Gamma_\mathfrak{q}-1}i\sigma_\mathfrak{q}^i\in\mathbb{Z}[\Gamma_\mathfrak{q}],$$

and for any $\mathfrak{r}\in\mathcal{R}(\mathcal{N})$, define

$$D_\mathfrak{r}=\prod_{\mathfrak{q}|\mathfrak{r}}D_\mathfrak{q}\in\mathbb{Z}[\Gamma_\mathfrak{r}].$$

And if $F\subset_{\text{fin}}L\subset F_\infty$, fix an element $N_{L(1)/L}\in\mathbb{Z}[\mathrm{Gal}(L(\mathfrak{r})/L)]$ whose restriction to $\mathrm{Gal}(F(1)/F)$ is $\sum_{\gamma\in\mathrm{Gal}(F(1)/F)}\gamma$, then define

$$D_{\mathfrak{r},L}=N_{L(1)/L}D_\mathfrak{r}.$$

⌟

Def. (22.1.4.3) [Kolyvagin Systems]. Suppose $\mathbf{c}$ is an Euler system, $F\subset_{\text{fin}}L\subset F_\infty, m\in\mathbb{Z}_+$, and $\mathfrak{r}\in\mathcal{R}_{L,m}$, define

$$\kappa_{L,\mathfrak{r},M}=\delta_L(\mathbf{d}(D_{\mathfrak{r},L}x_{F(\mathfrak{r})})\in H^1(F,W[m]).$$

⌟

Proof: ?. Cf.[Rubin, P66]. □

Cor. (22.1.4.4) [Properties of $\kappa_{L,\mathfrak{r},m}$].

- $\kappa_{L,1,m}$ is the image of $\mathbf{c}_L$ in $H^1(L,W[m])$.
- The restriction of $\kappa_{L,\mathfrak{r},m}$ to $L(\mathfrak{r})$ is the image of $D_{\mathfrak{r},L}\mathbf{c}_{L(\mathfrak{r})}$ in $H^1(L(\mathfrak{r}),W[m])$.
- $\kappa_{L,1,m}$ is compatible with m.

⌟

Proof: Cf.[Rubin, P67]?. □

Local Properties

Thm. (22.1.4.5). Suppose $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+$, and $\mathfrak{r} \in \mathcal{R}_{F',m}$, then

$$\kappa_{F,\mathfrak{r},m} \in \operatorname{Sel}^{S(p\mathfrak{r})}(F', W[m]).$$

⌟

Proof: Cf.[Rubin, P67]. □

Thm. (22.1.4.6) [Ramification of Kolyvagin Systems]. Suppose $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+$, and $\mathfrak{r}\mathfrak{q} \in \mathcal{R}_{F,m}$, then

$$\operatorname{loc}^s_{\mathfrak{q}}(\kappa_{F,\mathfrak{r}\mathfrak{q},m}) = \phi^{fs}_{\mathfrak{q}}(\kappa_{F,\mathfrak{r},m}).$$

⌟

Proof: Cf.[Rubin, P68]. □

5 p-adic L-Functions for Elliptic Curves

Thm. (22.1.5.1)[p-adic L-Functions]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}, p \in \mathbf{P}$. Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has good ordinary reduction or multiplicative reduction at p. Let $\alpha \in \mathbb{Z}_p^*, \beta = p/\alpha \in p\mathbb{Z}_p^*$ be the eigenvalues of Frob_p on $T_p(E)$ if E has good ordinary reduction at p, or $(\alpha, \beta) = (1, p)$ or $(-1, -p)$ if E has split or non-split multiplicative reduction.

Then there exists $c_E \in \mathbb{Z}_+$ independent of p and a **p-adic L-function** $\mathcal{L}_E \subset c_E^{-1}\Lambda_p$ s.t. for any character χ of $\operatorname{Gal}(\operatorname{cycl}_p(\mathbb{Q})/\mathbb{Q})$ of finite order,

$$\chi(\mathcal{L}_E) = \begin{cases} (1-\alpha^{-1})^2 L(E;1)/\Omega_E & ,\chi = 1 \& E \text{ has good reduction at } p. \\ (1-\alpha^{-1}) L(E;1)/\Omega_E & ,\chi = 1 \& E \text{ has multiplicative reduction at } p. \\ \alpha^{-n}\tau(\chi) L(E,\chi^{-1};1)/\Omega_E & ,\mathfrak{c}(\chi) = p^n > 1 \end{cases}.$$

And for any $N \in \mathbb{Z}_+$, we can define

$$\mathcal{L}_{E,N} = \prod_{q|N, q\neq p} P_\ell(\ell^{-1}\operatorname{Frob}_\ell^{-1})\mathcal{L}_E \in \Lambda_p.$$

⌟

Proof: Cf.[Mazur-Tate-T]**?**. □

Coleman Map

Def. (22.1.5.2) [Coleman Map]. Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has good ordinary reduction or multiplicative reduction at p, then there is an injective Λ_p-module map

$$\operatorname{Col}_\infty : H^1_{\infty,s}(\mathbb{Q}_p, T_p(E)) \hookrightarrow \Lambda_p$$

s.t.

- For any element $z = \{z_n\} \in H^1_{\infty,s}(\mathbb{Q}_p, T_p(E))$ and any non-trivial character χ of $G_n = \operatorname{Gal}(\operatorname{cycl}_{p,n}(\mathbb{Q})/\mathbb{Q})$ of conductor p^m,

$$\chi(\operatorname{Col}_\infty(z)) = \alpha^{-m}\tau(\chi)\sum_{\gamma\in G_n}\chi^{-1}(\gamma)\exp^*_{\omega_E}(z_n^\gamma).$$

- If χ_0 is the trivial character, then

$$\chi_0(\mathrm{Col}_\infty(z)) = (1-\alpha^{-1})(1-\beta^{-1})^{-1}\exp^*_{\omega_E}(z).$$

- If E has split multiplicative reduction at p, then the image of Col_∞ is contained in the augmentation ideal $\mathscr{J}_p$ of Λ_p.

$\lrcorner$

Proof: Cf.[Rubin short, Appendix]?. □

Local Cohomology Groups

Prop. (22.1.5.3). Let $K \in$ p-`Field` and $E \in \mathcal{E}\mathrm{ll}/K$ with a Neron differential ω_E, then $\mathrm{Tgt}^*(E/K) = K\omega_E$, and $\mathrm{Tgt}(E/K) = K\omega_E^*$. There exists an exponential map

$$\exp_E : \mathrm{Tgt}(E/K) \cong E(K) \otimes \mathbb{Q}_p$$

and the following diagram is commutative:

$$\begin{array}{ccccc} \mathrm{Tgt}(E/K) & & \xrightarrow{\quad\exp_E\quad} & & E(K)\otimes\mathbb{Q}_p \\ {\scriptstyle \cdot\omega_E^*}\uparrow & & & & \uparrow{\scriptstyle =} \\ K & \xleftarrow[\log_E]{} & \widehat{E}(\mathfrak{m}_K)\otimes\mathbb{Q}_p & \xrightarrow{\cong} & E_1(K)\otimes\mathbb{Q}_p \end{array}$$

where all the maps are isomorphisms. $\lrcorner$

Proof: ? □

Prop. (22.1.5.4). By the definition and local Tate pairing,

$$\mathrm{Hom}(E(\mathbb{Q}_{n,p}),\mathbb{Q}_p) = \mathrm{Hom}(H^1_f(\mathbb{Q}_{n,p},V_p(E)),\mathbb{Q}_p) \cong H^1_s(\mathbb{Q}_{n,p},V_p(E)).$$

So we can define a dual exponential map

$$\exp^*_E : H^1_s(\mathbb{Q}_{n,p},V) \to \mathrm{Tgt}^*(E/\mathbb{Q}_{n,p})$$

and its composite with ω_E^*:

$$\exp^*_{\omega_E} : H^1_s(\mathbb{Q}_{n,p},V) \to \mathrm{Tgt}^*(E/\mathbb{Q}_{n,p})/\omega_E \cong \mathbb{Q}_{n,p}.$$

More explicitly, for $z \in H^1_s(\mathbb{Q}_{n,p},V_p(E)), x \in E(\mathbb{Q}_{n,p})$,

$$\mathrm{tr}_{\mathbb{Q}_{n,p}/\mathbb{Q}_p}(\lambda_E(x)\exp^*_{\omega_E}(z)) = \langle x,z\rangle_{\mathbb{Q}_{n,p}}.$$

$\lrcorner$

Prop. (22.1.5.5).

$$\exp^*_{\omega_E}(H^1_s(\mathbb{Q}_p,T)) = \frac{1}{p}[E(\mathbb{Q}_p):E_1(\mathbb{Q}_p)+E(\mathbb{Q}_p)_{\mathrm{tor}}]\mathbb{Z}_p.$$

$\lrcorner$

Proof: By duality, if $\lambda_E(\mathbb{Q}_p) = p^{-a}\mathbb{Z}_p$, then $\exp^*_{\omega_E}(H^1_s(\mathbb{Q}_p,T)) = p^a\mathbb{Z}_p$. But $\lambda_E(E_1(\mathbb{Q}_p)) = p\mathbb{Z}_p$, so the assertion follows. □

6 Bounding Selmer Groups

Notation (22.1.6.1).

- Fix an Euler system $\mathbf{c}$ for (T, F_∞)(22.1.3.2). $\mathbf{c}_F \in \mathrm{Sel}^{S(p)}(F, T)$ by(22.1.1.4) and(22.1.2.2).
- Suppose the choices of Selmer local conditions satisfy hypothesis(22.1.2.4).

┘

Hypothesis on Representations

Def. (22.1.6.2) [Hypothesis]. T satisfies the hypothesis

Hypothesis $\mathrm{Hyp}(F_\infty; T)$ if:

- There exists $\tau \in \mathrm{Gal}_{F(1)F(\mu_{p^\infty})}$ s.t. $T/(\tau - 1)T$ is free of rank 1 over $\mathbb{Z}_p$, and
- $T/(p) \in \mathrm{Irr}_{\mathbb{F}_p}(\mathrm{Gal}_{F_\infty})$.

Hypothesis $\mathrm{Hyp}(F_\infty; V)$ if:

- There exists $\tau \in \mathrm{Gal}_{F(1)F(\mu_{p^\infty})}$ s.t. $\dim_{\mathbb{Q}_p} V/(\tau - 1)V = 1$, and
- $V \in \mathrm{Irr}_{\mathbb{Q}_p}(F_\infty)$.

Hypothesis $\mathrm{Hyp}(F_\infty/F)$ if:

- $\mathrm{rank}_{\mathbb{Z}_p}(\mathrm{Gal}_{F_\infty/F}) > 1$ or
- neither T nor $T(-1)$ is trivial, or
- F is imaginary quadratic, or
- F is totally real and leopoldt's conjecture holds for F.

┘

Prop. (22.1.6.3). Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, then

- $T = T_p(E)$ satisfies the hypothesis $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q}); V)$(22.1.6.2), and $\#H^1(\mathbb{Q}(E[p^\infty])/\mathbb{Q}, E[p^\infty]) < \infty$.
- If $\rho_{E,p} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{Aut}(T_p)$ is surjective, then $T_p(E)$ satisfies the hypothesis $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q}), T)$(22.1.6.2), and $H^1(\mathbb{Q}(E[p^\infty])/\mathbb{Q}, E[p^\infty]) = 0$.

┘

Proof: By Weil pairing,

$$\rho_{E,p}(\mathrm{Gal}_{\mathbb{Q}(\mu_{p^\infty})}) = \rho_{E,p}(\mathrm{Gal}_\mathbb{Q}) \cap \mathrm{SL}(2, \mathbb{Z}_p).$$

When $\rho_{E,p} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{Aut}(T_p)$ is surjective, then $\overline{\rho_{E,p}}$ is surjective thus irreducible, and also we can take $\rho_{E,p}(\tau) = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$. So $T_p(E)$ satisfies the hypothesis $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q}), T)$.

And because E has no CM, by [Serre, Galois Property Points Elliptiques, (1972) Cor1 of Thm3], $\rho_{E,p}(\mathrm{Gal}_\mathbb{Q}) \subset \mathrm{GL}(2, \mathbb{Z}_p)$ is open. So $\rho_{E,p}|_{\mathrm{Gal}_{\mathbb{Q}(\mu_{p^\infty})}}$ is irreducible, and we can take $\rho_{E,p}(\tau) = \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}$ for some $x \neq 0$. So $T_p(E)$ satisfies the hypothesis $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q}), V)$.

Finally, the cohomology group can be calculated directly?. □

Bounding Selmer Groups over F

Thm. (22.1.6.4). Suppose V satisfies $\mathrm{Hyp}(F;V)$(22.1.6.2), and V is not the trivial representation.

- If $\mathbf{c}_F \notin H^1(F,T)_{\mathrm{tor}}$, then $\#\,\mathrm{Sel}_{S(p)}(F,W^D) < \infty$.
- If $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \neq 0$ and $[H_s^1(\mathbb{Q}_p,T) : \mathbb{Z}_p \,\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q})] < \infty$, then $\#\,\mathrm{Sel}(\mathbb{Q},W^D) < \infty$.

(If V is trivial, this is true iff the Leopodlt's conjecture holds). ⌟

Proof: Cf.[Rubin, P24].?
2: It follows from(22.1.2.10) that

$$[\mathrm{Sel}(\mathbb{Q},W^D) : \mathrm{Sel}_p(\mathbb{Q},W^D)] = [H_s^1(\mathbb{Q}_p,T) : \mathbb{Z}_p \,\mathrm{loc}_p^s(\mathrm{Sel}^p(\mathbb{Q},T))] \leq [H_s^1(\mathbb{Q}_p,T) : \mathbb{Z}_p \,\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q})].$$

So the assertion follows from item1. □

Cor. (22.1.6.5). Suppose V satisfies $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q});V)$(22.1.6.2), $\mathrm{loc}_p^s \mathbf{c}_\mathbb{Q} \neq 0$, and $\mathrm{rank}_{\mathbb{Z}_p} H_s^1(\mathbb{Q}_p,T) = 1$, then $\#\,\mathrm{Sel}^{p^\infty}(\mathbb{Q},W^D) < \infty$. ⌟

Proof: This is because $H_s^1(\mathbb{Q}_p,T)$ is torsion-free. □

Thm. (22.1.6.6). Suppose T satisfies $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q});T)$(22.1.6.2), $p > 2$. Let $\Omega = \mathbb{Q}(W)\mathbb{Q}((\mathbb{Z}_p^*)^{1/p^\infty})$, where $\mathbb{Q}(W)$ is the minimal extension of $\mathbb{Q}$ that $\mathrm{Gal}_{\mathbb{Q}(W)}$ acts trivially on W.

- Then

$$\#\,\mathrm{Sel}_p(\mathbb{Q},W^D) \leq p^{\mathrm{ind}_{\mathbb{Z}_p}(\mathbf{c})}\#\Big(H^1(\Omega/\mathbb{Q},W)\cap \mathrm{Sel}^p(\mathbb{Q},W)\Big)\#\Big(H^1(\Omega/\mathbb{Q},W)\cap \mathrm{Sel}_p(\mathbb{Q},W^D)\Big)$$

- If $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \neq 0$(22.1.2.1), then

$$\#\,\mathrm{Sel}(\mathbb{Q},W^D) \leq [H_s^1(\mathbb{Q}_p,T) : \mathbb{Z}_p \,\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q})]\#\Big(H^1(\Omega/\mathbb{Q},W)\cap \mathrm{Sel}^p(\mathbb{Q},W)\Big)\#\Big(H^1(\Omega/\mathbb{Q},W^D)\cap \mathrm{Sel}_p(\mathbb{Q},W^D)\Big).$$

Notice $\#H^1(\Omega/\mathbb{Q},W)\#H^1(\Omega/\mathbb{Q},W^D) < \infty$ when V is irreducible and $\dim V > 2$, by [Rubin, P162].? ⌟

Proof: Cf.[Rubin, P24].?
2: Notice $H^1(\mathbb{Q},T)/\mathrm{Sel}^p(\mathbb{Q},T) \hookrightarrow \oplus_{v\in\Sigma_\mathbb{Q}^p} H_s^1(\mathbb{Q}_v,T)$ is torsion-free, so $\mathbf{c}_\mathbb{Q} \in p^n H^1(\mathbb{Q},T) + H^1(\mathbb{Q},T)_{\mathrm{tor}}$ implies $\mathbf{c}_\mathbb{Q} \in p^n \,\mathrm{Sel}^p(\mathbb{Q},T) + H^1(\mathbb{Q},T)_{\mathrm{tor}}$, which implies $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \in p^n \,\mathrm{loc}_p^s(\mathrm{Sel}^p(\mathbb{Q},T))$. Then the assertion follows from(22.1.2.10) and item1. □

Bounding Selmer Groups over F_∞

Prop. (22.1.6.7). Suppose V satisfies $\mathrm{Hyp}(F_\infty,V)$ with τ. Define Z(resp. Z^D) to be the maximal Gal_{F_∞}-stable submodule of $(\tau-1)W$(resp. W^D), and

$$a_\tau = [W^\tau : (W^\tau)_{\mathrm{div}}].\max(\#Z,\#Z^D).$$

Then $a_\tau < \infty$. And if T satisfies $\mathrm{Hyp}(F_\infty,T)$, then $a_\tau = 1$. ⌟

Proof: Cf.[Rubin, P98].? □

Thm. (22.1.6.8). Suppose V satisfies $\mathrm{Hyp}(F_\infty;V)$ and $\mathrm{Hyp}(F_\infty/F)$(22.1.6.2), $\mathbf{c}_{F,\infty} \notin H_\infty^1(F,T)_{\Lambda_p-\mathrm{tor}}$, then

- (Weak Leopoldt Conjecture) $X_{\infty,S(p)}$ is a torsion Λ_p-module.
- There exists $t \in \mathbb{N}$ s.t. $\operatorname{char}(X_{\infty,S(p)})|p^t \operatorname{ind}_{\Lambda_p}(\mathbf{c})$.
- If moreover T satisfies $\operatorname{Hyp}(F_\infty;T)$(22.1.6.2), then $\operatorname{char}(X_{\infty,S(p)})| \operatorname{ind}_{\Lambda_p}(\mathbf{c})$.

⌟

Proof: 1: [Rubin, Thm2.3.2].?

2,3: Cf.[Rubin, P101]?. Given item1, there exists an injective pseudo-isomorphism

$$\bigoplus_{i=1}^{r} \Lambda_p/(f_i) \to X_{\infty,S(p)},$$

where $f_{i+1}|f_i$. Then by(22.1.6.7), it suffices to show that $\operatorname{char}(X_{\infty,S(p)})|a_\tau^{5r} \operatorname{ind}_{\Lambda_p}(\mathbf{c})$.

Suppose $h \in \Lambda_p$ satisfies(22.1.6.14), and a finite set of places $\Sigma_F^\infty \cup S(p) \cup \operatorname{Ram}(T) \subset \Sigma \subset \Sigma_F$, then by(22.1.6.15),

$$h^r a_\tau^{5r} \mathbf{c}_L \in \operatorname{char}(X_{\infty,S(p)}).H^1(F_\Sigma/L,T)_{\mathrm{lf}}.$$

Then by taking limit over L(?[Rubin, P101]),

$$h^r a_\tau^{5r} \mathbf{c}_{F,\infty} \in \operatorname{char}(X_{\infty,S(p)}).H^1(F,T)_{\mathrm{lf}}.$$

Then by the definition of $\operatorname{ind}_{\Lambda_p}(\mathbf{c})$ and the fact h is prime to $\operatorname{char}(X_{\infty,S(p)})$(22.1.6.14), we get $\operatorname{char}(X_{\infty,S(p)})|a_\tau^{5r} \operatorname{ind}_{\Lambda_p}(\mathbf{c})$. □

Cor. (22.1.6.9). Suppose V satisfies $\operatorname{Hyp}(\operatorname{cycl}_p(\mathbb{Q});V)$(22.1.6.2), $\operatorname{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})$ is non-torsion over Λ_p, and $H^1_{\infty,s}(F_p,T)/\Lambda_p.\operatorname{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})$ is torsion, define

$$\mathcal{L} = \operatorname{char}\left(H^1_{\infty,s}(F_p,T)/\Lambda_p.\operatorname{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})\right),$$

then

- (Weak Leopoldt Conjecture) X_∞ is a torsion Λ_p-module.
- There exists $t \in \mathbb{N}$ s.t. $\operatorname{char}(X_\infty)|(p^t\mathcal{L})$.
- If T satisfies $\operatorname{Hyp}(F_\infty;T)$(22.1.6.2), then $\operatorname{char}(X_\infty)|\mathcal{L}$.

⌟

Proof: By(22.1.6.8), $X_{\infty,S(p)}$ is torsion over Λ_p, so by(22.1.2.7) and the hypothesis, X_∞ is also torsion over Λ_p, and

$$\operatorname{char}(X_\infty) = \operatorname{char}(X_{\infty,S(p)}) \operatorname{char}\left(H^1_{\infty,s}(F_p,T)/\operatorname{loc}^s_{p,\infty}(H^1_\infty(F,T))\right).$$

Notice the hypothesis also implies $\operatorname{loc}^s_{p,\infty}(H^1_\infty(F,T))$ has rank 1 over Λ_p, so by the definition of $\operatorname{ind}_{\Lambda_p}(\mathbf{c})$,

$$\operatorname{ind}_{\Lambda_p}(\mathbf{c})|\operatorname{char}\left(\operatorname{loc}^s_{p,\infty}(H^1_\infty(F,T))/\Lambda_p.\operatorname{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})\right).$$

Thus the assertion follows. □

Proof over F_∞

Lemma (22.1.6.10). Let $\rho : \mathrm{Gal}(F_\infty/F) \to \Lambda_p$ be a character, then theorem(22.1.6.8) for T and $\mathbf{c}$ are equivalent to the theorem for $T(\rho)$ and $\mathbf{c}^\rho$. ⌟

Proof: The hypothesis $\mathrm{Hyp}(F_\infty; V), \mathrm{Hyp}(F_\infty/F)$ and $\mathrm{Hyp}(F_\infty; T)$ depends only on T as a Gal_{F_∞}-module, so they are not affected. And the rest follows from the fact everything is twisted by ρ, by(22.1.3.4). □

Prop. (22.1.6.11). There are elements $z_1, \ldots, z_r \in X_{\infty,S(p)}$ and ideals $\mathfrak{g}_1, \ldots, \mathfrak{g}_r \in \Lambda_p$ s.t. for $1 \le k \le r$,

- $z_k \in \mathrm{ev}^*(\tau\, \mathrm{Gal}_{\Omega_\infty})$.
- $a_\tau \mathfrak{g}_k \in f_k \Lambda_p$, and $\mathfrak{g}_k \subset \mathfrak{g}_{k+1}$.
- There is a split exact sequence

$$0 \to \sum_{i=1}^{k-1} \Lambda_p z_i \to \sum_{i=1}^{k} \Lambda_p z_i \to \Lambda_p/\mathfrak{g}_k \to 0.$$

- $a_\tau(X_{\infty,S(p)}/\sum_{i=1}^r \Lambda_p z_i)$ is pseudo-null.

⌟

Proof: Cf.[Rubin, P98]. □

Def. (22.1.6.12) [Selmer Sequences and Kolyvagin Sequences]. Fix a sequence $(z_1, \ldots, z_r)$ for $X_{\infty,S(p)}$ as in(22.1.6.11), and let $Z_\infty \subset X_{\infty,S(p)}$ be the submodule they generate. Then for $0 \le k \le r$, $F \subset_{\mathrm{fin}} L \subset F_\infty$, then

- A **Selmer sequence** of length k is a sequence $(\sigma_1, \ldots, \sigma_k)$ s.t. Cf.[Rubin, P99].**?**
- A **Kolyvagin sequence** of length k for L and M is a sequence $(\mathfrak{Q}_1, \ldots, \mathfrak{Q}_k)$ of primes of L**?** Cf.[Rubin, P99].

Let $\Pi(k, L, M)$ be the set of Kolyvagin sequences of length k for F and M, and define

$$\Psi(k, L, M) = \sum_{\pi \in \Pi(k,L,M)} \sum_{\psi \in \mathrm{Hom}(\Lambda_p \kappa_{L,\mathfrak{r}(\pi),M}, \Lambda_{L,M})} \psi(\kappa_{L,\mathfrak{r}(\pi),M}) \subset \Lambda_{L,M}$$

⌟

Lemma (22.1.6.13). Suppose $G \in \mathcal{A}b^{\mathrm{fin}}$, $R \in \mathfrak{CRing}$ is a PID, and B is a f.g. $R[G]$-module without R-torsion. Suppose $f \in R[G]$ is a non-zerodivisor, $b \in B$, and

$$\{\psi(b) : \psi \in \mathrm{Hom}_{R[G]}(B, R[G])\} \subset fR[G],$$

then $b \in fB$. ⌟

Proof: Cf.[Rubin, P101]. □

Prop. (22.1.6.14). Situation as in(22.1.6.8), there exists $h \in \Lambda_p$ relatively prime to $\mathrm{char}(X_{\infty,S(p)})$, and for each $F \subset_{\mathrm{fin}} L \subset F_\infty$ a number $N_L \in p^{\mathbb{Z}_+}$, s.t. if $M \in p^{\mathbb{Z}_+}, N_L | M, 0 \le k \le r$, then

$$h a_\tau^5 \Psi(k, L, M N_L) \subset f_{k+1} \Psi(k+1, L, M)(22.1.6.12).$$

⌟

Proof: Cf.[Rubin, P100]**?**. □

Cor. (22.1.6.15). Situation and notation as in(22.1.6.14), if $F \subset_{\text{fin}} L \subset F_\infty$ and finite set of places $\Sigma_F^\infty \cup S(p) \cup \text{Ram}(T) \subset \Sigma \subset \Sigma_F$, then

$$h^r a_\tau^{5r} \mathbf{c}_L \in \text{char}(X_{\infty,S(p)}).H^1(F_\Sigma/L,T)_{\text{lf}}.$$

⌟

Proof: It follows from(22.1.6.14) and induction that

$$h^r a_\tau^5 \Psi(0,L,MN_L^r) \subset (\prod_{i=1}^r f_i)\Psi(r,L,M) \subset \text{char}(X_{\infty,S(p)})\Lambda_{L,M}.$$

By(22.1.6.13), it suffices to show that for any $\psi \in \text{Hom}(H^1(F_\Sigma/L,T),\Lambda_L)$, $h^r a_\tau^{5r}\psi(\mathbf{c}_L) \in \text{char}(X_{\infty,S(p)})\Lambda_L$. For this, notice by(22.1.4.4), $\kappa_{L,1,MN_L^r}$ is the image of $\mathbf{c}_L$ under the map

$$H^1(F_\Sigma/L,T)/(MN_L^r) \hookrightarrow H^1(F_\Sigma/L,W[MN_L^r]) \hookrightarrow H^1(L,W[MN_L^r]),$$

so we can define $\overline{\psi}$ to be the map

$$\Lambda_{L,MN_L^r}\kappa_{L,1,MN_L^r} \subset H^1(F_\Sigma/L,T)/(MN_L^r) \xrightarrow{\psi} \Lambda_{L,MN_L^r} \to \Lambda_{L,M}.$$

Then by definition $\overline{\psi}(\kappa_{L,1,MN_L^r}) \in \Psi(0,L,MN_L^r)\Lambda_{L,M}$, and $\overline{\psi}(\kappa_{L,1,MN_L^r}) \equiv \psi(\mathbf{c}_L)(\text{mod } M)$. Thus we get $\psi(\mathbf{c}_L) \in \Psi(0,L,MN_L^r)$ by noticing M can arbitrarily large.

□

7 Euler System for Elliptic Curves(Kato)

Thm. (22.1.7.1)[Kato]. Suppose $E \in \mathcal{E}\text{ll}/\mathbb{Q}$ with conductor N, and $p \in \mathbf{P}$. Then there exists $D, D \not\equiv 1 \mod p, (DD',6pN) = 1$, and $r_E \in \mathbb{Z}_+$ independent of p, and an Euler system $\overline{\mathbf{c}} = \overline{\mathbf{c}}(D,D')$ for $T_p(E)$(22.1.3.2):

$$\{\overline{\mathbf{c}}_{\mathbb{Q}_n(\mu_r)} \in H^1(\mathbb{Q}_n(\mu_r),T_p(E))\}_{r\in\mathcal{R}(NpDD'),n\in\mathbb{N}},$$

s.t. for any character $\chi \in \text{Gal}(\mathbb{Q}_n/\mathbb{Q})^\vee$,

$$\sum_{\gamma\in\text{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi(\gamma)\exp^*_{\omega_E}(\text{loc}_p^s(\overline{\mathbf{c}}_{\mathbb{Q}_n}^\gamma)) = r_E DD'(D-\chi^{-1}(D))(D'-\chi^{-1}(D'))L_{Np}(E,\chi;1)/\Omega_E.$$

⌟

Proof: Take $r = p^m$ and take corestriction to $\mathbb{Q}_n$. But we need to verify that $\exp^*_{\omega_E}\circ\text{loc}_p^s$ equals the dual exponential map defined in(22.4.3.2). □

Cor. (22.1.7.2). Situation as in(22.1.7.1), suppose that E has good ordinary reduction or multiplicative reduction at p, then there is an Euler system $\mathbf{c}$ for $T_p(E)$ s.t.

- $\exp^*_{\omega_E}(\text{loc}_p^s(\mathbf{c}_\mathbb{Q})) = r_E L_{Np}(E;1)/\Omega_E$.
- $\text{Col}_\infty(\text{loc}_{p,\infty}^s(\mathbf{c}_{\mathbb{Q},\infty})) = r_E\mathcal{L}_{E,N}$(22.1.5.1).

⌟

Proof: Let $\sigma_D, \sigma_{D'} \in \mathrm{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q})$ denote the automorphism $\zeta \mapsto \zeta^D, \zeta \in \mu_{p^\infty}$, then since $D, D' \nmid 1(\bmod\ p)$, $(D-\sigma_D)(D'-\sigma_{D'}) \in \Lambda_p$ is invertible. Let $\rho_{D,D'} \in \mathbb{Z}_p[[\mathrm{Gal}_\mathbb{Q}]]$ be any element that restricts to $(D-\sigma_D)^{-1}(D'-\sigma_{D'})^{-1}$, then we can define

$$\mathbf{c}_{\mathbb{Q}_n(\mu_r)} = (DD')^{-1}\rho_{D,D'}\bar{\mathbf{c}}_{\mathbb{Q}_n(\mu_r)},$$

which is also an Euler system, and by(22.1.7.1) and a change of variable, we get

$$\sum_{\gamma \in \mathrm{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi(\gamma) \exp^*_{\omega_E}(\mathrm{loc}^s_p(\mathbf{c}^\gamma_{\mathbb{Q}_n})) = r_E L_{Np}(E,\chi;1)/\Omega_E.$$

Then if χ is the trivial character, this gives equation1. And for any $\chi \in \mathrm{Gal}(\mathbb{Q}_\infty/\mathbb{Q})^\vee$,

$$\chi\Big[\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q},\infty}))\Big] =$$

$$\begin{cases} (1-\alpha^{-1})(1-\beta^{-1})^{-1}\exp^*_{\omega_E}(\mathrm{loc}^s_p(\mathbf{c}_\mathbb{Q})) = r_E L_{Np}(E;1)/\Omega_E & ,\chi = 1 \\ \alpha^{-n}\tau(\chi)\sum_{\gamma\in\mathrm{Gal}(\mathbb{Q}_n/\mathbb{Q})}\chi^{-1}(\gamma)\exp^*_{\omega_E}(\mathrm{loc}^s_p(\bar{\mathbf{c}}^\gamma_{\mathbb{Q}_n})) = r_E L_{Np}(E;\chi^{-1},1)/\Omega_E & \mathfrak{c}(\chi) = p^n > 1 \end{cases}$$

$$= \chi(r_E\mathcal{L}_{E,N}).$$

Thus $\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q},\infty})) = r_E\mathcal{L}_{E,N}$. □

Bounding Selmer Groups

Prop. (22.1.7.3). Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM. Notation as in(22.1.7.1),

- If E has good ordinary reduction or non-split multiplicative reduction at p, then $X_\infty(E[p^\infty])$ is f.g. torsion over Λ_p, and there exists $t \in \mathbb{N}$ s.t. $\mathrm{char}(X_\infty)|(p^t\mathcal{L}_{E,N})$. And if $\rho_{E,p}$ is surjective with $p \nmid r_E\prod_{q|N,q\neq p}\ell_q(q^{-1})$, then $\mathrm{char}(X_\infty)|(\mathcal{L}_E)$.
- If E has split multiplicative reduction at p, then similar results hold with $\mathrm{char}(X_\infty)$ replaced by $\mathcal{J}\,\mathrm{char}(X_\infty)$.

⌟

Proof: Because Col_∞ is injective(22.1.5.2), by(22.1.7.2),

$$\mathcal{L} = \mathrm{char}\left(H^1_{\infty,/\mathrm{Sel}}(\mathbb{Q}_p,T)/\Lambda_p.\,\mathrm{loc}^s_{p,\infty}(\mathbf{c}_\mathbb{Q})\right)\Big|\,\mathrm{char}\left(\mathrm{Im}(\mathrm{Col}_\infty)/(\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_\mathbb{Q})))\right)\Big|(r_E\mathcal{L}_{E,N})$$

So item1 follows from(22.1.6.9). Notice the hypothesis are satisfied by(22.1.6.3). Item2 also follows, by noticing that $\mathrm{Im}(\mathrm{Col}_\infty) \subset \mathcal{J}_p$(22.1.5.2). □

Cor. (22.1.7.4) [Greenberg]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, then there exists $M_E \in \mathbb{Z}_+$ s.t. if $p \in \mathbf{P}$ is good ordinary for E and $p \nmid M_E$, then $X_\infty(E)$(22.1.2.6) has no non-zero finite submodules. ⌟

Proof: Cf.[Rubin short, P363] and [Greenberg, Iwasawa theory for p-adic Representations]**?**. □

Cor. (22.1.7.5). Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, $p \in \mathbf{P}$ is a good place for E and $p \nmid 2r_EM_E\prod_{q|N}\ell_q(q^{-1})$(22.1.7.1)(22.1.7.4), and $\rho_{E,p}$ is surjective, then

$$\#\text{Ш}(E)[p^\infty]\Big|\frac{L(E;1)}{\Omega_E}.$$

⌟

Proof: If p is good supersingular for E, then $p \nmid \#\widetilde{E}(\mathbb{F}_p)$, and Cf.[Rubin short, P362]**?**

If p is good ordinary for E, then by(22.1.7.4), we may assume $X_\infty(E) \subset \prod_i \Lambda_p/(f_i^{n_{ij}})$, and then

$$\mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})} = (X_\infty(E))_{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})} \subset \chi_0(\prod_i \Lambda_p/(f_i^{n_{ij}}))$$

and the RHS has cardinality $\chi_0(\mathrm{char}(X_\infty(E)))$, which by(22.1.7.3) divides

$$\chi_0(\mathcal{L}_E) = (1-\alpha^{-1})^2 \prod_{q|N} \ell_q(q^{-1}) L(E;1)/\Omega_E (22.1.5.1).$$

Also, one show by proof of Mazur control theorem that

$$\mathrm{Sel}(\mathbb{Q}, E[p^\infty]) \to \mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})}.$$

is injective with cokernel of order divisible by $(1-\alpha^{-1})^2$**?**. Thus the assertion follows. □

Cor. (22.1.7.6). Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, and $L(E;1) \neq 0$, then $\#E(\mathbb{Q}) < \infty, \#\text{Ш}(E) < \infty$. ⌟

Proof: This is proven by Kolyvagin before, but Kato proved it again as follows:

For each $q|N, \ell_q(q^{-1}) \neq 0$, so $L_{Np}(E;1) \neq 0$, and then by(22.1.7.2), $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \neq 0$, then it follows from(22.1.6.5) that $\mathrm{Sel}^{p^\infty}(E/\mathbb{Q}) < \infty$. Notice the hypothesis is satisfied by(22.1.5.5).

But then by Serre's theorem, $\rho_{E,p}$ is surjective for a.e. p, so by(22.1.7.5), $\text{Ш}(E)[p^\infty] = 0$ for a.e. e. Thus the assertion follows. □

Thm. (22.1.7.7) [Kato]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, if $F/\mathbb{Q}$ is an Abelian extension and $\chi \in \mathrm{Gal}(F/\mathbb{Q})^\vee$, and $L(E,\chi;1) \neq 0$, then $\#E(F)^\chi < \infty, \#\text{Ш}(E_L)^\chi < \infty$. ⌟

Proof: We only prove for the case E without CM. For the CM case, Cf.[Coates-Wiles77], [Rubin, The Iwasawa Main conjecture for Imaginary Quadratic Fields] or [Rubin-Wiles, Mordell-Weil Groups of Elliptic Curves over Cyclotomic Fields].**?**

The proof is similar to that of(22.1.7.6): $\chi(\mathrm{char}(X_\infty(E)))$ is a non-zero multiple of $L(E,\chi;1)$, so $\#\,\mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^\chi < \infty$. Then use a variant of(22.1.7.5) to bound $\#\text{Ш}(E)$. □

Cor. (22.1.7.8) [Kato]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $F/\mathbb{Q}$ an Abelian extension, $p \in \mathbf{P}$, $E(\mathbb{Q}(\mu_{p^\infty}))$ is a f.g. Abelian group. ⌟

Proof: It follows from [Roh84]**?** that $L(E,\chi,1) \neq 0$ for a.e. character χ of finite order of $\mathrm{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q})$. **?** □

Def. (22.1.7.9) $[r_p(E/F)]$**.** For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, define

$$r_p(E/F) = \sum_{v \in S(p), E \text{ has potential supersingular reduction at } v} [F_v : \mathbb{Q}_p].$$

⌟

Conj. (22.1.7.10). For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, let $\Gamma = \mathrm{Gal}(\mathrm{cycl}_p(F)/F) \cong \mathbb{Z}_p$, then

$$\mathrm{rank}_{\mathrm{Frac}(\mathbb{Z}_p(\Gamma))}[\mathrm{Sel}(E/\mathrm{cycl}_p(F)) \otimes_{\mathbb{Z}_p(\Gamma)} \mathrm{Frac}(\mathbb{Z}_p(\Gamma))] = r_p(E/F) (22.1.7.9)$$

⌟

Proof: □

Conj.Cor. (22.1.7.11). For $F \in \texttt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$,

$$\mathrm{rank}_{\mathrm{Frac}(\Lambda_p)}[\mathrm{Sel}(E/\mathrm{cycl}_p(F)) \otimes_{\Lambda_p} \mathrm{Frac}(\Lambda_p)] \geq r_p(E/F)(22.1.7.9)$$

⌟

Proof: Cf.[Coates, Galois of Elliptic Curves, P19]. □

Cor. (22.1.7.12). For $F \in \texttt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, if E has potential good ordinary reduction at all places dividing p, and $\mathrm{Sel}(E/F)$ is finite, then $\mathrm{Sel}(E/\mathrm{cycl}_p(F))^\vee$ is $\mathbb{Z}_p(\Gamma)$-torsion. ⌟

Proof:

□

Cor. (22.1.7.13). If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $\mathrm{rank}_{\mathrm{an}}(E) = 0$, then $\mathrm{Sel}(E/\mathrm{cycl}_p(\mathbb{Q}))^\vee$ is Λ_p-torsion. ⌟

Proof: This follows from(21.6.2.1) and(22.1.7.12). □

Cor. (22.1.7.14). Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $p \in \mathbf{P}$ is of good ordinary reduction for E, then

$$\mathrm{Sel}(\mathbb{Q}(\mu_{p^\infty}), E)^\vee$$

is torsion over Λ_p. ⌟

Proof: Cf.[Kato]. □

Prop. (22.1.7.15) [Euler Characteristic of $\mathrm{Sel}(E/\mathrm{cycl}_p(F))$]. Let $p \in \mathbf{P} \setminus \{2\}, F \in \texttt{NField}$, and $E \in \mathcal{E}\mathrm{ll}/F$ with good ordinary reduction over all places $v \in S(p)$. Suppose $\mathrm{Sel}(E/F)$ is finite, then $\mathrm{Sel}(E/F)$ has finite Γ-Euler characteristic, and

$$\chi(\Gamma, \mathrm{Sel}(E/\mathrm{cycl}_p(F))) = \rho_p(E/F) = \Big|\frac{\#\text{Ш}(E/F)[p^\infty]}{(\#E(F)[p^\infty])^2} \cdot \prod_{v \in \Sigma_F^{\mathrm{fin}}} c_v \cdot \prod_{v \in S(p)} (\#\widetilde{E}_v(\kappa_v))^2\Big|_p^{-1}$$

⌟

Proof: Cf.[Coates, Galois cohomology of Elliptic Curves, P28]. □

8 Examples

Example (22.1.8.1). There are three elliptic curves of conductor 11 over $\mathbb{Q}$, namely

$$A_0 : y^2 + y = x^3 - x^2 - 10x - 20$$

$$A_1 : y^2 + y = x^3 - x^2$$

$$A_2 : y^2 + y = x^3 - x^2 - 7820x - 263580.$$

And they are all isogenous. ⌟

Proof: □

22.2 Iwasawa Theory

1 Iwasawa Theory for Fields

$\mathbb{Z}_[[T]]$

Prop. (22.2.1.1). ⌟

Iwasawa Algebra

Def. (22.2.1.2) [Iwasawa Algebra]. Let $\Gamma \cong \mathbb{Z}_p$, the **Iwasawa algebra** Λ_p is defined to be

$$\Lambda_p = \mathbb{Z}_p[\Gamma].$$

And it is non-canonically isomorphic to $\mathbb{Z}_p[[T]]$: Let γ be any topological generator of Γ, then

$$\Lambda_p \cong \mathbb{Z}_p[\Gamma] : \gamma \mapsto T + 1.$$

⌟

Proof: Let $\Gamma_n = \Gamma/\Gamma^{p^n}$, then it can be easily shown that $\mathbb{Z}_p[\Gamma_n] \cong \mathbb{Z}_p[T]/((T+1)^{p^n} - 1)$. Then it suffices to show that

$$\mathbb{Z}_p[[T]] \cong \varprojlim \mathbb{Z}_p[[T]]/((T+1)^{p^n} - 1).$$

For this, denote $P_n(T) = (T+1)^{p^n} - 1$, then $P_n(T)$ is distinguished(14.2.5.11), and $P_n(T)|P_{n+1}(T)$, and $P_{n+1}(T)/P_n(T) = (1+T)^{p^n(p-1)} + (1+T)^{p^n(p-2)} + \ldots + (1+T)^{p^n} + 1 \in (p, T)$ Thus $P_n(T) \in (p,T)^{n+1}$. By p-adic Weierstrass preparation theorem(14.2.5.12), for any $f(T) \in \mathbb{Z}_p[[T]]$ and $n \in \mathbb{N}$, $f(T) = q_n(T)P_n(T) + f_n(T)$, where $f_n(T)$ is a polynomial with degree$< p^n$.

And $f_{n+1}(T) - f_n(T) = (q_n - q_{n+1}P_{n+1}/P_n)P_n$, so by(14.2.5.14), $f_{n+1}(T) \equiv f_n(T) (\mathrm{mod}\ P_n(T))$ as polynomials. Then $(f_0, f_1, \ldots, f_n, \ldots) \in \varprojlim \mathbb{Z}_p[T]/(P_n(T))$.

Now if $f_k = 0$ for each k, then $P_k(T)|f(T)$ for each k, and then $f \in \cup_k (p,T)^{k+1} = 0$. And conversely, given any $(f_i) \in \varprojlim \mathbb{Z}_p[T]/(P_n(T))$, $f(T) = \lim f_k(T)$ exists in $\mathbb{Z}_p[[T]]$, and it can be shown that $f(T)$ is mapped to (f_i). Thus we are done. □

Def. (22.2.1.3) [Pseudo-Isomorphisms]. A homomorphism between Λ_p-modules are called a **pseudo-isomorphism** if its kernel and cokernel are all finite. ⌟

Lemma (22.2.1.4). If $f, g \in \Lambda_p$ are relatively prime(3.2.3.4), then

- The natural map $\Lambda_p/(fg) \to \Lambda_p/(f) \oplus \Lambda_p/(g)$ is an injection with finite cokernel.
- There exists an injection $\Lambda/(f) \oplus \Lambda/(g) \to \Lambda_p/(fg)$ with finite cokernel.

⌟

Proof: Cf.[Mazur Control Theorem, P9]. □

Thm. (22.2.1.5) [Classification of Modules over Λ_p]. For $M \in \mathcal{M}\mathrm{od}^{\mathrm{fg}}_{\Lambda_p}$, there exists $r, s, t, n_i, m_j \in \mathbb{N}$ and f_j distinguished and irreducible, s.t. M is pseudo-isomorphic to

$$\Lambda_p^{\oplus r} \oplus (\bigoplus_{i=1}^{s} \Lambda_p/(p^{n_i})) \oplus (\bigoplus_{j=1}^{t} \Lambda_p/(f_j(T)^{m_j})).$$

⌟

Proof: Cf.[Washington, P272] or [Mazur Control Theorem, P11]. □

Prop. (22.2.1.6). If $B \in \mathcal{M}\mathrm{od}_{\Lambda_p}^{\mathrm{tor,fg}}$, then there exists $f_i \in \Lambda_p^*$ and a pseudo-isomorphism(22.2.1.3)

$$B \to \bigoplus_i \Lambda_p/(f_i).$$

Moreover, the ideal $(\prod_i f_i) \subset \Lambda_p$ is well-defined, called the **characteristic ideal of** B, denoted by $\mathrm{char}(B)$. ⌟

Proof: □

Prop. (22.2.1.7). If $X \in \mathcal{M}\mathrm{od}_{\Lambda_p}^{\mathrm{fg}}$ and $\#X_\Gamma < \infty$, then X is torsion over Λ_p. ⌟

Proof: Cf.[Washington]. □

22.3 p-adic L-Functions

1 p-adic L-Functions

Main references are [Fontaine's rings and p-adic L-functions, Colmez], and [Mazur, B.; Tate, J.; Teitelbaum, J. On p-adic analogues of the conjectures of Birch and Swinnerton-Dyer. Invent. Math. 84 (1986), no. 1, 1–48.]

Thm. (22.3.1.1)[Kummer]. Let $a \geq$ be coprime to p and $k \geq 1$. If $n_1, n_2 \geq k$ that $n_1 \equiv n_2 \mod \varphi(p)$, then

$$(1 - a^{n_1})\frac{B_{n_1}}{n_1} \equiv (1 - a^{n_2})\frac{B_{n_2}}{n_2} \mod p^k.$$

⌟

Proof: Cf.[p-adic L-functions, Colmez]P5. □

Remark (22.3.1.2). This has vast generalizations in Iwasawa theory, Cf.[Iwasawa, On p-adic L-functions]. ⌟

2 Iwasawa Main Conjectures

[Wiles, A. The Iwasawa conjecture for totally real fields. Ann. of Math. (2) 131 (1990), no. 3, 493 – 540], [Rubin, Karl The "main conjectures" of Iwasawa theory for imaginary quadratic fields. Invent. Math. 103 (1991), no. 1, 25–68.].

Thm. (22.3.2.1)[Herbrand]. Let $p \in \mathbf{P}$, $Y = \mathrm{Cl}(\mathbb{Q}(\mu_p))[p]$, then $\mathrm{Gal}(\mathbb{Q}(\mu_p)/\mathbb{Q}) = (\mathbb{Z}/(p))^\times$ acts on Y as a $\mathbb{F}_p$-space by conjugation. Let Y^j be the subspace of Y that $(\mathbb{Z}/(p))^\times$ acts by character $a \mapsto a^j$. Then for $1 < j < p-1$ an odd integer, if $Y^j \neq 1$, then the Bernoulli number B_{p-j} has numerator divisible by p. ⌟

Proof: Cf.[Eisenstein Ideals, Mazur, P52]. □

3 Iwasawa Main Conjectures for GL(2)

Main references are [the Iwasawa Main Conjectures for GL(2), Skinner-Urban].

22.4 Kato's Euler Systems

Cf.[Kat04] and [Scholl], [Chao Li's Notes].

1 Kato-Siegel Functions

Thm. (22.4.1.1) [Kato-Siegel-Functions]. For $d \in \mathbb{Z}$ prime to 6, there exists a unique rule ϑ_d that associates each elliptic curve E/S a section $\vartheta_d^{(E/S)} \in \mathcal{O}^*(E \setminus E_S[d])$. satisfying:

- $\mathrm{div}(\vartheta_d^{(E/S)}) = d^2(e_E) - E_S[d]$.
- For a base change $g : E'/S' \to E/S$, $g^*\vartheta^{(E/S)} = \vartheta^{(E'/S')}$.
- If $\alpha : E/S \to E'/S$ is an isogeny and $(\deg \alpha, d) = 1$, then $\alpha_*\vartheta_d^{(E/S)} = \vartheta_d^{(E'/S)}$.
- $\vartheta_{-d} = \vartheta_d$,$\vartheta_1 = 1$. And if $d = mc$ where $m, c \in \mathbb{Z}_+$, then

$$[m]_*\vartheta_d = \vartheta_c^{m^2}, \quad \vartheta_c \circ [m] = \vartheta_d/\vartheta_m^{c^2}.$$

  In particular, $[d]_*\vartheta_d = 1$.

- If $\tau \in \mathscr{H}$ and $E_\tau/\mathbb{C} = \mathbb{C}/(\mathbb{Z} + \tau\mathbb{Z})$, then

$$\vartheta_d^{(E_\tau/\mathbb{C})}(u) = (-1)^{\frac{d-1}{2}}\Theta(u,\tau)^{d^2}\Theta(du,\tau)^{-1},$$

  where

$$\Theta(u,\tau) = q^{\frac{1}{12}}(t^{1/2} - t^{-1/2})\prod_{n\in\mathbb{Z}_+}(1-q^n t)(1-q^n t^{-1}), \quad q = e^{2\pi\,\mathrm{i}\,\tau}, t = e^{2\pi\,\mathrm{i}\,u}.$$

  In fact, this should be the case over the Tate curve.

⌟

Proof: Cf.[Scholl, P384]**?** □

Modular Eisenstein Series

Def. (22.4.1.2) [Eisenstein Series]. Let $S \in \mathcal{S}\mathrm{ch}_{\mathrm{int}}, E \in \mathcal{E}\mathrm{ll}/S, d, N \in \mathbb{Z}_+$, $(N,d) = 1$, and $x \in E(S)$ is a torsion section of exact order N. If x is disjoint with $E_S[d]$, then $\vartheta_d(x) = x^*\vartheta_d \in \mathcal{O}^*(S)$. This is the case if N is invertible on S or N is not a prime power.

In this case, define

$$\mathrm{dlog}_v\,\vartheta_d \in \Gamma(E \setminus E_S[d], \Omega^1_{E/S})$$

and

$${}_d\,\mathrm{Eis}(E/S,x) = x^*\mathrm{d}\log_v\vartheta_d \in \Gamma(S, x^*\Omega^1_{E/S}) = \Gamma(S,\omega_{E/S}).$$

is a modular form of weight 1(20.2.5.1).

Of course, we can also define $\mathrm{dlog}\,\vartheta_d(x) \in \Gamma(S,\Omega^1_S)$. ⌟

Def. (22.4.1.3) [Eis$(E/S,x)$]. Situation as in (22.4.1.2), by(22.4.1.1), for $d, d' \in \mathbb{Z}$ prime to 6,

$$(\vartheta_d)^{d'^2} \cdot\!\cdot \vartheta_{d'} \circ [d] = (\vartheta_{d'})^{d^2} \cdot\!\cdot \vartheta_d \circ [d'] = \vartheta_{dd'},$$

so

$$d'^2\mathrm{d}\log_v\vartheta_d - [d']^*\mathrm{d}\log_v\vartheta_d = d^2\mathrm{d}\log_v\vartheta_{d'} - [d]^*\mathrm{d}\log_v\vartheta_{d'}.$$

And
$$d'^2{}_d\operatorname{Eis}(E/S,x) - d'{}_d\operatorname{Eis}(E/S,d'x) = d^2{}_{d'}\operatorname{Eis}(E/S,x) - {}_{d}{}_{d'}\operatorname{Eis}(E/S,dx).$$
In particular, if $d \equiv 1 \mod N$ and $d \neq \pm 1$, then
$$\operatorname{Eis}(E/S,x) = \frac{1}{d^2-d}{}_d\operatorname{Eis}(E/S,x) \in \Gamma(S[\frac{1}{d(d-1)}],\omega)$$
is independent of d. And because d is arbitrary, we can in fact glue the definition to a section
$$\operatorname{Eis}(E/S,x) \in \Gamma(S[\frac{1}{2N}],\omega).$$

⌟

Cor. (22.4.1.4). For any $d \in \mathbb{Z}$ prime to 6,
$${}_d\operatorname{Eis}(E/S,x) = d^2\operatorname{Eis}(E/S,x) - d\operatorname{Eis}(E/S,dx) \in \Gamma(S[\frac{1}{2N}],\omega).$$

⌟

Example (22.4.1.5) [Eisenstein Series Over $\mathbb{C}$]. If $E = \mathbb{C}/(\mathbb{Z}\omega_1 + \mathbb{Z}\omega_2)$, and $x = \frac{a_1}{N}\omega_1 + \frac{a_2}{N}\omega_2 \in E[N]\setminus\{O\}$, then
$$\operatorname{Eis}(E/\mathbb{C},x) = \Big(\sum_{m_i \in \frac{a_i}{N}+\mathbb{Z}} \frac{1}{(m_1\omega_1+m_2\omega_2)|m_1\omega_1+m_2\omega_2|^{2s}}\Big)\Big|_{s=0} du.$$

⌟

Proof: Cf.[Scholl, P389]. □

Example (22.4.1.6) [Eisenstein Sereis over Tate Curves]. Consider the Tate curve $\operatorname{Tate}(q)$ over $\mathbb{Z}[\mu_N]((q^{1/N}))$, there is a level N structure
$$(\mathbb{Z}/(N))^2 \cong \operatorname{Tate}(q)_{\mathbb{Z}[\mu_N]((q^{1/N}))}[N] : (a_1,a_2) \mapsto \zeta_N^{a_1} q^{a_2/N}.$$
Then if $x = \zeta_N^{a_1} q^{a_2/N}, 0 \leq a_1, a_2 < N$, then
$$\operatorname{Eis}(\operatorname{Tate}(q)/\mathbb{Z}[\mu_N]((q^{1/N})),x) = \begin{cases} \Big[\frac{a_2}{N} - \frac{1}{2} - \sum_{n\in\mathbb{Z}_+}\Big(\sum_{d\in\mathbb{Z}, d|n, n/d \equiv a_2 (\mathrm{mod}\ N)} \operatorname{sgn}(d)\zeta_N^{a_1 d}\Big)q^{n/N}\Big]\operatorname{dlog} t & a_2 \neq 0 \\ ? & a_2 = 0 \end{cases}$$

Similarly, we can calculate that in $\Omega^1_{\mathbb{Z}[\mu_N]((q^{1/N}))/\mathbb{Z}}$,
$$\operatorname{dlog}\vartheta_d(x) \equiv \frac{{}_d\operatorname{Eis}(\operatorname{Tate}(q)/\mathbb{Z}[\mu_N]((q^{1/N})),x)}{\operatorname{dlog} t}(a_1\operatorname{dlog}\zeta_N + a_2\operatorname{dlog}(q^{1/N}))(\mathrm{mod}\ N).$$

⌟

Proof: Cf.[Scholl, P390]. □

2 Norm Relations

Suppose $\ell \in \mathbf{P}$, and $d, d' \in \mathbb{Z}$ s.t. $(6\ell, dd') = 1$. Denote $\vartheta = \vartheta_d^{(E/S)}$ and $\vartheta' = \vartheta_{d'}^{(E/S)}$.

Prop. (22.4.2.1). If $S = Y_H$ is a modular curve of level prime to ℓ, and z, z' are torsion sections of $E/S(\ell)$ whose projections onto $E_S[\ell]$ are linearly independent, then

$$\mathrm{Nm}_{S(\ell)/S}\{\vartheta(z), \vartheta'(z')\} = (1 - T_\ell \circ \langle \ell \rangle_* + \ell \langle \ell \rangle_*)\{\vartheta(\ell z), \vartheta'(\ell z')\}.$$

⌟

Proof: Cf.[Scholl, P399]**?**. □

Prop. (22.4.2.2). Suppose Y_H is a modular curve of level prime to ℓ and z, z' are two torsion sections of $E/Y_H(\ell^m, \ell^n)$ with $m, n \in \mathbb{Z}_{\geq 2}$. If the projections of z, z' into $E_S[\ell]$ are linearly independent, then

$$\mathrm{Nm}_{Y_H(\ell^m,\ell^n)/Y_H(\ell^{m-1},\ell^{n-1})}\{\vartheta(z), \vartheta(z')\} = \{\vartheta(\ell z), \vartheta'(\ell z')\}.$$

⌟

Proof: Cf.[Scholl, P400]**?**. □

Prop. (22.4.2.3). Suppose Y_H is a modular curve of level prime to ℓ and z, z' are two torsion sections of $E/Y_H(\ell^m, \ell^n)$ with $m, n \in \mathbb{Z}_{\geq 2}$. If the projections of z, z' into $E_S[\ell]$ are linearly independent, then

$$\mathrm{tr}_{Y_H(\ell^m,\ell^n)/Y_H(\ell^{m-1},\ell^{n-1})}\left({}_d\mathrm{Eis}(z) \cdot {}_{d'}\mathrm{Eis}(z')\right) = \ell^{-2}{}_d\mathrm{Eis}(\ell z) \cdot {}_{d'}\mathrm{Eis}(\ell z')$$

$$\mathrm{tr}_{Y_H(\ell^m,\ell^n)/Y_H(\ell^{m-1},\ell^{n-1})}\left(\mathrm{KS}\left({}_d\mathrm{Eis}(z) \cdot {}_{d'}\mathrm{Eis}(z')\right)\right) = \ell^2\,\mathrm{KS}\left(\ell^{-2}{}_d\mathrm{Eis}(\ell z) \cdot {}_{d'}\mathrm{Eis}(\ell z')\right)$$

⌟

Proof: Cf.[Scholl, P401]**?**. □

3 Dual Exponentials

Notation (22.4.3.1).

- Let $p \in \mathbf{P}$, $\mathbb{Q}_p \subset_{\text{fin}} K$.
- Let $K_n = K(\mu_{p^n})$, and $\mathfrak{d}_n = \mathfrak{d}_{K_n/K}$.

⌟

Def. (22.4.3.2) [Bloch-Kato Dual Exponential Maps]. For any $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$, the **dual exponential map**

$$\exp_p^* : H^1(K, V) \to D_{\mathrm{dR}}^0(V)$$

is defined to be

$$H^1(K, V) \to H^1(K, B_{\mathrm{dR}}^0 \otimes_{\mathbb{Q}_p} V) \overset{(18.4.5.5)}{=} H^1(K, \mathrm{Fil}^0(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V))) \cong D_{\mathrm{dR}}^0(V).$$

where the last isomorphism follows from Tate's computation(18.4.1.12) and the isomorphisms $B_{\mathrm{dR}}^j / B_{\mathrm{dR}}^{j+1} \cong \mathbb{C}_K(j)$. ⌟

Example (22.4.3.3). In case that $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}/K$ and $V = H^1(X, \mathbb{Q}_p(1))$, if $D^1_{\mathrm{dR}}(V) = 0$, then the Hodge-Tate decomposition

$$\mathbb{C}_K \otimes_{\mathbb{Q}_p} V \cong \otimes_{i\in\mathbb{Z}} \mathbb{C}_K(-i) \otimes_K \mathrm{gr}^i D_{\mathrm{dR}}(V),$$

so the the dual exponential map is just

$$H^1(K,V) \to H^1(K, \mathbb{C}_K \otimes_K V) \cong H^1(K, \mathbb{C}_K) \otimes_K D^0_{\mathrm{dR}}(V) \xleftarrow{\cup \log \chi_{\mathrm{cycl}}} D^0_{\mathrm{dR}}(V).$$

⌟

Cor. (22.4.3.4). If Y be a smooth $\mathcal{O}_K$-scheme, which is a complement in a smooth proper $\mathcal{O}_K$-scheme X of a divisor Z with relatively normal crossings, define

$$H^i_{\mathrm{dR}}(Y/\mathcal{O}_K) = H^i(X, \Omega^i_{X/\mathcal{O}}(\log Z)),$$

and $V = \mathrm{H}^1_{\text{ét}}(Y_{\overline{K}}, \mathbb{Q}_p(1))$.

Then V is also de Rham, and the deRham comparison also holds?, so

$$D^{-1}_{\mathrm{dR}}(V) = D_{\mathrm{dR}}(V) = H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) \otimes_{\mathcal{O}_K} K,$$
$$D^0_{\mathrm{dR}}(V) = H^0(X, \Omega^1_{X/\mathcal{O}_K}(\log Z)) \otimes_{\mathcal{O}_K} K = \mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) \otimes_{\mathcal{O}_K} K,$$
$$D^1_{\mathrm{dR}}(V) = 0.$$

Thus by the same reasoning as in(22.4.3.3), the dual exponential map is known if we can compute the projection

$$\mathrm{pr}_1 : \mathbb{C}_K \otimes_{\mathbb{Q}_p} V \cong \mathbb{C}_K \otimes_{\mathcal{O}_K} H^0(X, \Omega^1_{X/\mathcal{O}_K}(\log Z)) \bigoplus \mathbb{C}_K(1) \otimes_{\mathcal{O}_K} H^1(X, \mathcal{O}_X) \to \mathbb{C}_K \otimes_{\mathcal{O}_K} H^0(X, \Omega^1_{X/\mathcal{O}_K}(\log Z)),$$

which is the inversion by p of the limit of the map

$$H^1_{\text{ét}}(Y_{\overline{K}}, \mu_{p^n}) \cong H^0(Y_{\overline{K}}, \mathcal{O}^*_{\overline{K}}/p^n) \xleftarrow{\cong} H^0(Y_{\mathcal{O}_{\overline{K}}}, \mathcal{O}^*/p^n) \xrightarrow{\mathrm{dlog}} H^0(X, \Omega^1_{X/\mathcal{O}_K}(\log Z)) \otimes \mathcal{O}_{\overline{K}}/p^n.$$

⌟

Proof: Cf.[Scholl, P408].? □

Explicit Reciprocity Law

Thm. (22.4.3.5). If $2 \neq p \in \mathbf{P}$, $K/\mathbb{Q}_p$ is unramified, then there exists $c \in \mathbb{N}$ s.t. for any $n \in \mathbb{Z}_+$, the following diagram

$$\begin{array}{ccc}
K_2(Y_{\mathcal{O}_{K_n}}) \otimes \mu_{p^n}^{-1} & \xrightarrow{\quad c_2 \quad} & H^2(Y_{K_n}, \mu_{p^n}) \\
\big\downarrow \mathrm{dlog} & & \big\downarrow \text{H-S} \\
H^0(X_{\mathcal{O}_{K_n}}, \Omega^2_{X_{\mathcal{O}_{K_n}}/\mathcal{O}_K}(\log Z))(-1) & & H^1(K_n, H^1(Y_{\overline{K}}, \mu_{p^n})) \\
\big\| & & \big\downarrow \mathrm{pr}_1 (\mathrm{mod}\ p^{n-1}) \\
\Omega^1_{\mathcal{O}_{K_n}/\mathcal{O}_K}(-1) \otimes \mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) & & H^1(K_n, \mathcal{O}_{\overline{K}}/p^{n-1}) \otimes_{\mathcal{O}_K} \mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) \\
\mathrm{dlog}(\zeta_{p^n}) \otimes [\zeta_{p^n}]^{-1} \mapsto 1 \big\downarrow \cong & & \big\uparrow \cup \frac{1}{p^n} \log \chi_{\mathrm{cycl}} \\
\mathcal{O}_{K_n}/\mathfrak{d}_n \otimes_{\mathcal{O}_K} \mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) & \longrightarrow & \mathcal{O}_{K_n}/p^{n-1} \otimes_{\mathcal{O}_K} \mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K)
\end{array}$$

where H-S is the Hochschild-Serre boundary map defined as in(10.1.4.15), dlog is defined in(10.1.4.12), pr_1 is defined in(22.4.3.4). ⌟

Proof: Cf.[Scholl, P410]. □

Remark (22.4.3.6). ? The assumption that $K/\mathbb{Q}_p$ is unramified is not essential for the proof. The case $p=2$ is excluded because we don't know the compatibility of the trace map in this case. ⌟

Cor. (22.4.3.7) [Kato's Explicit Reciprocity Law]. If $2\neq p\in\mathbf{P}$, $K/\mathbb{Q}_p$ is unramified, then for any $m\in\mathbb{N}$, the following diagram is commutative:

$$\begin{array}{ccc}
\varprojlim_n (K_2(Y_{\mathcal{O}_{K_n}}))\otimes\mu_{p^n}^{-1} & \xrightarrow{\text{H-S}\circ c_2} & \varprojlim_n H^1(K_n, H^1(Y_{\overline{K}},\mu_{p^n})) \\
\downarrow{\scriptstyle \mathrm{dlog}} & & \downarrow{\scriptstyle \mathrm{cor}} \\
\varprojlim_n H^0(X_{\mathcal{O}_{K_n}},\Omega^2_{X_{\mathcal{O}_{K_n}}/\mathcal{O}_K}(\log Z))(-1) & & \varprojlim_{n\geq m} H^1(K_m, H^1(Y_{\overline{K}},\mu_{p^n})) \\
\| & & \| \\
\varprojlim_n \Omega^1_{\mathcal{O}_{K_n}/\mathcal{O}_K}(-1)\otimes \mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) & & H^1(K_m, H^1(Y_{\overline{K}},\mathbb{Z}_p(1))) \\
{\scriptstyle \mathrm{dlog}(\zeta_{p^n})\otimes[\zeta_{p^n}]^{-1}\mapsto 1}\downarrow{\scriptstyle\cong} & & \downarrow{\scriptstyle \exp^*} \\
\mathcal{O}_{K_n}/\mathfrak{d}_n\otimes_{\mathcal{O}_K}\mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) & \xrightarrow{\{\frac{1}{p^n}\mathrm{tr}_{\mathcal{O}_{K_n}/\mathcal{O}_{K_m}}\}_{n\geq m}} & K_m\otimes_{\mathcal{O}_K}\mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K)
\end{array}$$

⌟

Proof: It follows from(22.4.3.4) that there is a commutative diagram

$$\begin{array}{ccc}
H^1(K_m, H^1(Y_{\overline{K}},\mathbb{Q}_p(1))) & \xrightarrow{\mathrm{pr}_1} & H^1(K_m,\mathbb{C}_K\otimes_{\mathcal{O}_K}\mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K)) \\
\downarrow{\scriptstyle \exp^*} & & \| \\
K_m\otimes_{\mathcal{O}_K}\mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K) & \xrightarrow{\cup\log\chi_{\mathrm{cycl}}} & H^1(K_m,\mathbb{C}_K)\otimes_{\mathcal{O}_K}\mathrm{Fil}^1 H^1_{\mathrm{dR}}(Y/\mathcal{O}_K)
\end{array}.$$

And also for any $n\geq m$, there exists a commutative diagram(Cf. [Scholl, P416]?)

$$\begin{array}{ccc}
\mathcal{O}_{K_n} & \xrightarrow{\frac{1}{p^n}\log\chi_{\mathrm{cycl}}} & H^1(K_n,\mathcal{O}_{\mathbb{C}_K}) \\
{\scriptstyle \frac{1}{p^{n-m}}\mathrm{tr}_{\mathcal{O}_{K_n}/\mathcal{O}_{K_m}}}\downarrow & & \downarrow{\scriptstyle \mathrm{cor}} \\
\mathcal{O}_{K_m} & \xrightarrow{\frac{1}{p^m}\log\chi_{\mathrm{cycl}}} & H^1(K_m,\mathcal{O}_{\mathbb{C}_K})
\end{array}.$$

Thus the assertion follows from(22.4.3.5) by taking limit and inverting p. ? How the check the compatibility of the limits? □

4 Rankin-Selberg Convolution

Notations

Def. (22.4.4.1). For $t\in\mathbb{Q}_p$ with $v_p(t)<0$, denote

$$\phi_p^0=\chi_{\mathbb{Z}_p\times\mathbb{Z}_p},\quad \phi_p^{1,t}=\chi_{(t+\mathbb{Z}_p)\times\mathbb{Z}_p},\quad \phi_p^{2,t}=\chi_{(t+\mathbb{Z}_p)\times\mathbb{Z}_p^*}-p^{-1}\chi_{(t+p^{-1}\mathbb{Z}_p)\times\mathbb{Z}_p^*}.$$

And for any $\varphi\in C^\infty(\mathbb{Z}_p\times\mathbb{Z}_p)$, denote $\varphi^{\mathrm{tr}}(x,y)=\varphi(y,x)$.

For $\varphi\in\mathscr{S}(\mathbf{A}_f^2)$ and $\delta\in\mathbf{I}_f$, denote $[\delta]\varphi(\underline{x})=\varphi(\delta^{-1}\underline{x})$. ⌟

Results

Notation (22.4.4.2) [Setup].

- Let $F \in S_{k+l}(\Gamma(1))$, generating an irreducible $\pi = \otimes' \pi_p$, and whose Whittaker function $A(g) = \prod A_p(g_p)$ factorizes, with $A_p(1) = 1$ for each p.?
- Let ε be the character of $GL(2, \mathbf{A}_f)$ on A^*?.
- Let $M, R, N \in \mathbb{Z}_+, (R, N) = 1, M|N$.
- If $p \nmid N$, then A_p is assumed to be $\mathcal{K}_p$-invariant.
- Let $\lambda : \mathbf{I}_f / \mathbb{Q}_+^\times \to \mathbb{C}^\times$ be unramified outside T.
- Let $N = \prod_{p \in S} p^{\nu_p}$, $M = \prod_{p \in S} p^{\mu_p}$, $R = \prod_{p \in T} p^{\nu_p}$, where if $p|N$, then $\nu_p > \mu_p \geq 0, \nu_p \geq 2$, and A_p is $\mathcal{K}_1(p^{\nu_p})$-invariant. And if $p|R$, then $\nu_p \geq \mathfrak{c}_p(\lambda)$.
- Let $y \in \mathbb{Z}$, and define $t = 1/NR, t' = 1/MR \in \mathbf{I}_f$.

⌟

Def. (22.4.4.3) [Eisenstein Series]. For $\varphi \in \mathscr{S}(\mathbf{A}_f^2)$, define the Eisenstein series

$$E_{k,s}(\varphi)(\tau, g) = \sum_{0 \neq \underline{m} \in \mathbb{Q}^2} \frac{(g\varphi)(\underline{m})}{(m_1 + m_2\tau)^k |m_1 + m_2\tau|^{2s}}.$$

And $E_k(\varphi) = E_{k,0}(\varphi, 1)$. ⌟

Def. (22.4.4.4). Denote $\varphi = \varphi_{t,t'}, \varphi' = \varphi'_{t,t'} \in \mathscr{S}(\mathbf{A}_f^2)$ s.t. the local components are given by (22.4.4.1)

$$\begin{cases} \phi_p^0 & , p \nmid NR \\ \phi_p^{1,t_p}, (\phi_p^{1,t'_p})^{\mathrm{tr}} & , p|R \\ \phi_p^{1,t_p}, \phi_p^{2,t'_p} & , p|N \end{cases}$$

⌟

Def. (22.4.4.5) [Inner Products]. ⌟

Thm. (22.4.4.6) [Rankin-Selberg Equation]. ?

$$\langle E_{l,s}(\varphi)E_k(\varphi') \otimes \overline{\lambda}, F \rangle = \frac{i^{k-1}\Gamma(k+l+s-1)}{2^{k+2l+2s-4}(k-1)!} \cdot \frac{N^{l+2s-2}R^{k+l+2s}}{\# GL(2, \mathbb{Z}/(R))} \prod_{p|R} \lambda_p(MNt_pt'_p) \prod_{p|N} (1 - \frac{1}{p^2})^{-1}$$
$$\times L_{NR}(\pi \otimes \lambda; l+k+s-1)\Big(L_N(\pi; l+s, \frac{y}{M}) + (-1)^k \lambda(-1) L_N(\pi; l+s, -\frac{y}{M})\Big)$$

⌟

Proof: Cf. [Scholl, P446]? □

Cor. (22.4.4.7). If $k = l = 1, s = 0$, then

$$\langle E_1(\varphi)E_1(\varphi') \otimes \lambda, F \rangle = 2N^{-1} \prod_{p|N} (1 - \frac{1}{p^2})^{-1} \cdot \frac{R^2}{\# GL(2, \mathbb{Z}/(R))} \prod_{p|R} \lambda_p(MNt_pt'_p)^{-1}$$
$$\times L_{NR}(\pi \otimes \lambda; 1)\Big(L_N(\pi; 1, \frac{y}{M}) - \lambda(-1) L_N(\pi; 1, -\frac{y}{M})\Big)$$

⌟

5 Euler System for Elliptic Curves(Kato)

Notation (22.4.5.1).

- Fix $p \in \mathbf{P}$.
- Fix $N \in \mathbb{Z}_+$ not divisible by p, and fix $d, d' \in \mathbb{Z}_{\geq 2}$ prime to $6Np$.
- Denote
$$\mathcal{R}'_p = \mathcal{R}(Npdd'), \quad \mathcal{R}_p = \mathcal{R}'_p \times p^{\mathbb{Z}_+}.$$

⌟

General Procedure to produce Euler system for Modular Curves

Def. (22.4.5.2) [Setup]. Suppose for each $r \in \mathcal{R}_p$, there are points $z_r, z'_r \in \mathcal{E}^{\mathrm{uni}}(Y(Nr)) \cong (\mathbb{Z}/(Nr))^2$ satisfying:

- If $r, rs \in \mathcal{R}_p$, then $sz_{rs} = z_r, sz'_{rs} = z'_r$. So we have inverse limits
$$(z_r)_r, (z'_r)_r \in \varprojlim_{r \in \mathcal{R}_p} \mathcal{E}^{\mathrm{uni}}[Nr] \cong \mathbb{Z}_p^2 \times \prod_{\ell \nmid NpDD'} \mathbb{Z}/(\ell).$$
In particular, there exists $e \in \mathbb{Z}_p^*$ s.t. if $r = r_0 p^m \in \mathcal{R}_p$, the Weil pairing
$$e_{Nr}(z_r, z'_r) = \zeta_{p^m}^{er_0^{-1}} \times (\text{prime to } p \text{ roots of } 1).?$$
- for any $r \in \mathcal{R}_p$, the points Nz_r, Nz'_r generate $\mathcal{E}^{\mathrm{uni}}[r]$.
- If $r = p^m$, then the orders of z_r, z'_r are not powers of p.

⌟

Prop. (22.4.5.3). By(22.4.1.2), item3 in the setup(22.4.5.2) ensures that z_r, z'_r doesn't meet the zero section of $\mathcal{E}^{\mathrm{uni}}/Y(Nr)$ in any characteristic. So $\vartheta_d(z_r), \vartheta_d(z'_r)$ actually belongs to $\mathcal{O}^*(Y(Nr))$.

Thus for $r \in \mathcal{R}_p$ we can define
$$\widetilde{\sigma}_r = \{\vartheta_d(z_r), \vartheta_d(z'_r)\} \in K_2(Y(Nr)),$$
$$\sigma_r = \mathrm{Nm}_{Y(Nr)/Y(N)\otimes\mathbb{Q}(\mu_r)} \widetilde{\sigma}_r \in K_2(Y(N) \otimes \mathbb{Q}(\mu_r)).$$
Then they satisfy:

- For $r \in \mathcal{R}_p$, $\mathrm{Nm}_{\mathbb{Q}(\mu_{rp})/\mathbb{Q}(\mu_r)} \sigma_{rp} = \sigma_r$.
- If $\ell \in \mathbf{P}, r, r\ell \in \mathcal{R}_p$, then
$$\mathrm{Nm}_{\mathbb{Q}(\mu_{r\ell})/\mathbb{Q}(\mu_r)} \sigma_{r\ell} = (1 - T_\ell \langle \ell \rangle_* \otimes \mathrm{Frob}_\ell^{-1} + \ell \langle \ell \rangle_* \otimes \mathrm{Frob}_\ell^{-2})\sigma_r.$$

⌟

Proof: If $\ell \nmid Nr$, then
$$\mathrm{Nm}_{Y(Nr)/Y(N)_{\mathbb{Q}(\mu_r)}} \circ T_{\ell, Y(Nr)} = (T_{\ell, Y(N)} \otimes \mathrm{Frob}_\ell) \circ \mathrm{Nm}_{Y(Nr)/Y(N)_{\mathbb{Q}(\mu_r)}},$$
$$\mathrm{Nm}_{Y(Nr)/Y(N)_{\mathbb{Q}(\mu_r)}} \circ \langle \ell \rangle_{Y(Nr)*} = (\langle \ell \rangle_{Y(Nr)*} \otimes \mathrm{Frob}_\ell^{-2}) \circ \mathrm{Nm}_{Y(Nr)/Y(N)_{\mathbb{Q}(\mu_r)}},$$
because T_ℓ acts on the constant fields by Frob_ℓ, and $\langle \ell \rangle_*$ acts by Frob_ℓ^{-2}. So the theorem follows from □

Def. (22.4.5.4). Denote $\mathbb{T}_{p,N} = H^1(\overline{Y(N)}, \mathbb{Z}_p(1))$, then for $r = r_0 p^m \in \mathcal{R}_p$, there are homomorphisms

$$\begin{array}{c} \varprojlim_{n\geq m} K_2(Y(N)_{\mathbb{Q}(\mu_{r_0p^n})}) \otimes \mu_{p^n}^{-1} \\ \downarrow \text{AJ} \\ \varprojlim_{n\geq m} H^1(\mathbb{Q}(\mu_{r_0p^n}), H^1(Y(N)_{\overline{\mathbb{Q}}}, \mu_{p^n})) \\ \downarrow \text{cor} \\ \varprojlim_{n\geq m} H^1(\mathbb{Q}(\mu_{r_0p^m}), H^1(Y(N)_{\overline{\mathbb{Q}}}, \mu_{p^n})) \\ \| \\ H^1(\mathbb{Q}(\mu_r), \mathbb{T}_{p,N}) \end{array}.$$

By(22.4.5.3), the family $\{\sigma_{r_0p^n} \otimes [\zeta_{p^n}]^{-1}, n \geq m\}$is an element of the first group above, so we get elements

$$\xi_r = \xi_r(Y(N); p, d, d', z, z') \in H^1(\mathbb{Q}(\mu_r), \mathbb{T}_{p,N})$$

And they satisfy:

- For each $r \in \mathcal{R}_p$, $\operatorname{cor}_{\mathbb{Q}(\mu_{rp})/\mathbb{Q}(\mu_r)} \xi_{rp} = \xi_r$.
- If $\ell \in \mathbf{P}, r, r\ell \in \mathcal{R}_p$, then

$$\operatorname{cor}_{\mathbb{Q}(\mu_{r\ell})/\mathbb{Q}(\mu_r)} \xi_{r\ell} = (1 - \ell^{-1} T_\ell \langle \ell \rangle_* \operatorname{Frob}_\ell^{-1} + \ell^{-1} \langle \ell \rangle_* \operatorname{Frob}_\ell^{-2}) \xi_r.$$

⌟

Proof: The operators T_ℓ and $\langle \ell \rangle$ acts functorially on the cohomology groups, and Frob_ℓ acts as ℓ on μ_{p^n}, so by the twisting, we get the desired formula. □

Prop. (22.4.5.5). For any $N \in \mathbb{Z}_{\geq 3}$, in $\Omega_{Y(N)^{\mathrm{ord}}/\mathbb{Z}} \cong \Omega^1_{Y(N)^{\mathrm{ord}}/\mathbb{Z}[\mu_N]} \otimes \Omega^1_{Z[\mu_N]/\mathbb{Z}}$,

$$\operatorname{dlog}\{\vartheta_d(z), \vartheta_{d'}(z')\} = \frac{1}{N} \mathrm{KS}_{Y(N)}({}_d \operatorname{Eis}(z) \cdot {}_{d'} \operatorname{Eis}(z')) \otimes \mathrm{d} \log e_N(z, z').$$

⌟

Proof: By q-expansion principle, it suffices to check this at cusps. If $z = \zeta_N^{a_1} q^{a_2/N}, z' = \zeta_N^{b_1} q^{b_2/N}$, then $e_N(z, z') = \zeta_N^{a_2b_1 - a_1b_2}$, and $\Omega^1_{Z[\mu_N]/\mathbb{Z}}$ is generated by $\operatorname{dlog}(\zeta_N)$ and killed by N, so the assertion follows immediately from the description of KS(20.2.5.4) and(22.4.1.6). □

Prop. (22.4.5.6). For any $r = r_0 p^m \in \mathcal{R}_p$, define

$$\widetilde{\omega_r} = \frac{1}{Nr} \mathrm{KS}_{Y(Nr)}({}_d \operatorname{Eis}(z_r) \cdot {}_d \operatorname{Eis}(z'_r)) \in H^0(X(Nr), \Omega^1(\log \mathrm{cusp})),$$

$$\omega_r = \operatorname{tr}_{X(Nr)/X(N)_{\mathbb{Q}(\mu_r)}} \in H^0(X(N)_{\mathbb{Q}(\mu_r)}, \Omega^1(\log \mathrm{cusp})).$$

Then

$$\exp_p^* \xi_r = \frac{e}{r} \omega_r \text{(22.4.5.2)(22.4.5.4)}.$$

⌟

Proof: It follows from(22.4.5.5) that

$$\operatorname{dlog}\widetilde{\sigma}_r = \widetilde{\omega}_r \otimes \operatorname{dlog} e_{Nr}(z_r, z_r')(22.4.5.3) \in H^0(X(Nr)^{\mathrm{ord}}, \Omega_{X(Nr)/\mathbb{Z}}(\log \mathrm{cusp})),$$

so after taking p-adic completion, by(22.4.5.2),

$$\operatorname{dlog}\widetilde{\sigma}_r = \frac{e}{r_0}\widetilde{\omega}_r \otimes \operatorname{dlog}(\zeta_{p^m}) \in H^0(X(Nr)^{\mathrm{ord}}, \Omega_{X(Nr)_{\mathbb{Z}_p}/\mathbb{Z}}(\log \mathrm{cusp})).$$

Taking traces to $X(N)_{\mathbb{Q}(\mu_r)}$, and use the compatibility(10.1.4.12), then

$$\operatorname{dlog}\sigma_r = \frac{e}{r_0}\omega_r \otimes \operatorname{dlog}(\zeta_{p^m}).$$

Then it follows from Kato's explicit reciprocity law(22.4.3.7),

$$\exp_p^* \xi_r = \lim_{n\to\infty} \frac{e}{r_0 p^n} \operatorname{tr}_{\mathbb{Z}_p[\mu_{p^n}]/\mathbb{Z}_p[\mu_{p^m}]}(\omega_{r_0 p^n}).$$

But by(22.4.2.3),

$$\operatorname{tr}_{Y(Nr_0p^n)/Y(Nr_0p^m)} \widetilde{\omega}_{r_0p^n} = p^{n-m}\widetilde{\omega}_{r_0p^m},$$

so

$$\operatorname{tr}_{\mathbb{Z}_p[\mu_{p^n}]/\mathbb{Z}_p[\mu_{p^m}]}(\omega_{r_0p^n}) = p^{n-m}\omega_r,$$

which implies the desired equation. □

Elliptic Curves

Def. (22.4.5.7) [Setup].

- Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has with conductor N_E and a Weil parametrization $\varphi_E : X_0(N_E) \to E$.
- Let ω_E be a differential on $E/\mathbb{Q}$ s.t. $\varphi_E^*\omega_E$ is a newform on $X_0(N_E)$.?
- Let Ω_E^+, Ω_E^- be the real and imaginary periods of ω_E.?
- Let $N \in \mathbb{Z}_+, N_E|N$, and $p \in \mathbf{P}$ be prime to $2N$.

⌟

Prop. (22.4.5.8). Situation as in(22.4.5.7), there are maps

$$f : H^1(X(N)_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) \to H^1(Y(N)_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) = \mathbb{T}_{p,N}$$

and

$$H^1(X(N)_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) \xrightarrow{\varphi_{E,N*}} H^1(E_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) = T_p(E).$$

By the proof of the Manin-Drinfeld theorem?, there is an idempotent Π_N^{cusp} in the Hecke algebra with rational coefficients s.t. for any p, it induces a left inverse to f as above. Thus for some $h_E \in \mathbb{Z}_+$ independent of p, we can define a map

$$h_E\varphi_{E,N*} \circ \Pi_{N,*}^{\mathrm{cusp}} : \mathbb{T}_{p,N} \to T_p(E).$$

⌟

Prop. (22.4.5.9) [Associated Euler System for Elliptic Curves]. For $r \in \mathcal{R}_p$(22.4.5.2), define

$$\xi_r(E) = (h_E\varphi_{E,N*} \circ \Pi_{N*}^{\text{cusp}})\xi_r(Y(N)) \in H^1(\mathbb{Q}(\mu_r), T_p(E))(22.4.5.4),$$

then $\{\xi_r(E)\}_r$ is an Euler system for $(T_p(E), \mathcal{K}, Ndd'r)$(22.1.3.2). ⌟

Proof: This follows from(22.4.5.4) and the fact $\langle \ell \rangle = 1, T_\ell = a_\ell$ on $T_p(E)$ for $\ell \in \mathbf{P} \cap \mathcal{R}_p$ by definition and the fact $f_E \in S_2(\Gamma_0(N))$.? □

Prop. (22.4.5.10). On differentials, Π_N^{cusp} is identity on cusp forms and annihilates Eisenstein forms?. Denote

$$\omega_r^{\text{cusp}} = \Pi_N^{\text{cusp}}(\omega_r) \in H^0(X(N)_{\mathbb{Q}(\mu_r)}, \Omega^1).$$

Then it follows from(22.4.5.6) and the functoriality of $\exp_p^*$ that

$$\exp_p^* \xi_r(E) = \frac{eh_E}{r}\varphi_{E,N*}(\omega_r^{\text{cusp}})(22.4.5.8).$$

⌟

The Calculation

Notation (22.4.5.11).

- Use the setup(22.4.4.2), where M, N is defined in(22.4.5.12),$R = r = r_0 p^m$ is any number in $\mathcal{R}_p$, and $\lambda : \mathbf{I}_f / \mathbb{Q}_+^\times \to \mathbb{C}^\times$ is a character with conductor dividing r.
- In particular, by(22.4.4.2)(22.4.4.4), there are elements $t, t' \in \mathbf{I}_f$, and $\varphi, \varphi' \in \mathscr{S}(\mathbf{A}_f^2)$.
- Let $\varepsilon = \lambda(-1) \in \{\pm 1\}$.
- Fix $d, d' \in \mathbb{Z}_{\geq 2}$ with $(dd', 6pN_E) = 1$, $d \equiv d' \equiv 1 (\text{mod } M)$.
- Denote
$$\delta \in \mathbf{I}_f : \delta_p = \begin{cases} d & , p | Nr \\ 1 & , \text{otherwise} \end{cases}, \quad {}_d\varphi = d^2\varphi - d[\delta]\varphi,$$
and similarly define δ' and ${}_{d'}\varphi'$.

⌟

Prop. (22.4.5.12). For any $\alpha \in \mathbb{Q}$,

$$L_{MN_E}(E, 1; \alpha) - \varepsilon L_{MN_E}(E, 1; -\alpha)$$

is a rational multiple of $\Omega_E^{-\varepsilon}$, and one can find α with denominator prime to any integer for which the expression is non-zero, by [Shimura, On the periods of modular forms]?.

Then we can find y/M.?Cf.[Scholl, P454].

And also define

$$N = \prod_{p | MN_E} p^{\nu_p}, \quad \nu_p = \max(2, v_p(N_E), v_p(M) + 1).$$

⌟

Prop. (22.4.5.13) [The function φ]. Choose $z_r \in \mathcal{E}^{\mathrm{uni}}(Y(Nr))$ to be the point which in complex coordinates is

$$\frac{1}{Nr} \in (\frac{1}{Nr}\mathbb{Z} + \frac{\tau}{Nr}\mathbb{Z})/(\mathbb{Z}+\tau\mathbb{Z}) \cong (\mathbb{Z}/(Nr))^2.$$

Then for $\ell \in \mathbf{P}, r, r\ell \in \mathcal{R}_p$, $\ell z_{r\ell} = z_r$, and

$$_d\operatorname{Eis}(z_r) = E_1(_d\varphi)\mathrm{d}u.$$

⌟

Proof: **?** Calculate using(22.4.4.3) and(22.4.1.5) and the definition of φ(22.4.4.4). □

Prop. (22.4.5.14) [The function φ']. There exists f.m. constants $b_j \in N^{-1}\mathbb{Z}$ independent of r and points $z'_{r,j} \in \mathcal{E}^{\mathrm{uni}}(Y(Nr))$, s.t.

$$\sum_j b_j \cdot {}_{d'}\operatorname{Eis}(z'_{r,j}) = E_1(_{d'}\varphi')\mathrm{d}u.$$

Moreover, for $\ell \in \mathbf{P}, r, r\ell \in \mathcal{R}_p$, $\ell z_{r\ell,j} = z_{r,j}$, and $z'_{r,j} - z'_{r,i}$ are N-torsion. And in complex coordinates,

$$Nz'_{r,j} = (-Nt'(\mathrm{mod}\ \widehat{\mathbb{Z}}))\tau \in (\frac{1}{r}\mathbb{Z} + \frac{1}{r}\tau)/(\mathbb{Z}+\tau\mathbb{Z}) \cong (\mathbb{Z}/(r))^2.$$

So

$$e_{Nr}(z_r, z'_{r,j}) = \zeta_{p^m}^{-(Mr_0)^{-1}} \times (\text{prime to } p \text{ roots of } 1),$$

so $e_{z,z'_j} = -M^{-1}$(22.4.5.2). ⌟

Proof: Cf.[Scholl, P456]**?**. □

Thm. (22.4.5.15)[Final Construction and Calculation]. Let $\xi_{r,j}(E)$ be the Euler system for $T_p(E)$ associated to $(z_r, z_{r,j})$(22.4.5.9) in the setup(22.4.5.7), then define a new Euler system

$$c_r = \sum_j b_j \xi_{r,j}(E) \in H^1(\mathbb{Q}(\mu_r), T_p(E)).$$

Then this Euler system satisfies the requirement of(22.4.5.16). ⌟

Proof: Let $\widetilde{\omega}_{r,j}$ be the differential associated to $(z_r, z_{r,j})$(22.4.5.6), then because the Kodaira-Spencer map takes $(\mathrm{d}\log t)^2$ to $\mathrm{d}\log q$, so it takes $\mathrm{d}u^2$ to $(2\pi\,\mathrm{i})^{-1}\mathrm{d}\tau$. Thus

$$\sum_j b_j\widetilde{\omega}_{r,j} = \frac{(2\pi\,\mathrm{i})^{-1}}{Nr}E_1(_d\varphi)E_1(_{d'}\varphi')\mathrm{d}\tau.$$

Then for any character $\lambda : \operatorname{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q}) \cong (\mathbb{Z}/(r))^* \to \mathbb{C}^\times$,

$$\sum_{\gamma\in\operatorname{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q})} \lambda(\gamma)\exp_p^* c_r^\gamma = \sum_j b_j \sum_{\gamma\in\operatorname{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q})} \lambda(\gamma)\exp_p^*\xi_{r,j}(E)^\gamma$$

$$\text{(22.4.5.10)} = \sum_j b_j \sum_{x\in(\mathbb{Z}/(r))^*} \lambda(x)\frac{-M^{-1}h_E}{r}\iota_x\varphi_{E,N*}(\omega_{r,j}^{\mathrm{cusp}})$$

where $\iota_x : \mathbb{Q}(\mu_r) \hookrightarrow \mathbb{C}$ is the injection that maps ζ_r to $e^{2\pi \mathrm{i}\, x/r}$. Then it equals

$$\begin{aligned}
&\frac{-M^{-1}h_E}{r}\sum_j b_j \frac{\int_{E^{\mathrm{an}}}\sum_{x\in(\mathbb{Z}/(r))^*}\lambda(x)\iota_x\varphi_{E,N*}(\omega^{\mathrm{cusp}}_{r,j})\wedge\overline{\omega}_E}{\int_{E^{\mathrm{an}}}\omega_E\wedge\overline{\omega}_E}\omega_E\\
&=\frac{-h_E}{Mr\Omega_E^+\Omega_E^-}\Big(\sum_j b_j\int_{Y(N)^{\mathrm{an}}\times(\mathbb{Z}/(r))^*}\lambda(x)\iota_x\omega^{\mathrm{cusp}}_{r,j}\wedge\varphi^*_{E,N}\overline{\omega}_E\Big)\omega_E\\
&=\frac{-h_E}{Mr\Omega_E^+\Omega_E^-}\Big(\sum_j b_j\int_{Y(N)^{\mathrm{an}}\times(\mathbb{Z}/(r))^*}\lambda(x)\iota_x\omega_{r,j}\wedge\varphi^*_{E,N}\overline{\omega}_E\Big)\omega_E\\
&=\frac{-h_E}{Mr\Omega_E^+\Omega_E^-}\Big(\sum_j b_j\int_{Y(Nr)}(\lambda\circ e_{Nr})\widetilde{\omega}_r\wedge\varphi^*_{E,N}\overline{\omega}_E\Big)\omega_E\\
?&=\frac{-h_E\#\,\mathrm{GL}(2,\mathbb{Z}/(Nr))}{MNr^2\Omega_E^+\Omega_E^-}\langle E_1({}_d\varphi)E_1({}_{d'}\varphi')\otimes\lambda, F\rangle\omega_E
\end{aligned}$$

where $e_{Nr} : Y_{Nr}(\mathbb{C}) \to \mu_N(\mathbb{C})$ is the Weil pairing.

Using(22.4.4.7) and the facts $\mathfrak{c}(\lambda)|r$ and $d \equiv d' \equiv 1(\mathrm{mod}\ \ M)$, it equals?

$$\frac{C_{E,M}}{\Omega_E^+\Omega_E^-}DD'(D-\chi^{-1}(D))(D'-\chi^{-1}(D'))L_{rMN_E}(E,\chi;1)\Big(L_{MN_E}(\pi;1,\frac{y}{M})-\lambda(-1)L_{MN_E}(\pi;1,-\frac{y}{M})\Big)\omega_E$$

Where $C_{E,M}$ only depends on E and M.(Notice N only depends on E and M(22.4.5.12)).

Then by the choice of y/M(22.4.5.12), depending on $\lambda(-1) = \pm 1$, it equals

$$C^{\pm}_{E,M}DD'(D-\chi^{-1}(D))(D'-\chi^{-1}(D'))\frac{L_{rMN_E}(E,\chi;1)}{\Omega_E^{\pm}}\omega_E,$$

where $C^{\pm}_{E,M}$ only depends on E and M. □

Conclusions

Thm. (22.4.5.16) [Kato]. Situation as in(22.4.5.7), then there exists $M \in \mathbb{Z}_+$ prime to p s.t. for any $d, d' \in \mathbb{Z}_{\geq 2}$ with $(dd', 6pN_E) = 1$, $M|d-1, M|d'-1$, there is an Euler system

$$\overline{\mathbf{c}} = \{\overline{\mathbf{c}}_r(E,p,d,d') \in H^1(\mathbb{Q}(\mu_r), T_p(E)), \quad r = r_0p^m, m \geq 1, r_0 \in \mathcal{R}(pMN_E)\}.$$

satisfying: For any $r \in \mathcal{R}_p$ and $\chi : \mathrm{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q}) \cong (\mathbb{Z}/(r))^* \to \mathbb{C}^*$, with $\chi(-1) = \pm 1$,

$$\sum_{\gamma\in\mathrm{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q})}\chi(\gamma)\exp_p^*\overline{\mathbf{c}}_r^{\gamma} = C_E^{\pm}DD'(D-\chi^{-1}(D))(D'-\chi^{-1}(D'))L_{rMN_E}(E,\chi;1)/\Omega_E^{\pm}.$$

⌟

Proof: This follows from(22.4.5.15). □

24.1 Computational Number Theory

References are [Princeton Companion] and [Pi and the AGM. A study in Analytic Number theory and computational complexity].

1 Primality Testing

Algo. (24.1.1.1) [AKS Primality Proving]. Consider the following algorithm:

Input: An integer $n \in \mathbb{Z}_{\geq 2}$
Output: `PRIME` or `COMPOSITE`

1. **if** $n = a^b$ *for some* $a \in \mathbb{Z}_+, b \in \mathbb{Z}_{\geq 2}$ **then return** `COMPOSITE`;
2. `Find` the smallest number r s.t. $\mathrm{ord}_r(n) > \log^2 n$;
3. **if** $1 < \gcd(a, n) < n$ *for some* $a \leq r$ **then return** `COMPOSITE`;
4. **if** $n \leq r$ **then return** `PRIME`;
5. **for** $a \leftarrow 1$ **to** $\lfloor \sqrt{\varphi(r) \log n} \rfloor$ **do**
   if $(X + a)^n \not\equiv X^n + a (\mathrm{mod}\ \ (X^r - 1, n))$ **then return** `COMPOSITE`;
6. **return** `PRIME`;

Then for any input $n \in \mathbb{Z}_+$, this algorithm returns `PRIME` iff $n \in$ `Prime`. And its asymptotic time complexity is $\widetilde{O}(\log^{15/2} n)$.

In particular, deciding the language `Prime` $\subset \mathbb{N}$ is in the class P(2.7.4.1). ⌟

Remark (24.1.1.2) [Lenstra and Pomerance, Primality testing with gaussian periods]. has an improvement that has ⌟

Proof: To prove the algorithm is correct: Notice if n is prime, then it can only return prime. And the converse is proved in(24.1.1.3).

To analyze the asymptotic time complexity, we use [Modern Computer Algebra].

The first step of the algorithm takes asymptotic time $\widetilde{O}(\log^3 n)$.

For the second step, use(21.4.11.4). To find such an r, we check for each $r < \log^{3+\varepsilon}$ and each $k < \log^2 n$ whether $r | n^k - 1$. For each r, the complexity is $\widetilde{O}(\log^2 n \log r)$, so the asymptotic complexity is $\widetilde{O}(\log^5 n)$.

The third step takes asymptotic time $O(\log^6 n)$.

The fourth step takes asymptotic time $O(\log n)$.

In step 5, we need to verify $\lfloor\sqrt{\varphi(r)\log n}\rfloor$ equations, each equation requires $O(\log n)$ multiplications of degree r polynomials with coefficients of size $O(\log n)$. So the asymptotic time is

$$\widetilde{O}(r\log^2 n\sqrt{\varphi(r)\log n}) \le \widetilde{O}(r^{3/2}\log^3 n) \le \widetilde{O}(\log^{15/2} n).$$

Thus the total asymptotic time is $\widetilde{O}(\log^{15/2} n)$. □

Lemma (24.1.1.3). If the AKS algorithm in(24.1.1.1) returns `PRIME`, then n is a prime. ⌟

Proof: If it returns at step 4, then step3 implies that n is a prime. So we assume that it returns at step6. Since $\operatorname{ord}_r(n) > 1$, there exists $p|n$ s.t. $\operatorname{ord}_r(p) > 1$. By step3, $p > r$ and $(r, n) = 1$.

Let G be the subgroup of $(\mathbb{Z}/r)^*$ generated by n and p, with $\#G > \log^2 n$. And denote $\zeta = \zeta_{\operatorname{ord}_r(p)}$ and let $\mathcal{G}$ be the subgroup of $\mathbb{F}_p(\zeta)$ generated by $\zeta, \zeta+1, \ldots, \zeta + \lfloor\sqrt{\varphi(r)\log n}\rfloor$. Then

$$\begin{aligned}
\#\mathcal{G} &\overset{(24.1.1.4)}{\geq} \binom{\#G + \lfloor\sqrt{\varphi(r)\log n}\rfloor}{\#G - 1} \\
(\because \#G > \sqrt{\#G}\log n) &\geq \binom{\lfloor\sqrt{\varphi(r)\log n}\rfloor + 1 + \lfloor\sqrt{\#G\log n}\rfloor}{\lfloor\sqrt{\#G\log n}\rfloor} \\
&\geq \binom{2\lfloor\sqrt{\#G\log n}\rfloor + 1}{\lfloor\sqrt{\#G\log n}\rfloor} \\
(11.6.1.14) &> 2^{\lfloor\sqrt{\#G\log n}\rfloor + 1} \\
&\geq n^{\sqrt{\#G}}.
\end{aligned}$$

But then by(24.1.1.4), $n \in p^{\mathbb{Z}_+}$. So in view of step1, $n = p \in$ `Prime`. □

Lemma (24.1.1.4). Let $G, \mathcal{G}$ be the group defined in the proof of(24.1.1.3), then

$$\#\mathcal{G} \geq \binom{\#G + \sqrt{\varphi(r)\log n}}{\#G - 1}.$$

And if $n \notin p^{\mathbb{Z}_+}$, then $\#\mathcal{G} \leq n^{\sqrt{\#G}}$. ⌟

Proof: By the hypothesis, n passed step4, so any $0 \le a \le \sqrt{\varphi(r)\log n}$,

$$(X+a)^n \equiv X^n + a(\bmod\ X^r - 1, p),$$

so

$$(X+a)^{\frac{n}{p}} \equiv X^{\frac{n}{p}} + a(\bmod\ X^r - 1, p).$$

More generally, for any $m \in I = \{(\frac{n}{p})^i p^j : i, j \in \mathbb{N}\}$ and any polynomial

$$f(X) \in P = \{\prod_{a=0}^{\lfloor\sqrt{\#G\log n}\rfloor} (X+a)^{e_a} : e_a \in \mathbb{N}\},$$

we have

$$f(X)^m \equiv f(X^m)(\bmod\ X^r - 1, p).$$

Then we claim that any two polynomials in P with degree$< \#G$ will be distinct elements in $\mathbb{F}_p(\zeta)$: If $\overline{f} = \overline{g}$, then for each $m \in G$, $f(\zeta^m) \equiv g(\zeta^m)$, so f and g are equal on $\#G$ values. This forces $f \equiv g(\text{mod } p)$. But this is not possible as $i \not\equiv j(\text{mod } p)$ for $i, j \leq \lfloor\sqrt{\#G \log n}\rfloor < \sqrt{r \log n} < r < p$.

Then by combinatorics, $\#\mathcal{G} \geq \binom{\#G+\sqrt{\varphi(r)\log n}}{\#G-1}$.

For the upper bound, consider the subset $I' = \{(\frac{n}{p})^i p^j : 0 \leq i, j \leq \sqrt{\#G}\}$. If $n \notin p^{\mathbb{Z}_+}$, then $\#I' > \#G$, so there are two elements $m_1, m_2 \in I'$ s.t. $r | m_1 - m_2$. Then $f(\zeta)^{m_1} = f(\zeta^{m_1}) = f(\zeta^{m_2}) = f(\zeta)^{m_2}$ for any $f(X) \in P$. Then $f(\zeta)$ is a root of the polynomial $X^{m_1} - X^{m_2}$, which has degree$\leq n^{\sqrt{\#G}}$. In view of the fact $\mathcal{G}$ is the values of polynomials in P at ζ, we have $\#\mathcal{G} \leq n^{\sqrt{\#G}}$. □

1 Polytopes

Def. (25.1.1.1) [Polytopes]. A n-**polytope** is a compact subset of $\mathbb{R}^n$ for some $n \in \mathbb{Z}$ with boundaries given by polytopes of smaller dimensions. A **polygon** is a 2-polytope. A **polyhedron** is a 3-polytope. ⌟

Def. (25.1.1.2) [Tetrahedra]. A **tetrahedron** is an 3-simplex in $\mathbb{R}^3$. ⌟

Def. (25.1.1.3) [Orthohedra]. An **orthohedron** is a tetrahedron isomorphic to the convex hull of the four points

$$\{(0,0,0),(x,0,0),(x,y,0),(x,y,z)\} \in \mathbb{R}^3.$$

⌟

Prop. (25.1.1.4) [Dihedral Angles of Orthohedra].

- Each orthohedron has dihedral angles $(\alpha,\beta,\gamma,\pi/2,\pi/2,\pi/2)$.
- A rectangular solid can be cut into 6 orthohedra sharing a common diagonal. And for any $\alpha,\beta,\gamma \in (0,\pi), \alpha+\beta+\gamma=\pi$, there is a rectangular solid that can be cut into 6 orthohedra s.t. the dihedral angles along the diagonal are $(\alpha,\beta,\gamma,\alpha,\beta,\gamma)$.

⌟

Proof: Only 2 needs a proof, and this is verified by brutal force calculations. □

2 Hilbert's 3rd Problem

Cf.[Sch13b].

Def. (25.1.2.1) [Scissors Congruence]. A **dissection of a polytope** P is an expression $P = \cup_i^n P_i$ s.t. the interiors of P_i are disjoint.

Two polytopes P, Q are called **scissors-congruent** if there are dissections $P = \cup_i^n P_i, Q = \cup_i^n Q_i$ s.t. $P_i \cong Q_i$ for $1 \le i \le n$. Scissors congruence relations are denoted by $\sim_s$. ⌟

Thm. (25.1.2.2) [Wallace-Bolyai-Gerwien]. Any two polygons P, Q in $\mathbb{R}^2$ are scissors-congruent. ⌟

Proof: Find a line l that is not parallel to any line generated by vertices of P and Q, cut P, Q through lines parallel to l and passing through some vertices of O, Q. Then we get some trapezoids. Then we cut them into right triangles.

Now we transform any right triangle P with vertices $\{A = (-0, 0), B = (0, 2b), C = (0, c)\}$ to a triangle triangle of height 2: Now consider another right triangle with vertices $\{A = (-0, 0), X = (0, 2), Y = (0, bc)\}$. Then $BY//CX$, thus BYC and BYX are triangles of the same base and height.

Then $BYC \sim_s BYX$: cut them into parallelograms with the same base and height, then it is easy to see any two such parallelograms are scissor-congruent.

Now all the triangles has a side of length2, we can transform them into rectangles with a side of length1. Then clearly P, Q are transformed together. □

Thm. (25.1.2.3) [Zylev]. If P, A, B are polytopes, $A \subset P, B \subset P$, $P\backslash A \sim_s P\backslash B$, then $A \sim_s B$. ⌟

Proof: Let

$$F = A \coprod \coprod_{k=1}^{n} P_k = B \coprod \coprod_{k=1}^{n} Q_k, P_k \sim_s Q_k$$

We can dissect them even further s.t. $\mathrm{Vol}(P_k) < \frac{1}{2}\mathrm{Vol}(A)$. Then we use induction on n to show that $A \sim_s B$: $n = 0$ is trivial. For $n > 0$, because of the volume bound, $\mathrm{Vol}(A\backslash Q_n) > \mathrm{Vol}(Q_n)$, thus we can find disjoint $T_1, \ldots, T_n \subset A\backslash Q_n$ s.t. $T_k \sim_s P_k \cap Q_n$. Now define

$$F' = F\backslash Q, P_k' = (P_k\backslash Q_n) \cup T_k \sim_s P_k, \quad A' = F' \backslash \bigcup_{k=1}^{n-1} P_k' = (A\backslash \bigcup_{k=1}^{n-1} T_k) \bigcup_{k=1}^{n-1} Q_k$$

Then by induction, $A' \sim_s B' = B$. But $A' \sim_s A$ by changing T_k with Q_k. □

Dehn-Sydler Theorem

Prop. (25.1.2.4) [Tetrahedra]. Any polyhedron has a dissection into tetrahedra. ⌟

Proof: By choose a sufficiently small lattice dissection of $\mathbb{R}^3$, it suffices to consider three cases:

- A cube.
- A cube cut by one hypersurfaces.
- A cube cut by two hypersurfaces.
- A cube containing a single vertex.

All cases are straightforward. □

Def. (25.1.2.5) [Dehn Invariants]. For a polyhedron P, define the **Dehn invariant** of P as

$$\Delta(P) = \sum_i l_i[\alpha_i] \in \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi)$$

where the sum is over all edges e_i, of P, $l_i = l(e_i)$, and α_i is the dihedral angles of e_i. ⌟

Thm. (25.1.2.6) [Dehn]. If two polyhedra in $\mathbb{R}^3$ are scissors-congruent, then they have the same volume and Dehn invariants. ⌟

Proof: The volumes are the same by the invariance properties of Lebesgue measure. To show the Dehn invariants are the same, notice the dissections of a polytope P may create new edges, but the sum of angles around a new edge is 2π for if it is contained in the interior of P, or π if it is in the surface of P. □

Def. (25.1.2.7) [Simple Prisms]. A **simple prism** is a polyhedron that is isomorphic to an affine translate of $T \times I \subset \mathbb{R}^2 \times \mathbb{R}$, where $T \subset \mathbb{R}^2$ is a triangle. ⌟

Prop. (25.1.2.8). A simple prism P is scissors-congruent to $[0,1]^2 \times [0, \mathrm{Vol}(P)]$. ⌟

Proof: Place the three edges P_1Q_1, P_2Q_1, P_3Q_3 that is the image of Vertices$(T) \times I$ vertically, and they have length l. Then we can talk about the **heights** of P_i, Q_i. Suppose $h(P_1) \geq h(P_2) \geq h(P_3)$. If $h(P_3) \geq h(Q_1)$, then we can cut P along height $h(Q_1)$ make P scissors-congruent to a perfect simple prism $P' = T' \times I'$. If $h(P_3) < h(Q_1)$, then we can cut P along the plane $P_2P_3Q_1$ to make $P \sim_s P'$, where for P', $h(P_3') - h(Q_1')$ is larger. And if this process goes on, every 2 transform makes $h(P_3) - h(Q_1)$ bigger by at least l, so eventually $h(P_3) \geq h(Q_1)$, and we can transform it to a perfect simple prism.

Now if $P = T \times I$ is a perfect simple prism, (25.1.2.2) shows T is scissors equivalent to $[0,1] \times [0, \mathrm{Vol}(T)]$, and then it suffices to show $[0, \mathrm{Vol}(T)] \times I$ is scissors equivalent to $[0, \mathrm{Vol}(P)]$, which is by(25.1.2.2) again. □

Def. (25.1.2.9) [pseudo-prisms]. A **pseudo-prisms** is a convex polyhedra $(OPQRS)$, where

- OPQ is is an isosceles with $OP = PQ$,
- PR, QS is orthogonal to the plane OPQ,
- $l(QS) = 2l(PR)$.

Notice a pseudo-prism $(OPQRS)$ is scissors-congruent to the perfect simple prism $OPQ \times PR$. ⌟

Def. (25.1.2.10). Denote

- $\mathcal{P}$ the free Abelian group generated by isomorphism classes of all polyhedra.
- $\mathcal{E}$ the subgroup of $\mathcal{P}$ generated by the dissection relations.
- $\mathcal{F}$ is the subgroup of $\mathcal{P}$ generated by $\mathcal{E}$ and all the simple prisms(25.1.2.7).
- $\mathcal{V} = \mathcal{P}/\mathcal{F}$.

Then clearly two polyhedra P, Q are scissors-congruent iff $[P] = [Q] \in \mathcal{P}/\mathcal{E}$. ⌟

Prop. (25.1.2.11)[$\mathbb{R}$-Structures]. $\mathbb{R}$ acts on the set of polyhedra by scaling, and this action is additive and multiplicative, and stablizes $\mathcal{F}$, thus inducing an $\mathbb{R}$-structure on $\mathcal{V}$. ⌟

Proof: By(25.1.2.4), $\mathcal{P}$ is generated by tetrahedra. So it suffices to show that for $\lambda_1, \lambda_2 \in \mathbb{R}_+$ and a tetrahedron T, $[\lambda_1 T] + [\lambda_2 T] - [(\lambda_1 + \lambda_2)T] \in \mathcal{F}$. For this, use geometry, notice $(\lambda_1 + \lambda_2)T \backslash (\lambda_1 T \cup \lambda_2 T)$ consists of two simple prisms, where these two smaller tetrahedra aligned along an edge of T. □

Prop. (25.1.2.12) [Orthohedra]. $\mathcal{V}$ is generated by orthohedra(25.1.1.3). ⌟

Proof: By(25.1.2.4), it suffices to show that for any tetrahedron T, $[T]$ is a linear combinations of orthohedra. For this, take the center I of the inscribed circle of T, and take its projections I_1, I_2, I_3, I_4 to the faces of T, then they form 24 orthohedra(may be degenerate ones). Thus T is a linear combinations of those non-degenerate orthohedra. □

Prop. (25.1.2.13). A simple primes P has Dehn invariant $\Delta(P) = 0$(25.1.2.14) and(25.1.2.8), so by(25.1.2.8) again, Δ factors through $\Delta : \mathcal{V} \to \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi)$, which is $\mathbb{R}$-linear with $\mathbb{R}$-structure on $\mathcal{V}$ given in(25.1.2.11). ⌟

Thm. (25.1.2.14) [Dehn-Sydler]. Two polyhedra in $\mathbb{R}^3$ are scissors-congruent iff they have the same volume and Dehn invariants. ⌟

Proof: One direction is shown in(25.1.2.6). For the other, it suffices to show this map $\Delta : \mathcal{V} = \mathcal{P}/\mathcal{F} \to \mathbb{R}\otimes(\mathbb{R}/\mathbb{Z}\pi)$(25.1.2.13) is injective, because in this way, if two polyhedra has the same volume and Dehn invariants, then they are scissors equivalent to two prisms with the same volume, hence scissors-congruent, by(25.1.2.8).

Take a good function $\varphi : \mathbb{R} \to \mathcal{V}$(25.1.2.24). φ vanishes on $\mathbb{Z}\pi$, thus extends to an $\mathbb{R}$-linear map $\Phi : \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi) \to \mathcal{V}$, and for an orthohedron T, $\Phi(\Delta([T])) = [T]$ by(25.1.2.15), and orthohedra generate $\mathcal{V}$ by(25.1.2.12), so $\Phi \circ \Delta = \mathrm{id}_{\mathcal{V}}$. Thus Δ is injective. □

Homological Arguments

Def. (25.1.2.15) [Good Functions]. A map $\varphi : \mathbb{R} \to \mathcal{V}$ is called a **good function** if
- φ is additive and $\varphi(\pi) = 0$.
- For any orthohedron T, $[T] = \sum_{i=1}^{6} l_i\varphi(\alpha_i)$, where the notation is the same as in(25.1.2.5).

⌟

Def. (25.1.2.16) [$T(a, b)$]. For $a, b \in (0, 1)$, define $a' = \sqrt{a^{-1} - 1}, b' = \sqrt{b^{-1} - 1}$, and define $T(a, b)$ to be the orthohedron with vertices

$$\{(0, 0, 0), (a', 0, 0), (a', a'b', 0), (a', a'b', b')\} \in \mathbb{R}^3.$$

Notice $T(a, b) \cong T(b, a)$.

The order of the vertices is also important. It is always assumed to be written in this order. ⌟

Prop. (25.1.2.17). For $\alpha, \beta \in \mathbb{R}$, $T(\sin^2(\alpha), \sin^2(\beta))$ has three edges with dihedral angle $\pi/2$, and three edges with lengths $\cot(\alpha), \cot(\beta), \cot(\gamma)$ and dihedral angles $(\alpha, \beta, \pi/2 - \gamma)$ resp., where $\sin^2(\gamma) = ab, \gamma \in (0, \pi/2)$. In particular,

$$\Delta(T(\sin^2(\alpha), \sin^2(\beta))) = \cot(\alpha) \otimes \alpha + \cot(\beta) \otimes \beta + \cot(\gamma) \otimes (\pi/2 - \gamma).$$

⌟

Proof: Brutal force calculation. □

Prop. (25.1.2.18). For $a, b, c \in \mathbb{R}_+$,

$$a[T(\frac{a+b}{a+b+c}, \frac{a}{a+b})] + b[T(\frac{a+b}{a+b+c}, \frac{b}{a+b})] = a[T(\frac{a+c}{a+b+c}, \frac{a}{a+c})] + c[T(\frac{a+c}{a+b+c}, \frac{c}{a+c})]$$

⌟

Proof: This follows from the different ways of cutting the tetrahedron with vertices

$$\{O = (0, 0, 0), X = (\sqrt{bc}, 0, 0), Y = (0, \sqrt{ac}, 0), Z = (0, 0, \sqrt{ab})\} \in \mathbb{R}^3.$$

In fact, for this tetrahedron, the plane orthogonal to YZ passing through X cut this to two orthohedra, and similar does the plane orthogonal to XZ passing through Y. These two cutting give the assertion above. □

Def. (25.1.2.19) [Homological Functions]. A **homological function** is a function $h : (0, 1) \to \mathcal{V}$ s.t.
- For $a, b \in (0, 1), [T(a, b)] = h(a) + h(b) - h(ab)$.

- If $a, b \in (0,1), a+b=1$, then $ah(a)+bh(b)=0$.

⌟

Prop. (25.1.2.20). For $V \in \mathcal{V}\mathrm{ect}/\mathbb{R}$, if $g : \mathbb{R}_+ \to V$, define $\delta(g)(a,b) = g(a)+g(b)-g(ab)$. And if $F : \mathbb{R}_+^2 \to V$, define $\delta(F)(a,b,c) = F(a,b) - F(a,c) + F(ab,c) - F(ac,b)$.

Then if $F : (0,1) \to V$ is symmetric and $\delta(F) = 0$, then $F = \delta(f)$ for some $f : (0,1) \to V$. ⌟

Proof: Cf.[Sch13b]. □

Prop. (25.1.2.21). Let $G : \mathbb{R}_+^2 \to V$ be a symmetric function satisfying

- $G(\lambda a, \lambda b) = \lambda G(a,b), \lambda, a, b \in \mathbb{R}_+$,
- $G(a,b) + G(a+b,c) = G(a,c) + G(a+c,b)$.

Then there exists a homomorphism $g : \mathbb{R}_+^\times \to V$ s.t. when $a+b=1$,

$$G(a,b) = ag(a) + bg(b).$$

⌟

Proof: Cf.[Sch13b]. □

Prop. (25.1.2.22)[Sydler]. Let $F : (0,1)^2 \to \mathcal{V} : (a,b) \mapsto [T(a,b)]$, then F is symmetric, and $\delta(F) = 0$. ⌟

Proof: We check that $[T(a,b)] + [T(ab,c)] = [T(a,c)] + [T(ac,b)]$. This is done by geometry:

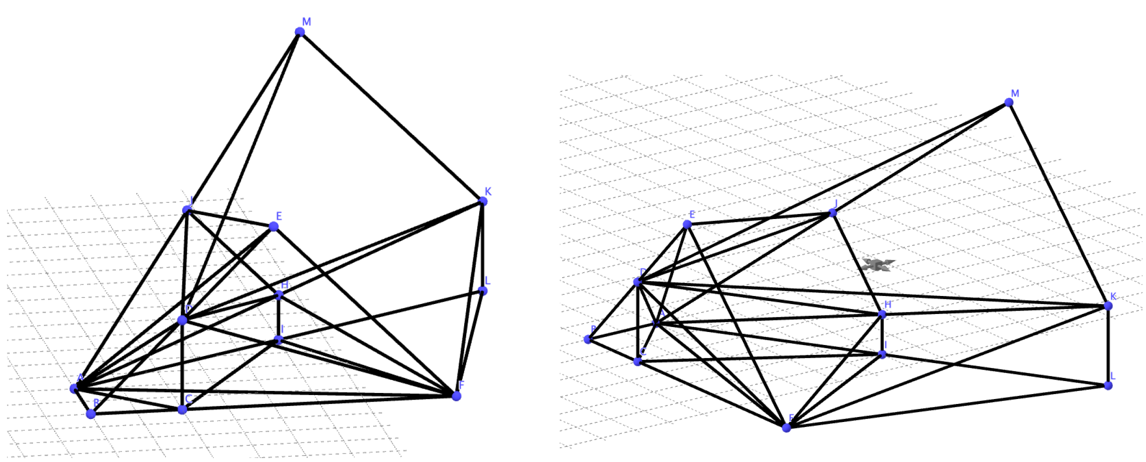
Put $T(a,b), T(a,c)$ together: $T(a,b) \cong ABCD, T(a,c) \cong ABEF$, where BDE is collinear. Let H be the center of the sphere S passing through $ACDEF$, and the projection of H on the planes ABC, ABD is denoted by I, J resp. Let K, L, M be the intersection of AH, AI, AJ with the sphere S resp.

Then it can be verified that $T(ab,c) \cong ANMK, T(ac,b) \cong AFLK$. Let $P = ABDFHI + ADHJ$, then

$$P - (AICHD) - (FICHD) + (DJMHK) = T(a,b) + T(ab,c).$$

$$P + (DJEHF) - (AJEHF) + (FILHK) = T(a,c) + T(ac,b).$$

□



Cor. (25.1.2.23). Homological functions(25.1.2.19) exist. ⌟

Proof: By(25.1.2.20), there exists $f : (0,1) \to \mathcal{V}$ s.t. $F(a,b) = [T(a,b)] = f(a) + f(b) - f(ab)$. Then we want to find $h = f - g$, where $g : (0,1) \to \mathcal{V}$ is a homomorphism s.t. when $a + b = 1$, $ah(a) + bh(b) = 1$, which is equivalent to

$$ag(a) + bg(b) = af(a) + bf(b).$$

Let

$$G : \mathbb{R}_+^2 \to \mathcal{V} : (a,b) \mapsto af(\frac{a}{a+b}) + bf(\frac{b}{a+b}),$$

then $G(\lambda a, \lambda b) = \lambda G(a,b), \lambda, a, b \in \mathbb{R}_+$, and $G(a,b) + G(a+b,c) = G(a,c) + G(a+c,b)$. In fact, this boils down to(25.1.2.18). Thus by(25.1.2.21), we truly can find such a function g. □

Prop. (25.1.2.24). Good functions(25.1.2.15) exist. ⌟

Proof: Take a homological function h(25.1.2.23), define $\varphi : \mathbb{R} \to \mathcal{V}$:

$$\varphi(\frac{n\pi}{2}) = 0, \quad n \in \mathbb{Z}, \quad \varphi(\alpha) = \tan(\alpha)h(\sin^2(\alpha)).$$

We show this is a good function:

Firstly we show:

Lemma (25.1.2.25). $\varphi(\pi/2 - \alpha) = -\varphi(\alpha), \varphi(\alpha + \pi/2) = \varphi(\alpha)$. ⌟

Proof: If $\alpha = n\pi/2$, the assertion holds. So we assume $\alpha \neq n\pi/2$ and let $\beta = \pi/2 - \alpha, a = \sin^2(\alpha), b = \sin^2(\beta)$, then $a + b = 1$, so by definition(25.1.2.19),

$$\begin{aligned} 0 = 2ah(a) + abh(b) &= 2\sin^2(\alpha)\cot(\alpha)\varphi(\alpha) + 2\sin^2(\beta)\cot(\beta)\varphi(\beta) \\ &= \sin(2\alpha)\varphi(\alpha) + \sin(2\beta)\varphi(\beta) = \sin(2\alpha)(\varphi(\alpha) + \varphi(\beta)) \end{aligned}$$

So the assertion holds as $\sin(2\alpha) \neq 0$.

The second equality follows from the first. □

Next, we show $[T] = \sum_{i=1}^6 l_i\varphi(\alpha_i)$ for a orthohedron T: By scaling, it suffices to prove for T of the form $T(\sin^2(\alpha), \sin^2(\beta))$(25.1.2.16). Thus by(25.1.2.19) and(25.1.2.17),

$$\begin{aligned} [T(\sin^2(\alpha), \sin^2(\beta))] &= h(\sin^2(\alpha)) + h(\sin^2(\beta)) - h(\sin^2(\alpha)\sin^2(\beta)) \\ &= \cot(\alpha)\varphi(\alpha) + \cot(\beta)\varphi(\beta) + \cot(\gamma)\varphi(\pi/2 - \gamma) = \sum_{i=1}^6 l_i\varphi_i(\alpha_i) \end{aligned}$$

Finally, to show additivity of φ, notice by the lemma above, it suffices to show $\varphi(\alpha) + \varphi(\beta) = \varphi(\alpha + \beta)$ for $\alpha, \beta \in (0, \pi/2)$. In this case, let $\gamma = \pi - \alpha - \beta \in (0, 2\pi)$, then use(25.1.1.4) to find a rectangular solid that cuts along a diagonal to 6 orthohedra T_i s.t. the dihedral angles along the diagonals are $(\alpha, \beta, \gamma, \alpha, \beta, \gamma)$. Then

$$0 = [R] = \sum_{k=1}^6 [T_i] = 2l(\varphi(\alpha) + \varphi(\beta) + \varphi(\gamma)) + \sum_{k=1}^6 l_k(\varphi(\theta_{k1}) + \varphi(\theta_{k2}))$$

where l is the length of the diagonal, θ_{k_i} are the dihedral angles along the edges of the rectangular solid that is connected to the diagonal, and $\theta_{k_1} + \theta_{k_2} = \pi/2$. Thus by the lemma above, $\varphi(\alpha) + \varphi(\beta) = -\varphi(\gamma) = \varphi(\alpha + \beta)$. □

3 Combinatorial Geometry

Convex Polygons

Prop. (25.1.3.1). For $n \in \mathbb{Z}_{\geq 4}$ and any n points in $\mathbb{R}^2$ in general position, they form a convex n-gon iff any 4 points of them form a convex quadrilateral. ⌟

Proof: We use induction on n. $n = 4$ is trivial. For $n \geq 5$, let the points by $\{P_1, \ldots, P_n\}$, then by induction hypothesis, any $n-1$ points of them form a convex $(n-1)$-gon. So for any $1 \leq k \leq n$, $\{X_1, \ldots, \widehat{X_k}, \ldots X_n\}$ is a convex $(n-1)$-gon, and X_k is not contained in any sub-$(n-2)$-gon of $X_1 \ldots \widehat{X_k} \ldots X_{n-1}$. But any convex $(n-1)$ is a sum of its sub-$(n-2)$-gons, because we can use equations of the form $a_1P_1 + a_2P_2 = a_3P_3 + a_4P_4, a_i > 0$ to eliminate some P_i. Because k is arbitrary, this means $P_1 \ldots P_n$ is convex. □

Thm. (25.1.3.2) [Erdös-Szekeres]. For any $n \in \mathbb{Z}_{\geq 2}$, there exists a minimal positive integer $N(n)$ s.t. for any $ES(n)$ points in $\mathbb{R}^2$ in general position, there exists a subset of n points forming a convex n-gon. Moreover,

$$2^{n-2} + 1 \leq ES(n) \leq \binom{2n-4}{n-2} + 1.$$

⌟

Proof: We first prove that $ES(4) = 5$: Given 5 points in $\mathbb{R}^2$ in general position, we need to find 4 points that form a convex quadrilateral. If the convex hull of these 5 points is a quadrilateral or a pentagon, we are done, and if the convex hull is a triangle ABC, and D, E are inside ABC, then suppose BC lies in the same side of the line $\overline{DE}$, then $BDEC$ form a convex quadrilateral.

For general n, in fact $ES(n) \leq R(4, 2; 5, n)$(25.4.2.1), because for $R(4, 2; 5, n)$ many points $X \subset \mathbb{R}^2$, divide the 4-subsets of X into two classes depending on either they form a convex quadrilateral or not, then either there exists a 5-subset whose 4-subsets are all non-convex, or there exists an n-subset whose 4-subsets are all convex. The first case is not possible by the fact $ES(4) = 5$, so the second case is true. Thus we get a convex n-gon by(25.1.3.1).

For the lower bound, it suffices to construct 2^{n-2} points with no n points forming a convex n-gon: Cf.[Art of Counting, Erdös]P680.?

For the upper bound for $ES(n)$, Cf. [Erdös-Szekers](or [Holmsen-Mojarrad-Pach-Tardos], where they proved that $ES(n) \leq 2^{n+O(\sqrt{n \log n})}$). □

Conj. (25.1.3.3) [Erdös-Szekeres]. For any $n \in \mathbb{Z}_{\geq 2}$, $ES(n) = 2^{n-2} + 1$. ⌟

Proof: □

Remark (25.1.3.4). This conjecture has been proven for $n \leq 6$. ⌟

Crossing Numbers of Graphs

Thm. (25.1.3.5) [Leighton]. For any simple graph G with n vertices and $e \geq 4n$ edges drawn in $\mathbb{R}^2$, $\mathrm{Cr}(G)$(the number of crossing of G) is at least $e^3/(100n^2)$. ⌟

Proof: Cf.[Ajtai, M.; Chvátal, V.; Newborn, M. M.; Szemerédi, E. Crossing-free subgraphs]. □

Incidences

Thm. (25.1.3.6) [Szemérédi-Trotter]. There exists $C \in \mathbb{R}_+$ s.t. if $n, t \in \mathbb{Z}_+$, then for any $\mathscr{P} \subset \mathbb{R}^2, \#\mathscr{P} = n$ and a family $\mathscr{L}$ of lines in $\mathbb{R}^2$ s.t. $\#\mathscr{L} = t$, the numbers of incidences $\#I(\mathscr{P}, \mathscr{L})$ between points in $\mathscr{P}$ and lines in $\mathscr{L}$ is$\leq 22(nt)^{2/3} + 4n + t$. ⌟

Proof: We may assume that any line in $\mathscr{L}$ is incident to at least one point in $\mathscr{P}$. Draw a graph G in $\mathbb{R}^2$ with $V(G) = \mathscr{P}$, and join two points with a straight segment if they are consecutive points on one of the lines in $\mathscr{L}$. Then G is a simple graph, and the crossing number of G is at most t^2. Also $\#I(\mathscr{P}, \mathscr{L}) = t + E(G)$.

Then it follows from(25.1.3.5) that either $4n > \#I(\mathscr{P}, \mathscr{L}) - t$, or $t^2 \geq \mathrm{Cr}(G) \geq (\#I(\mathscr{P}, \mathscr{L}) - t)^3/(100n^2)$, from these the assertion follows. □

Cor. (25.1.3.7). There exists $C \in \mathbb{R}_+$ s.t. if $n \in \mathbb{Z}_+$ and $\mathscr{P} \subset \mathbb{R}^2$ is a set of n points, and $\mathscr{L}$ is family of lines determined by $\mathscr{P}$, then there exists a point $P \in \mathscr{P}$ belong to at most Cn lines in $\mathscr{L}$. ⌟

Proof: Cf.[S-T83]. □

Thm. (25.1.3.8) [Szemérédi-Trotter]. There exists $C \in \mathbb{R}_+$ s.t. if $n, k \in \mathbb{Z}_+, 2 \leq k \leq 10\sqrt{n} + 1$, $\mathscr{P} \subset \mathbb{R}^2, \#\mathscr{P} = n$, and $\mathscr{L}$ is a family of lines in $\mathbb{R}^2$ each containing at least k points from $\mathscr{P}$, then $\#\mathscr{L} \leq 100n^2/(k-1)^3$.

(The constant C can be taken to be 3 by [Clarkson et al. Combinatorial complexity bounds for arrangements of curves and surfaces].) ⌟

Proof: Let $t = \mathscr{L}$. Draw a graph G in $\mathbb{R}^2$ with $V(G) = \mathscr{P}$, and join two points with a straight segment if they are consecutive points on one of the lines in $\mathscr{L}$. Then G is a simple graph, and the crossing number of G is at most t^2. Also $E(G) \geq t(k-1)$.

Then it follows from(25.1.3.5) that either $4n > t(k-1)$, or $t^2 \geq \mathrm{Cr}(G) \geq t^3(k-1)^3/(100n^2)$, from these the assertion follows. □

Remark (25.1.3.9). The assertion is tight for $2 \leq k \leq \sqrt{n}$: Take $\mathscr{P}$ to be the $\sqrt{n} \times \sqrt{n}$ integer grid. Cf.[Beck, On the lattice property of the plane and some problems of Dirac, Motzkin, and Erdös in combinatorial geometry]?. ⌟

Distance Problems

Thm. (25.1.3.10) [Erdös/Guth-Katz]. For $n \in \mathbb{Z}_{\geq 2}$, let $f(n)$ be the minimal number of distinct distances generated by n distinct points in $\mathbb{R}^2$, then

$$f(n) = \Theta(\frac{n}{\log n}).$$

⌟

Proof: Consider the points (x, y) where $1 \leq x, y \leq \sqrt{n}$, then the distances between them are all of the form $\sqrt{a^2 + b^2}$, where $1 \leq a^2 + b^2 < 2n$. Then by(21.4.1.4), there are $O(\frac{n}{\log n})$ many points.

Conversely, Cf.[Guth-Katz]? □

Thm. (25.1.3.11) [Solymosi]. There exists $C \in \mathbb{R}_+$ s.t. for any $n \in \mathbb{Z}_{\geq 2}$ and any n distinct points in $\mathbb{R}^2$, one of them determine at least $Cn^{6/7}$ different distances from the others. ⌟

Proof: Cf.[Solymosi, Distinct distances in the plane]. □

Conj. (25.1.3.12) [Erdös]. For $n \in \mathbb{Z}_{\geq 2}$, the number of distinct distances determined by the vertices of a convex n-gon in $\mathbb{R}^2$ is at least $\lfloor \frac{n}{2} \rfloor$, with equality iff this is a regular n-gon. ⌟

Proof: □

Thm. (25.1.3.13) [Erdös/Spencer-Szemérredi-Trotter]. For $n \in \mathbb{Z}_{\geq 3}$ and $r \in \mathbb{R}_+$, let $U(n)$ be the maximal number of times the unit distance occur among n points in $\mathbb{R}^2$, then there exists $C \in \mathbb{R}_+$ s.t.

$$n^{1+C/\log\log n} < U(n) < \min(n^{3/2}, 6n^{5/4}).$$

⌟

Proof: To prove $U(n) < n^{3/2}$: This is clearly true for $n \leq 3$, so we assume $n \geq 4$. Given n points $\{P_1, \ldots, P_n\}$, and for $1 \leq i \leq n$, suppose there are x_i points with distance r from P_i. We may assume that $x_1 \geq x_2 \geq \ldots \geq x_n$. Then for any $i \neq j$, the x_i points at distance r from P_i can contain at most two points with distance r from P_j, so for each $1 \leq j \leq n$,

$$\sum_{i=1}^{j} (x_i - 2i + 2) \leq n.$$

Denote $\lfloor \sqrt{n} \rfloor = a, \{\sqrt{n}\} = \varepsilon$, then

$$x_1 + x_2 + \ldots + x_a \leq n + a(a-1) = 2n - 2\varepsilon\sqrt{n} + \varepsilon^2 - \sqrt{n} + \varepsilon < 2n - 2\varepsilon\sqrt{n}.$$

Thus $x_a < \frac{1}{a}(2n - 2\varepsilon\sqrt{n}) = 2\sqrt{n}$, and

$$\sum x_i < 2n - 2\varepsilon\sqrt{n} + (n-a)2\sqrt{n} = 2n^{3/2}.$$

To prove $U(n) < 6n^{5/4}$: Let U be the number of times the unit distance occur. Draw a graph G in $\mathbb{R}^2$ with vertices the given points, and two points are connected by an arc in unit circle if they are consecutive points on the unit circle centered at one of the points. Then G is a multigraph. Noticing two points are connected by at most two arcs, so minimally delete arcs so that each pair is connected by at most one arc, we get a graph G satisfies $E(G) \geq U - n/2$ and $\mathrm{Cr}(G) \leq 2n^2$. Then by(25.1.3.5), either $U - n/2 \leq E(G) < 4n$, or $2n^2 \geq \mathrm{Cr}(G) \geq (U - n/2)^3/(100n^2)$, from these the assertion follows.

For the lower bound, consider the set of points $(x, y), 0 \leq x, y \leq \sqrt{n}$.**?** Cf.[Erd46]. □

Prop. (25.1.3.14). For $n \geq 3$, let $a_{\min}(n)$ and $a_{\max}(n)$ be the maximal number of times the minimal and maximal distance of distinct n points in $\mathbb{R}^2$ can be achieved, then

$$a_{\max}(n) = n, \quad a_{\min}(n) \leq 3n - 6, \quad |3n - a_{\min}(n)| = \Theta(\sqrt{n}).$$

⌟

Proof: For $a_{\max}(n)$, notice $a_{\max}(n) \geq n$ because it can easily achieve n times. To prove $a_{\max}(n) \leq n$, we use induction on n: if the given points are $\{P_1, \ldots, P_n\}$, and $d(P_1, P_2)$ and $d(P_3, P_4)$ are both maximal, then by an easy argument, $P_1P_2 \cap P_3P_4 \neq \varnothing$. Now connect any two points with maximal distance, and consider two cases: if each point is connected to at most 2 points, then there are at most n edges; and if some point P_1 is connected to 3 points P_2, P_3, P_4, where $\angle P_2P_1P_4$ is acute, and P_3 are between P_2, P_4, then it is clear P_3 cannot connect to any other P_i, so we can omit P_3 and use induction on n.

For $a_{\min}(n)$, we first prove that $a_{\min}(n) \leq 3n-6$?: Connect two points if they has minimal distance, then clearly these edges don't intersect. Thus the resulting graph is planer, and then has at most $3n-6$ edges by Euler's theorem(25.2.6.3).

To show $|3n - a_{\min}(n)| = \Theta(\sqrt{n})$, use triangular constellation?. □

Conj. (25.1.3.15) [Borsuk]. For $k \in \mathbb{Z}_+$, each subset $S \subset \mathbb{R}^k$ of diameter 1 can be decomposed into $k+1$ subsets s.t. each subset has diameter< 1. ⌟

Proof:

□

Rational Distances

References are [Sol00], [A-E45] and [Erd45a].

Def. (25.1.3.16) [Integral Sets]. An **integral set** in $\mathbb{R}^2$ is a point set s.t. the distances between the elements in S are all integers. ⌟

Prop. (25.1.3.17) [Anning-Erdös]. For any $n \in \mathbb{Z}_+$, we can a planer integral set of cardinality n in general position. ⌟

Proof: let $\alpha = \arcsin(3/5)$, then α/π is non-rational Consider the n points $P_k = e^{\mathrm{i}k\alpha}, 0 \leq k \leq n-1$, then it is clear that all the distances between the points are rational. Thus by scaling, we can find n points with integral distances. □

Lemma (25.1.3.18). If a triangle T has integer side-lengths $a \leq b \leq c$, then the minimal height m of it is at least $\sqrt{a - \frac{1}{4}}$. ⌟

Proof: As $a, b, c \in \mathbb{Z}_+$, $a + b \geq c + 1$. The minimal height m corresponds to the side with length c, so it follows from heron's formula? that

$$m^2 = a^2 - (\frac{c^2 + a^2 - b^2}{2c})^2.$$

Clearly larger c gives smaller height, so we may assume $c = a + b - 1$. Then

$$\frac{c^2 + a^2 - b^2}{c} = c + \frac{a+b}{c}(a-b) \leq c + a - b = 2a - 1.$$

And the assertion follows. □

Lemma (25.1.3.19) [Erdös]. In a planer integral set H, if there exists two point-pairs (A, B) and (C, D) in general position(i.e. the lines AB and CD are distinct, and the bisector lines are distinct), then $\#H \leq 4d(A, B) \cdot d(C, D)$. ⌟

Proof: This is because for any $d \in \mathbb{Z}$, the set $\{d(P, A) - d(P, B) = d\}$ is a hyperbola, and similar for C, D. The condition implies that the hyperbolas for any two such distance pairs are different, so they intersect at at most 2 points. So there are at most $4d(A, B) \cdot d(C, D)$ many points. □

Prop. (25.1.3.20) [Annin-Erdös/Solymosi]. If H is a planer infinite integral set, then the points of H lie on a line.

In fact, if A, B are two points in a planer integral set H with $d(A, B) = d > 1$, and $\#H \geq d^3$, then there are at most $2d - 1$ points of H not on the line AB. ⌟

Proof: The first assertion follows from(25.1.3.19). For the second assertion, Cf.[Sol00]P339**?**. □

Cor. (25.1.3.21) [Minimal distances of Integral Sets]. If H is a planer integral set in general position and $\#H \geq 4$, then the minimal distance between points in H is at least $(\#H+1)^{1/3}$. ⌟

Proof: If there are two points A, B with $d(A,B) = 1$, then by triangular inequality, any other points must be in equal distances with A and B. So it follows from(25.1.3.18) that there are at most points.

In other cases, it follows from the proposition that $\#H \leq d(A,B)^3 - 1$. □

Conj. (25.1.3.22) [Erdös-Ulam]. There doesn't exists a dense subset $S \subset \mathbb{R}^2$ s.t. all the distances between points in S are rational. ⌟

Proof: It follows from `https://terrytao.wordpress.com/2014/12/20/the-erdos-ulam-problem-varieties-of-general-type-and-the-bombieri-lang-conjecture/#more-7930` that this conjecture is a consequence of the Bombieri-Lang conjecture(15.14.8.1).**?** □

Lemma (25.1.3.23). If H is a planer integral set with $\#H \geq 4$ with diameter Δ and having at most $n/2$ colinear points, then there exists two point-pairs (A,B) and (C,D) in general position(as in(25.1.3.19)) s.t. $d(A,B), d(C,D) \leq 12\Delta/\sqrt{n}$. ⌟

Proof: Call a point $P \in H$ single if there is at most one other point in H with distance smaller than $12\Delta/\sqrt{n}$ with P. Then a method of volume counting implies that there are less than $n/2$ single points.

Remove all the single points, then in the remaining set H', any point P has two points $Q_1, Q_2 \in H'$ s.t. $d(P, Q_i) \leq 12\Delta/\sqrt{n}$. **?** Then we can find two point-pairs in general position.**?** □

Thm. (25.1.3.24) [Minimal Diameters of Integral Sets]. There exists $c \in \mathbb{R}_+$ s.t. for any $n \in \mathbb{Z}_+$, any planer integral set with cardinality n has diameter at least cn. ⌟

Proof: If there are more than $n/2$ points in a single line, then the diameter is at least $n/2$. Suppose this is not the case, then it follows from(25.1.3.23) that

$$n \leq 4\left(\frac{\Delta}{\sqrt{n}}\right)^2,$$

and the assertion follows. □

4 Probabilistic Methods

References are [The probabilistic method, Alon-Spencer].

25.2 Graph Theory I

References are [Die17].

Notation (25.2.0.1).

- For simplicity, we usually use graph to denote a simple graph(25.2.1.1)(unless specified otherwise), and a multi-graph to denote a graph with (possibly)multi-edges or loops.
- For a multi-graph G,
  - let $V(G)$ denote the set of vertices of G,
  - let $E(G)$ denote the set of edges of G,
  - let $\overrightarrow{E}(G)$ denote the set of triples (e, x, y) where $e \in E(G)$, and $e \cap V(G) = \{x, y\}$,
  - let $v(G)$ denote the number of vertices,
  - let $e(G)$ denote the number of edges,
  - let $\chi(G) = v(G) - e(G)$ denote the Euler characteristic of G,
  - for $v \in V(G)$, let $\deg(v)$ denote the set of vertices of G,
  - let $d(G)$(or $t(G)$) denote the average degree of vertices in G, which equals $2e(G)/v(G)$ when G is finite,
  - let $\delta(G)$ denote the minimum degree of vertices of G,
  - let $\Delta(G)$ denote the maximum degree of vertices of G,
  - for $U \subset V(G)$, let $N(U)$ denote the set of vertices connected to U, and let $E(U)$ denote the set of edges adjacent to U.
  - let $\omega(G)$ denote the maximal cardinality of a clique in G(25.2.5.1),
  - let $\alpha(G)$ denote the maximal cardinality of an independent subset of G,
  - for two disjoint non-empty subset $X, Y \subset V(G)$, let $e(X, Y)$ denote the number of edges between vertices in X and vertices in Y, and $d(X, Y) = \frac{e(X,Y)}{\#X\#Y}$ the density between X and Y.
  - for $U \subset G$, $G(U)$ is the induced subgraph on U,
  - let $\gamma(G)$ denote the chromatic number of G,
  - let $\kappa(G)$ denote the number of spanning trees of G,
  - let $g(G)$ denote the girth of G,
  - let $h(G)$ denote the expanding constant of G(25.3.9.1).

⌟

1 Basics

Def. (25.2.1.1) [Graphs]. A **graph** X is a CW-complex of dimension≤ 1 with a given presentation $(X^0, X^1 = X)$(4.13.3.1). the elements in the set of X^0 are called **vertices** of X, and the 1-cells are called **edges** of X.

A **simple graph** is a graph without loops and multi-edges.

For a graph X, a **subgraph** is a sub CW-complex of X. And if $V' \subset V(X)$ is a subset, the **induced subgraph** of X is defined to be the subgraph $X' \subset V(X)$ whose vertices are just V', and two vertices in V' are connected by an edge iff they are connected by an edge in X. ⌟

Def. (25.2.1.2)[Claws]. A **claw graph** is any graph isomorphic to the graph $G = (V(G), E(G))$ where $V(G) = \{1, 2, 3, 4\}, E(G) = \{12, 13, 14\}$. ⌟

Degrees of Vertices

Def. (25.2.1.3) [Complete Graphs]. A **complete graph** is a simple graph that each two vertices is connected by an edge. For $r \in \mathbb{Z}_+$, a complete graph of size r is denoted by K^r. ⌟

Def. (25.2.1.4) [Complement Graph]. For $G \in \mathtt{Graph}^{\mathtt{simple}}$ the **complement graph** $G^c \in \mathtt{Graph}^{\mathtt{simple}}$ is a simple graph s.t. $V(G^c) = V(G)$, and two distinct vertices in G^c are adjacent if they are not adjacent in G. ⌟

Def. (25.2.1.5) [Kernels]. For any oriented graph $H \in \mathtt{Graph}$, a **kernel of graph** of H is an independent set $U \subset V(H)$ s.t. for any $v \in V(H) \setminus U$, there exists an edge $vu \in \overrightarrow{E}(G)$ with $u \in U$. ⌟

Prop. (25.2.1.6). For any $G \in \mathtt{Graph}^{\mathrm{fin}}$ with $E(G) \neq \varnothing$, there is a subgraph H of G s.t. $2\delta(H) \geq t(H) \geq t(G)$. ⌟

Proof: If there is a vertex $v \in V(G)$ s.t. $\deg(v) < \frac{1}{2}t(G) = e(G)/v(G)$, then we delete v, and get $G_1 = G \setminus \{v\}$. Do the same for G_1, and so on. In this way, it is easy to see that $t(G)$ is increasing. Because G is finite, this process stops at some point. But because $t(\mathrm{pt}) = 0 < G$, the stopping graph H cannot be empty. And this graph H satisfies $2\delta(H) \geq t(H) \geq t(G)$. □

Def. (25.2.1.7)[Groupies]. A **groupie** in a graph G is a vertex $P \in V(G)$ s.t. if $r(P)$ is the summation of degree of vertices of points Q adjacent to P, then $r(P) \geq \frac{2e(G)}{v(G)} \deg P$. ⌟

Prop. (25.2.1.8). Any $G \in \mathtt{Graph}$ has a groupie. ⌟

Proof: For $P \in V(G)$, let $r(P)$ is the summation of degree of vertices of points Q adjacent to P. then

$$\sum_{P \in V(G)} r(P) = \sum_{Q \in V(G)} \deg(Q)^2 \geq (\sum \deg(P))^2/v(G) = t(G)^2 v(G) = t(G) \sum \deg(P).$$

So there must be some $P \in V(G)$ that $r(P) \geq t(G) \deg P$. □

Paths and Circuits

Def. (25.2.1.9) [Paths, Circuits and Cycles]. For $G \in \mathtt{Graph}$, a **walk in an (oriented)graph** of length $k \in \mathbb{Z}_{\geq 2}$ is a sequence $(v_1, e_1, \ldots, e_{k-1}, v_k)$ s.t.

- $v_j \in V(G)$ for any $j \in [k]_+$,
- $e_i = v_i v_{i+1} \in E(G)$ for $i \in [k-1]_+$.

A **simple path** is a path without repetition vertices.

A **circuit in a graph** of length $k \in \mathbb{Z}_{\geq 2}$ is a sequence $(v_1, e_1, \ldots, e_{k-1}, v_k, e_k)$ s.t.

- $v_j \in V(G)$ for any $j \in [k]_+$,
- $e_i = v_i v_{i+1} \in E(G)$ for $i \in [k-1]_+$,
- $e_k = v_k v_1 \in E(G)$.

A **simple circuit** is a circuit without repetition vertices.

A **cycle in a graph**(resp. ordered cycle) is an $\mathbb{Z}/(k) \ltimes \mathbb{Z}/(2)$(resp. $\mathbb{Z}/(k)$)-orbit of simple circuits.

The **girth** $g(G)$ of G is the minimal length of a circuit in G. ⌟

Prop. (25.2.1.10) [Minimal Degree and Large Cycles]. For any $G \in \mathtt{Graph}$, G contains a path of length $\delta(G)$. And if $\delta(G) \geq 2$, it contains a cycle of length$\geq \delta(G)+1$. ⌟

Proof: Consider the largest simple path, then the neighbourhood of the endpoints are all on this path, thus it has length$\geq \delta(G)$. And consider its neighbors on this path, we get a simple circuit. □

Def. (25.2.1.11) [Distances]. For any $G \in \mathtt{Graph}$ and $x, y \in V(G)$, the **distance between vertices** $d_G(x, y)$ is defined to be the infimum of lengths of paths in G with endpoints x and y.

The maximal distances between two vertices in G is called the **diameter of graph** of G, denoted by $\operatorname{diam}(G)$. ⌟

Def. (25.2.1.12) [Radius]. For $G \in \mathtt{Graph}$, the **radius** of G is defined to be

$$\operatorname{rad}(G) = \min_{x \in V(G)} \max_{y \in V(G)} d_G(x, y).$$

Clearly $\operatorname{rad}(G) \leq \operatorname{diam}(G) \leq 2\operatorname{rad}(G)$. ⌟

Prop. (25.2.1.13). For $G \in \mathtt{Graph}$, either $g(G) = \infty$ or $g(G) \leq 2\operatorname{diam}(G) + 1$. ⌟

Prop. (25.2.1.14) [Radius, Maximal Degrees and Sizes]. For $k, d \in \mathbb{Z}_+, G \in \mathtt{Graph}$, if $\operatorname{rad}(G) \leq k, \Delta(G) \geq d \geq 3$, then

$$v(G) \leq \frac{d}{d-2}(d-1)^k.$$

⌟

Proof: Take a central point $z \in G$ and let D_i be the set of vertices with distances i from z. Then $\#D_0 = 1$, $\#D_i \leq d(d-1)^{i-1}$ for $i \in \mathbb{Z}_+$. Thus we get the desired result by counting. □

Prop. (25.2.1.15) [Average Degree, Girth and Sizes, Alon-Hoory-Linial2002]. For $g, d \in \mathbb{Z}_+, G \in \mathtt{Graph}$, if $d(G) \geq d \geq 2$ and $g \leq g(G) < \infty$, then

$$v(G) \geq \begin{cases} 2\sum_{i=0}^{\lfloor \frac{g}{2} \rfloor - 1}(d-1)^i & ,2|g \\ 1 + d\sum_{i=0}^{\lfloor \frac{g}{2} \rfloor - 1}(d-1)^i & ,2 \nmid g \end{cases}.$$

⌟

Proof: ? □

Cor. (25.2.1.16). If $d(G) \geq 3$, then $g(G) < 2\log v(G)$. ⌟

Def. (25.2.1.17) [Large Girth Families]. For $k \in \mathbb{Z}_{\geq 3}$, a family of k-regular finite simple graphs $(X_n) \in \mathtt{Graph}^{\mathbb{Z}_+}$ is called a family of **large girth graphs** if there exists $C \in \mathbb{R}_+$ s.t. $\varinjlim v(X_n) = \infty$ and $g(X_n) \geq C\log_{k-1} v(X_n)$. ⌟

Prop. (25.2.1.18) [Large Girth and Large Connectivity Graphs]. For any $k \in \mathbb{Z}_+$, there exists a finite graph $H \in \mathtt{Graph}^{\mathtt{simple}}$ with $g(H) > k$ and $\kappa(H) > k$. ⌟

Proof: This follows from(25.3.2.9) and(25.2.4.5). □

Def. (25.2.1.19) [Prime circuits]. A **prime circuit** in an unoriented graph G is a circuit that is not a non-trivial multiple of another cycle, and doesn't contain a segment of the form $\ldots, x, y, x, \ldots$ for $x, y \in V(G)$. ⌟

Def. (25.2.1.20) [Primitive Graphs]. For a connected graph $G \in \mathtt{Graph}$, the gcd of lengths of circuits in G is called the **period of graph** G. G is called a **primitive graph** if it has period 1.

If G has period v, then it can be decomposed into $G_1 \amalg \ldots G_v$ s.t. each edge is between some G_i to G_{i+1}. ⌟

Def. (25.2.1.21) [Holes]. For a simple graph, a **hole of graph** $H \subset G$ is an induced subgraph that is isomorphic to a cycle of length≥ 4. An **antihole of a graph** is an induced subgraph of G whose complement is a graph in G^c. ⌟

Trees and Forests

Def. (25.2.1.22) [Trees]. A **tree** is a graph T s.t. $H_1(T) = 0$. A tree in a graph X is called a **maximal tree** if it contains all vertices of X. A **forest** is a graph that is a disjoint union of trees. ⌟

Prop. (25.2.1.23). Any tree T is contractible, and any vertex v is a deformation retract of T. ⌟

Proof: □

Prop. (25.2.1.24) [Maximal Trees]. Every connected graph contains a maximal tree, and any tree in a connected graph is contained in a maximal tree.

A tree T in a graph X is maximal iff $X^0 \subset T$. ⌟

Proof: Cf.[Hat02]P84. □

Prop. (25.2.1.25) [π_1 of Graphs]. For a connected graph X with a maximal tree T, $\pi_1(X)$ is a free group with basis the classes $[f_\alpha]$ corresponding to the edges $e_\alpha \in X \backslash T$. ⌟

Proof: The quotient map $X \to X/T$ is a homotopy equivalence by(4.13.6.7). And the quotient space X/T has only one vertex, thus is a wedge sum of circles corresponding to $e_\alpha \in X \backslash T$. So we are done by(4.13.4.29). □

Prop. (25.2.1.26) [Covering Spaces of Graphs]. Every covering space $\pi : \widetilde{X} \to X$ of a graph is also a graph, with vertices and edges lifts of vertices and edges of X. ⌟

Proof: Let the sets $\pi^{-1}(v)$ be vertices of $\widetilde{X}$, where v are vertices of X. And if we write X as a quotient space of $X^0 \cup_\alpha I_\alpha$, each I_α can be lifted to maps to $\widetilde{X}$, and we let these be edges of $\widetilde{X}$. The topology of $\widetilde{X}$ coming from quotient topology of this is the same as the original topology, because they has the same basis open sets, because π is a local homeomorphism. □

Def. (25.2.1.27) [Path Trees]. For $G \in \mathtt{Graph}$, the **path tree** of G at u is defined to be the universal covering of G at u consisting of simple paths at u. ⌟

Prop. (25.2.1.28) [Spencer's Lemma]. If there is a triangulation of a plane polygon P, for arbitrary 3-color numbering($\{0, 1, 2\}$) of the vertices, if the number of edges on the boundary with color $(0, 1)$ is odd, then there is a triangle with vertices of pairwise different colors. ⌟

Proof: In fact the number of those triangles with vertices of pairwise different colors is odd. In fact, the number of $(0, 1)$-edges on a triangle is odd iff its vertices has pairwise different colors. But the sum of numbers of $(0, 1)$-edges on the triangles are odd, by hypothesis, thus the result. □

Contractions and Minors

Def. (25.2.1.29)[Subdivisions and Topological Minors]. A **subdivision** of a graph X is any graph obtained from X by 'subdividing'some or all of its edges by drawing new vertices on those edges.

For graphs X, Y, if Y contains a subgraph that is isomorphic to a subdivision of X, then X is called a **topological minor graph** of Y. ⌟

Def. (25.2.1.30)[Contractions and Minors]. For any graph G, divide $V(G)$ into connected subsets $V_{\alpha_1}, \ldots, V_{\alpha_k}$, and let X be the graph with

$$V(X) = \{\alpha_1, \ldots, \alpha_k\}, \quad E(X) = \{(\alpha_i, \alpha_j) | i \neq j, E(V_{\alpha_i}, V_{\alpha_j}) \neq \varnothing\}.$$

Then X is called a **contraction graph** of G.

For graphs X, Y, if X is isomorphic to a contraction of a subgraph of Y, then X is called a **minor graph** of Y. We sometimes use the notation $X = Y/U$ to denote a minor of Y that only contracts one connected connected subset U. ⌟

Prop. (25.2.1.31). Any topological minor is a minor. And if X is a minor of a graph G with $\Delta(X) \leq 3$, then X is also a topological minor of G. ⌟

Proof: The first assertion is easy. For the last assertion, consider each V_x for $x \in X$, then it suffices to show that for any three vertices x, y, z in a connected graph, there is a vertex with separate paths to them without intersection. For this, firstly find a shortest path W from x to y. If this path contains z, then z is the vertex we want. If this path doesn't contain z, then find a shortest path W' from z to W, then the endpoint of W' is the vertex we want. □

2 Spectral Graph Theory

Def. (25.2.2.1)[Companion Matrices]. For a finite multi-graph G with $\#V(G) = n$, given an ordering of the vertices, the

- **adjacency matrix** A_G of G is defined to be the $n \times n$ matrix (a_{ij}) with $a_{ij} = \alpha(v_i, v_j)$, the number of edges between v_i and v_j.
- **valence matrix** D_G of G is defined to be the $n \times n$ diagonal matrix $\mathrm{diag}(\deg(v_1), \ldots, \deg(v_n))$.
- **Laplacian matrix** L_G of G is defined to be the $A_G - D_G$.

It is clear that M_G, D_G, L_G are all real symmetric. In particular, they have real spectrums. ⌟

Def. (25.2.2.2)[Spectrums of Graphs]. For any finite multi-graph $G \in \mathtt{Graph}$, denote

$$\lambda_0 \geq \lambda_1 \geq \ldots \lambda_{v(G)}$$

be the set of eigenvalues of M_G. And denote $\rho(G) = \max |\lambda_i(G)|$ the **spectrum radius** of G. ⌟

Prop. (25.2.2.3)[Spectra of Adjacency Matrices]. For $k, n \in \mathbb{Z}_+$, if $G \in \mathtt{Graph}$ is k-regular and $n = v(G) \leq n$, then

- $k = \lambda_0 \geq \lambda_1 \geq \ldots \geq \lambda_{n-1} \geq -k$.
- $k > \mu_1$ iff G is connected.

⌟

Proof: 1: Clearly $(1, \ldots, 1)^t$ is an eigenvector with eigenvalue k. To show that $|\lambda_i| \leq k$, just choose a coordinate with largest absolute value.

2: This is also easy by taking a maximum coordinate. □

Prop. (25.2.2.4) [Spectrum of Bipartite Graphs]. For $k, n \in \mathbb{Z}_+$, if $G \in \texttt{Graph}$ is connected, k-regular and $n = v(G) \leq n$, then the following are equivalent:

- G is bipartite.
- $\lambda_i + \lambda_{n-1-i} = 0$.
- $\mu_{n-1} = -k$.

⌟

Proof: 1 → 2: Suppose $G = G^+ \coprod G^-$. If v is an eigenvector of A_G with eigenvalue μ, then by multiplying the coordinates of v corresponding to $v \in G^-$, we get an eigenvector of A_G with eigenvalue $-\mu$.

2 → 3 follows from(25.2.2.3).

3 → 1: similarly, choose a coordinate of the eigenvector with eigenvalue $-k$. Then

$$v_x = -\frac{1}{k} \sum_{yx \in E(G)} v_y.$$

So it can be shown that $v_y = -v_x$ if $xy \in E(G)$. By this way and the fact G is connected, we get a bipartition of $V(G)$. □

L_G and Spectral Gaps

Prop. (25.2.2.5). For any finite graph $G \in \texttt{Graph}$, L_G is positive-semidefinite, as for any $\mathbf{x} \in \mathbb{R}^n$,

$$\mathbf{x}^T L_G \mathbf{x} = \sum_{1 \leq i \leq j \leq n} \alpha(v_i, v_j)(x_i - x_j)^2.$$

And if G is connected, then L_G has nullity 1, whose eigenspace is spanned by $\mathbf{x} = (1, 1, \ldots, 1)^t$. ⌟

Prop. (25.2.2.6). Let G be a finite connected multi-graph with $\#V(G) = n$ and diameter $d = d(G)$, then the smallest eigenvalue λ_1 of L_G satisfies $\lambda_1 \geq 1/(nd)$. ⌟

Proof: Let w be the unit eigenvector belong to λ_1, then there exists $i \in [n]_+$ s.t. $|w_i| \geq 1/\sqrt{n}$. We may assume that $w_1 > 1/\sqrt{n}$. Since w is orthogonal to $(1, \ldots, 1)^t$, we have $\sum w_i = 0$. So there exists some $w_k < 0$. Let $v_1, v_2, \ldots, v_k$ be a minimal path from v_1 to v_k, then $k - 1 \leq d$, and

$$\lambda_1 = \mathbf{w}^t L_G \mathbf{w} = \sum_{1 \leq i \leq j \leq n} \alpha(v_i, v_j)(w_i - w_j)^2 \geq \sum_{i=1}^{k-1} (w_i - w_{i+1})^2 \geq \frac{1}{k-1}(w_1 - w_n)^2 \geq \frac{1}{nd}.$$

□

Prop. (25.2.2.7) [Bigg]. For k-regular finite graph $G \in \texttt{Graph}$ and any cofactor M of L_G, $\det(M) = \mathrm{tree}(G)$. ⌟

Proof: Cf.[Biggs, Algebraic Graph Theory]Thm6.3.? □

Spectral Radius

Prop. (25.2.2.8). If $X \in \mathtt{Graph}$ is connected, then for any $x \in X$,

$$\rho(X) = \limsup_{s\to\infty} \sqrt[s]{t_s(x)}$$

where $t_s(x)$ is the number of closed paths starting from x. ⌟

Proof: Cf.[Discrete Groups, Expanding Graphs and Invariant Measures]Chap4.? □

Prop. (25.2.2.9). The spectrum radius of a (c,d)-regular tree is $\sqrt{c-1}+\sqrt{d-1}$. ⌟

Proof: ?Cf.[Walk generating functions and spectral measures of infinite graphs] and [Spectra of regular graphs and hypergraphs and orthogonal polynomials]. □

Thm. (25.2.2.10)[Greenberg/Cioabă]. Let X be a connected, infinite graph with $\Delta(X) < \infty$. Given $\varepsilon \in \mathbb{R}_+$, there exists $c(X,\varepsilon) \in \mathbb{R}_+, g(X,\varepsilon) \in \mathbb{Z}_+$ such that

- for any finite graph $Y \in \mathtt{Graph}^{\mathtt{simple}}$ covered by X,

$$\#\{\lambda \in \mathrm{Spec}(Y) | \lambda \geq \rho(X) - \varepsilon\} \geq c(\varepsilon, k)v(Y).$$

- for any finite graph $Y \in \mathtt{Graph}^{\mathtt{simple}}$ covered by X s.t. $g(Y) \geq g$,

$$\#\{\lambda \in \mathrm{Spec}(Y) | \lambda \leq -\rho(X) + \varepsilon\} \geq c(\varepsilon, k)v(Y).$$

⌟

Proof: Cf.[Eigenvalues of graphs and a simple proof of a theorem of Greenberg].? □

Cor. (25.2.2.11) [Alon-Boppana/Serre]. For any $\varepsilon \in \mathbb{R}_+$ and $k \in \mathbb{Z}_{\geq 3}$, there exists a $c(\varepsilon, k) \in \mathbb{R}_+$ s.t. for k-regular connected finite graph $G \in \mathtt{Graph}^{\mathtt{simple}}$,

$$\#\{\lambda \in \mathrm{Spec}(G) | \lambda \geq (2-\varepsilon)\sqrt{k-1}\} \geq c(\varepsilon, k)v(G).$$

⌟

Proof: [Sarnak, Elementary Number Theory]P26. □

3 Matching, Covering and Packing

Def. (25.2.3.1) [Matchings]. For $G \in \mathtt{Graph}$, a **matching on graph** is a subset $M \subset E(G)$ s.t. no two edges in M have a common vertex. ⌟

Def. (25.2.3.2) [Stable Matchings]. For any finite bipartite graph $G \in \mathtt{Graph}^{\mathrm{fin}}$, a **family of preferences** on $E(G)$ is a family $\{\leq_v\}_{v\in V(G)}$ where each $\leq_v$ is a linear ordering on $E(v)$.

Given a finite simple bipartite graph $G \in \mathtt{Graph}^{\mathrm{fin}}$ with a family of preferences, a **stable matching** on G is a matching M on G s.t. for any $e \in E(G)\setminus M$, $\exists f \in M$ s.t. e, f has a common vertex v and $e \leq_v f$. ⌟

Thm. (25.2.3.3) [Stabel Mapping Theorem, Gale-Shapley1962]. Any finite bipartite graph $G \in \mathtt{Graph}$ with a family of preferences has a stable matching(25.2.3.2). ⌟

Proof: ?Cf.[Diestel]P40. □

Matching Polynomials

Def. (25.2.3.4) [Matching Polynomials]. Let $G \in \texttt{Graph}$ with $n = v(G) < \infty$. For $i \in \mathbb{N}$, let m_i be the number of matchings in G consisting of i edges, then the **matching polynomial** of G is defined to be

$$\mu_G(T) = \sum_{i \in \mathbb{N}} (-1)^i m_i T^{n-2i}.$$

⌟

Thm. (25.2.3.5) [Roots of Matching Polynomials, Heilmann-Lieb/Godsil]. For any $G \in \texttt{Graph}$, the roots of the matching polynomial $\mu_G(X)$ are real, and have absolute value at most $\rho(P(G,u))$, where $P(G,u)$ is the path tree of G at u(25.2.1.27).

In particular, the roots have absolute values at most $\rho(T)$, where T is the universal cover of G, which is bounded by $2\sqrt{\Delta(G)-1}$. ⌟

Proof: Cf.[Algebraic Combinatorics, Godsil].?

For the last assertion, notice $P(G,u)$ is an induced subgroup of T, so so clearly $\rho(P(G,u)) \leq \rho(T)$. □

4 Connectivity

Def. (25.2.4.1) [s-Connected Graphs]. For $s \in \mathbb{Z}_+$, a graph $G \in \texttt{Graph}$ is called k**-connected** if it is connected after deleting any $k-1$ vertices.

The maximal $k \in \mathbb{Z}_+$ s.t. G is k-connected is denoted by $\kappa(G)$. ⌟

Def. (25.2.4.2) [Edge-Connected Graphs]. The maximal $k \in \mathbb{Z}_+$ s.t. G is k-edge-connected is denoted by $\lambda(G)$. ⌟

Def. (25.2.4.3) [Toughness]. For $t \in \mathbb{R}_+$, a graph $G \in \texttt{Graph}$ is called a t**-tough graph** if for any separator $S \subset V(G) \cup E(G)$, $G \setminus S$ has at most $\#S/t$ connected components. ⌟

Prop. (25.2.4.4). For any finite graph $G \neq \mathrm{pt} \in \texttt{Graph}^{\texttt{simple}}$, $\kappa(G) \leq \lambda(G) \leq \delta(G)$. ⌟

Proof: The second inequality is trivial. For the first, let F be a minimal edge separating set of G. If there is a vertex $v \in V(G)$ that is not incident to any edge in F, let C be the connected component of $G \setminus F$ containing v, then each edge in F connects C to another connected component, by minimality. But the vertices in C that is incident to any edge in F separates v from $G \setminus C$, thus $\kappa(G) \leq \lambda(G)$.

If every vertex $v \in V(G)$ is incident to an edge in F, then the neighborhoods w of v s.t. $vw \notin F$ are incident to different edges in F by minimality. Thus $\deg(v) \leq \lambda(G)$. As the neighborhoods of v separates G if $G \neq \{v\} \cup N(v)$, if G is not complete, then we get $\kappa(G) \leq \lambda(G)$. But when G is complete, $\kappa(G) = \lambda(G) = v(G) - 1$. □

Thm. (25.2.4.5) [Minimal Degree and Connectivity, Mader1972]. For $k \in \mathbb{Z}_+$, any $G \in \texttt{Graph}$ with $d(G) \geq 4k$ has a $(k+1)$-connected subgraph H s.t. $d(H) \geq d(G) - 2k$. ⌟

Proof: Cf.[Diestel]P13.? □

Def. (25.2.4.6) [(x,y)-Cuts]. For a finite graph G and $x, y \in V(G)$ with $d(x,y) \geq 2$, an (x,y)**-cut** in G is a set $S \in V(G) \setminus \{x,y\}$ s.t. $G \setminus S$ has no (x,y)-paths. ⌟

Thm. (25.2.4.7) [Menger]. Let G be a finite graph and $x, y \in V(G)$ s.t. $d(x,y) \geq 2$. Denote $\kappa_G(x,y)$ the minimum size of an (x,y)-cut in G and $\lambda_G(x,y)$ a maximum number of internally-disjoint (x,y)-paths in G, then $\kappa_G(x,y) = \lambda_G(x,y)$. ⌟

Proof: □

Def. (25.2.4.8) [(x,U)-Fans]. For a finite graph G and a subset $U \subset V(G)$ and $x \in V(G) \setminus U$, an **(x,U)-fan** of size k is a set of k-paths from x to U s.t. any two of them shear only x. ⌟

Prop. (25.2.4.9) [Fan Lemma, Dirac]. For $k \in \mathbb{Z}_+$ and $G \in \mathtt{Graph}$, $\kappa(G) \geq k$ iff $v(G) \geq k+1$, and for any subset $U \subset V(G)$ and each $x \in V(G) \setminus U$, G has an (x,U)-fan of size $\min(k, \#U)$. ⌟

Proof: If G has at least $k+1$ vertices and for any subset $U \subset V(G)$ with $|U| \geq k$ and each vertex $x \notin U$, G has an (x,U)-fan of size k, we show G is k-connected: If there is a $(k-1)$-vertex cut S, let A be a connected component of $G \setminus S$, and $U = V(G) \setminus A$. Then $\#U \geq k$, and for any $x \in A$, there are no (x,U)-cut of size k, because each path from x to U must intersect with S.

Conversely, if G is k-connected and $U \subset V(G), \#U \geq k$. Let $G' = G *_U \{y\}$, then G' is also k-connected. Then by Menger's theorem(25.2.4.7), $\lambda_G(x,y) = \kappa_G(x,y) \geq k$. Let $P_1, \ldots, P_k$ be internally-disjoint (x,y)-paths in G', then after deleting y, they form an (x,U)-fan of size k. □

Hamilton Cycles

Def. (25.2.4.10) [Eulerian Tours]. For a connected graph $G \in \mathtt{Graph}^{\text{fin}}$, an **Eulerian tour** is a circuit on G that traverses each edge of G exactly once. An **Eulerian graph** is a finite connected graph that admits an Euler tour. ⌟

Def. (25.2.4.11) [Hamilton Cycles]. For a graph $G \in \mathtt{Graph}^{\text{fin}}$, a **Hamilton-cycle** is a cycle in G that contains each vertex of G exactly once. Similarly, a **Hamilton-path** is a simple path in G that traverse each vertex of G exactly once. G is called a **Hamiltonian graph** if it has a Hamiltonian path.

G is called **Hamiltonian-connected** if each pair of vertices $x \neq y \in G$ is the endpoint of a Hamiltonian path in G. ⌟

Prop. (25.2.4.12) [Euler1736]. A connected graph $G \in \mathtt{Graph}^{\text{fin}}$ is an Eulerian graph iff $2|\deg(v)$ for any $v \in V(G)$. ⌟

Proof: One direction is clear. For the other, we use induction on $v(G)$. If $v(G) = 0$, this is true. For $v(G) > 0$, we can clearly find a walk with no repeated edges. Let W be such a walk with maximum length. Then we claim W is a Euler tour: Suppose not, then $G' = G \setminus E(W)$ also satisfies the hypothesis that $2|\deg(v)$ for any $v \in V(G)$. As G is connected there is an edge $e \in E(G')$ that is incident to a vertex in W. Then by induction hypothesis, the component of G' containing e has an Eulerian tour, which in concatenating with W makes a larger walk, contradiction. □

Thm. (25.2.4.13) [Asratian-Khachatrian1990]. A connected graph $G \in \mathtt{Graph}^{\text{fin}}$ has a Hamiltonian cycle if $v(G) \geq 3$, and

$$\deg(u) + \deg(w) \geq \#N(u) \cup N(v) \cup N(w)$$

for any induced path uvw(i.e. $uw \notin E(G)$). ⌟

Proof: The hypothesis is in fact equivalent to that

$$\#N(u) \cup N(w) \geq \#N(v) \setminus N(\{(u,w)\}).$$

As $\{u,w\} \subset N(v) \setminus N(\{(u,w)\})$, this implies that G has simple circuits. Let C be a longest simple circuit in G. Suppose G is not Hamiltonian, then there exists $u \in G \setminus C$ with $V = N(u) \cap C \neq \varnothing$. Let $V^+ = \{v^+ | v \in V\}$ be the set of successors of V in G, then by the maximality of C, $V \cap V^+ \neq \varnothing$, and $V^+ \cup \{u\}$ is an independent set, and no two of them have a common neighborhood outside C. Thus for any $v \in V$, we have

$$\#N(u) \cap N(v^+) \geq \#N(v) \setminus N(\{u, v^+\}) \geq \#N(v) \cap V^+ + 1.$$

Thus

$$e(V, V^+) = \sum_{v \in V} \#N(v) \cap V^+ \leq \sum_{v \in V} (\#N(u) \cap N(v^+) - 1) = e(V, V^+) - \#V,$$

contradiction. □

Cor. (25.2.4.14) [Dirac1952]. For any finite simple graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with $n = v(G) \geq 3$ and $\delta(G) \geq n/2$ has a Hamilton cycle. ⌟

Thm. (25.2.4.15) [Chvátal-Erdös]. If $k \in \mathbb{Z}_+$ and a simple graph $G \in \mathtt{Graph}^{\mathrm{fin}}$ satisfies $v(G) \geq 3, i(G) \leq \kappa(G)$, then G has a Hamiltonian-cycle. ⌟

Proof: The hypothesis implies that G is not a tree thus contains a simple path. Let $k = \kappa(G)$, and take a longest simple path C, if there exists $x \in V(G) \setminus C$, then by fan lemma(25.2.4.9), there exists an (x, U)-fan of size $\min(k, \#C)$, with vertices $x_1, \ldots, x_r$. Let y_i be the successor of x_i in C, then $xy_i \notin E(G)$ for each i, otherwise there is a longer simple path. This implies that $\#C > k$. Now for the set $\{x, y_1, \ldots, y_r\}$, the hypothesis $\kappa(G) = k$ implies that there is a path $y_i y_j$. Then we can find a cycle of larger size, contradiction. □

Cor. (25.2.4.16). If $k \in \mathbb{Z}_+$ and a simple graph $G \in \mathtt{Graph}^{\mathrm{fin}}$ satisfies $v(G) \geq 3, i(G) \leq \kappa(G) + 1$, then G has a Hamiltonian-cycle. ⌟

Proof: The graph $G * \mathrm{pt}$ satisfies the hypothesis of(25.2.4.15) and has a Hamiltonian cycle. Thus G has an Hamiltonian-path. □

Cor. (25.2.4.17). If $k \in \mathbb{Z}_+$ and a simple graph $G \in \mathtt{Graph}^{\mathrm{fin}}$ satisfies $v(G) \geq 3, i(G) \leq k$, and G is k-connected, then G is Hamiltonian-connected. ⌟

Proof: The proof is similar to that of(25.2.4.15): For any vertices $x \neq y \in G$, just choose the longest path from x to y. □

Prop. (25.2.4.18) [Tutte1956]. Any 4-connected Tutte planer graph has a Hamilton cycle. ⌟

Proof: □

Conj. (25.2.4.19) [Toughness Conjecture, Chvátal]. There exists $t \in \mathbb{R}_+$ s.t. every t-tough graph(25.2.4.3) has a Hamilton-cycle. ⌟

Proof: □

5 Complete Graphs

Cliques and Independent Sets

Def. (25.2.5.1) [Cliques]. For $G \in \texttt{Graph}$, a **clique** in G is a subgraph $H \subset G$ that is a complete graph. An **independent set** in a graph is a set of vertices that no two of them are adjacent.

For any graph G, let $\omega(G)$ be the size of the maximal clique in G, and let $\alpha(G) = \omega(G^c)$ be the size of the maximal independent set of G. ⌟

Def. (25.2.5.2) [Simplicial Cliques]. For $G \in \texttt{Graph}$, a **simplicial clique** in G is a clique K in G s.t. $N(k) \setminus K$ is a clique in $G \setminus K$ for any $k \in K$. ⌟

Prop. (25.2.5.3). If $G \in \texttt{Graph}$ is claw-free**??**nd K is a simplicial clique in G, then for any $k \in K$, $N(k) \setminus K$ is also a simplicial clique. ⌟

Proof: By definition $N(k) \setminus K$ is a clique. If for some $k \in K$ and $n \in N(k) \setminus K$, the set $H = N(n) \setminus (N(k) \cup K)$ is not a clique, then there exists two non-adjacent vertices $x, y \in H$. Then the graph induced by $\{x, y, n, k\}$ is a claw, contradiction. □

Prop. (25.2.5.4) [Erdös]. For any $k, l \in \mathbb{Z}_+$ and a graph G of size $(k-1)(l-1)+1$, either G contains a complete k-graph, or any no-circuits ordering of the complement graph G^c contains a directed path of l-vertices. ⌟

Proof: Consider any ordering on G^c. then we can put the vertices in a matrix by the following rule: The first row are vertices with no inward order, and for any $k \geq 1$, the row k are vertices not in the first k row and has an inward edge from some vertex in the row k.

Then there are no edges between vertices in the same row, and we are done if some row has k vertices. If each row has less than k vertices, then there are at least l row, which will give us a directed path of l-vertices, by our rule of construction. □

Prop. (25.2.5.5) [Turán/Ajtai-Komlós-Szeméredi]. If G is a multi-graph with $\omega(G) = 2$(25.2.5.1) and $v(G) \leq n, d(G) \leq t$, where $n, t \in \mathbb{R}_+$, then

$$\alpha(G) \geq \max\left(\frac{n}{100t}\log t, \frac{n}{t+1}\right).$$

⌟

Proof: Cf.[note on Ramsey Numbers]. □

Prop. (25.2.5.6). Let G be a graph with $n = \#V(G), e = \#E(G)$, and h be the number of triangles in G. Suppose $p \in (0,1)$ with $pn \geq 3$, then there exists an induced subgraph $G' \subset G$ s.t.

$$n' > np/2, \quad e' < 3ep^2, \quad h' < 3hp^3.$$

⌟

Proof: □

Prop. (25.2.5.7) [Ajtai-Komlós-Szeméredi]. Let $\varepsilon \in \mathbb{R}_+$ and G be a graph with $n = v(G), t = d(G)$, h the number of triangles in G. Suppose $h < nm^{2-\varepsilon}$ and $t \leq m-1$, where $m \in \mathbb{Z}_{>12^{2/\varepsilon}}$, then

$$\alpha(G) > \frac{\varepsilon}{4800}.\frac{n}{m}.\log m.$$

⌟

Proof: Cf.[note on Ramsey Numbers]. □

Independence Polynomials

Def. (25.2.5.8)[Independence Polynomials]. For $G \in \texttt{Graph}^{\text{fin}}$, the **independence polynomial** is defined to be

$$I(G) = \sum_{A \subset V(G), A \text{ independent}} X^{\#A} \in \mathbb{Z}[X].$$

⌟

Prop. (25.2.5.9). For any $G \in \texttt{Graph}^{\text{fin}}$ and $v \in V(G)$, $I(G) = I(G \setminus \{v\}) + XI(G \setminus N(v))$. ⌟

Prop. (25.2.5.10) [Independence Polynomials of Line Graphs are Real-Rooted]. If $G \in \texttt{Graph}^{\text{fin}}$ is claw-free, then $I(G)$ is real-rooted. In particular, the independence polynomial of a line graph is real-rooted. ⌟

Proof: Use induction on $v(G)$. The case $v(G) = 0$ is trivial, and if $v(G) > 0$, take $v \in V(G)$, then $I(G) = I(G\setminus\{v\}) + XI(G \setminus N(v))$. So to prove $I(G)$ is real-rooted, it suffices to prove that $I(G\setminus\{v\})$ and $XI(G \setminus N(v))$ has a common interlacing polynomial(3.3.3.14).

For this we use another induction on $v(G)$. The case $v(G) = 1$ is trivial, so suppose $v(G) \geq 2$. If $N(v) \setminus \{v\} = \varnothing$, then $I(G \setminus N(v)) = I(G \setminus \{v\})$, so the assertion is true. And if $N(v) \setminus \{v\} \neq 0$, let $n \in N(v) \setminus \{v\}$, then

$$I(G \setminus \{v\}) = I(G \setminus \{u, v\}) + XI(G \setminus (u \cup N(u))),$$

so by(3.3.3.14), it suffices to show that every pair of the polynomials

$$XI(G \setminus (u \cup N(u))), \quad XI(G \setminus (v \cup N(v))), \quad I(G \setminus \{u, v\})$$

has a common interlacing. The two pairs $(XI(G \setminus (u \cup N(u))), I(G \setminus \{u, v\}))$ and $(XI(G \setminus (v \cup N(v))), I(G\setminus\{u, v\}))$ are compatible by induction hypothesis. And for the pair $(I(G\setminus(u\cup N(u))), I(G\setminus (v \cup N(v))))$, let $H = G \setminus (\{u, v\} \cup N(u) \cup N(v))$, then it is easy to show that $N_H(u), N_H(v)$ are both simplicial cliques in H(25.2.5.2). So we can use lemma(25.2.5.11) to show that the pair $(I(G \setminus (u \cup N(u))), I(G \setminus (v \cup N(v))))$ has a common interlacing. □

Lemma (25.2.5.11). If $G \in \texttt{Graph}^{\text{fin}}$, and $I(H)$ is real-rooted for every induced subgroup H, then

- For any two simplicial cliques $K, L \subset V(G)$(25.2.5.2), the two polynomials $I(G \setminus K), I(G \setminus L)$ have a common interlacing polynomial.
- For any simplicial clique $K \subset V(G)$, the two polynomials $I(G), XI(G \setminus K)$ have a common interlacing polynomial.

⌟

Proof: The proof use induction on $v(G)$ for both assertions. The case $v(G) = 0$ is trivial. For $v(G) > 0$, we may assume $K \neq \varnothing$, and denote $H = G \setminus (K \cup L)$. Then

$$I(G \setminus L) = I(H) + \sum_{v \in K \setminus L} XI(H \setminus N_H(v)),$$

$$I(G \setminus K) = I(H) + \sum_{v \in L \setminus K} XI(H \setminus N_H(v)).$$

$$I(G) = I(G \setminus K) + \sum_{v \in K} XI(G \setminus N(v)).$$

So it suffices to show that every pair of the polynomials

$$\{XI(H \setminus N_H(v))\}_{v\in K\cup L}, \quad I(H)$$

has a common interlacing polynomial(3.3.3.14). These from from the induction hypothesis and(25.2.5.3). For assertion 2, it suffices to show that every pair of the polynomials

$$I(G \setminus K), XI(G \setminus K), \{XI(H \setminus N_H(v))\}_{v\in K}$$

has a common interlacing polynomial. The pair $(I(G \setminus K), XI(G \setminus K))$ follows from the hypothesis, The pairs $(I(G \setminus K), XI(H \setminus N_H(v)))$ have common interlacings by induction hypothesis and(25.2.5.3). The pairs $(XI(G \setminus K), XI(H \setminus N_H(v)))$ have common interlacings by induction hypothesis and(25.2.5.3). The family $\{XI(H \setminus N_H(v))\}_{v\in K}$ have common interlacings by induction hypothesis and(25.2.5.3). □

6 Planer Graphs

Def. (25.2.6.1) [Planer Graphs]. A **planer graph** is a graph $G \in \mathtt{Graph}$ that is embeddable in $\mathbb{R}^2$. ⌟

Prop. (25.2.6.2) [Plane Graphs]. When can a graph be embedded in $\mathbb{R}^2$.**?** ⌟

Proof: □

Prop. (25.2.6.3) [Euler]. Any finite planer graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ satisfies $e(G) < 3v(G) - 6$. ⌟

Proof: □

Prop. (25.2.6.4) [Maximally Plane Graphs are Triangulations]. For any finite planer graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with $v(G) \geq 3$, G is maximally planer iff it is a planer triangulation. ⌟

Proof: Cf.[Diestel]P96. □

7 Flows

Def. (25.2.7.1) [Circulations]. A **circulation** on a finite multi-graph G is a function $f : \overrightarrow{E}(G) \to H$ where $H \in \mathcal{A}\mathrm{b}$, satisfying the following:

- For any $(e, x, y) \in \overrightarrow{E}(G)$, $f(e, x, y) = -f(e, y, x)$,
- (**Kirchhoff's law**)For any $x \in V(G)$,

$$\sum_{(e,x,y)\in \overrightarrow{E}(G)} f(e, x, y) = 0.$$

⌟

Def. (25.2.7.2). For a finite multi-graph G and and function $f : \overrightarrow{E}(G) \to H$ where $H \in \mathcal{A}\mathrm{b}$, for any two subsets $X, Y \subset V(G)$, denote

$$f(X, Y) = \sum_{(e,x,y)\in \overrightarrow{E}(G), x\in X, y\in \overline{Y}} f(e, x, y).$$

⌟

Def. (25.2.7.3) [Networks and Flows]. A **network** is a quadruple $N = (G, s, t, c)$ where G is a finite multi-graph, $s \neq t \in V(G)$, and $c : \overrightarrow{E}(G) \to \mathbb{N}$ a map called the **capacity function**. Then a **flow** on a network N is a function $f : \overrightarrow{E}(G) \to \mathbb{R}$ satisfying the following:

- For any $(e, x, y) \in \overrightarrow{E}(G)$, $f(e, x, y) = -f(e, y, x)$,
- For any $x \in V(G) \setminus \{s, t\}$,
$$\sum_{(e,x,y)\in\overrightarrow{E}(G)} f(e, x, y) = 0.$$
- $f(\overrightarrow{e}) \le c(\overrightarrow{e})$ for any $\overrightarrow{e} \in \overrightarrow{E}(G)$.

⌟

Def. (25.2.7.4) [Flow-Cuts]. For a flow f on a network $N = (G, s, t, c)$, a **flow-cut** is a pair $(S, \overline{S})$ where $S \subset V(G), \overline{S} = V(G) \setminus S, s \in S, t \in \overline{S}$, and $c(S, \overline{S}) = \sum_{(e,x,y)\in\overrightarrow{E}(G),x\in S,y\in\overline{S}} c(e, x, y)$ is called the **capacity of the cut**. ⌟

Prop. (25.2.7.5) [Total Values of Flows]. Given a flow f on a network $N = (G, s, t, c)$ for any flow-cut $(S, \overline{S})$, $f(S, \overline{S}) = f(s, V(G))$, called the **total value of the flow** f, denoted by $|f|$.

It is clear that $|f| \le c(S, \overline{S})$ for any flow-cut S. ⌟

Thm. (25.2.7.6) [Maximum Value and Minimum Capacity]. For any network $N = (G, s, t, c)$, the maximal total value of a flow on N equals the minimum value $c(S, \overline{S})$ for ay flow-cut S. Moreover, such a maximal flow can be integral-valued. ⌟

Proof: Let f be a flow with maximal total value. Let S be the set of all vertices $v \in V(G)$ s.t. there exists a path $x_0e_0x_1e_1 \ldots x_{k-1}e_kx_k$ from s to v with $f(e_i, x_i, x_{i+1}) < c(e_i, x_i, x_{i+1})$ for any $i \in [k-1]$.

If $t \in S$, suppose W is a shortest such path from s to t, and $\varepsilon = \min_{\overrightarrow{e}\in W}(c(\overrightarrow{e}) - f(\overrightarrow{e}))$, then we can modify f to add a value ε along the orientation of W. In this way, we get a flow with bigger $|f| = f(s, V)$, contradiction.

So $t \notin S$. Thus $(S, \overline{S} = V(G) \setminus S)$ is a flow-cut for N, and by the definition of S, $f(\overrightarrow{e}) = c(\overrightarrow{e})$ for any $\overrightarrow{e} \in \overrightarrow{E}(S, \overline{S})$. Thus $|f| = f(S, \overline{S}) = c(S, \overrightarrow{S})$. □

8 Extremal Graph Theory

Prop. (25.2.8.1) [Rademacher]. For any $n \in \mathbb{Z}_+$, any graph G with $\#V(G) = 2n, \#E(G) = n^2 + 1$ contains at least n triangles. ⌟

Proof:

□

Thm. (25.2.8.2) [Turán1941]. For any $r, n \in \mathbb{Z}_+, r > 1$, any $G \in \mathtt{Graph}^{\mathtt{simple}^n}$ not containing a subgraph K^r with $e(G) = \mathrm{Xtrm}(n, K_r)$ is isomorphic to $\mathrm{Tur}^{r-1}(n)$. ⌟

Proof: Cf.[Graph Theory, Diestel]P175. □

Thm. (25.2.8.3) [Erdös-Stone1946]. Given any $r, s \in \mathbb{Z}_+, r \ge 2$ and $\varepsilon \in \mathbb{R}_+$, then for $n \in \mathbb{Z}_+$ sufficiently large, any graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with $v(G) = n$ and $e(G) \ge t_{r-1}(n) + \varepsilon n^2$ contains K_s^r as a subgraph. ⌟

Proof: Cf.[Graph Theory, Diestel]P178.? □

Szemerédi's Regularity Lemma

Def. (25.2.8.4) [ε-Regular Pairs]. For $G \in \mathtt{Graph}^{\mathtt{simple}}$, two disjoint non-empty subsets $A, B \subset V(G)$ are called a **ε-regular pair** if for any $X \subset A, Y \subset B$ s.t. $\#X > \varepsilon\#A, \#Y > \varepsilon\#B$, we have

$$|d(X,Y) - d(A,B)| < \varepsilon.$$

⌟

Thm. (25.2.8.5) [Szeméredi's Regularity Lemma]. For any $\varepsilon \in \mathbb{R}_+$ and $m \in \mathbb{Z}_+$, there exists $M(\varepsilon, m), N(\varepsilon, m) \in \mathbb{Z}_+$ satisfying the following: For any graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with $v(G) \geq N(\varepsilon, m)$, there is a partition of $V(G)$ into $k+1$ classes

$$V(G) = V_0 \amalg V_1 \amalg \ldots \amalg V_k$$

where V_0 is called the **exceptional set**, s.t.

- $m \leq k \leq M(\varepsilon, m)$,
- $\#V_0 < \varepsilon v(G)$,
- $\#V_1 = \ldots = \#V_k$,
- All but at most εk^2 pairs of $(V_i, V_j), 1 \leq i < j \leq k$ are ε-regular pairs(25.2.8.4).

In other words, in some sense, every graph can be approximated by random graphs. ⌟

Proof: ? □

Cor. (25.2.8.6) [Szeméredi's Regularity Lemma, alternative forms]. For any $\varepsilon \in \mathbb{R}_+$, there exists $M(\varepsilon) \in \mathbb{Z}_+$ satisfying the following: For any graph $G \in \mathtt{Graph}^{\mathtt{simple}}$, $V(G)$ can be partitions into

$$V(G) = V_1 \amalg \ldots \amalg V_k$$

s.t.

- $\#V_i \leq \lceil \varepsilon v(G) \rceil$ for any i,
- $|\#V_i - \#V_j| \leq 1$ for any $1 \leq i < j \leq k$,
- All but at most εk^2 pairs of $(V_i, V_j), 1 \leq i < j \leq k$ are ε-regular pairs(25.2.8.4).

⌟

Proof: ? □

⌟

1 Random Graphs

Prop. (25.3.1.1) [Small Random Independent Sets]. Let $k \in \mathbb{Z}_+$ and let G_n be a random graph with each edge appearing with probability $p = 8k^2/n$, then

$$\lim_{n\to\infty} \mathbf{P}(\alpha(G_n) \geq \frac{k}{2n}) = 0.$$

⌟

Proof:

$$\mathbf{P}(\alpha(G_n) \geq n/(2k)) \leq \binom{n}{n/(2k)}(1 - 16k^2/n)^{\binom{r}{2}} \leq 2^n e^{-p(\frac{n}{2k})^2/2} \leq 2^n e^{-n},$$

which tends to 0 as n tends to ∞. □

<u>**Signed Adjacency Matrices**</u>

Prop. (25.3.1.2) [Signed Adjacency Matrices and Matching Polynomials, Godsil-Gutman]. For any $G \in \mathtt{Graph}$ and a choice of signing $s \in \{\pm 1\}^{E(G)}$ of the edges of G, then we can consider the signed adjacency matrices $A_{s,G}$ of G and the corresponding characteristic polynomials $f_s(G)$. Then

$$\mathbf{E}_{s\in\{\pm1\}^{E(G)}} f_s(G) = \mu_G(X).$$

⌟

Proof:

$$\begin{aligned}\mathbf{E}_{s\in\{\pm1\}^{E(G)}} f_s(G) &= \mathbf{E}[\sum_{\sigma\in \mathrm{Sym}([n]_+)} \mathrm{sgn}(\sigma)\prod_{i=1}^n (xI - A_{s,G})_{i,\sigma(i)}]\\ &= \sum_{k=0}^n x^{n-k}(-1)^k \sum_{S\subset[n]_+,\#S=k}\ \sum_{\pi\in\mathrm{Sym}(S)} \mathbf{E}[\mathrm{sgn}(\pi)\prod_{i\in S}(A_s)_{i,\pi(i)}]\\ &= \sum_{k\in 2\mathbb{N}, 0\leq k\leq n} x^{n-k} \sum_{S\subset[n]_+,\#S=k}\ \sum_{\pi\in\mathrm{Matching}(S)} (-1)^{k/2}\\ &= \mu_G(x)\end{aligned}$$

□

Prop. (25.3.1.3) [Random Adjacency matrices, Marcus-Spielman-Srivastava]. For any $G \in \mathtt{Graph}^{\mathtt{simple}}$ with an arbitrary ordering of $E(G)$, and any $p_1, \ldots, p_{e(G)} \in [0, 1]$, the expected value of the singed adjacency characteristic polynomial as in(25.3.1.2):

$$P(X) = \sum_{s\in\{\pm1\}^{E(G)}} \prod_{s_i=1} p_i \prod_{s_i=-1} (1 - p_i) f_s(X) \in \mathbb{R}[X]$$

is real-rooted. ⌟

Proof: Denote $d = \Delta(G)$. For any $s \in \{\pm 1\}^{E(G)}$ and $u \neq v \in V(G)$, denote by $s_{u,v}$ the value on the edge (u, v), and define $a^{\pm}_{u,v} = e_u \pm e_v$, $L^{\pm}_{u,v} = a^{\pm}_{u,v} a^t_{u,v}$. Then

$$d\mathbf{1} - A_s = \sum_{(u,v)\in E} a^{s_{u,v}}_{u,v} (a^{s_{u,v}}_{u,v})^t + D$$

where $D = \mathrm{diag}(d - d_1, \ldots, d - d_{e(G)})$.

Now

$$P(X + d) = \sum_{s\in\{\pm 1\}^{E(G)}} \prod_{s_i=1} p_i \prod_{s_i=-1} (1 - p_i) \det\Big(X\mathbf{1} + D + \sum_{(u,v)\in E(G)} a^{s_{u,v}}_{u,v} (a^{s_{u,v}}_{u,v})^t\Big),$$

which is real-rooted by(3.3.3.10). □

Cor. (25.3.1.4)[Signed Adjacency Characteristic polynomials are Interlacing, Marcus-Spielman-Srivastava]. For any $G \in \mathtt{Graph}^{\mathtt{simple}}$ with an arbitrary ordering of $E(G)$, the singed adjacency characteristic polynomials(25.3.1.2) form an interlacing family(3.3.3.16). ⌟

Proof: By(3.3.3.14), it suffices to show that for any $k \in [e(G)-1]_+$ and $s_1, \ldots, s_k \in \{\pm 1\}, \lambda \in \mathbb{R}_{\geq 0}$, the polynomial

$$\lambda f_{s_1,\ldots,s_k,1}(X) + (1 - \lambda) f_{s_1,\ldots,s_k,-1}(X)$$

is real-rooted. But this follows from(25.3.1.3). □

Thm. (25.3.1.5) [Minimal Eigenvalues of Signed Adjacency Characteristic Polynomials, Marcus-Spielman-Srivastava]. For any connected graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with universal covering T, there exists a signed adjacency characteristic polynomial $f_{s,G}$ of G(25.3.1.2) with all roots bounded above by $\rho(T)$. ⌟

Proof: This follows from(25.3.1.4)(3.3.3.18) and(25.3.1.2)(25.2.3.5). □

<u>Second Moment Method</u>

2 Coloring

Def. (25.3.2.1) [Colorings]. For $G \in \mathtt{Graph}$ and $k \in \mathbb{Z}_+$, a k-**vertex coloring** of G is a map $c : V(G) \to [k]_+$ s.t. $c(u) \neq c(v)$ for any any edge $e = (u, v) \in E(G)$.

A graph $G \in \mathtt{Graph}$ with a k-vertex coloring is called k-**colorable**. The infimum of $k \in \mathbb{Z}_+$ s.t. G is k-colorable is denoted by $\gamma(G)$, called the **chromatic number** of G.

Similarly, we can define **edge-colorings** of a graph as a vertex coloring of the line graph $L(G)$, and define the **edge-chromatic number** of G, denoted by $\gamma'(G)$. ⌟

Def. (25.3.2.2) [Chromatic Numbers]. For $G \in \mathtt{Graph}$, the **chromatic number** $\gamma(G) \in \mathbb{Z}_+ \cup \{\infty\}$ is the minimal number $n \in \mathbb{Z}_+$ s.t. $V(G)$ can be partitioned into n disjoint subsets $V = V_1 \amalg V_2 \amalg \ldots \amalg V_n$ s.t. if $x, y \in V_i(G)$ for some i, then $e(x, y) = 0$. ⌟

Def. (25.3.2.3) [Partite Graphs]. For $r \in \mathbb{Z}_{\geq 2}$, an r-**partite graph** is a graph G s.t. $V(G)$ has an r-partition $V = V_1 \amalg \ldots \amalg V_r$ s.t. vertices in a same partition class are not adjacent. 2-partite graphs are also called **bipartite graphs**.

A maximal r-bipartite graph $K_s * K_s * \ldots * K_s$ is denoted by K^r_s. ⌟

Prop. (25.3.2.4)[Bipartite Graphs and Odd Cycles]. A graph $G \in \mathtt{Graph}$ is bipartite iff it contains no odd cycles. ⌟

Proof: One direction is clear. For the other, let T be a spanning tree of G, with a root t. Then we can define a tree order on $V(G)$. Now $V(G)$ is partitions into two classes according to whether $v \in V(G)$ satisfies $d(t, v)$ is even.

This is truly a bipartite partition, because if an odd-distance vertex is adjacent to an even-distance vertex, then we get an odd cycle. □

Prop. (25.3.2.5) [Chromatic Numbers and Independent Sets]. For a finite graph $G \in \mathtt{Graph}^{\mathtt{simple}}$, $v(G) \leq i(G)\gamma(G)$. ⌟

Proof: Let $V(G) = V_1 \amalg \ldots \amalg V_{\gamma(G)}$ be a coloring of G, then each V_i is an independent set. Thus $\# V_i(G) \leq i(G)$. □

Prop. (25.3.2.6) [Chromatic Numbers and Minimal Degree]. For any $k \in \mathbb{Z}_+$, any k-chromatic graph $G \in \mathtt{Graph}^{\mathrm{fin}}$ has a k-chromatic subgraph H with $\delta(H) \geq k - 1$. ⌟

Proof: Cf.[Diestel]P123. □

Cor. (25.3.2.7). For any $G \in \mathtt{Graph}^{\mathrm{fin}}$, G contains a cycle of length at least $v(G)/\gamma(G)$. ⌟

Proof: This follows from(25.3.2.6) and(25.2.1.10). □

Prop. (25.3.2.8) [Coloring Numbers and Spectrums]. For $k \in \mathbb{Z}_{\geq 2}$ and a connected k-regular graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with $n = v(G) < \infty$, we have

$$i(G) \leq \frac{n}{k} \max\Big(|\lambda_1(G)|, |\lambda_{v(G)-1}(G)|\Big).$$

In particular, by(25.3.2.5),

$$\gamma(G) \geq \frac{k}{\max\Big(|\lambda_1(G)|, |\lambda_{v(G)-1}(G)|\Big)}.$$

⌟

Proof: Let $F \subset V(G)$ be a maximal independent set of G. Take $f \in \ell^2(V(G))$ s.t.

$$f(x) = \begin{cases} \# V(G) \setminus F & , x \in F \\ -\# F & , x \notin F \end{cases}.$$

Then $||f|| = \# F \cdot \# V(G) \setminus F \cdot \# V(G) \leq i(G)n^2$. And for any $x \in F$, $(Af)(x) = -ki(G)$. So $||Af||^2 \geq k^2 i(G)^3$.

Since $\sum_{v \in V(G)} f(v) = 0$, $||Af|| \leq \max(|\mu_1|, |\mu_{n-1}|)||f||$, so $ki(G)^{3/2} \leq \max(|\mu_1|, |\mu_{n-1}|) \cdot ni(G)^{1/2}$, which gives the desired result. □

Thm. (25.3.2.9)[Large Girth, Large Chromatic and Large minimal Degree Graphs, Erdös]. For any $k \in \mathbb{Z}_+$, there exists a finite graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with

$$g(H), \gamma(H), \delta(H) > k.$$

⌟

Proof: Assume $k \geq 3$. Fix $\varepsilon \in (0, 1/k)$ and n large, and consider the random graph G_n of size n with each edge appearing with probability $p = n^{\varepsilon-1}$. Then the expected value of number X of cycles with length$\leq k$ is

$$\mathbf{E}(X) = \sum_{i=3}^{k} \frac{n(n-1)\dots(n-i+1)}{2i} p^i \leq \frac{1}{2}\sum_{i=3}^{k} n^i p^i \leq \frac{k-2}{2} n^{k\varepsilon}.$$

Thus

$$\mathbf{P}(X \geq n/2) \leq \mathbf{E}(X)/(n/2) \leq (k-2)n^{k\varepsilon-1}.$$

So when n is large, $\mathbf{P}(X \geq n/2) \leq 1/2$. And notice $n^{\varepsilon-1} \geq 16k^2/n$ for n large, so by(25.3.1.1), when n is large, $\mathbf{P}(i(G_n) \geq n/(2k)) \leq 1/2$. Thus there is a graph G with $v(G) = n, i(G) < n/(2k)$, and has less than $n/2$ cycles of length$\leq k$.

Delete a vertex from each cycle of length$\leq k$ in G, and let H be the remaining graph, then $v(H) \geq n/2, g(H) > k$, and $\gamma(H) \geq v(H)/i(H) \geq \frac{1}{2}n/i(G) > k$(25.3.2.5).

Finally, we can make $\delta(G)$ large by restricting to a subgraph H, by(25.3.2.6). □

Thm. (25.3.2.10) [Vizing[Viz64]]. For any finite simple graph $G \in \mathtt{Graph}^{\mathtt{simple}}$, $\Delta(G) \leq \gamma'(G) \leq \Delta(G) + 1$. ⌟

Proof: $\Delta(G) \leq \gamma'(G)$ is clear. For the other inequality, use induction on $e(G)$: The case $e(G) = 0$ is trivial, and for $e(G) > 0$, for any $e = (x, y) \in E(G)$, there is a color of $G \setminus \{e\}$, and if there is a color α that is missing at x and a color β that is missing at y, then the maximal (β, α)-alternating path from y will end in x, otherwise we can switch α, β in the color of this maximal path, and color e with α.

Now let $xy_0 \in E(G)$, and let c_0 be the coloring of $G \setminus \{xy_0\}$, and let α be a color missing at x in the coloring c_0, and $c(1)$ be the color missing at y_0 in the coloring c_0. Then there may exists $xy_1 \in E(G)$ s.t. $c_0(xy_1) = c(1)$. Continuing this way, we find a maximal $k \in \mathbb{Z}_+$ s.t. there exists $xy_0, xy_1, \dots, xy_k \in E(G)$ s.t. $c(i) \overset{\triangle}{=} c_0(xy_i)$ is a color missing at y_{i-1} in the coloring c_0.

Then we can define colorings c_i of $G \setminus \{xy_i\}$ for each i: $c_i(e) = \begin{cases} c(i+1) & , e = xy_k, k \in [i] \\ c_0(e) & \text{otherwise} \end{cases}$.

Let β be a color missing at y_k in the coloring c_0, and consider the (β, α)-alternating path P from y_k ending at x. By maximality of k, this path ends with $y_k, \dots, y_i, x$ for some $i \in [k]$. Then $\beta = c(i+1)$, which is missing at y_i in the coloring c_0(thus also missing at y_i in the coloring c_k). Then in the coloring c_i, the (β, α)-path from y_i is just the reverse of P ending at y_k, and then cannot go further, contradiction. □

Prop. (25.3.2.11) [König1916]. For any bipartite graph $G \in \mathtt{Graph}^{\mathrm{fin}}$, $\gamma'(G) = \Delta(G)$. ⌟

Proof: Use induction on $e(G)$. The case $e(G) = 0$ is trivial. For $e(G) > 0$, take $e = (x, y) \in G$, and choose a $\Delta(G)$-coloring of $G' = G \setminus \{e\}$, which is possible by induction hypothesis. Then there exists $\alpha, \beta \in [\Delta(G)]_+$ s.t. x is not incident with an α-edge and y is no incident with an β-edge. If α can be chosen to be β, then a coloring of G is possible.

If $\alpha \neq \beta$, then x has an β-edge. Then we can extend this edge to a maximal (α, β)-alternating path W in G'. This path must be a simple path, and it cannot contain y, because in this way, it must end with an α-edge, making an odd cycle in G, contradicting the fact that G is bipartite. So we can now swap all the colors of edges in W, and then color e with β. This is a $\Delta(G)$-coloring of G. □

Prop. (25.3.2.12) [Csaba-Kühn-Lo-Osthus-Treglown2016]. There exists $n_0 \in \mathbb{Z}_+$ s.t. for any $n \in \mathbb{Z}_{n_0}$ and $d \in \mathbb{Z}_{\geq n/2}$, any d-regular graph $G \in \texttt{Graph}$ with $v(G) = n$ satisfies $\gamma'(G) = \Delta(G)$. ⌟

Proof: □

Tutte Polynomial

Def. (25.3.2.13) [Tutte Polynomials]. The **Tutte polynomial** of a multi-graph G is defined to be $T_G(q, v) =$**?**. ⌟

Prop. (25.3.2.14). For any $G \in \texttt{Graph}$ and $q \in \mathbb{Z}_+$, the number of ways of coloring vertices of G with no two vertices of the same color connected is just $T_G(q, -1)$. ⌟

Proof: Cf.[The Knot Book, Adams]P233.**?** □

List Colorings

Def. (25.3.2.15) [List Colorings]. For $k \in \mathbb{Z}_+$, a graph $G \in \texttt{Graph}$ is called k-**choosable** iff for any family of subsets $S_v \subset \mathbb{N}$ indexed by $V(G)$, there is a map $c : V(G) \to \mathbb{N}$ s.t. $c(v) \in S_v$ for any $v \in V(G)$, and $c(u) \neq c(v)$ for any any edge $e = (u, v) \in E(G)$. The infimum of $k \in \mathbb{Z}_+$ s.t. G is k-choosable is denoted by $\mathrm{ch}(G)$, called the **choice number** of G.

Similarly, we can define **edge-list-colorings** of a graph as a vertex coloring of the line graph $L(G)$, and define the **edge-choice number** of G, denoted by $\mathrm{ch}'(G)$.

Clearly, $\mathrm{ch}(G) \geq \gamma(G), \mathrm{ch}'(G) \geq \gamma'(G)$. ⌟

Prop. (25.3.2.16)[Bondy-Boppana-Siegel]. If $H \in \texttt{Graph}^{\mathrm{fin}}$ be an oriented graph s.t. every induced subgraph has a kernel(25.2.1.5), and $\{S_v\}_{v \in V(H)}$ is a family of lists(25.3.2.15) s.t. $\deg^+(v) < \#S_v$ for any $v \in V(H)$, then H can be colored from the list S_v. ⌟

Proof: Use induction on $v(H)$. $v(H) = 0$ is trivial, and for $v(H) > 0$, take $\alpha \in \cup_v S_v$, and let H' be the subgraph induced by vertices $v \in V(H)$ s.t. $\alpha \in S_v$. Then H' has a kernel $U \neq \varnothing$. Now color U with α. Then the graph $H \setminus U$ can be colored from the list $\{S'_v\}_{v \in V(H)}$, where $S'_v = S_v \setminus \{\alpha\}$, by induction hypothesis and the definition of a kernel. Thus H can also be colored from the list S_v. □

Conj. (25.3.2.17) [List Coloring Conjecture]. For any $G \in \texttt{Graph}$, $\mathrm{ch}'(G) = \gamma'(G)$. ⌟

Proof: □

Thm& Conj.Cor. (25.3.2.18) [Bipartite Graphs, Galvin[Gal95]]. For any bipartite graph $G \in \texttt{Graph}$, $\mathrm{ch}'(G) = \gamma'(G) = \Delta(G)$. ⌟

Proof: The second equality follows from(25.3.2.11). For the first, it suffices to show that $\mathrm{ch}'(G) \leq \gamma'(G)$. Let $G = X \amalg Y$ where X, Y are independent subset of G. Assume $k = \gamma'(G) < \infty$, and let c be a k-coloring.

We define an orientation on $L(G)$ as follows: For any two adjacent edges $e, e' \in E(G)$ s.t. $c(e) < c(e')$, assign $e < e'$ if e, e' meet in X, and $e > e'$ if e, e' meet in Y. In this way, $\deg^+(e) > k$ for any $e \in E(G)$.

Notice this orientation also defines a linear preference on $E(G)$(25.2.3.2), thus any induced subgraph of $L(G)$ has a kernel by the stable matching theorem(25.2.3.3). Now it follows from(25.3.2.16) that $L(G)$ is k-choosable. □

Planer Graphs

Thm. (25.3.2.19) [4-Coloring Problem, Appel-Haken1977]. Every planer graph is 4-colorable. ⌟

Proof: ?Cf.[N. Robertson, D. Sanders, P.D. Seymour and R. Thomas1977]. □

Thm. (25.3.2.20) [3-Coloring Theorem, Grötzsch1959]. Every Planer graph not containing a triangle is 3-colorable. ⌟

Proof: □

Thm. (25.3.2.21) [Alon1993]. For any $k \in \mathbb{N}$, there exists $f(k) \in \mathbb{N}$ s.t. any graph $G \in \texttt{Graph}$ with $d(G) \geq f(k)$ satisfies $\mathrm{ch}(G) \geq k$. ⌟

Proof: □

Thm. (25.3.2.22) [5-Choice Theorem, Thomassen[Tho94]]. Any planer graph is 5-choosable. ⌟

Proof: It suffices to prove for finite maximally planer graphs $G \in \texttt{Graph}^{\texttt{simple}}$. By(25.2.6.4), G is a graph triangulation, so this follows from the following excellently tailored lemma:

Lemma (25.3.2.23). Let G be a planer graph s.t. $v(G) \geq 3$, its interiors is triangularized, and its boundary is a cycle $C = v_1 v_2 \ldots v_k v_1$. Then given any family of subsets $S_v \subset \mathbb{N}$ indexed by $V(G)$ s.t. $\#S_v \leq 5$, and $\#S_v \leq 3$ if $v \in C$, and given $c_1 \in S_{v_1}, c_2 \in S_{v_2}$, there is a map $c: V(G) \to \mathbb{N}$ s.t. $c(1) = c_1, c(2) = c_2$, $c(v) \in S_v$ for any $v \in V(G)$, and $c(u) \neq c(v)$ for any any edge $e = (u, v) \in E(G)$. ⌟

Proof: Use induction on $v(G)$. The case $v(G) = 3$ is trivial. And for $v(G) \geq 4$, if there is an arc vw in G, then we can use induction hypothesis on the two parts divided by vw and get the desired result for G. If instead there are no arcs in G, let $v_1, u_1, u_2, \ldots, u_m, v_{k-1}$ be the neighborhoods of v_k with their clockwise orientation around v_k. Now choose two elements $a, b \in S_{v_k}$ distinct to c_1, and delete a, b from $S_{u_1}, \ldots, S_{u_m}$. Then the resulting family is a family for the graph $G' = G \setminus \{v_k\}$ that satisfies the induction hypothesis, thus there is a choice function $c: V(G) \setminus \{v\} \to \mathbb{N}$. Now either a or b are different from $c(v_{k-1})$, so we can define $c(v_k)$ to be this number. □

□

Remark (25.3.2.24). This is strict because Voigt(1993) constructed a plane graph of order 238 that is not 4-choosable. ⌟

3 Cayley Graphs

Def. (25.3.3.1) [Cayley Graphs]. For $G \in \mathcal{G}\mathrm{rp}$ and $S \subset G$ s.t. $k \overset{\triangle}{=} \#S < \infty$ and $S = S^{-1}$, the **Cayley graph** is a graph $\mathrm{Cay}(G, S) \in \texttt{Graph}$ s.t.

$$V(\mathrm{Cay}(G, S)) = G, \quad E(\mathrm{Cay}(G, S)) = \{(x, y) \in G^2 | y^{-1}x \in S\}.$$

Then

- $\mathrm{Cay}(G, S)$ is a k-regular.
- $\mathrm{Cay}(G, S)$ is connected iff S generates G.
- If there is a homomorphism $\chi: G \to \mathbb{Z}/(2)$ s.t. $\chi(S) = \{1\}$, then $\mathrm{Cay}(G, S)$ is bipartite. The converse is also true if S generates G.

⌟

Proof: 3: One direction is clear. For the other direction, if S generates G, by item2, G is connected, so we can use the bipartition to define χ using the parity of distances. □

4 Perfect Graphs

Def. (25.3.4.1) [Perfect Graphs]. A **Perfect graph** is a finite simple graph G s.t. for any induced subgraph $H \subset G$, the maximal cardinality of a clique of H equals the chromatic number of H. ⌟

Def. (25.3.4.2) [Berge Graphs]. A finite simple graph G is called a **Berge graph** if it doesn't contain holes or antiholes(25.2.1.21) of odd cardinality. ⌟

Thm. (25.3.4.3) [Perfect Graph Theorem, Chudnovsky-Robertson-Seymour-Thomas]. A simple finite graph G is perfect iff it is Berge. ⌟

Proof:

□

5 Triangulated Graphs

6 Interval Graphs

7 Graph Minors

Conj. (25.3.7.1) [Self-Minor Conjecture, Seymour]. Every countably-infinite graph is a proper minor of itself(i.e. the minor is not an identity). ⌟

Proof:

□

Thm& Conj.Cor. (25.3.7.2) [Graph Minor Theorme, Robertson-Seymour 1986–2004]. The minor relation on the set of finite graphs is a quasi-well-ordering. ⌟

Proof: Clearly there cannot be an infinite decreasing minor sequence of finite graphs, so by(2.2.3.19), it suffices to show that there cannot be an infinite set of non-comparable finite graphs. This follows from the self-minor conjecture, because by considering the disjoint union of the graphs.

Alternatively, ? □

Lemma (25.3.7.3) [Kruskal1960]. The root-preserving topological minor relation on the set of finite rooted trees is a quasi-well-ordering. ⌟

Proof: Clearly there cannot be an infinite decreasing topological minor sequence of finite rooted trees, so by(2.2.3.19), it suffices to show that there cannot be an infinite set of non-comparable finite rooted trees.

Suppose the contrary, and we can choose a bad sequence $(T_i)_{i\in\mathbb{N}}$ of finite rooted trees s.t. for any $n \in \mathbb{N}$, T_n is a tree of minimum order s.t. $(T_0, T_1, \ldots, T_n)$ extends to a bad sequence. Let r_n be root of T_n, and let A_n be the set of trees of the forest $T_n \setminus \{r_n\}$. Then we claim that $A = \cup_n A_n$ is quasi-well ordered by the root-preserving topological minor relation:

Let (T^k) be a sequence of trees in A, and find a smallest $n \in \mathbb{N}$ s.t. $T^k \in A_n$ for some k. Then $T^k \subsetneq T_n$, and

$$T_0, \ldots, T_{n-1}, T^k, T^{k+1}, \ldots$$

is not a bad sequence by the choice of T_n. Let (T, T') be an ascending pair, then T cannot be in $(T_0, \ldots, T_{n-1})$, as then we will have $T \le T' \le T_{n'}$, but $n' \ge n$, so $(T, T_{n'})$ is an ascending pair in $(T_i)_{i\in\mathbb{N}}$, contradiction. Thus (T, T') is an ascending pair in (T^k), which is what we want to prove.

Now by(2.2.3.20), the sequence $(A_n)_{n\in\mathbb{N}} \in [A]^{<\aleph_0}$ has an ascending pair $A_i \le A_j$ where $i < j$. Let $f : A_i \to A_j$ be injective with $T \le f(T)$ for any $T \in A_i$, then we get a root-preserving injection $T_i \to T_j$. Thus $T_i \le T_j$, contradiction. □

8 Lifts of Graphs

Def. (25.3.8.1) [Double Covers of Graphs]. For any simple graph $G \in \mathtt{Graph}^{\mathtt{simple}}$, the **double covering** of G is the graph $\widetilde{G} = (\widetilde{V}, \widetilde{E})$ where $\widetilde{V} = V(G) \times \{\pm 1\}$, and

$$\widetilde{E} = \{(v_1, \varepsilon_1, v_2, \varepsilon_2) \in \widetilde{V}(G)^2 | (v_1, v_2) \in E(G), \varepsilon_1 \neq \varepsilon_2\}.$$

It is a bi-partite graph, and $\widetilde{G} \to G$ is a covering map. ⌟

Def. (25.3.8.2) [Signing of a 2-Lifting]. For any simple graph $G \in \mathtt{Graph}^{\mathtt{simple}}$, the **signed 2-lift** of G with signing $s : E(G) \to \{\pm 1\}$ is the graph $\widetilde{G}_s = (\widetilde{V}_s, \widetilde{E}_s)$ s.t. $\widetilde{V}_s = E(G) \times \{\pm 1\}$, and

$$\widetilde{E}_s = \{(v_1, \varepsilon_1, v_2, \varepsilon_2) \in \widetilde{V}(G)^2 | (v_1, v_2) \in E(G), \varepsilon_1 \begin{cases} = \varepsilon_2 & , s(v_1, v_2) = 1 \\ \neq \varepsilon_2 & , s(e(v_1, v_2)) = -1 \end{cases}\}.$$

It is a bi-partite graph, and $\widetilde{G} \to G$ is a covering map. ⌟

Thm. (25.3.8.3) [Spectrums of Signed 2-Lifts, Bilu-Linial]. For any simple graph $G \in \mathtt{Graph}^{\mathtt{simple}}$ with signing $s : E(G) \to \{\pm 1\}$, the spectrum of the signed 2-lift of G w.r.t. s is the sum of the spectrum of G and the spectrum of the signed adjacency matrix $A_{s,G}$ of G(25.3.1.2). ⌟

Proof: It is not hard to see that the adjacency matrix of $\widetilde{G}_s$ is $\widetilde{A} = \begin{bmatrix} A_1 & A_2 \\ A_2 & A_1 \end{bmatrix}$, where $A_1 = (V(G), s^{-1}(1))$, and $A_2 = (V(G), s^{-1}(-1))$, $A = A_1 + A_2$, $A_s = A_1 - A_2$.

Then it is easy to see that if v is an eigenvector of A with eigenvalue λ, then (v, v) is an eigenvector of $\widetilde{A}$ with eigenvalue λ, and if u is an eigenvector of A_s with eigenvalue μ, then $(u, -u)$ is an eigenvector of $\widetilde{A}$ with eigenvector μ. As these vectors are linearly independent, the result follows. □

9 Expander Graphs

References are [DSV03].

Def. (25.3.9.1) [Expanding Constants]. For $G \in \mathtt{Graph}$, the **expanding constant** of G is defined to be

$$h(G) = \inf_{F \subset V(F), \# F < \infty} \Big(\frac{e(F, V(G) \setminus F)}{\min(\# F, \#(V(G) \setminus F))} \Big).$$

⌟

Prop. (25.3.9.2) [Cheeger – Buser Inequlity, Dodziuk/Alon-Milman]. Let $k \in \mathbb{Z}_{\geq 2}$ and $G \in \mathtt{Graph}^{\mathtt{simple}}$ be a finite connected k-regular graph with $n \overset{\triangle}{=} v(G)$, and the spectrum of M_G are $\mu_0 \geq \mu_1 \ldots \geq \mu_{n-1}$, then

$$\frac{k - \mu_1}{2} \leq h(X) \leq \sqrt{2k(k - \mu_1)}.$$

⌟

Proof: Take an arbitrary orientation of G, and consider the the coboundary functor $d : \ell^2(V(G)) \to \ell^2(E(G)) : df(e) = f(e^+) - f(e^-)$, and its adjoint $d^* : \ell^2(E(G)) \to \ell^2(V(G))$. Then $d^* d = L_G = k\mathbf{1} - A_G$. The spectrum of L_G is $0, k - \lambda_1, \ldots, k - \lambda_{n-1}$. So for any $f \in \ell^2(V(G))$ s.t. $\sum_{v \in V(G)} f(v) = 0$, we have $|df|_2^2 = \langle L_G f, f \rangle \geq (k - \lambda_1)|f|_2^2$.

Now for any $F \subset V(G)$, consider $f \in \ell^2(V) : f(x) = \begin{cases} \#(V \setminus F) & , x \in F \\ -\#F & , x \notin F \end{cases}$. Then $\sum_{v \in V(G)} f(v) = 0$, and $|f|_2^2 = n\#F\#(V \setminus F)$. And

$$df(e) = \begin{cases} \pm n & , e \in E(F, V \setminus F) \\ 0 & , \text{otherwise} \end{cases}.$$

So $|df|_2^2 = n^2 e(F, V \setminus F)$. The the inequality above applied to f implies that

$$e(F, V \setminus F) \geq (k - \lambda_1)\frac{\#F \cdot \#V \setminus F}{n} \geq \frac{k - \lambda_1}{2}\min(\#F, \#V \setminus F).$$

This proves the lower hound for $h(F)$.

For the upper bound: For any $f \in \ell^2(V(G))$, define $B_f = \sum_{e \in E(G)} |f(e^+)^2 - f(e^-)^2|$, then

Lemma (25.3.9.3).

- If $\beta_r > \beta_{r-1} > \ldots > \beta_0$ are the values of f, and let $L_i = f^{-1}([\beta_i, \infty))$, then $B_f = \sum_{i=1}^r e(L_i, V(G) \setminus L_i)(\beta_i^2 - \beta_{i-1}^2)$.
- $B_f \leq \sqrt{2k}|df|_2|f|_2$.
- If $\#\operatorname{Supp}(f) \leq n/2$, then $B_f \geq h(G)|f|_2^2$.

⌟

Proof: 1: This is clear.

2:

$$B_f = \sum_{e \in E(G)} |f(e^+) + f(e^-)|.|f(e^+) - f(e^-)| \leq \sqrt{\sum_{e \in E(G)} (f(e^+) + f(e^-))^2} \cdot \sqrt{\sum_{e \in E(G)} (f(e^+) - f(e^-))^2} \leq \sqrt{2k}|df|_2|f|_2.$$

3: The hypothesis implies that $\#L_i \leq n/2$ for any i, thus $e(L_i, V(G) \setminus L_i) \geq h(G)\#L_i$. Thus

$$B_f = \sum_{i=1}^r e(L_i, V(G) \setminus L_i)(\beta_i^2 - \beta_{i-1}^2) \geq h(G)\sum_{i=1}^r \#L_i(\beta_i^2 - \beta_{i-1}^2) = h(G)|f|_2^2.$$

□

Now consider an eigenvalue g for L_G with eigenvector $k - \lambda_1$, and let $V^+ = \{x \in V | g(x) > 0\}$, $f = \max(g, 0)$. We may assume $0 < \#V^+ \leq n/2$. Then for $x \in V^+$,

$$L_G f(x) = kg(x) - \sum_{y \in V^+} A_{xy} g(y) \leq kg(x) - \sum_{y \in V} A_{xy} g(y) = (k - \lambda_1)g(x).$$

So

$$|df|_2^2 = \langle L_G f, f \rangle = \sum_{x \in V^+} L_G f(x) g(x) \leq (k - \lambda_1) \sum_{x \in V^+} g(x)^2 \leq (k - \lambda_1)|f|_2^2.$$

Combining this and the lemma above, we get

$$h(x)|f|_2^2 \leq B_f \leq \sqrt{2k}|df|_2|f|_2 \leq \sqrt{2k(k - \lambda_1)}|f|_2^2,$$

which implies $h(x) \leq \sqrt{2k(k - \lambda_1)}$. □

Def. (25.3.9.4) [Expander Graphs]. For $k \in \mathbb{Z}_{\geq 2}$, a family of k-regular finite simple graphs $(X_n) \in \mathtt{Graph}^{\mathbb{Z}_+}$ is called a family of **expander graphs** if $\varinjlim v(X_n) = \infty$, and $\inf_n h(X_n) > 0$, or equivalently by (25.3.9.2), $\inf_n(k - \mu_1(X_n)) > 0$. ⌟

Ramanujan Graphs

References are [DSV03] and [L-S88].

Def. (25.3.9.5) [Ramanujan Graphs]. A **Ramanujan graph** is a finite connected graph $G \in \texttt{Graph}^{\text{fin}}$ with universal covering T s.t. for any eigenvalue λ_i of G, either $|\lambda_i| = \lambda_1$, or $|\lambda_i| \leq \rho(T)$.

In particular, by(25.2.2.9), for any $c, d \in \mathbb{Z}_{\geq 2}$, a finite connected (c,d)-bi-regular graph has trivial eigenvalues $\pm\sqrt{cd}$, so it is a **Ramanujan bi-regular graph** iff all its non-trivial eigenvalues λ_i satisfy $|\lambda_i| \leq \sqrt{c-1} + \sqrt{d-1}$. ⌟

Cor. (25.3.9.6). For a k-regular non-bi-partite Ramanujan graph G, $\gamma(G) \geq \frac{k}{2\sqrt{k-1}} \geq \frac{\sqrt{k}}{2}$, by(25.3.2.8). ⌟

Conj. (25.3.9.7) [Bilu-Linial]. For any $c, d \in \mathbb{Z}_{\geq 3}$ and any (c,d)-bi-regular graph G, there is a signing of a 2-lift(25.3.8.2) such that the new eigenvalues all have absolute value $\leq \sqrt{c-1} + \sqrt{d-1}$. ⌟

Proof: □

Thm& Conj.Cor. (25.3.9.8) [Marcus-Spielman-Srivastava]. For any $c, d \in \mathbb{Z}_{\geq 3}$ and any (c,d)-bi-regular graph G, there is a signing of a 2-lift such that the new eigenvalues are all bounded above by $\sqrt{c-1} + \sqrt{d-1}$. ⌟

Proof: Then the universal cover T of G is a (c,d)-bi-regular tree, which has spectrum radius $\rho(T) = \sqrt{c-1} + \sqrt{d-1}$ by(25.2.2.9). Thus the assertion follows from(25.3.1.5) and(25.3.8.3). □

Cor. (25.3.9.9) [Lubotzky-Phillips-Sarnak/Margulis/Chiu/Lubotzky/Marcus-Spielman-Srivastava]. For any $c, d \in \mathbb{Z}_{\geq 3}$, there exists an infinite family of (c,d)-bi-regular Ramanujan graphs. ⌟

Proof: This follows from consecutively using(25.3.9.8) on any (c,d)-bi-regular Ramanujan graph G, for example a complete (c,d)-bi-regular graph(because its spectrum is $\{\sqrt{cd}, -\sqrt{cd}, 0, 0, \ldots, 0\}$). □

Explicit Constructions

Def. (25.3.9.10) [$S_{p,q}$]. Let $p \neq q \in \texttt{Prime}_{\geq 3}$ s.t. $q \geq 2\sqrt{p}$, then $\mathbb{H}(\mathbb{F}_q) \cong \text{Mat}(2; \mathbb{F}_q)$. Fix such an isomorphism ψ_p.

Let $S_p \subset \mathbb{H}(\mathbb{Z})$ be a distinguished set of elements of norm p, $\#S_p = p+1$(**?** Cf.[Sarnak, Ramanujan Graph book]P68). Define

$$S_{p,q} = \psi_q(S_p) \subset \text{PGL}(2; \mathbb{F}_q),$$

then $\#S_{p,q} = p+1$, and $S_{p,q} \subset \text{PSL}(2; \mathbb{F}_q)$ iff $\left(\frac{p}{q}\right) = 1$. ⌟

Proof: Cf.[Sarnak, Ramanujan Graph book]P113.**?**

For the last assertion, notice $x \in \text{GL}(2; \mathbb{F}_q)$ mapsto $\text{PSL}(2; \mathbb{F}_q)$ iff $\det(x) \in \mathbb{F}_q^2$, so $S_{p,q} \subset \text{PSL}(2; \mathbb{F}_q)$ iff $\left(\frac{p}{q}\right) = 1$. □

Thm. (25.3.9.11) [$X^{p,q}$]. Let $p \neq q \in \texttt{Prime}_{\geq 3}$ s.t. $q \geq 2\sqrt{p}$, we can define

$$X^{p,q} = \begin{cases} \text{Cay}(\text{PSL}(2; \mathbb{F}_q), S_{p,q}) & , \left(\frac{p}{q}\right) = 1 \\ \text{Cay}(\text{PGL}(2; \mathbb{F}_q), S_{p,q}) & , \left(\frac{p}{q}\right) = -1 \end{cases}.$$

Then $X^{p,q}$ is a $(p+1)$-regular connected Ramanujan graph, and for fixed p, this forms a large girth family(25.2.1.17). In fact,

- If $\left(\frac{p}{q}\right) = -1$, then $X^{p,q}$ is bipartite, $v(X^{p,q}) = q(q^2-1)$, and $g(X^{p,q}) \geq 4\log_p q - \log_p 4$.
- If $\left(\frac{p}{q}\right) = 1$, then $X^{p,q}$ is not bipartite, $v(X^{p,q}) = q(q^2-1)/2$, and $g(X^{p,q}) \geq 2\log_p q$.

□

11 Zeta Functions

Def. (25.3.11.1)[Ihara Zeta Functions]. For a finite unoriented graph $G \in \mathtt{Graph}^{\mathrm{fin}}$, the **Ihara zeta function** is defined to be

$$Z(u,G) = \prod_{\mathfrak{p}\in P}(1-u^{\mathrm{length}(\mathfrak{p})})^{-1},$$

where P is the set of primes circuits in G(25.2.1.19).

Similarly we can define zeta function $Z^o(u,G)$ of an oriented graph.

WARNING: the zeta function of a graph and its duplication oriented graph, because of the primality condition. ⌟

Prop. (25.3.11.2). For a finite oriented graph $G \in \mathtt{Graph}^{\mathrm{fin}}$ and $m \in \mathbb{Z}_+$, let N_m be the number of circuits in G of length m with an endpoint, then

$$Z^o(u,G) = \exp\Big(\sum_{m\in\mathbb{Z}_+}\frac{N_m}{m}u^m\Big) = \det(1-uM_G)^{-1}.$$

In particular, it is a rational function. ⌟

Proof: The first equation is easy by taking log. For the second equation, because $N_m = \mathrm{tr}(M_G^m)$, let the eigenvalues of M_G be $\lambda_1,\ldots,\lambda_n$, then using an triangulation of M_G,

$$\exp\Big(\sum_{m\in\mathbb{Z}_+}\frac{N_m}{m}u^m\Big) = \exp\Big(\sum_{m\in\mathbb{Z}_+}\frac{1}{m}\sum_{i=1}^n\lambda_i^m u^m\Big) = \prod_{i=1}^n\exp(-\log(1-\lambda_i u)) = \det(1-uM_G)^{-1}.$$

□

Cor. (25.3.11.3). For $G \in \texttt{Graph}^{\text{fin}}$, G is bipartite iff $Z(u, G)$ is an even function. ⌟

Proof: Since the vertices $v \in V(G)$ s.t. $\deg(v) = 1$ doesn't affect the result, we can discard them. Then the assertion follows easily from(25.3.2.4). □

Prop. (25.3.11.4) [Edge Zeta Functions]. For a finite unoriented graph $G \in \texttt{Graph}^{\text{fin}}$, consider its **line graph** G_L where

$$V(G_L) = \overrightarrow{E}(G), \quad E(G_L) = \{(e_1, e_2) \in \overrightarrow{E}(G) \times \overrightarrow{E}(G), e_1 \neq \overline{e}_2, t(e_1) = s(e_2)\}.$$

Then it is easy to see that

$$Z(u, G) = Z^o(u, G_L).$$

⌟

Thm. (25.3.11.5) [Bass]. For a finite connected unoriented graph $G \in \texttt{Graph}^{\text{fin}}$ s.t. $\deg(v) \geq 2$ for any $v \in G$, we have

$$Z(u, G) = (1 - u^2)^{\chi(G)} \det(\mathbf{1} - uA + u^2(D - \mathbf{1}))^{-1}.$$

⌟

Proof: Cf.[Zeta functions of finite graphs]. □

Cor. (25.3.11.6) [Regular Graphs]. Let $q \in \mathbb{Z}_+$ and $G \in \texttt{Graph}$ a finite connected k-regular graph, then

$$Z(u, G) = (1 - u^2)^{(1-q)v(G)/2} \det((1 + qu^2)\mathbf{1} - uA)^{-1}.$$

In particular, by(25.2.2.3),

- $$\text{Pole}(Z(u, G)) \subset [q^{-1}, 1] \cup [-1, -q^{-1}] \cup \{|z| = q^{-1/2}\}.$$
- $u = -q^{-1}$ is a pole iff G is bipartite.
- $\text{Pole}(Z(u, G)) \subset \{|z| = q^{-1/2}\} \cup \{\pm 1, \pm q^{-1}\}$ iff G is a Ramanjan graph(25.3.9.5).

⌟

Prop. (25.3.11.7) [Northshield]. For a finite connected oriented graph $G \in \texttt{Graph}^{\text{fin}}$ s.t. $\deg(v) \geq 2$ for any $v \in G$,

$$\lim_{u \to 1} \frac{Z(u, G)}{(1 - u)^{\chi(G) - 1}} = \frac{2^{\chi(G) - 1}}{\chi(G)\,\text{tree}(G)}.$$

⌟

Proof: Let $f(u) = \det(\mathbf{1} - uA + u^2(D - \mathbf{1})|\ell^2(V(G)))$, then by(25.3.11.5), it suffices to prove that

$$f`(1) = -2\chi(G)\,\text{tree}(G).$$

Let $M(u) = \mathbf{1} - uA + u^2(D - \mathbf{1})$, and let M_k be the result of M derivating the k-th row. Then $M_k(1) = M(1) + (\deg(v_k) - 2)e_{kk}$. So

$$\frac{\partial}{\partial u} \det(M(u))|_{u=1} = \sum_k [\det M(1) + (\deg(v_k) - 2) \det \widetilde{M}_{kk}],$$

where M_{kk} is the (k, k)-th cofactor of $M(1)$. But by (25.2.2.7), $\det \widetilde{M}_{kk} = \text{tree}(G)$, so the result follows. □

12 Applications

Thm. (25.3.12.1) [Monsky]. A square cannot be divided into m triangles of the same area, where m is odd. ⌟

Proof: Choose a 3-coloring on $\mathbb{R}^2$: By(14.2.1.28) there can be an extended 2-adic valuation $|\cdot|_2$ on $\mathbb{R}$ that extends the 2-adic valuation on $\mathbb{Q}$, then color a point (x, y)

- 0 if $|x|_2 < 1, |y|_2 < 1$,
- 1 if $|x|_2 \geq 1$ and $|x|_2 \geq |y|_2$.
- 2 if $|y|_2 \geq 1$ and $|y|_2 > |x|_2$.

Then there are two things:

1. The coloring is invariant under translation by vectors represented by a point of color 0.
2. The valuation of the area of a triangle with vertices of 3 different colors is bigger than 1, because we can assume one vertex is the origin, and then its area is $\frac{1}{2}|x_1y_2 - x_2y_1|$, which, because the coloring, must have 2-adic valuation bigger than 1.

Now back to the question, let the square be placed as a unit square, then its area is 1, and it has exactly one $(0, 1)$-edge, so by Spencer's lemma(25.2.1.28), it has a triangle with vertices of pairwise different colors, so its area A has valuation> 1, but the total area is $mA = 1$ that has valuation 1, so $|m| < 1$, which means that m is even. □

Prop. (25.3.12.2) [Hindman's Theorem]. Whenever $\mathbb{N}$ is colored with f.m. colors, one can find an infinite subset $A \subset \mathbb{N}$ and a color c that whenever $F \subset A$ is finite, the color of the sum of numbers in F is colored c. ⌟

Proof: Cf.[W. W. Comfort, Ultrafilters: some old and some new results, Bull. Amer. Math. Soc. 83 (1977) 417–455.] □

25.4 Combinatorial Set Theory

Def. (25.4.0.1) [Notations]. For a set S, let $[S]^r$ be the set of subsets of S of order r. Let κ, λ be cardinals, we write $\kappa \to (\lambda)^r_s$ as a shorthand for: for any set S with $|S| = \kappa$ and every partition of $[S]^r$ into s classes, there exists a subset $H \subset S$ that $[H]^r$ is in the same class, and $|H| \geq \lambda$. ⌟

Prop. (25.4.0.2) [Ramsey's Theorem for $\aleph_0$]. For any positive natural number r, s if we color the r-subsets of a set with cardinality $\aleph_0$ into s families, then there is a subset of cardinal $\aleph_0$ that all its r-subsets are colored the same. ⌟

Proof: Cf.[Graph Theory, Thm9.1.2]. □

Cor. (25.4.0.3). Every infinite linearly ordered set contains a subset isomorphic to $(\mathbb{N}, <)$ or $(\mathbb{N}, >)$. ⌟

Proof: Choose a well ordering of it. Then consider this new ordering and the original ordering. Then there is an infinite set that is compatible with the original ordering, or converse. Then its initial segment of order type ω_0 satisfies the requirement. □

Def. (25.4.0.4) [Weakly Compact Cardinals]. An **weakly compact cardinal** is an uncountable cardinal κ that $\kappa \to (\kappa)^r_s$(25.4.0.1) for any $r, s \in \mathbb{Z}_+$. ⌟

Prop. (25.4.0.5). Weakly compact cardinals are strongly inaccessible. ⌟

Proof: Cf.[Jec03]P224. □

Trees

Def. (25.4.0.6). A **tree** is a partial ordered set T that there is a minimal element r and for each x, $\{y \in T | y < x\}$ is finite and linearly ordered.

A tree is called **of finite branched** for each x, there is a finite set $\{y_1, \ldots, y_r\}$ is T that $y_i > x$ and if $z > x$, then $z \geq y_i$ for some i.

⌟

Def. (25.4.0.7) [Height]. For any node x, $\{y \in T | y < x\}$ is a well-ordered set, which is isomorphic to an ordinal by(2.2.4.7), it is called the **height** of x. T_α denotes the set of all nodes of T of order α. The least α that $T_\alpha \neq \varnothing$ is called the **height** of T.

A **branch** is a maximal chain in T, its **length** is its ordinal. The length is always smaller than the height of the tree. If it equals the height of the tree, it is called **cofinal**. ⌟

Def. (25.4.0.8). A **subtree** is a subset T' of T that if $x \in T', y < x$, then $x \in T'$.

An **antichain** of a tree T is a subset $A \subset T$ that any two elements in A are incomparable. ⌟

Def. (25.4.0.9). A **path** through T is a morphism of ordering from ω to T. ⌟

Lemma (25.4.0.10) [König's Lemma]. If T is an infinite finite branching tree, then there is a path through T. ⌟

Proof: Use recursion to choose for each n an element that has infinite successors. □

Def. (25.4.0.11). An **Aronszajn tree** is a tree of height κ and all its level sets are at most countable, but has no branches of length κ. ⌟

Prop. (25.4.0.12). An **Aronszajn tree** of height ω_1 exists. ⌟

Proof: Cf.[Set Theory Jech P228]. □

1 Finite Sets

Thm. (25.4.1.1) [Dirichlet's Box Principle]. ⌟

Proof: □

2 Finite Ramsey's Theory

Thm. (25.4.2.1) [Finite Ramsey's Theorem]. For any $\alpha, k, n_1, \ldots, n_k \in \mathbb{Z}_+, n_i \geq \alpha$, there exists a minimal $R(\alpha, k; n_i) \in \mathbb{Z}_+$ s.t. if we divide the α-subsets of a set with cardinality $R(\alpha, k; n_i)$ into k groups $C_1, \ldots, C_k$, then there is some $1 \leq i \leq k$ and a subset S of cardinality n_i s.t. all the α-subset of S is in C_i. Moreover,

$$R(\alpha, k; n_i) \leq R(\alpha - 1, k; m_j = R(\alpha, k; n_1, \ldots, n_{j-1}, n_j - 1, n_{j+1}, \ldots, n_k)) + 1.$$

⌟

Proof: We use double induction on (α, k) in lexicographical order. If $\alpha = 1$, clearly $R(1, k; n_i) = \sum_{i=1}^{k}(n_i - 1) + 1$. And if $k = 1$, then $R(\alpha, 1; n_1) = n_1$.

Suppose $\alpha > 1, k > 1$, if some $n_i = \alpha$, then $R(\alpha, k; n_i) = R(\alpha, k - 1; n_1, \ldots, \widehat{n_i}, \ldots, n_k)$, thus we are reduced to smaller k. So we can assume that $n_i > \alpha$ for each i. In this case, we prove that

$$R(\alpha, k; n_i) \leq R(\alpha - 1, k; m_j = R(\alpha, k; n_1, \ldots, n_{j-1}, n_j - 1, n_{j+1}, \ldots, n_k)) + 1.$$

And this will finish the induction process.

To prove this, notice that if we have a set X with cardinality equal to the RHS, and let $x \in X$, then we can divide the $(\alpha - 1)$ subsets of $X \setminus \{x\}$ into k groups $C'_1, \ldots, C'_k$ s.t. an $(\alpha - 1)$-set S has cardinality $\alpha - 1$ belongs to C'_i iff $S \cup \{x\}$ belongs to C_i. Then by definition, there exists some i and some subset Y of $X \setminus \{x\}$ of cardinality $R(\alpha, k; n_1, \ldots, n_{i-1}, n_i - 1, n_{i+1}, \ldots, n_k)$ s.t. all $(\alpha - 1)$-subset of Y belongs to C'_i. Then by definition, there either exists some $j \neq i$ and some subset Z_1 of Y of cardinality n_j s.t. all the α-subset of Z_1 is in C_j, in which case the assertion is satisfied; or exists some subset Z_2 of Y of cardinality $n_i - 1$ s.t. all the α-subset of Z_2 is in C_i. Then $Z_2 \cup \{x\}$ satisfies the assertion. □

Prop. (25.4.2.2) [Szekeres]. For any $a, b \in \mathbb{Z}_{\geq 2}$, $R(2; a, b) \leq \binom{a+b-2}{a-1}$. ⌟

Proof: Use induction on $a + b$: If $a = 2$ or $b = 2$, this is easy. And for $a, b \geq 3$, by(25.4.2.1),

$$R(2; a, b) \leq R(2; a - 1, b) + R(2; a, b - 1) \leq \binom{a+b-3}{a-2} + \binom{a+b-3}{a-1} = \binom{a+b-2}{a-1}$$

□

Prop. (25.4.2.3) [Erdös]. For $k \in \mathbb{Z}_{\geq 3}$,

$$2^{k/2} < R(2; k, k) \leq \binom{2k-2}{k-1} < 4^{k-1}.$$

⌟

Proof: If $N < 2^{k/2}$, then the number of different graphs of N vertices equals $2^{N(N-2)/2}$, and the number of different graphs containing a complete k-graph is less than

$$\binom{N}{k}2^{N(N-1)/2-k(k-1)/2} < \frac{N^k}{k!}2^{N(N-1)/2-k(k-1)/2} < \frac{2^{N(N-1)/2}}{2},$$

because $2^{\frac{k}{2}+1} < k!$ for $k \geq 3$. So there exists a graph G that neither G and its complement graph G' contains a complete k-graph. Thus $2^{k/2} < R(2; k, k)$.

The second inequality follows form(25.4.2.2). □

Prop. (25.4.2.4) [Erdös]. There exists $C \in \mathbb{R}_+$ s.t.

$$R(2; 3, x) \geq Cx^2/\log^2 x$$

for any $x \in \mathbb{Z}_+$. ⌟

Proof: [Graph theory and Probability 2, Erdös]. □

Prop. (25.4.2.5) [Ajtai-Komlós-Szeméredi]. For any $k \in \mathbb{Z}_{\geq 2}$, there exists $C_k \in \mathbb{R}_+$ s.t. for $x \in \mathbb{Z}_+$ sufficiently large,

$$R(2; k, x) \leq 5000\frac{x}{\log(R(2; k-1, x)^{\frac{1}{k-2}})}.R(2; k-1, x).$$

In particular, there exists $C'_k \in \mathbb{R}_+$ s.t.

$$R(2; k, x) \leq C'_k x^{k-1}/\log^{k-2} x.$$

⌟

Proof: Cf.[note on Ramsey numbers].**?**

$k = 2$ is trivial. For $k \in \mathbb{Z}_{\geq 3}$, let $\varepsilon \in (\frac{0.96}{k-2}, \frac{1}{k-2})$. Suppose G is a graph with

$$n = \#V(G) \geq 5000\frac{x}{\log(R(2; k-1, x)^{\frac{1}{k-2}})}.R(2; k-1, x)$$

and $\omega(G) < k$ and $\alpha(G) \geq x$. Let $h(G)$ be the number of triangles in G.

Suppose $\deg(P) \geq R(2; k-1, x)$ for some $P \in V(G)$, then $\omega(G) \geq k$ or $\alpha(G) \geq x$, contradiction. So $\deg(P) < R(2; k-1, x)$ for any $P \in V(G)$, which implies that $t = 2\#E(G)/n < R(2; k-1, x)$.

If $h(G) < nR(2; k-1, x)^{2-\varepsilon}$, when x is large, $R(2; k, x)$ is large, so by(25.2.5.7),

$$\alpha(G) > \frac{\varepsilon}{4800}.\frac{n}{R(2; k-1, x)}.\log R(2; k-1, x) \geq x,$$

contradiction.

Thus when x is large, we can assume that $h(G) \geq nR(2; k-1, x)^{2-\varepsilon}$, thus some point $P \in V(G)$ belongs to at least $R(2; k-1, x)^{2-\varepsilon}/3$ triangles. Because $\deg(P) < R(2; k-1, x)$, there exists a point Q adjacent to P and $\deg(Q) > 2R(2; k-1, x)^{1-\varepsilon}/3 > R(2; k-2, x)$ by hypothesis on ε. Then we can find a clique of size $k-2$ that is adjoint to P and Q, contradiction. □

Erdös-Hajnal Cnnjecture

Conj. (25.4.2.6) [Erdös-Hajnal]. For any finite graph $H \in \mathtt{Graph}^{\text{fin}}$, there exists $\delta_H \in \mathbb{R}_+$ s.t. for any graph $G \in \mathtt{Graph}^{\text{fin}}$, if H is not an induced subgroup of G, then $\max(\omega(G), i(G)) \geq v(G)^{\delta_G}$. ⌟

Proof: □

3 Intersection Theorems

References are [EKR61] and [G-M16].

Prop. (25.4.3.1) [Sperner]. For $n \in \mathbb{Z}_+$, any system $\{S_1, \ldots, S_v\}$ of subsets of $[n]_+$ s.t. no set S_i contains another S_j, then $v \le \binom{n}{\lfloor n/2 \rfloor}$. ⌟

Proof: □

Thm. (25.4.3.2) [Erdös-Ko-Rado/Wilson]. For $k, n, t \in \mathbb{Z}_+$ s.t. $n \ge (t+1)(k-t+1)$ and any system $\mathcal{S} = \{S_1, \ldots, S_v\} \subset \mathscr{P}([n]_+)$ s.t.

- $\#S_i = k$ for each i,
- $\#S_i \cap S_j \ge t$ for any $1 \le i, j \le v$,

we have $v \le \binom{n-t}{k-t}$.

Moreover, if $n \ge (t+1)(k-t+1)+1$, then $v \le \binom{n-t}{k-t}$ iff $\mathcal{S}$ consists of all k-subsets containing a fixed subset of cardinality t. ⌟

Proof: Use counting by twice method: For any permutation σ of $[n]_+$, let $A_s^\sigma = \{\sigma(s), \sigma(s+1), \ldots, \sigma(s+k-1)\}$(where addition is modulo n), then it can be seen easily that among the subsets $\{A_1^\sigma, \ldots, A_n^\sigma\}$, at most k of them are contained in $\mathcal{S}$. Thus by counting twice,

$$\frac{\#\mathcal{S}}{\binom{n}{k}} \le \frac{k}{n},$$

which implies $\#\mathcal{S} \le \frac{k}{n}\binom{n}{k} = \binom{n-1}{k-1}$.

For equality**?**, Cf.[Wilson, Exact Bound on Erdös-Ko-Rado theorem] or [Erdös-Ko-Rado theorem]Chap8. □

Conj. (25.4.3.3) [Erdös-Ko-Rado]. For $r \in \mathbb{Z}_+$ and any system $\mathcal{S} = \{S_1, \ldots, S_v\} \subset \mathscr{P}([4r]_+)$ s.t.

- $\#S_i = 2r$ for each i,
- $\#S_i \cap S_j \ge 2$ for any $1 \le i, j \le v$,

we have $v \le \frac{1}{2}\binom{4r}{2r} - \frac{1}{2}\binom{2r}{r}^2$. ⌟

Proof: □

Thm. (25.4.3.4)[Hilton-Milner[H-M67]]. For $k, n \in \mathbb{Z}_+, n \ge 2k$ and any system $\mathcal{S} = \{S_1, \ldots, S_v\} \subset \mathscr{P}([n]_+)$ s.t.

- $\#S_i = k$ for each i,
- $\#S_i \cap S_j \ne \varnothing$ for any $1 \le i, j \le v$.
- $\bigcap_i S_i = \varnothing$,

we have $v \le \binom{n-1}{k-1} - \binom{n-k-1}{k-1} + 1$. ⌟

Proof: Cf.[Erdös-Ko-Rado theorem]P15. □

Conj. (25.4.3.5) [Erdös-Ko-Rado]. For $k \le n \in \mathbb{Z}_+$ and any system $\mathcal{S} = \{S_1, \ldots, S_v\} \subset \mathscr{P}([n]_+)$ s.t. $\#S_i \cap S_j \ge k$ for any $1 \le i, j \le v$, find the largest value of v. ⌟

Proof: □

Prop. (25.4.3.6) [Erdös-Ko-Rado]. For $n \in \mathbb{Z}_{\geq 2}$ and any system $\mathcal{S} = \{S_1, \ldots, S_v\} \subset \mathscr{P}([n]_+)$ s.t. $S_i \cap S_j \cap S_k \neq \varnothing$ for any $1 \leq i, j, k \in v$, then we have $v \leq 2^{n-1}$, with equality iff $\mathcal{S}$ consists of all subsets containing a fixed element. ⌟

Proof: The inequality is clear. Consider the smallest $p \in [v]_+$ s.t.

$$S_1 \cap S_2 \ldots \cap S_p \in \{S_1, \ldots, S_v\}.$$

If $p = n$, then they have a common element. If $p < n$, then

$$\{S_1 \cap S_2 \ldots \cap S_{p+1}, S_1, \ldots, S_v\}$$

is another class s.t. any two of them has non-empty intersection. This implies that $v + 1 < 2^{n-1}$. □

25.5 Partition Theory

References are [The Theory of Partitions, Andrews].

Def. (25.5.0.1) [Partitions]. For $n \in \mathbb{Z}_+$, a **partition** of n is a tuple $(a_1, \ldots, a_k) \in \mathbb{Z}_+^{\mathbb{Z}_+}$ s.t.

$$a_1 \leq a_2 \ldots \leq a_k, \quad \sum_i a_i = n.$$

The number of partitions of n is denoted by $\mathrm{Par}(n)$. For convenience, denote $\mathrm{Par}(0) = 1$, and $P(\alpha) = 0$ for $\alpha \in \mathbb{R} \setminus \mathbb{N}$. Clearly,

$$\sum_{n \in \mathbb{N}} \mathrm{Par}(n) X^n = \prod_{k \in \mathbb{Z}_+} (1 - X^k)^{-1} \in \mathbb{Z}[[X]].$$

⌟

Thm. (25.5.0.2) [Ramanujan's most Beautiful Identity].

$$\sum_{n \in \mathbb{N}} \mathrm{Par}(5n+4) X^n = 5 \prod_{k \in \mathbb{Z}_+} \frac{(1 - X^{5k})^5}{(1 - X^k)^6} \in \mathbb{Z}[[X]].$$

⌟

Proof: □

1 Congruences between Partition Functions

Thm. (25.5.1.1) [Ramanujan Congruences]. For any $n \in \mathbb{Z}_+$,

$$5 | \mathrm{Par}(5n+4),$$

$$7 | \mathrm{Par}(7n+5),$$

$$11 | \mathrm{Par}(11n+6).$$

⌟

Proof: 1 follows from(25.5.0.2).
2:
3: □

Prop. (25.5.1.2) [Ahlgren-Boylan]. A **Ramanujan congruence** is a congruence property of the partition function of the form: For any $n \in \mathbb{Z}_+$,

$$p | \mathrm{Par}(pn + r)$$

where $p \in \texttt{Prime}, r \in \mathbb{Z}$. Then the only Ramanujan congruences are those three listed in(25.5.1.1). ⌟

Proof: □

Prop. (25.5.1.3) [Atkin-O'Brien]. For any $n \in \mathbb{Z}_+$,

$$13 | \operatorname{Par}(11^3 \cdot 13n + 237).$$

⌟

Thm. (25.5.1.4) [Schinzel/Ono]. For any $p \in \texttt{Prime} \setminus \{3\}$ and $k \in \mathbb{Z}_+$, a positive portion of primes $\ell \in \texttt{Prime}$ satisfy

$$p | \operatorname{Par}(\frac{p^k \ell^3 n + 1}{24}).$$

⌟

Proof: Cf.[Distribution of the partition function modulo m]. □

Prop. (25.5.1.5) [Ono]. For any $p \in \texttt{Prime}_{\geq 5}$, there exists $N(p), P(p) \in \mathbb{Z}_+, N(p), P(p) \leq 8(m^3 - 2m - 1)$ s.t. for any $i \in \mathbb{Z}_{\geq N(p)}$,

$$\operatorname{Par}(\frac{p^i n + 1}{24}) \equiv \operatorname{Par}(\frac{p^{P(p)+i} n + 1}{24}) (\bmod\ p).$$

⌟

Proof: Cf.[Distribution of the partition function modulo m, Ono]. □

Conj. (25.5.1.6) [Newmann]. For any $M \in \mathbb{Z}_+$ and $r \in \mathbb{Z}$, there are infinitely many $n \in \mathbb{Z}_+$ s.t.

$$\operatorname{Par}(n) \equiv r (\bmod\ m).$$

⌟

Proof: □

Thm& Conj.Cor. (25.5.1.7) [Schinzel/Ono/Ahlgren-Boylan]. For any $p \in \texttt{Prime}_{\geq 5}$ and $r \in \mathbb{Z}_+$, there exists $C(p, r) \in \mathbb{R}_+$ s.t.

$$\#\{n \in \mathbb{Z}_+ : n \leq X, \operatorname{Par}(n) \equiv r (\bmod\ p)\} \geq \begin{cases} C(p,r)\sqrt{X}/\log X & , 1 \leq r \leq p-1 \\ C(p)X & , r = 0, p \geq 5 \\ C(p)\sqrt{X} & , p = 2 \end{cases}.$$

⌟

Proof: Cf.[Distribution of the partition function modulo m, Ono], [Arithmetic properties of the partition function], [On the parity of additive representation functions, Nicolas-Ruzsa-Sárközy]. □

Remark (25.5.1.8). What about $p = 3$**?**. ⌟

25.6 Additive Combinatorics

1 Zero-Sum Sets

Def. (25.6.1.1) [Davenport Numbers]. For $G \in \mathcal{A}\mathrm{b}^{\mathrm{fin}}$, define the **Davenport number** $D(G)$ to be the smallest positive integer s s.t. any sequence of G of length s has a non-empty subsequence whose elements product to $1 \in G$. ⌟

Thm. (25.6.1.2) [Emde-Kruyswijk/Meshulam]. For $G \in \mathcal{A}\mathrm{b}^{\mathrm{fin}}$ and let m be the largest order of an element of G, then

$$D(G) \leq \lceil m(1 + \log \frac{\#G}{m})\rceil.$$

⌟

Proof: Let $n \geq m(1 + \log \frac{\#G}{m})$ and let $g_1, \ldots, g_n$ be a sequence of elements in G. □

Prop. (25.6.1.3). For $G \in \mathcal{A}\mathrm{b}^{\mathrm{fin}}$ and $r > t \geq D(G)$, any sequence of elements of G of cardinality r contains at least $\binom{r}{t}/\binom{r}{D(G)-1}$ many distinct sequences of length at most t and at least $t - D(G) + 1$ s.t. its elements product to $1 \in G$. ⌟

Proof: □

Zero-Sum Sets of Prescribed Sizes

Prop. (25.6.1.4) [Cauchy-Davenport]. If A, B are two nonempty subsets of $\mathbb{F}_p$, then $|A + B| \geq \min\{p, |A| + |B| - 1\}$. ⌟

Proof: If $|A| + |B| > p$, then this is trivial, because $A \cap (B - x) \neq \varnothing$ for all x.

Now if $|A| + |B| \leq p$, and if $A + B \subset C$ with $|C| = |A| + |B| - 2$, define $f = \prod_{c\in C}(x + y - c)$, then $f(a, b) = 0$ for all $a \in A, b \in B$, but the coefficient of the highest degree term $x^{|A|-1}y^{|B|-1}$ is $C^{|A|-1}_{|A|+|B|-2} \neq 0$, so this contradicts combinatorial Nullstellensatz(3.3.1.6). □

Cor. (25.6.1.5). Any element of $\mathbb{F}_p$ is a sum of two squares, as there are $\frac{p+1}{2}$ squares. ⌟

Cor. (25.6.1.6) [Erdös-Ginzburg-Ziv]. For any $2n - 1$ elements (a_i) in $\mathbb{Z}/(n)$, there exists $I \subset \{1, 2, \ldots, 2n - 1\}$ with $\#I = n$ and $\sum_{i\in I} a_i = 0$. ⌟

Proof: We use induction on n. If $n \in \mathbf{P}$, then this follows from Cauchy-Davenport(25.6.1.4). If this is true for m, then for $p \in \mathbf{P}$ and $n = mp$, given any $2n - 1$ numbers, we can find pairwise disjoint subsets $I_1, \ldots, I_{2m-1}$ of $\{1, \ldots, 2pm - 1\}$ where $\#I_i = p$ and $\sum_{j\in I_i} a_j \equiv 0 (\mathrm{mod}\ p)$ for any $1 \leq i \leq 2m - 1$. Define

$$A_i = (\sum_{j\in I_i} a_j)/p,$$

then we can use the induction hypothesis for m and A_i to get the desired assertion. □

2 Arithmetic Progressions

Arithmetic Progressions in $\mathbb{Z}_+$

Thm. (25.6.2.1) [Salem-Spencer/Behrend]. Given $\varepsilon \in \mathbb{R}_+$, for $N \in \mathbb{Z}_+$ sufficiently large, there exists a subset $S \subset \mathbb{Z}/N$ that avoids three-term arithmetic sequences, with

$$\#S > N^{1-\frac{2\sqrt{2\log 2}+\varepsilon}{\sqrt{\log N}}}.$$

⌟

Proof: For this N, let $n = \lfloor\sqrt{\frac{2\log N}{\log 2}}\rfloor$, and $d \in \mathbb{Z}_+$ s.t. $(2d-1)^n \leq N < (2d+1)^n$. Then $d \geq 2$. Then for any $k \leq n(d-1)^2$, consider the set $S_k(n,d)$ of all positive integers of the form

$$A = a_1 + a_2(2d-1) + \ldots + a_n(2d-1)^{n-1},$$

where $0 \leq a_i \leq d-1$, and $\sum_i a_i^2 = k$.

It follows from triangular inequlity that the image of any such $S_k(n,d)$ in $\mathbb{Z}/(N)$ avoids three-term arithmetic sequences, and by Dirichlet's box principle, there exists some $1 \leq k \leq n(d-1)^2$ s.t.

$$\#S_k(n,d) \geq (d^n-1)/n(d-1)^2 \geq d^{n-2}/n \geq \frac{(N^{\frac{1}{n}}-1)^{n-2}}{n(2+\varepsilon)^{n-2}} = \frac{N^{1-2/n}}{n(2+\varepsilon)^{n-2}}.$$

So for N large,

$$\#S_k(n,d) \geq N^{1-\frac{2}{n}-\frac{\log n}{\log N}-\frac{(n-2)\log(2+\varepsilon)}{\log N}} > N^{1-\frac{2\sqrt{2\log 2}+3\varepsilon}{\sqrt{\log N}}}.$$

□

Thm. (25.6.2.2) [Erdös-Turán Conjecture, Szeméredi/Gowers]. For any $k \in \mathbb{Z}_+$ and $\delta \in \mathbb{R}_+$, if $N \in \mathbb{Z}_+$ and $N \geq 2^{2^{(\delta^{-1})^{2^{2^{k+9}}}}}$, then any subset $A \subset [N]_+$ with $\#A \geq \delta N$ contains an arithmetic sequence of length k. ⌟

Proof: ? □

Cor. (25.6.2.3) [Roth]. For $X \in \mathbb{Z}_+$, let $A(X)$ be the maximal set of a subset of $[X]_+$ that avoids three-term arithmetic sequences, then

$$\frac{A(X)}{X} = O(\frac{1}{\log\log X}).$$

⌟

Proof: We give Roth's proof for this special case.

Let $b(X) = A(2^{4^X})/2^{4^X}$, then $b(X)$ is decreasing by(25.6.2.4), and(25.6.2.5) applied to $m = 2^{4^X}$ implies that if $\delta = \frac{1}{2^{4^{X+1}}\eta}$ where $0 < \eta < 1/2$, then

$$b(X)^2 < C[b(X)\delta + b(X)^2\delta^2 + (\delta^{-1}b(X)+1)(b(X)-b(X+1)+\frac{1}{2^{4^x}})].$$

Then notice for X large, we can choose $\delta = \delta(X) = \frac{b(X)}{2C_1} < \frac{1}{2}$ where $C_1 > \min(C,1)$ is a constant: it suffices to verify that $\frac{1}{2^{4^{X+1}}\cdot\frac{1}{2}} < \frac{b(X)}{2C}$, or equivalently $C < 2^{3\cdot 4^X-2}A(2^{4^X})$, which is clearly true for X large.

Thus by the fact $b(X) < 1$,

$$\begin{aligned} b(X)^2 &< C_1[b(X)\delta + b(X)^2\delta^2 + (\delta^{-1}b(X)+1)(b(X)-b(X+1)+\frac{1}{2^{4^x}})] \\ &\le b(X)^2(\frac{1}{2}+\frac{1}{4C_1}) + C_1(\delta^{-1}b(X)+1)(b(X)-b(X+1)+\frac{1}{2^{4^x}}) \\ &< \frac{3}{4}b(X)^2 + C_1(2C_1+1)(b(X)-b(X+1)+\frac{1}{2^{4^x}}) \end{aligned}$$

Thus there exists a constant C_2 s.t. for X large,

$$b(X)^2 < C_2(b(X)-b(X+1)+\frac{1}{2^{4^x}}).$$

which implies there exists a constant $C_3 > C_2$ that for X large,

$$Xb(2X)^2 \le \sum_{k=X}^{2X-1} b(X)^2 < C_3(b(X)-b(2X)+\frac{2C_3}{X}).$$

Hence whenever $2Xb(2X) > 4C_3$,

$$2Xb(2X) < \frac{1}{4C_3}4X^2b(2X)^2 < (Xb(X)-Xb(2X)+2C_3) < Xb(X).$$

From this that the fact $b(X)$ is decreasing(25.6.2.4) it is clear that $Xb(X)$ is bounded, i.e. $b(X) = O(\frac{1}{X})$. And clearly this together with(25.6.2.4) implies the desired assertion. □

Lemma (25.6.2.4). For any $X, Y \in \mathbb{Z}_+$, $A(X)$ equals the maximal number of elements without three-term arithmetic sequences that can be selected from any X-term arithmetic sequence. $\frac{A(XY)}{XY} \le \frac{A(X)}{X}$, and $\frac{A(X)}{X} \le \frac{X+Y}{X}\frac{A(Y)}{Y}$. ┘

Proof: The first assertion is easy. Thus $A(X+Y) \le A(X) + A(Y)$, and

$$A(X) \le A(\Big[1+\lfloor\frac{X}{Y}\rfloor\Big]Y) \le \frac{X+Y}{X}A(Y).$$

□

Lemma (25.6.2.5) [Hardy-Littlewood Method]. For $X \in \mathbb{Z}_+$, let $a(X) = \frac{A(X)}{X}$, then for any $m \in 2\mathbb{Z}_+$, if $\delta = \frac{1}{m^4\eta}$ where $0 < \eta < 1/2$, there exists constant $C > 0$

$$a(m)^2 < C[a(m)\delta + a(m)^2\delta^2 + (\delta^{-1}a(m)+1)(a(m)-a(m^4)+m^{-1})].$$

┘

Proof: Let $\{u_1, \dots, u_{A(m^4)}\}$ be a maximal subset of $\{m^4\}$ without three-term arithmetic sequences, and let $\{2v_1, \dots, 2v_V\}$ be the set of even integers among u_k. Then by(25.6.2.4),

$$A(m^4) \le m^4a(m), \quad V \le A(\frac{m^4}{2}) \le \frac{m^4}{2}a(m), \quad V \ge A(m^4) - A(\frac{m^4}{2}) \ge m^4a(m^4) - \frac{m^4}{2}a(m).(\star)$$

Define

$$f_1(\alpha) = \sum_{k=1}^{A(m^4)} e^{2\pi\,\mathrm{i}\,\alpha u_k}, \quad f_2(\alpha) = \sum_{k=1}^{V} e^{2\pi\,\mathrm{i}\,\alpha v_k},$$

$$F_1(\alpha)=a(m)\sum_{n=1}^{m^4}e^{2\pi\,\mathrm{i}\,\alpha n},\quad F_2(\alpha)=a(m)\sum_{n=1}^{m^4/2}e^{2\pi\,\mathrm{i}\,\alpha n},$$

then by the above, $|f_i(\alpha)|\le m^4a(m),\quad |F_i(\alpha)|\le m^4a(m)$. And

$$f_i(\alpha)-F_i(\alpha)=O\Big(m^4[a(m)-a(m^4)]+m^3\Big)(\star\star):$$

Using(25.6.2.6), if $q=1$, this is true for $i=1$, and for $i=2$, use the lower bound for V above. On the other hand, if q cannot be chosen to be 1, then $S'=0$, and it suffices to show that $F_r(\alpha)=O(m^3)$, which is true by(14.1.1.1) and the fact $\{\{\alpha\}\}\ge 1/\sqrt{2N}$(because q cannot be chosen to be 1).

Thus

$$\begin{aligned}f_1(\alpha)f_2(-\alpha)^2-F_1(\alpha)F_2(-\alpha)^2&=f_1(\alpha)(f_2(-\alpha)+F_2(-\alpha))(f_2(-\alpha)-F_2(-\alpha))+F_2(-\alpha)^2(f_1(\alpha)-F_1(\alpha))\\&=O\Big([m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big).\end{aligned}$$

and by(14.1.1.1), if $0<\eta<\{\{\alpha\}\}<1/2$, then

$$f_1(\alpha)=O\Big(a(m)\eta^{-1}+m^4[a(m)-a(m^4)]+m^3\Big).(\star\star\star)$$

Then for any $0<\eta<1/2$,

- The hypothesis implies that $u_h=v_k+v_l$ iff $k=l$ and $u_h=2v_k$, so by $(\star)$

$$\int_{-\eta}^{1-\eta}f_1(\alpha)f_2^2(-\alpha)\mathrm{d}\alpha=V=O(m^4a(m)).$$

- By $(\star\star\star)$,

$$\int_{\eta}^{1-\eta}f_1(\alpha)f_2(-\alpha)^2\mathrm{d}\alpha<[\max_{\eta<\alpha<1-\eta}f_1(\alpha)]\int_0^1f_2(-\alpha)^2\mathrm{d}\alpha=O\Big(\Big[a(m)\eta^{-1}+m^4[a(m)-a(m^4)]+m^3\Big]m^4a(m)\Big).$$

- By $(\star\star)$ and(14.1.1.1),

$$\begin{aligned}\int_{-\eta}^{\eta}f_1(\alpha)f_2^2(-\alpha)\mathrm{d}\alpha&=\int_{-\eta}^{\eta}F_1(\alpha)F_2^2(-\alpha)\mathrm{d}\alpha+O\Big(\eta[m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big)\\&=\int_{-1/2}^{1/2}F_1(\alpha)F_2^2(-\alpha)\mathrm{d}\alpha+O(a(m)^3\eta^{-2})+O\Big(\eta[m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big)\\&=a(m)^3m^8/4+O(a(m)^3\eta^{-2})+O\Big(\eta[m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big)\end{aligned}$$

And these three estimates give the desired assertion. □

Lemma (25.6.2.6). Let $M\in\mathbb{Z}_+$ and $A=\{u_1,\dots,u_U\}$ be a subset of $[M]_+$ without three-term arithmetic sequences. For any $\alpha\in\mathbb{R}$, by Dirichlet's box principle, there exists $h,q\in\mathbb{Z}$ s.t.

$$\alpha=\frac{h}{q}+\beta,\quad (h,q)=1,1\le q\le\sqrt{M},\quad q|\beta|<1/\sqrt{M}.$$

Thus for any $m\in\mathbb{Z}_+,m<M$, we can define

$$S=S(\alpha)=\sum_{k=1}^{U}e^{2\pi\,\mathrm{i}\,\alpha u_k},\quad S'=S'(\alpha,q,h,m)=\frac{A(m)}{m}\frac{1}{q}(\sum_{r=1}^{q}e^{2\pi\,\mathrm{i}\,\frac{rh}{q}})(\sum_{n=1}^{M}e^{2\pi\,\mathrm{i}\,\beta n}).$$

Then
$$|S-S'| = M\frac{A(m)}{m} - U + O(m\sqrt{M}),$$
and $S'=0$ unless $q=1$. ⌟

Proof: Firstly, notice
$$S = \frac{1}{mq}\sum_{r=1}^{q}\sum_{n=1}^{M}\sum_{n\le u_k\le n+mq, u_k\equiv r(\mathrm{mod}\ q)} e^{2\pi\,\mathrm{i}\,\alpha u_k} + O(mq),$$
because the coefficient for $e^{2\pi\,\mathrm{i}\,\alpha u_k}$ is 1 unless $u_k\le mq$, which is compensated by the error term.

Then notice
$$e^{2\pi\,\mathrm{i}\,\alpha u_k} = e^{2\pi\,\mathrm{i}\,\frac{rh}{q}} e^{2\pi\,\mathrm{i}\,\beta u_k} = e^{2\pi\,\mathrm{i}\,\frac{rh}{q}} e^{2\pi\,\mathrm{i}\,\beta n} + O(mq|\beta|),$$
and the number of k s.t. $u_k\equiv r(\mathrm{mod}\ q)$ and $n\le u_k\le n+mq$ is at most $A(m)$ for each n,r, by(25.6.2.4), which we denote by $A(m)-D(n,m,q,r)\le A(m)$, then
$$S = S' - \frac{1}{mq}\sum_{r=1}^{q} e^{2\pi\,\mathrm{i}\,\frac{rh}{q}}\sum_{n=1}^{M} e^{2\pi\,\mathrm{i}\,\beta n} D(n,m,q,r) + O(Mmq|\beta|) + O(mq).$$
But this estimate is also true for $\alpha\in\mathbb{Z}$, so
$$U = M\frac{A(m)}{m} - \frac{1}{mq}\sum_{r=1}^{q}\sum_{n=1}^{M} D(n,m,q,r) + O(mq),$$
then combining these two estimates and the facts $q\le\sqrt{M}, q|\beta|\le 1/\sqrt{M}$, the assertion follows. □

Conj. (25.6.2.7) [Erdös-Turán]. Let $S\subset\mathbb{Z}_+$ s.t.
$$\sum_{n\in S}\frac{1}{n} = \infty,$$
then S contains arithmetic progressions of any length. ⌟

Proof: □

Arithmetic Progressions in Finite Fields

Lemma (25.6.2.8). For $n\in\mathbb{Z}_+, d\in\mathbb{R}_+$, let $S_{n,d}$ be the subspace of all polynomials in $\mathbb{F}_q[X_1,\dots,X_n]$ with total degree at most d and each variable has degree at most $q-1$. Let $\alpha,\beta\in\mathbb{F}_q$.

Suppose $P\in S_{n,d}$ satisfies $P(\alpha a+\beta b)=0$ for every pair $(a,b)\in A^2$ unless $a=b$, then
$$\#\{a\in A|P((\alpha+\beta)a)\ne 0\}\le 2\dim S_{n,d/2}.$$
⌟

Proof: Let
$$P(\alpha x+\beta y) = \sum c_{m,m'} m(x)m'(y)$$
where the sum is over pairs of monomials (m,m') s.t. $\deg(mm')\le d$. Then
$$P(\alpha x+\beta y) = \sum_{\deg m\le d/2} m(x)F_m(y) + \sum_{\deg m\le d/2} m(y)G_m(x).$$
Then the $\#A\times\#A$ matrix $\Big[P(\alpha a+\beta b)\Big]_{a,b\in A}$ has rank at most $2\dim S_{n,d/2}$. And the hypothesis means that this matrix is diagonal, so at most $2\dim S_{n,d/2}$ many diagonal entries are non-zero. □

Thm. (25.6.2.9). For $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and $\alpha, \beta, \gamma \in \mathbb{F}_q$ that are not all zero s.t. $\alpha + \beta + \gamma = 0$. Let A be a subset of $\mathbb{F}_q^n$ s.t. the equation

$$\alpha a_1 + \beta a_2 + \gamma a_3 = 0$$

has no solutions $(a_1, a_2, a_3) \in A^3$ except when $a_1 = a_2 = a_3$. Then

$$\#A \leq 3 \dim S_{n,(q-1)n/3} (25.6.2.8).$$

⌟

Proof: WLOG, assume that $\gamma \neq 0$. Let $d \in [0, (p-1)n]$, then the space V of polynomials in $S_{n,d}$ that vanishes on the complement of $-\gamma A$ has dimension at least $\dim S_{n,d} - q^n + \#A$.

Let $P \in V$ be a function with maximal support $\Sigma \subset \mathbb{F}_q^n$, then $\#\Sigma \geq \dim V$, otherwise there is a non-zero polynomial $Q \in V$ vanishing on Σ, thus $\Sigma \subsetneq \mathrm{Supp}(P+Q)$.

Let $S(A) = \{\alpha a_1 + \beta a_2 | a_1 \neq a_2 \in A\} \subset \mathbb{F}_q$, then by hypothesis, $S(A) \cap \{-\gamma A\} = 0$. Thus P vanishes on $S(A)$. Then by(25.6.2.8), $P(-\gamma a) \neq 0$ for at most $2 \dim S_{n,d/2}$ many points of $a \in A$. Thus

$$\dim S_{n,d} - q^n + \#A \leq \dim V \leq \#\Sigma \leq 2 \dim S_{n,d/2}.$$

So

$$\#A \leq 2 \dim S_{n,d/2} + (q^n - \dim S_{n,d}) = 2 \dim S_{n,d/2} + \dim S_{n,(q-1)n-d}.$$

So if we take $d = \frac{2}{3}(q-1)n$, then we get the desired assertion. □

Cor. (25.6.2.10) [Ellenberg-Gijswijt]. For $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and let A be a subset of $(\mathbb{F}_q)^n$ containing no three-term arithmetic progressions, then there exists some calculable constant $C_q < q$ s.t. $\#A = O(C_q^n)$.

In particular, $C_3 < 2.756$. ⌟

Proof: Take $\alpha = \beta = 1, \gamma = -2$, and use the fact(Cf.[E-G17]P342.**?**)

$$\lim_{n \to \infty} \frac{1}{n} \log(\frac{1}{q^n} \dim S_{n,(q-1)n/3}) = -I(\frac{2}{3}(q-1)) = -\sup_{\theta \in \mathbb{R}} \left\{ \frac{2}{3}(q-1)\theta - \log\left(\frac{1}{q}(1+e^\theta+\ldots+e^{(q-1)\theta})\right) \right\} < 0.$$

□

3 Littlewood-Offord Problem

Prop. (25.6.3.1) [Littlewood-Offord Problem, Erdös].

- If $\{x_i\}_{1 \leq i \leq n}$ is a set of real numbers with $|x_i| \geq 1$, then for any $r \in \mathbb{Z}_+$, the number of sums $\sum \pm x_k$ which lies in the interior of any interval of length $2r$ doens't exceed $r\binom{n}{\lfloor n/2 \rfloor}$.
- If $\{x_i\}_{1 \leq i \leq n}$ is a set of complex numbers with $|x_i| \geq 1$, then for any $r \in \mathbb{Z}_+$, the number of sums $\sum \pm x_k$ which lies in the interior of an arbitrary circle of radius r is $O(r\binom{n}{\lfloor n/2 \rfloor}) \leq O(r 2^n / \sqrt{n})$.

⌟

Proof: Cf.[Erdös, On a lemma of Littlewood and Offord. Bull. Amer. Math. Soc. 51 (1945), 898–902.] □

4 Sidon's Problem

Prop. (25.6.4.1) [Erdös-Turán]. For $n \in \mathbb{Z}_+$, let $\Phi(n)$ be the maximal number of subset $\{a_1, \ldots, a_X\}$ of $[n]_+$ s.t. $\{a_i + a_j\}_{i \leq j}$ are pairwise different. Then

$$\frac{1}{\sqrt{2}} \leq \varliminf_{n\to\infty} \frac{\Phi(n)}{\sqrt{n}} \leq \varlimsup_{n\to\infty} \frac{\Phi(n)}{\sqrt{n}} \leq 1.$$

⌟

Proof: Let $p \in \mathbf{P} \setminus \{2\}$ and $a_k = 2pk + u(k), k = 1, 2, \ldots, p-1$, where $1 \leq u(k) \leq p-1, u(k) \equiv k^2 (\mathrm{mod}\ p)$. Then $a_k < 2p^2$ for each k, and

$$a_i + a_j = a_k + a_l \iff (i,j) = (k,l),$$

because in this case

$$i + j = k + l, \quad i^2 + j^2 \equiv k^2 + l^2 \equiv q.$$

Thus $\Phi(2p^2) \geq p - 1$, and because there are infinitely primes, $\varliminf_{n\to\infty} \frac{\Phi(n)}{\sqrt{n}} \geq \frac{1}{\sqrt{2}}$.

For the other direction, for any such set $S = \{a_1, \ldots, a_X\}$ of $[n]_+$ s.t. $\{a_i + a_j\}_{i \leq j}$ are pairwise different. Choose $1 \leq m < n$, then for each $u \in \mathbb{Z}$, let $A_u = \#[u - m, u) \cap S$, then

$$\sum_{u=1}^{m+n} A_u = mx,$$

and the number of triples (i, j, n) s.t. $a_i, a_j \in A_u, a_j > a_i$ is

$$\sum_{u=1}^{m+n} \frac{1}{2} A_u (A_u - 1) \geq \frac{1}{2}(m+n) \frac{mx}{m+n} (\frac{mx}{m+n} - 1).$$

But by the hypothesis, there are at most

$$\sum_{r=1}^{m-1} (m - r) = \frac{1}{2} m(m-1)$$

such triples. Thus

$$\frac{1}{2} mx(mx - m - n) \leq \frac{1}{2} m(m-1)(m+n),$$

and whence

$$x < \frac{n}{m} + \sqrt{n + m + \frac{n^2}{m^2}}.$$

Taking $m = \lfloor \sqrt{n} \rfloor$, we get $x = \sqrt{n} + O(n^{\frac{1}{4}})$, thus $\varlimsup_{n\to\infty} \frac{\Phi(n)}{\sqrt{n}} \leq 1$. □

5 Sums and Products

Conj. (25.6.5.1) [Erdös-Szeméredi]. For $n \in \mathbb{Z}_+$, denote

$$g(n) = \min\Big(\max(\#(A + A), \#(A \cdot A)) : A \subset \mathbb{C}, \#A = n\Big).$$

Then it is conjectured that for any $\varepsilon \in \mathbb{R}_+$, when n is large, $g(n) \geq n^{2-\varepsilon}$. ⌟

Thm& Conj.Cor. (25.6.5.2) [Erdös-Szeméredi/Elekes/Solymosi]. Let $g(n)$ be as in(25.6.5.1), then there exists $C \in \mathbb{R}_+$ s.t. if $n \geq 2$,

$$g(n) \geq C \frac{n^{14/11}}{(\log n)^{3/11}}.$$

⌟

Proof: We only prove that $g(n) \geq 0.23n^{5/4}$, for the stronger result, Cf.[On the number of sums and products, Solymosi]?.

Let $A = \{a_1, \ldots, a_n\}$. and define n^2 linear functions on $\mathbb{R}$:

$$f_{j,k}(x) = a_j(x - a_k).$$

Then each $f_{j,k}$ maps at least n points in $A + A$ into $A \cdot A$: In fact, $f_{j,k}(a_k + a_i) = a_i a_j$. Thus $\Gamma(f_{j,k}) \subset \mathbb{R}^2$ contain at least n points from $(A + A) \times (A \cdot A)$. As $n \leq 10\sqrt{\#(A + A) \cdot \#(A \cdot A)}$, it follows from(25.1.3.8) that

$$n^2 \leq 100(\#(A + A) \cdot \#(A \cdot A))^2/(n - 1)^3$$

from which the assertion follows. □

Prop. (25.6.5.3) [Erdös -Szeméredi]. Let $g(n)$ be as in(25.6.5.1), then there exists $c \in \mathbb{R}_+$ s.t.

$$g(n) < \frac{n^2}{e^{c \log n/ \log\log n}}.$$

⌟

Proof: Cf.[Sums and Products of Integers]. □

Finite Fields

Thm. (25.6.5.4) [Bourgain-Katz-Tao/Bourgain-Konyagin]. Let $p \in \mathbf{P}$, then for $\delta \in \mathbb{R}_+$ and any $A \subset \mathbb{F}_p$ s.t. $\#A < q^{1-\varepsilon}$, there exists $\delta = \delta(\varepsilon) \in \mathbb{R}_+$ and $C \in \mathbb{R}_+$ s.t.

$$\max(\#(A + A), \#(A \cdot A)) \geq C(\delta)(\#A)^{1+\delta}.$$

⌟

Proof: Cf.[BGK06] □

Lemma (25.6.5.5). For $p \in \mathbf{P}$, and $A \subset \mathbb{F}_p$, denote

$$I(A) = \{a_1(a - 2 - a_3) + a_4(a_5 - a_6) : a_1, \ldots, a_6 \in A\}.$$

Then

$$\#I(A) \geq \begin{cases} p/2 & , \#A \geq \sqrt{p} \\ 0.1(\#A)^{3/2} & , \#A \leq \sqrt{p} \end{cases}.$$

⌟

Proof: Cf.[BGK06]P381. □

Thm. (25.6.5.6). For any $C_1, C_2 \in \mathbb{R}_+$, there exists $C \in \mathbb{R}_+$ s.t. for any $p \in \mathbf{P}_{\geq 3}, q \in p^{\mathbb{Z}_+}$, if $A \subset \mathbb{F}_q$ with $C_1 q^{1/2} \leq \#A \leq C_2 q^{7/10}$, then

$$\max(\#(A + A), \#(A \cdot A)) \geq C \frac{(\#A)^{3/2}}{q^{1/4}}.$$

⌟

Proof: Cf.[Sum-product Estimates in Finite Fields via Kloosterman Sums]. □

6 Others

Thm. (25.6.6.1). Given $n \in \mathbb{Z}_+$ and a set $M \subset (\mathbb{Z}_+)^n$, there exists a finite subset $S \subset M$ s.t. for any $m \in M$, there exists $s \in M$ s.t. $s_i \leq m_i$ for each $1 \leq i \leq n$. ⌟

Proof: Use induction on n. The case $n = 1$ is trivial, and for the induction process, choose randomly an $m \in M$. Then an element n is not "divisible" by m iff some $n_i < m_i$. Notice there are only f.m. such n_i. For each of this case, consider the subset $M'_{i,n_i} \subset (\mathbb{Z}_+)^{n-1}$ with the i-th coordinate discarded, then by induction there exists a finite subset S'_{i,n_i} s.t. each element in M'_{i,n_i} is divisible by some element in S'_{i,n_i}. Then S being $\{m\}$ with the collection of S'_{i,n_i} just satisfies the requirement. □

Prop. (25.6.6.2) [Erdös]. For any $k, l \in \mathbb{Z}_+$ and $a_1 < a_2 < \ldots < a_{(k-1)(l-1)+1} \in \mathbb{Z}_+$, there either exists k of them no one dividing the other, or there exists l of them each of a multiple of the previous one. ⌟

Proof: This follows immediately from(25.2.5.4). □

25.7 Word Theory

1 Sturmain Words

Def. (25.7.1.1). Given any word w on an alphabet $\mathcal{A}$, for any $k \in \mathbb{Z}_+$, let $W_k(w)$ be the set of k-words appearing in A. ⌟

Prop. (25.7.1.2) [Morse-Hedlund]. For any infinite word w over an alphabet $\mathcal{A}$,

- If w is eventually periodic, then there exists $C \in \mathbb{R}_+$ s.t. $\#W_k(w) \leq C$ for any $k \in \mathbb{Z}_+$.
- If w is not eventually periodic, then $\#W_{k+1}(w) \geq W_k(w) + 1$ for any $k \in \mathbb{Z}_+$. In particular, $\#W_k(w) \geq k + 1$.

⌟

Proof: □

Cor. (25.7.1.3). Given any infinite word w over a finite alphabet $\mathcal{A}$ that is not eventually periodic, then for any $n \in \mathbb{Z}_+$, there exists finite words V, W of length n, and $a, a', b, b' \in \mathcal{A}$ s.t. each of $a \amalg W, a' \amalg W, V \amalg b, V \amalg b'$ appears in w infinitely often. ⌟

Proof: This follows from the fact $\#W_{k+1}(w) \geq W_k(w) + 1$ and the fact $\#\mathcal{A} < \infty$. □

Def. (25.7.1.4) [Sturmian Words]. For $\theta, \rho \in \mathbb{R}$ s.t. $\theta \in (0, 1)$ and θ is irrational, we can define

$$s_n = \lfloor (n + 1)\theta + \rho \rfloor - \lfloor n\theta + \rho \rfloor, \quad s'_n = \lceil (n + 1)\theta + \rho \rceil - \lceil n\theta + \rho \rceil, \quad n \in \mathbb{Z}_+.$$

And define the infinite words

$$s_{\theta,\rho} = s_1 s_2 s_3 \ldots, \quad s'_{\theta,\rho} = s'_1 s'_2 s'_3 \ldots.$$

These are called **Sturmian words** with slope θ and intercept ρ. ⌟

Prop. (25.7.1.5). An infinite word w on alphabet $\{0, 1\}$ is a Sturmian word iff $\#W_k(w) = k + 1$ for any $k \in \mathbb{Z}_+$. ⌟

Proof: Cf.[Distributions modulo one]P225.? □

2 Thue-Morse Words

Cf.[Distributions modulo one].

25.8 Game Theory

1 Nash Equilibrium

References are [Non-corporative Games, Nash].

Def. (25.8.1.1) [Games]. A finite normal-form (mathematical)**game** is a tuple (N, A, O, μ, u), where

- N is a finite set of players, $n = \#N$.
- $A = (A_1, \ldots, A_n)$, where each A_i is a finite set of actions(or **pure strategies**).
- O is a set of outcomes.
- $\mu : A \to O$ determines the outcome as a function of the action profile.
- $u = (u_1, \ldots, u_n)$ where $u_i : O \to \mathbb{R}$ is the real-valued utility function for player i.

⌟

Def. (25.8.1.2) [Mixed Strategies]. In a mathematical game(25.8.1.1) (N, A, u), each player may randomize his actions, this is called a **mixed strategy**. The **support** of a mixed strategy s_i for player i is the set of pure strategies that s_i has positive probability.

Give a mixed strategy profile $s = (s_1, \ldots, s_n)$, the **expected utility** for player i is

$$u_i(s) = \sum_{a\in A} u_i(a) \prod_j s_j(a_j).$$

⌟

Def. (25.8.1.3) [Best Response]. In a mathematical game(25.8.1.1) (N, A, u), given any mixed strategy profile $s^i = (s_1, \ldots, s_{i-1}, s_{i+1}, \ldots, s_n)$, a **best response** of player i to this strategy profile is a mixed strategy s_i s.t. $u_i(s_i, s^i) \geq u_i(s_i', s^i)$ for any mixed strategy s_i'. ⌟

Def. (25.8.1.4) [Nash-Equilibrium]. A strategy profile $s = (s_1, \ldots, s_n)$ is a **Nash equilibrium** if for each player i, s_i is a best response(25.8.1.3) to $s^i = (s_1, \ldots, s_{i-1}, s_{i+1}, \ldots, s_n)$. ⌟

Thm. (25.8.1.5) [Nash1951]. Each finite normal-form mathematical game(25.8.1.1) has a Nash-equilibrium. ⌟

Proof: Let S be the set of mixed strategy profiles. Given a mixed strategy profile s, for all i and $a_i \in A_i$, define

$$\varphi_{i,a}(s) = \max(0, u_i(a, s^i) - u_i(s)),$$

and define the function $f : S \to S$ by

$$f(s)_i(a) = \frac{s_i(a) + \varphi_{i,a}(s)}{1 + \sum_{b\in A_i} \varphi_{i,b}(s)}.$$

Then with the natural topology, S is homeomorphic to $\mathbb{D}^1$ and f is continuous. So by Brouwer Fixed Point Theorem, f has a fixed point s.

Now we show this s is a Nash-equilibrium: By linearity of expected utility(25.8.1.2), for each i, there exists at least one $a \in A_i$ s.t. $u_{i,a}(s) \leq u_i(s)$. Then $\varphi_{i,a}(s) = 0$, and because $f(s) = s$, $\varphi_{i,b}(s) = 0$ for each $b \in A_i$. This implies that $u_i(s_i', s^i) \leq u_i(s)$ for any mixed strategy s_i'. As this is true for any i, we know s is a Nash-equilibrium. □

Prop. (25.8.1.6) [Symmetries in Games]. ⌟

Proof: □

Def. (25.8.1.7) [Solutions of Games]. ⌟

Finite Deterministic Competitive Games

Thm. (25.8.1.8). For any finite deterministic competitive game with complete information, one of the players has a winning strategy. ⌟

Proof: □

2 Greedoids

Def. (25.8.2.1) [Greedoids and Antimatroids with Repetitions]. For a set of symbols Σ, a language L on Σ(2.7.2.5) is called

- **left-hereditary** if $\alpha,\beta\in\mathrm{String}(\Sigma)$ and $\alpha\beta\in L$, then $\alpha\in L$.
- **permutable** if $\alpha,\beta\in L$ and $\mathrm{length}_x(\alpha)=\mathrm{length}_x(\beta)$ for any $x\in A$, then $\beta x\in L\iff\alpha x\in L$.
- **locally-free** if $\alpha\in L$ and $x\neq y\in\Sigma$ with $\alpha x\in L,\alpha y\in L$, then $\alpha xy\in L$.
- **strongly exchangeable** if for any $\alpha,\beta\in L$, there is a subword α' of α s.t. $\beta\alpha'\in L$, and $\mathrm{length}_x(\beta\alpha')=\max(\mathrm{length}_x(\beta),\mathrm{length}_x(\alpha))$ for any $x\in\Sigma$.
- **augmentary** if $\alpha,\beta\in L$ and $\mathrm{length}(\alpha)>\mathrm{length}(\beta)$, then there exists $x\in\alpha$ s.t. $\beta x\in L$.

A **greedoid** is a left-hereditary and augmentary language on a set of symbols. An **antimatroids with repetition** is a left-hereditary locally-free permutable language on a set of symbols. ⌟

Prop. (25.8.2.2)[Ranks of Greedoids]. In a greedoids, any two maximal words have the same length, called the **rank of this language**(which is defined to be ∞ if no maximal words exist). ⌟

Def. (25.8.2.3) [Flats]. In a left-hereditary language L on a set of symbols Σ, a **flat of words** is an equivalent class of words where two words $\alpha,\beta\in L$ are called equivalent if for any $\gamma\in\mathrm{String}(\Sigma),\alpha\gamma\in L\iff\beta\gamma\in L$.

A flat f is called a **subflat** of a flat g if any word in f can be extended to a word in g. ⌟

Prop. (25.8.2.4) [Strongly Exchangeable Languages]. Any strongly exchangeable language L on a set of symbols Σ is locally-free and permutable. Conversely, any left-hereditary locally-free and permutable language is strongly exchangeable. ⌟

Proof: It is easy to show that a strongly exchangeable language is locally-free and permutable. Conversely, for $\alpha,\beta\in L$, let α' be the subword of α consisting of those $x\in\Sigma$ that are preceded by at least $\mathrm{length}_x(\beta)$ many occurrence of x, then we show that $\beta\alpha'\in L$: We use induction on $\sum_x\max(\mathrm{length}_x(\alpha,\mathrm{length}_x(\beta))$. Let α'' be the longest prefix of α' s.t. $\beta\alpha''\in L$. Suppose for the contrary that $\alpha''\neq\alpha'$, and let x be the letter in α' following α''. Then $\mathrm{length}_x(\beta\alpha'')<\mathrm{length}_x(\alpha)$. Then we can write $\alpha=\alpha_1x\alpha_2$, where $\mathrm{length}_x(\alpha_1)=\mathrm{length}_x(\beta\alpha'')$.

By the definition of α', $\mathrm{length}_y(\alpha_1)\leq\mathrm{length}_y(\beta\alpha'')$ for any $y\in\Sigma$, so $\sum_y\max(\mathrm{length}_y(\alpha_1,\mathrm{length}_y(\beta\alpha''))<\sum_y\max(\mathrm{length}_y(\alpha,\mathrm{length}_y(\beta))$. Then by induction hypothesis, there exists $\gamma\in\mathrm{String}(\Sigma)$ s.t. $\alpha_1\gamma\in L$, and $\mathrm{length}_y(\alpha_1\gamma)=\mathrm{length}_y(\beta\alpha'')$ for any $y\in\Sigma$. Clearly $x\notin\gamma$, so we can use locally-freeness repeatedly to show that $\alpha_1\gamma x\in L$. Now permutability implies that $\beta\alpha''x\in L$, contradicting the maximality of α''. □

Cor. (25.8.2.5) [Antimatroids with Repetitions are Greedoids, Björner-Lovász-Shor]. Any antimatroids L with repetitions on a set of symbols Σ is a greedoids. And if L has finite rank(25.8.2.2), for any two words $\alpha,\beta\in L$, $\overline{\alpha}$ is a subflat of $\overline{\beta}$(25.8.2.3) iff $\mathrm{length}_x(\alpha)\leq\mathrm{length}_x(\beta)$ for any $x\in\Sigma$. In particular, α,β belongs to the same flat iff $\mathrm{length}_x(\alpha)=\mathrm{length}_x(\beta)$ for any $x\in\Sigma$. ⌟

Proof: By(25.8.2.4), any antimatroids with repetitions is strongly-exchangeable, thus is clearly augmentary.

If $\text{length}_x(\alpha) \leq \text{length}_x(\beta)$ for any $x \in \Sigma$, then by strongly exchangeable property, there exists $\gamma \in \text{String}(\Sigma)$ s.t. $\text{length}_x(\alpha\gamma) = \text{length}_x(\beta)$ for any $x \in \Sigma$. Thus by permutability, α is a subflat of β. Conversely, let $\alpha\gamma$ be equivalent to β, and extend $\alpha\gamma$ to a maximal word $\alpha\gamma\delta$, then $\beta\delta$ is also in L, and by strong exchangeability, $\text{length}_x(\alpha\gamma) = \text{length}_x(\beta)$ for any $x \in \Sigma$. In particular, $\text{length}_x(\alpha) \leq \text{length}_x(\beta)$ for any $x \in \Sigma$. □

3 Firing Games

References are [ALS91].

Def. (25.8.3.1) [Firing Games]. Given a finite set A, a **firing game** is a legal sequence of elements of A. where for any finite legal sequence $(a_1, \ldots, a_k)$ of A, there is a rule to determine which element $a_{k+1} \in A$ can be chosen s.t. $(a_1, \ldots, a_{k+1})$ is also legal. A firing game terminates for a legal sequence $(a_1, \ldots, a_k)$ if no such $a_{k+1} \in A$ can be found. ⌟

Def. (25.8.3.2) [Monotone Firing Games]. A **monotone firing game** is a firing game on a set A satisfying the following: For any $k, l \in \mathbb{N}$ and $c \in A$, if $X = (a_1, \ldots, a_k), Y = (b_1, \ldots, b_l)$ be two legal sequences s.t.

$$\#\{i|a_i = x\} \leq \#\{j|b_j = x\}$$

for any $x \in A$, and

$$\#\{i|a_i = c\} = \#\{j|b_j = c\},$$

then $(b_1, \ldots, b_l, c)$ is legal if $(a_1, \ldots, a_k, c)$ is legal. ⌟

Thm. (25.8.3.3) [Thorup]. For a monotone firing game on a set A, any element of A appears the same number of times in any terminating sequence legal sequence. ⌟

Proof: It is easy to check that the set of legal sequences form a antimatroids with repetitions on A(25.8.2.1), so the assertion follows from(25.8.2.5).

Alternatively, let $X = (a_1, \ldots, a_m), Y = (b_1, \ldots, b_n)$ be two legal terminating firing sequences. It suffices to prove that for any element $c \in A$, c appears in Y no more than it does in X. If this is not true, consider the smallest $k \in \mathbb{N}$ s.t.

$$\#\{i|a_i = a_{k+1}, i \leq k\} = \#\{j|b_j = a_{k+1}\}.$$

Then we can compare the two sequences $(a_1, \ldots, a_k)$ and $(b_1, \ldots, b_n)$, and use the minimality of k to conclude that $(b_1, \ldots, b_n, c)$ is also a legal sequence, contradicting the fact that Y is terminating. □

Lemma (25.8.3.4). The possible records of games form a locally-free permutable left-hereditary language on the set $V(G)$. ⌟

Chip-Firing Games

Def. (25.8.3.5) [Chip-Firing Games]. Given a simple finite graph G and a number a_i to each of its vertex v_i called the **initial distribution of chips**, a **chip-firing game** on this graph is sequence of **chip-firings** which means if $a_i \geq \deg(v_i)$ for some i, then we can decrease a_i by $\deg(v_i)$, and increase a_j by 1 for each v_j that is connected to j. ⌟

Thm. (25.8.3.6) [Björner-Lovász-Shor]. Given a simple finite graph G and initial distribution of chips(25.8.3.5), either every game can be continued infinitely, or every game terminates under after the same number of moves, and the number of times a given vertex is fired is the same in each vertex. ⌟

Proof: This is clearly a monotone firing game, so the assertion follows from(25.8.3.3). □

Lemma (25.8.3.7)[Tardos/Björner-Lovász-Shor]. Let G be a connected simple finite graph. Then:

- If a chip-firing game is infinite, then every node is fired infinitely often.
- If a chip-firing game terminates, then there is a node that is not fired at all.

⌟

Proof: 1: There is a vertex that is fired infinitely often, so the vertices connected to it receives infinitely many chips, so they must fire infinitely often too. In this way, because G is connected, every vertex is fired infinitely often.

2: Suppose each vertex is fired. Consider the vertex v s.t. at the end of the game, v has been idle for the longest time. Then after it fired the last time, all of its neighbors fired at least once. Thus v has $\deg(v)$ chips, so it can be fired again, contradiction. □

Prop. (25.8.3.8). Let G be a connected simple finite graph with $n = \#V(G)$ and $e = \#E(G)$, and $\sum_i a_i = N$.

- If $N > 2e - n$, then the game is infinite.
- If $e \le N \le 2e - n$, then there is an initial configuration of chips with infinite games and also an initial configuration of chips with finite games.
- If $N < e$, then the game is finite.

⌟

Proof: 1: If $N > 2e - n$, then there is always a vertex v with at least $\deg(v)$ chips.

2: We can always place $\deg(v_i) - 1$ chips at vertex v_i, so in this way we can place $2e - n$ chips with a finite game. On the other hand, if we have e chips, then we can choose an arbitrary acyclic orientation of vertices of G, and place $\deg^+(v_i)$ chips at vertex v_i. Then for this configuration the game is infinite: There is a source v, so we can fire v, and then after reverting the orientation of all edges from v, we get another acyclic orientation of G, and the chips are also places by $\deg^+(v_i)$ at vertex v_i. Then this process can go on forever.

3: Choose any acyclic orientation of G, and let $T = \sum_i \max(0, a_i - \deg^+(v_i))$. Call a vertex deficient if $a_i - \deg^+(v_i)$. Then along with any game, we can modify the orientation of G so that the quantity T never increases. And moreover, when the set of deficient vertices v_i changes, T decreases. In this way, we can show that the game is finite: A deficient vertex can never be fired, so an infinite game must change the set of deficient vertices infinitely often, contradiction.

To show the monotone property of T, when a vertex v is fired, reverse the orientation of all the edges leaving v, then this is also an acyclic orientation, but for T, the term at v decreases by $\deg^-(v)$, and all the terms at the vertices with an edge going to v increases by at most 1. Moreover, if such an vertex with an edge going to v is deficient, then in fact T decreases. If none of these are deficient, then the set of deficient sets doesn't change. □

Prop. (25.8.3.9). Let G be a connected simple finite graph with $n = \#V(G)$, and let λ_1 be the lest non-zero eigenvalue of the Laplacian matrix L_G(25.2.2.1), then any terminating chip-firing game with N chips has at most $\sqrt{2}nN/\lambda_1$ steps. ⌟

Proof: Suppose we start with a_i chips on vertex v_i and after s steps, we end up with b_i chips on vertex v_i. Let x_i be the number of times that v_i was fired. By(25.8.3.7), we may assume $x_n = 0$. Then clearly $Lx = \mathbf{a} - \mathbf{b}$.

Let

$$L_G = \sum_{i=1}^{n-1} \lambda_i v_i v_i^t$$

where $v_1 \leq v_1 \leq \ldots \leq v_{n-1}$ are the eigenvalues of L_G, and $v_1, \ldots, v_{n-1}$ are the corresponding orthogonal eigenvectors of unit length. Denote

$$L' = \sum_{i=1}^{n-1} \frac{1}{\lambda_i} v_i v_i^t, \quad v_n = \frac{1}{\sqrt{n}}(1, \ldots, 1)^t,$$

then

$$L' L_G = \sum_{i=1}^{n-1} v_i v_i^t = \mathbf{1} - v_n v_n^t = \mathbf{1} - \frac{1}{n}\mathbf{J}.$$

Hence $e_n^t L' L_G = e_n^t - \frac{1}{n}(1, \ldots, 1)^t$, and

$$s = (1, \ldots, 1).\mathbf{x} = n(e_n^t - e_n^t L' L)\mathbf{x} = -n e_n^t L' L \mathbf{x} = \sum_{i=1}^{n-1} -\frac{n}{\lambda_i}(e_n^t \lambda_i)(v_i^t(\mathbf{a} - \mathbf{b})).$$

Thus

$$s \leq \frac{n}{\lambda_i} \sum_{i=1}^{n-1} |e_n^t v_i|.|v_i^t(\mathbf{a} - \mathbf{b})| \leq \frac{n}{\lambda_i} \sqrt{\sum_{i=1}^{n-1} (e_n^t v_i)^2}.\sqrt{\sum_{i=1}^{n-1} (v_i^t(\mathbf{a} - \mathbf{b}))} \leq \frac{n}{\lambda_i}|\mathbf{a} - \mathbf{b}| \leq \sqrt{2}\frac{nN}{\lambda_1}.$$

26.1 Hamiltonian Mechanics

References are [Arn89] and [Notes on Quantum Field Theory, Etingof].

Notation (26.1.0.1).
- Use notations as in **??**.

⌟

1 Hamiltonian Mechanics

<u>**Newtonian Mechanics**</u>

Physical Law (26.1.1.1)[Space and Time in Newtonian Mechanics]. The **Galilean space-time structure** is a 4-dimensional real vector space. Its points are called world points or events.

The **time** is a projection from the space to $\mathbb{R}$: $t : \mathbb{R}^N \to \mathbb{R}$. Two events a, b are called **simultaneous** if $t(a) = t(b)$.

The set of events simultaneous to a given event forms a 3-dimensional affine subspace of $\mathbb{R}^3$, called a **space of simultaneous events**. ⌟

Def. (26.1.1.2) [Galilean Transformations]. By(26.1.1.1), we can assume that the Galilean space-time is isomorphic to $\mathbb{R} \times \mathbb{R}^3$, where the first coordinate is time. Any such isomorphism determines a **Galilean coordinate system** on the space-time structure. Thus on the Galilean space-time, we can define the Eisenstein metric $\mathrm{d}s^2 = \mathrm{d}x_1^2 + \mathrm{d}x_2^2 + \mathrm{d}x_3^2 - \mathrm{d}t^2$.

The **Galilean group** is the group of automorphisms of the Galilean space preserving the Eisenstein metric. The transformations of a Galilean coordinate system is also the class of **inertia coordinate systems** w.r.t. this coordinate system. ⌟

Prop. (26.1.1.3). Any Galilean transformation g can be written as a product $g_1 \circ g_2 \circ g_3$ where
- g_1 is a **uniform motion** with velocity v: $g_1(t, x) = (t, x + tv)$.
- g_2 is a **translation of the origin**: $g_2(t, x) = (t + s, x + x')$.
- g_3 is a **rotation of coordinate axis**: $g_3(t, x) = g_3(t, Gx)$, where $G \in O(3, \mathbb{R})$.

⌟

Proof: □

Def. (26.1.1.4)[Motion, Velocity and Acceleration]. A **motion** in $\mathbb{R}^N$ is a smooth curve $x : I \to \mathbb{R}^N$, where I is an interval in $\mathbb{R}$.

For $t_0 \in I$, the **velocity of a motion** $x : I \to \mathbb{R}^N$ is defined to be the derivative $\dot{x} = \frac{\partial}{\partial t} x|_{t=t_0}$. And the **acceleration vector** of t_0 is defined to be the the second derivative $\ddot{x} = \frac{\partial^2}{\partial t^2} x|_{t=t_0}$. ⌟

Physical Law (26.1.1.5) [Newtonian Mechanics and Newton's Principle of Determinacy]. Any motion of a newtonian mechanical system uniquely determined by its initial positions(i.e. $x(t_0) \in \mathbb{R}^N$) and its initial states(i.e. $\dot{x}(t_0) \in \mathbb{R}^N$).

The study of motions in a newtonian system is called a **Newtonian mechanics**(of particles). ⌟

Def. (26.1.1.6) [Newton's Equation]. In a given Galilean coordinate system, it follows from the newton's principle of determinacy(26.1.1.5) that there is a function $F : \mathbb{R}^N \times \mathbb{R}^N \times \mathbb{R} \to \mathbb{R}$ s.t. for any motion x in $\mathbb{R}^N$,

$$\ddot{x}(t) = F(x, \dot{x}, t).$$

This is called the **Newton's equation**. ⌟

Axiom (26.1.1.7) [Galileo's Principle of Relativity]. The Newton's equations(26.1.1.6) are invariant under the action of Galilean group(26.1.1.2). Equivalently,

$$F(x, \dot{x}, t) = F(x, \dot{x}, t + s),$$

$$F(x + tv, \dot{x} + v, t) = F(x + tv, \dot{x} + v, t),$$

$$GF(x, \dot{x}, t) = F(Gx, G\dot{x}, t), \quad G \in O(3, \mathbb{R}).$$

⌟

Def. (26.1.1.8) [Forces]. A **force** is a vector field on the configuration space.

A **conservative force** is a force F s.t. there exists a potential energy U s.t. $\operatorname{grad} U = F$. ⌟

Def. (26.1.1.9) [Work of a Force]. The **work** of a force**?** F on a path γ is defined to be

$$A = (F, \gamma) = \int_\gamma (F, \mathrm{d}\gamma).$$

⌟

Prop. (26.1.1.10). If the configuration space is simply-connected(e.g. $\mathbb{R}^N$), then a force is conservative iff its work along any path only depends on the endpoints. ⌟

Hamiltonian Mechanics

Def. (26.1.1.11) [Lagrangian Dynamical System]. A **Lagrangian (dynamical) system** of particles consists of the following:

- A differentiable manifold M.
- A differentiable function $\mathcal{L} \in C^\infty(TM \times \mathbb{R})$ called the **Lagrangian of the system**.

If $\mathcal{L}$ factors through the projection to TM, then it is called an **autonomous Lagrangian system**, otherwise it is called a **non-autonomous Lagrangian system**.

In particular, a Lagrangian system is a classical field theory(13.1.0.1). ⌟

Def. (26.1.1.12) [Generalized Coordinates and Velocities]. Given a Lagrangian system M, any smooth chart $\varphi_\alpha : U_\alpha \subset M \cong V_\alpha \subset \mathbb{R}^n$ defines a **generalized coordinate** $q_i = (\varphi_\alpha)_i$ on U_α. And $\frac{\partial}{\partial \dot{q}_i}\mathcal{L} = p_i$ are called the **generalized velocities**. ⌟

Def. (26.1.1.13) [Hamiltonian Mechanics and the Principle of Least Action]. For any Lagrangian dynamical system(26.1.1.11) and any generalized coordinate q_i, then a **motion** in this system is a path $\gamma : [t_0, t_1] \to M$ s.t. γ is the extremal curve(11.13.1.3) of the functional

$$\Phi(\gamma) = \int_{t_0}^{t_1} \mathcal{L}(\gamma, \dot{\gamma}, t)\mathrm{d}t.$$

Equivalently, it satisfies the Euler-Lagrangian equation(11.13.1.5)

$$\frac{\partial}{\partial t}\frac{\partial}{\partial \dot{q}}\mathcal{L} = \frac{\partial}{\partial q}\mathcal{L}.$$

The study of motions in a Lagrangian system is called a **Hamiltonian mechanics**. ⌟

Def. (26.1.1.14) [Natural Lagrangians]. For a Lagrangian system with phase space M, A Riemannian structure on M will give a **kinetic energy**

$$T = \frac{1}{2}\langle v, v\rangle_x, \quad v \in T_x M,$$

and a **potential energy** is a function $U \in C^\infty(M)$ that is viewed as a function on TM via projection.

Then the Lagrangian $\mathcal{L}$ is called a **natural Lagrangian** if it is of the form $\mathcal{L} = T - U$ for some kinetic energy T and some potential energy U. ⌟

Thm. (26.1.1.15) [Hamilton's Form of the Principle of Least Action]. if q_i are the generalized coordinates for the system of n mass points in a Euclidean space, define the natural Lagrangian $\mathcal{L}(q, \dot{q}, t) = T - U$, where $T = \frac{1}{2}\sum m_i \dot{q}_i^2$ is the kinetic energy and U is a potential energy. Then its Euler-Lagrangian equation is

$$-\frac{\partial}{\partial q_i}U = m\ddot{q}_i, \quad 1 \le i \le n.$$

which is just the **Newton's equation** of kinetic mechanics. By(26.1.1.13), this equation is satisfied when the system evolves with time. ⌟

Cor. (26.1.1.16). Newtonian mechanics(26.1.1.5) are Hamiltonian mechanics, thus are classical field theories. ⌟

Example (26.1.1.17) [Free Particles]. In the system of a free mass point of weight m in $\mathbb{R}^3$, if $q = r$ is the usual coordinate, then

$$L = T = \frac{m\dot{r}^2}{2} = \frac{m}{2}(\dot{q}_1^2 + \dot{q}_2^2 + \dot{q}_3^2).$$

Then the generalized momenta are $p_i = m\dot{q}_i$. And the Lagrangian equation is $\frac{\partial}{\partial t}p = 0$. ⌟

Example (26.1.1.18) [Central Potential Fields]. In the system of a free mass point in $\mathbb{R}^2$ with a central potential field $U = U(r)$ in the polar coordinate (r, φ). Then in this coordinate $q_1 = r, q_2 = \varphi$,

$$\mathcal{L}(q, \dot{q}) = T(q, \dot{q}) - U(q) = \frac{m}{2}(\dot{q}_1^2 + q_1^2\dot{\varphi}^2) - U(q_1).$$

Then the generalized momentum is

$$p_1 = m\dot{r}, \quad p_2 = mr^2\dot{\varphi},$$

and the Lagrangian equations are

$$m\ddot{r} = mr\dot{\varphi}^2 - \frac{\partial}{\partial r}U, \quad \dot{p}_2 = 0.$$

Notice the second equation is called the **law of conservation of angular momentum**. This is a special case of(26.1.1.19). ⌟

Prop. (26.1.1.19) [Generalized Law of Conservation of Angular Momentum]. A coordinate q_i not appearing in the Lagrangian(i.e. $\frac{\partial}{\partial q_i}\mathcal{L} = 0$) is called a **cyclic coordinate**. Then it follows from(26.1.1.15) that the generalized momentum corresponding to a cyclic coordinate remains constant. ⌟

Symmetries

Thm. (26.1.1.20) [Noether's Theorem]. ⌟

Thm. (26.1.1.21) [Continuity Equation]. ⌟

Prop. (26.1.1.22) [Dimensional Analysis]. In an equation raising from a physical problem, we can normalize all the indeterminants to get a non-dimensional one, giving the equation some kind of characteristic length. ⌟

2 Symplectic Structure

26.2 Quantum Mechanics

Basic References are [Nap].

1 Basics

Physical Law (26.2.1.1) [Law of Quantum Mechanics]. The Schrodinger equation can be derived from the Dirac-von Neumann axioms:

The **states of particles** is a countable dimensional Hilbert space, and

- The **observables** of a quantum system are defined to be the (possibly unbounded)Hermitian operators A on $\mathbb{H}$. Then any continuous observable is unitarily diagonalizable, with real eigenvalues by Hilbert-Schmidt(11.9.4.16). The eigenvalues of the matrix corresponding to an observable is called the **observations**.
- The **state** φ of the quantum system is a unit vector of $\mathbb{H}$, up to scalar multiples.
- The expectation value of an observable A for a system in a state φ is given by the inner product $(\varphi, A\varphi)$.
- (Unitarity)The time evolution of a quantum state according to the Schrodinger equation is mathematically represented by a unitary operator $U(t)$ (depends only on the state an relative time)(one-parameter subgroup).

Now that $\varphi(t) = \widehat{U}(t)\varphi(t_0)$, so $\widehat{U}(t)\varphi(t_0) = e^{-i\widehat{\mathcal{H}}t}, where \widehat{\mathcal{H}}$ is Hermitian, called the **quantum Hamiltonian**.

So now take derivative w.r.t t, we get $i\frac{d\varphi}{dt} = \widehat{\mathcal{H}}\varphi$. By **quantum correspondence principle**, it is possible to derive the expression of $\widehat{\mathcal{H}}$ by classical methods. ⌟

Def. (26.2.1.2) [Qubits]. A **qubit** is a state that is complex combination of $|0\rangle$ and $|1\rangle$, i.e. $|\varphi\rangle = \alpha|0\rangle + \beta|1\rangle$. ⌟

Def. (26.2.1.3) [Quantum Entanglement and Singlets]. Any tensor in a tensor space of two Hilbert space that is not a pure tensor will correspond to a **quantum entanglement**. The simplest quantum entanglement is the **singlet state**

$$|\Psi_-\rangle = \frac{1}{\sqrt{2}}|01\rangle - \frac{1}{\sqrt{2}}|10\rangle \in (\mathbb{C}\{|0\rangle, |1\rangle\})^{\otimes 2} \cong \mathbb{C}^4.$$

⌟

Def. (26.2.1.4) [Pauli Observables]. The observables on a two dimensional Hilbert space, i.e. a qubit state space, are all combinations of **Pauli Observables** plus **1**:

$$\sigma_z = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \quad \sigma_x = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \quad \sigma_y = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$$

Their corresponding eigenvalues are denoted by

$$\uparrow = \begin{bmatrix} 0 \\ 1 \end{bmatrix} \quad \downarrow = \begin{bmatrix} 1 \\ 0 \end{bmatrix}, \quad \rightarrow = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \leftarrow = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ -1 \end{bmatrix}, \quad \otimes = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ i \end{bmatrix} \quad \odot = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ -i \end{bmatrix}$$

⌟

Remark (26.2.1.5). The solution of a Schrodinger equation for a non Relativistic particle is assumed to be a Schwartz function (Vanish fast enough at infinity). The coefficients is assumed smooth enough to guarantee at least uniqueness and existence locally. ⌟

Prop. (26.2.1.6). The wave function on the (p,t) coordinates is the Fourier Transform of the wave function on the (x,t) coordinates, because the eigenstate of the p-operator $i\hbar\frac{\partial}{\partial x}$ is e^{ikx}, the coefficients of which is the value (probability) of the wave function of the (p,t) coordinates. ⌟

Prop. (26.2.1.7) [Schrödinger Uncertainty Principle]. Set $\sigma_A=\sqrt{\langle\widehat{A}^2\rangle-\langle\widehat{A}\rangle^2}$, then:

$$\sigma_A^2 2\sigma_B^2\geq\left|\frac{1}{2}\langle\widehat{A}\widehat{B}+\widehat{B}\widehat{A}\rangle-\langle\widehat{A}\rangle\langle\widehat{B}\rangle\right|^2+\left|\frac{1}{2i}\langle[\widehat{A},\widehat{B}]\rangle\right|^2.$$

⌟

Proof: Derived from definition and Schwarz inequality, Cf.[Wiki]. □

Cor. (26.2.1.8) [Heisenberg Uncertainty Principle]. $\sigma_x\sigma_p\geq\frac{\hbar}{2}$. ⌟

Proof:

$$[x,i\hbar\frac{\partial}{\partial x}]=i\hbar.$$

□

Prop. (26.2.1.9) [Spectral Decomposition]. In Quantum physics, one need to use spectral decomposition of the Hamiltonian operator. But at most cases, there are only countably many eigenstate and the eigenvalue has a lower bound and tends to infinity. In this case, $(\widehat{H}+A)^{-1}$ is a compact operator thus by spectral theorem(11.9.4.15) the eigenstate of $\widehat{H}$ forms a set of complete basis. ⌟

Prop. (26.2.1.10) [No-Cloning Theorem]. ? ⌟

Calculations

Prop. (26.2.1.11) [Virial Theorem]. For a system that $V(r)\sim r^n$, the average kinetic energy and the average potential energy has the relation :

$$2\langle T\rangle=n\langle V\rangle.$$

⌟

Spin

2 Quantum Computations

Classical Logic Gates

Def. (26.2.2.1) [Boolean Functions]. A **Boolean function** is a function $f:\mathbb{F}_2^n\to\mathbb{F}_2$. ⌟

Def. (26.2.2.2) [Classical Logic Gates]. There are four classical logic gates, if we let $0,1\in\mathbb{F}_2$, then:

- **AND gate**: $(a,b)\mapsto ab$.
- **OR gate**: $(a,b)\mapsto ab+a+b$.
- **NOT gate**: $a\mapsto a+1$.

- **COPY gate**: $a \mapsto (a, a)$.

┘

Def. (26.2.2.3) [Reversible Gates]. A gate is called **reversible** iff it is a bijection from $\mathbb{F}_2^n$ to $\mathbb{F}_2^n$. ┘

Def. (26.2.2.4) [Simulations]. A set of gates is said to be able to **simulate** a boolean function f iff there is a composition of these gates that maps

$$(x_1, \ldots, x_{m+n}) \to (g_1(x_1, \ldots, x_{m+n}), \ldots, g_k(x_1, \ldots, x_{m+n}))$$

such that if we let $x_{i_1} = a_1, x_{i_2} = a_2, \ldots, x_{i_m} = a_m$ be fixed, where $\{0, 1 \ldots, m+n\} - \{i_1, \ldots, i_m\} = \{j_1, \ldots, j_n\}$(in some order), then $g_1(x_1, \ldots, x_{m+n}) = f(x_{j_1}, \ldots, x_{j_n})$.

A set of gates is called **universal** iff they can simulates all Boolean function $f : \mathbb{F}_2^n \mapsto \mathbb{F}_2$. ┘

Prop. (26.2.2.5) [Classical Gates are Universal]. The four classical gates are universal. In fact, $\text{And}(x, y) = \text{OR}(\text{NOT}(x), \text{NOT}(y))$, so even AND is disposable, and COPY is not used as well. ┘

Proof: Just use OR gate to juxtapose all possible combinations that are mapped to 1. □

Example (26.2.2.6) [Reversible Gates].

- The **CNOT gate** is defined to be $\text{CNOT} : (a, b) \mapsto (a, b + a)$.
- The **Toffoli gate** is defined to be $\text{CCNOT} : (a, b, c) \mapsto (a, b, c + ab)$.
- The **Fredkin gate** or CSWAP gate is a three-bit gate defined as the quantization of the gate given by:$(a, b, c) \mapsto (a, (1 - a)c + ab, (1 - a)b + ac)$.

┘

Prop. (26.2.2.7). CNOT gate cannot simulate AND. In particular, CNOT is not universal. ┘

Proof: It can be shown that any Boolean function that can be simulated by CNOT gate is of the form $(x_1, \ldots, x_n) \mapsto \sum a_i x_i + b$. But AND is of the form $(a, b) \mapsto ab$, which is not of the form, so it is not simulated by CNOT. □

Prop. (26.2.2.8). The Toffoli gate(26.2.2.6) is universal(26.2.2.4). ┘

Proof: By(26.2.2.5), it suffices to show that it can simulate AND and NOT, then it can simulate OR because $\text{OR}(x, y) = \text{NOT}(\text{NOT}(x), \text{NOT}(y))$.

AND is outputted in the third bit with $c = 0, a = x, b = y$, NOT is outputted in the third bit with $a = 1 = c, b = x$. □

Prop. (26.2.2.9). The Fredkin gate(26.2.2.6) is universal(26.2.2.4). ┘

Proof: If we set the third input to be 0, then the second output of $\text{CSWAP}(x, y, 0)$ is $\text{And}(x, y)$, and if we set the second input to be 0 and the third input to be 1, then the second output of $\text{CSWAP}(x, 0, 1)$ is $\text{NOT}(x)$. Thus the Fredkin gate can simulate both AND and NOT gates, thus universal, by(26.2.2.5). □

Quantum Logic Gates

Our model of quantum computation is quantum logic gates.

Def. (26.2.2.10) [Quantum Logic Gates]. A **quantum logic gate** is a unitary matrix. In particular a quantum logic gate is always reversible. ⌟

Prop. (26.2.2.11) [Examples of Quantum Gates].

- The **Hadamard gate** H is a rotation on one single qubit given by the matrix $\begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$.
- If a classical gate is reversible and its matrix is unitary, then the same matrix will give out a quantum gate with all entries 0 and 1, called the **quantization of classical gates**.

⌟

3 Quantum Algorithms

Algo. (26.2.3.1) [Deutsch-Jozsa Algorithm]. The **Deutsch-Jozsa problem** is that: given a function $f:\mathbb{F}_2^n\to\mathbb{F}_2$, which is either a constant function or a function that takes half value 0 and half value 1,

Consider the gate $U_f:(x_1,\ldots,x_n,x)\mapsto(x_1,\ldots,x_n,x+f(x_1,\ldots,x_n))$, then there is a **Deutsch-Jozsa algorithm** that can determine if f is a constant function just using the gate U_f once. ⌟

Proof: Make the state

$$H^{\otimes n+1}\circ U_f\circ H^{\otimes(n+1)}(0,0,\ldots,0,1)=\Big(\frac{1}{2^n}\sum_{(a_1,\ldots,a_n)\in\mathbb{F}_2^n}\Big(\sum_{(x_1,\ldots,x_n)\in\mathbb{F}_2^n}(-1)^{f(a_1\ldots a_n)+\sum_i a_ix_i}\Big)|a_1\ldots a_n\rangle\Big)\otimes|0\rangle,$$

and then measure all the first n bits in the $|0\rangle/|1\rangle$-basis. Then the result is $(0,0,\ldots,0)$ iff f is constant. □

Making Classical Algorithms Reversible

Because quantum computers can only deal with reversible algorithms, we need to spend either time or space to make classical algorithms revertible. This is because by von-Neumann-Landauer limit, it takes energy to erase a bit of information.

For example, The modular exponentiation algorithm(2.10.2.1) can be made revertible as in [Sho97].

Quantum Fourier Transform

Def. (26.2.3.2) [Quantum Fourier Transform]. The (inverse)**quantum Fourier transform** is an algorithm represented by the matrix

$$U_{\mathrm{QFT}}=\frac{1}{\sqrt{N}}\operatorname{Van}(1,\zeta_N,\zeta_N^2,\ldots,\zeta_N^{N-1}).$$

⌟

Proof: It suffices to prove this matrix is unitary, which is easy. □

Lemma (26.2.3.3) [Tensor Representation]. The trick of the quantum Fourier transform lies in its connection with the 2-adic decimal representation:

$$\begin{aligned} U_{\mathrm{QFT}}(|x_n x_{n-1}\dots x_1\rangle) = \frac{1}{\sqrt{N}}&(|0\rangle + \exp(2\pi\,\mathrm{i}\cdot 0.x_1)|1\rangle \\ &\otimes(|0\rangle + \exp(2\pi\,\mathrm{i}\cdot 0.x_2x_1)|1\rangle \\ &\otimes\dots \\ &\otimes(|0\rangle + \exp(2\pi\,\mathrm{i}\cdot 0.x_n x_{n-1}\dots x_1)|1\rangle \end{aligned}$$

⌟

Proof: Direct calculation.**?** □

Algo. (26.2.3.4) [Quantum Fourier Transform Algorithm, Shor]. Because of the tensor representation of quantum Fourier transform, it is anticipated that the transformation can be represented using Hadamard gate and phase change gates. The circuit given in `https://en.wikipedia.org/wiki/Quantum_Fourier_transform` shows that for $n\in\mathbb{Z}_+$, U_{QFT} on $N=2^n$ can be represented by a circuit with $n(n+1)/2$ gates up to a swap. And there are $O(n^2)$ qbit swaps to be performed, which shows that the quantum Fourier transform has complexity $O(n^2)$. ⌟

Shor's Algorithms

References are [Sho94], [Sho97]

Def. (26.2.3.5). For a number $M=pq$, where p,q are different odd prime numbers, $x\in(\mathbb{Z}/(M))^*$ is called **good** iff $r=\mathrm{ord}(x)$ is even, and neither of $x^{r/2}\pm 1$ is divisible by M.

Then at least half of $(\mathbb{Z}/(M))^*$ is good. ⌟

Proof: It suffices to consider a fixed order $2a$, and this is additive in $\mathbb{Z}/(2a,p-1)\mathbb{Z}\times\mathbb{Z}/(2a,q-1)\mathbb{Z}$.**?**. □

Algo. (26.2.3.6) [Shor's Algorithm for Computing Orders]. If we find a good x for M, then $x^{r/2}\pm 1$ contains separately a prime p or q, so we can use Euclidean algorithm to extract a prime of M. This is just the idea of Shor's algorithm(26.2.3.7). ⌟

Algo. (26.2.3.7) [Shor's Prime Factorization Algorithm]. For $M=pq$, we can factor p,q out with high probability in $O((\log M)^2)$ time. ⌟

Proof: Cf.[Napkin P274]. □

Algo. (26.2.3.8) [Shor's Discrete Logarithm Algorithm]. ⌟

Grover's Algorithm

Prop. (26.2.3.9). ⌟

Prop. (26.2.3.10) [Grover's Selection Algorithm]. If there are n items labeled $\{0,\dots,n-1\}$, and there is a marked item w. then there is a quantum algorithm that find w in $O(\sqrt{n})$ times. ⌟

Proof: Cf.[Quantum Algorithm MIT P33,35]. □

4 Quantum Informations

Quantum Cryptography

x1dddd

26.3 General Relativity Theory

1 Basics

Prop. (26.3.1.1) [Maxwell's Equation]. Normal Maxwell's equation reads:

$$\begin{cases} \mathrm{div}E = q & \text{(Coulomb's law)} \\ \mathrm{div}H = 0 & \text{(Gaussian law)} \\ \mathrm{curl}E = -\frac{1}{c}\frac{\partial H}{\partial t} & \text{(Faraday's law)} \\ \mathrm{curl}H = j + \frac{1}{c}\frac{\partial E}{\partial t} & \text{(Ampère-Maxwell law)} \end{cases}$$

where E is the magnetic field, H is the electric field, q the charge density, j the electric current.

In Minkowski space, we define the electromagnetic 2-form

$$F = \frac{1}{2}F_{\alpha\beta}dx^\alpha \wedge dx^\beta,$$

where $F_{i0} = E_i, \quad Fij = H_k$, and electric current J, $J^i = -j^i, J^0 = q$.

Maxwell's equation can be re-written as:

$$d^*F = J \qquad dF = 0.$$

Where $d^* = *d*$. ⌟

Proof: The Minkowski space is flat, the equivalence can be seen by direct calculation. □

27 Non-Commutative Geometry(Connes)

27.1 Supersymmetry

Def. (27.1.0.1) [Supermanifolds]. A **supermanifold** of dimension (n,m) is a smooth manifold $|M|$ together with a sheaf $\mathcal{O}_M$ of $\mathbb{Z}/(2)$-graded algebras that is locally isomorphic to $\mathcal{O}_{|M|}\otimes\Lambda[\xi_1,\ldots,\xi_m]$. The odd functions on M generate a nilpotent ideal $\mathcal{J}\subset\mathcal{O}_M$, with $(|M|,\mathcal{O}_M/\mathcal{J})$ a manifold, called the underlying manifold of M, denoted by M_{red}.

A map of supermanifolds $\varphi: M\to N$ is a map of manifolds $\varphi_0: M_0\to N_0$ together with a map of supervectors spaces $\varphi_0^*\mathcal{O}_N\to\mathcal{O}_M$. ⌟

Remark (27.1.0.2). In a similar fashion, we can define complex supermanifold, analytic supermanifolds or superschemes. ⌟

Prop. (27.1.0.3) [Morphisms between Supermanifolds]. Let M be a supermanifold and $U\subset\mathbb{R}^{p|q}$ an open submanifold, then a map of supermanifolds $f: M\to U$ is equivalent to a tuple $(f_1,\ldots,f_p,\varphi_1,\ldots,\varphi_q)$ s.t. for any $x\in|M|$, $(f_1(x),\ldots,f_p(x))\in|U|$.

In fact, giving such a tuple, suppose $f_i=f_i^0+r_i$ where $f_i^0\in\mathcal{O}_{|M|}$ and $r_i\in\mathcal{J}$, then in local coordinates, the pullback of $F=\sum F_I\theta^I$ is

$$F(f_1,\ldots,f_p,\varphi_1,\ldots,\varphi_q)=\sum_I\Big(\sum\partial^\alpha F(f_1^0,\ldots,f_p^0,\varphi_1,\ldots,\varphi_q)\frac{r^\alpha}{\alpha!}\Big)\varphi^I.$$

⌟

Def. (27.1.0.4) [Super Vector Bundles]. A **super-vector bundle** over a supermanifold M is an $\mathcal{O}_M$-sheaf $\mathcal{E}$, locally free of dimension $p|q$. ⌟

1 Real Structures

2 Super Lie Groups

Def. (27.1.2.1) [Super Classical Groups].

- $\mathrm{GL}(p|q)$.
- There is a Berezinian map $\mathrm{Ber}:\mathrm{GL}(p|q)\to\mathrm{GL}(1|0)$, and the kernel is denoted by $\mathrm{SL}(p|q)$.
- $\mathrm{OSp}(n|2m)$ is the group fixing an even supersymmetric non-degenerate bilinear form Φ.
- $\pi\,\mathrm{Sp}(n|n)$ is the group fixing an odd super-anti-symmetric non-degenerate bilinear form Φ.
- The kernel of $\mathrm{Ber}:\pi\,\mathrm{Sp}(n|n)\to\mathrm{GL}(1|0)$ is called the group of P-series.

- Let $D = \mathbb{R}[\eta]$ be the super division algebra with η odd and $\eta^2 = -1$, then there is a odd determinant map
$$\text{odet} : \text{GL}(n; D) \to \mathbb{R}^{0|1},$$
the kernel of odet is called the group of Q-series.

⌟

Proof: Cf.[Deligne, Supersymmetry]P70. □

28 Others

28.1 Probability Theory

References are [Dudley, Real Analysis and Probability], and [Real Analysis, Folland].

Notation (28.1.0.1).

- Use notations as in Real Analysis(Functions on $\mathbb{R}^n$).

⌟

1 Basics

Def. (28.1.1.1) [Events]. Given a probability space $(\Omega, \mathcal{M}, P)$, any measurable space $A \in \mathcal{M}$ is called an **event** in $\mathcal{M}$, and its **probability of the event** is defined to be $\mathbf{P}(A)$. ⌟

Def. (28.1.1.2) [Independent Events]. Given a probability space $(\Omega, \mathcal{M}, P)$, two events(28.1.1.1) A and B are called **independent events** if $\mathbf{P}(A \cap B) = \mathbf{P}(A) \cdot \mathbf{P}(B)$. Similarly, we can define jointly-independent events. ⌟

Def. (28.1.1.3) [Random Variables]. A measurable function(11.3.1.17) X from a probability space $(\Omega, \mathcal{M}, P)$(11.3.1.3) to a measurable space $(S, \mathcal{A})$ is called a **random variable** on Ω. ⌟

Def. (28.1.1.4) [Independent Variables]. Suppose $(\Omega, \mathcal{M}, P)$ is a probability space and $X : (\Omega, \mathcal{M}, P) \to (S, \mathcal{A})$ and $Y : (\Omega, \mathcal{M}, P) \to (T, \mathcal{B})$ are two random variables, then X, Y is called a pair of **independent variables** if for any event $U \in \mathcal{A}$ and $V \in \mathcal{B}$, $X^{-1}(U)$ and $Y^{-1}(V)$ are independent events(28.1.1.2), i.e.

$$\mathbf{P}(X \in U, Y \in V) = \mathbf{P}(X \in U) \cdot \mathbf{P}(Y \in V).$$

Similarly, we can define jointly-independent variables.

If $\mathscr{S}$ is a set of random variable, then variables in S are called **independent variables** if any subset of variables in $\mathscr{S}$ are jointly-independent. ⌟

Def. (28.1.1.5) [Expected Values, Variances and Standard Deviations]. Suppose $(\Omega, \mathcal{M}, P)$ is a probability space and X is a random variable on Ω(28.1.1.3) valued in $(\mathbb{R}, \mathrm{dm})$. Then

- If $\int_\Omega X \mathrm{d}P$ exists, it is called the **expected value** of X, denoted by $\mathbf{E}(X)$.
- The **variance** of X is defined to be

$$\mathrm{var}(X) \triangleq \sigma^2(X) \triangleq \begin{cases} \mathbf{E}(X - \mathbf{E}(X))^2 = \mathbf{E}(X^2) - (\mathbf{E}\, X)^2 & , \mathbf{E}(X^2) < \infty \\ +\infty & , \mathbf{E}(X^2) = \infty \end{cases}.$$

- The **standard deviation** of X is defined to be $\sigma(X) = \sqrt{\mathrm{var}(X)} \in [0, \infty]$.

Notice by Cauchy's inequality, if $\mathbf{E}(X^2) < \infty$, then $\mathbf{E}(X) < \infty$, so the definition makes sense. ⌟

Def. (28.1.1.6) [Covariances and Correlation Coefficients]. Suppose $(\Omega, \mathcal{M}, P)$ is a probability space and X, Y are real-valued random variables on Ω, then

- If $\mathbf{E}(X) < \infty, \mathbf{E}(Y) < \infty$, the **covariance** of X and Y is defined to be
$$\mathrm{cov}(X,Y) \stackrel{\triangle}{=} \mathbf{E}((X - \mathbf{E}(X))(Y - \mathbf{E}(Y))) = \mathbf{E}(XY) - \mathbf{E}(X) \cdot \mathbf{E}(Y).$$
- If $\mathbf{E}(X^2) < \infty$ and $\mathbf{E}(Y^2) < 0$, and $\mathrm{cov}(X) \neq 0, \mathrm{cov}(Y) \neq 0$, then the **correaltion coefficient** between X and Y is defined to be
$$r(X,Y) = \frac{\mathrm{cov}(X,Y)}{\sigma(X)\sigma(Y)}.$$

Notice $r(X,Y) \in [-1,1]$ if it is defined. ⌟

Proof: $r(X,Y) \in [-1,1]$ by Cauchy inequality because $L^2(\Omega)$ is a Hilbert space. □

Prop. (28.1.1.7) [Independence and Covariances]. Suppose $(\Omega, \mathcal{M}, P)$ is a probability space and X, Y are real-valued random variables on Ω that are independent, then $\mathrm{cov}(X,Y) = 0$. ⌟

Proof: Cf.[Dudley, P252]. □

Prop. (28.1.1.8). Suppose $(\Omega, \mathcal{M}, P)$ is a probability space and X, Y are real-valued random variables on Ω, then
$$\mathrm{var}(\sum_i X_i) = \sum_i \mathrm{var}(X_i) + 2 \sum_{1 \leq i < j \leq n} \mathrm{cov}(X_i, X_j).$$
In particular, if X_i are independent or pairwise-independent, by(28.1.1.7),
$$\mathrm{var}(X_1 + \ldots + X_n) = \sum_i \mathrm{var}(X_i).$$
⌟

Proof: We may first assume that $\mathbf{E}(X_i) = 0$ for each i, then
$$\mathrm{var}(\sum_i X_i) = \mathbf{E}((X_1 + \ldots + X_n)^2), \quad \mathrm{cov}(X_i, X_j) = \mathbf{E}(X_i X_j).$$
So the assertion is easy. □

2 Convergence of Laws and Central Limit Theorems

3 Conditional Expectations and Martingales

4 Stochastic Processes

Brownian Motion

Remark (28.1.4.1). The motion of a Brownian particle in $\mathbb{R}^N$ with a potential field U is described by a stochastic process $q = (q_1(t), \ldots, q_N(t)) \in \mathbb{R}^N$. (Which means that for each time t, there is a random variable $q(t) \in \mathbb{R}^N$ s.t. the dependence in t is regular in some sense.

All in all, the density of the probability that the motion with restrict $q(a) = \underline{a}, q(b) = \underline{b}$ is a smooth curve $\gamma : [a,b] \to \mathbb{R}^N$ is propositional to
$$e^{-S(\gamma)/\kappa}, \quad S(\gamma) = \int_a^b (\frac{1}{2}\dot{\gamma}^2 + U(\gamma)\mathrm{d}t$$
where κ is called the **diffusion coefficient**. ⌟

Remark (28.1.4.2). It follows from Kolmogorov's theorem that the stochastic process is determined by the **correlations functions**:

$$\operatorname{cor}(j_1, \ldots, j_n; t_1, \ldots, t_n) = \mathbf{E}\left(q_{j_1}(t_1) \cdot \ldots \cdot q_{j_n}(t_n)\right).$$

⌟

Proof: ? □

28.2 Information Theory

1 Cryptography

References are [Algebraic aspects of cryptography] and [Computational Complexity].

Def. (28.2.1.1) [Protocols]. A **protocol** is a multi−party algorithm, defined by a sequence of steps, specifying the actions required of two or more parties in order to achieve a specified objective ⌟

Public Key Cryptosystems

References are [AAG99].

Def. (28.2.1.2) [Keys]. public key cryptosystems use cyphers whose algorithm can be revealed to everyone without compromising the security of the cryptosystem.

In such cryptosystems, a set of specific parameters, called the **keys**, is supplemented together with the plaintext as an input to the cypher. The security of this cryptosystem depends entirely on the ecrecy of the keys. ⌟

Def. (28.2.1.3) [Key Establishment Protocols]. A **key establishment protocol** is a protocol whereby a key becomes available to two or more parties, for subsequent cryptographic applications.

The key establishment protocol is usually done over a reliable and secure channel. Once the key is established, subsequence communications involve sending cryptograms over a public channel which is vulnerable to total passive interception. ⌟

Algo. (28.2.1.4) [Public Key Cryptosystem]. A **public key cryptosystem** with signature works as follows:

- Each user A finds a encryption method E_A and a decryption method D_A of data, such that
$$E_A \circ D_A = D_A \circ E_A = \mathrm{id},$$
and both E_A and D_A are easy to compute, but it is hard or ineffective to know D_A from E_A.
- Each user A reveals E_A, and keeps D_A as secret.
- If user A wants to send message M to user B, he sends the message $E_B(D_A(M))$ to user B.
- If user B receives a message S from user A, he gets the plaintext $E_A(D_B(S))$.

⌟

Proof: The security of this system depends on the fact that it is ineffective to compute M from $E_B(D_A(M))$.

User B can prove the message is sent from user A because he has the texts M and $D_A(M)$, which is possible only because user A sent him the text $D_A(M)$, as it is hard to compute D_A.

User B cannot forge the message because he cannot find $D_A(M)$ from the message M. □

Algo. (28.2.1.5) [RSA Public Key cryptosystem, Rives-Shami- Adleman[RSA78]]. The (Rives-Shami- Adleman)**RSA public key cryptosystem** with signature works as follows:

- Use A chooses two large primes p, q using primality testing, and calculate $N = pq$.
- Then user A choose randomly an integer $2 \le e \le \varphi(N) - 2$ s.t. $(e, p) = (e, q) = 1$, and use the extended Euclid algorithm to find the inverse
$$d = \mathrm{rem}(e^{-1} (\mathrm{mod}\ \ \varphi(N))).$$

- User A reveals (N, e), which is called the **Public RSA key** of user A.
- The encryption method to user A is breaking a message to a series of positive integers (a_i) less than N, and then $E_A(a_i) = \text{rem}(a_i^e (\text{mod } N))$.
- The decryption method of user A is changing a text in the form of a series of positive integers (s_i) less than N to $D_A(s_i) = \text{rem}(s_i^d (\text{mod } N))$.
- Then use cryptosystem schemes as described in(28.2.1.4).

⌟

Proof: It is easy to show that $D_A \circ E_A = E_A \circ D_A = \text{id}$. By(28.2.1.4), the security of this cryptosystem depends on the difficulty of calculating d. It is shown that if d is know, then we can factor n effectively**?**, which is assumed to be difficult. □

Algo. (28.2.1.6) [Discrete Logarithm Key Establish Protocol, Diffie-Hellman1976]. Choose a $p \in \mathbf{P}$ and a primitive root g for p, then there is a key establish protocol as follows:

1. User A choose a random chosen $n \in \mathbb{Z}_+, n < p$, user B choose a random chosen $m \in \mathbb{Z}_+, n < p$.
2. Use A sends $g^n (\text{mod } p)$ to user B, and user B sends $g^m (\text{mod } p)$ to user A.
3. User A calculates $(g^n)^m (\text{mod } p)$, and user B calculates $(g^m)^n (\text{mod } p)$. Then user A and user B get a same element $s = g^{mn} (\text{mod } p)$.
4. Now User A can use this element s to send user B messages 1 bit a time.

⌟

Proof: The security of this cryptosystem is based on the difficulty of computing discrete logarithm over finite fields**?**. Because it is not feasible to determine any of $g^{mn} (\text{mod } p), g, m, n$ from $p, g^n (\text{mod } p)$ and $g^m (\text{mod } p)$. □

Algo. (28.2.1.7) [An Algebraic Key Establish Protocol, Anshel-Andhel-Goldfeld]. Let U, V be monoids and

$$\beta : U \times U \to V, \gamma_0, \gamma_1 : U \times V \to V$$

be feasibly computable functions satisfying the following properties:

- $\beta(x, y_1 y_2) = \beta(x, y_1)\beta(x, y_2)$.
- $\gamma_1(x, \beta(y, x)) = \gamma_2(y, \beta(x, y))$.
- Given $y_1, y_2, \ldots, y_k \in U$ and $\beta(x, y_1), \ldots, \beta(x, y_k)$, it is in general infeasible to determine the element x.

Then there is a key establish protocol as follows:

1. Publicly assign users A, B elements $S = \{s_1, \ldots, s_m\}$ and $T = \{t_1, \ldots, t_n\}$.
2. User A choose some $a \in S$ and transmit the elements $\beta(a, t_i)$ to user B.
3. User B chose some $b \in T$ and transmit the elements $\beta(b, t_i)$ to user A.
4. Then item1 guarantees that user A can calculate $\beta(b, a)$ and thus $\gamma_1(a, \beta(b, a))$. Similarly user B can calculate $\beta(a, b)$ and thus $\gamma_2(b, \beta(a, b))$. Then notice

$$\kappa = \gamma_1(a, \beta(b, a)) = \gamma_2(b, \beta(a, b))$$

is an established key.

But to extract an identical element, there are two cases: If there is a feasible algorithm to put every word in U in canonical form, then they get an identical element. Otherwise there are no canonical form algorithm but has a fast word identifying algorithm, then user A can choose a random word τ other than κ and then choose either send τ or κ to user B. Then user B can determine if this is κ or not, and receives a bit in this way.

⌟

Proof: The security of this cryptosystem is ? □

Remark (28.2.1.8). An example is given by $U = V = G \in \mathcal{G}\mathrm{rp}$ and

$$\beta(x,y) = x^{-1}yx, \quad \gamma_1(u,v) = u^{-1}v, \quad \gamma_2(u,v) = v^{-1}u.$$

Then

$$\kappa(a,b) = [a,b].$$

⌟

Algo. (28.2.1.9) [ECDHE Key Establishment Protocol]. ⌟

Algo. (28.2.1.10)[SIDH Key Establishment Protocol]. Using a supersingular elliptic curve $E/\mathbb{F}_{p^2}$. ⌟

Distributed Data Structures

Def. (28.2.1.11) [Secrete Sharings]. The goal of **secrete sharing** is to share a common secret in such a way that all of a group of people together can reconstruct the secret but any proper subset of them cannot do so. ⌟

Prop. (28.2.1.12)[Secrete Sharing via Lagrange Interpolation]. For $n \in \mathbb{Z}_{\geq 2}$, if we want to share a secrete among n peoples, we can choose a (large)field $k \in \mathtt{Field}$, and encode the information in a polynomial $f \in k[X]$ of degree $n-1$. Then we can choose distinct numbers $a_1, \ldots, a_n \in k$, and give each user i the number $f(a_i)$. In this way, it is easy to see that only all of them together can reconstruct the original information, through Lagrange interpolation.

The same method can be modified to store data among users that are robust to failure of some of them. ⌟

Elliptic Curves

2 Quantum Cryptography

Algo. (28.2.2.1) [Ekert's Key Establish Protocol]. The **Ekert's key establish protocol** is the following:

- A source emits a sequence of pair of entangled singlet half-spin particles to users A and B resp..
- For each particle, user A randomly choose from the three axis: $0, \pi/4, \pi/2$ to measure the spin of the particle.
- For each particle, user B randomly choose from the three axis: $\pi/4, \pi/2, 3\pi/4$ to measure the spin of the particle.
- User A and user B publish their data of axis of measurements, and determine the group particles that their axis of measurements are the same.

- Then they can use Bell's inequality on the group of particles with different axis of measurements as in [Eke91] to determine if there are eavesdroppers**?**.
- Finally, for the group of particles that they measured with the same axis of measurements, their result are opposite. Thus they get a sequence of same keys.

⌟

Proof: The security of this protocol follows from the no-cloning theorem(26.2.1.10) and also cannot measure a particle without disturbing the purity of the entanglement. Cf.[Neilson, Quantum Informations]. □

3 Error Correction

Def. (28.2.3.1)[Error Corrections]. Error correction are data structure designations that are used to eliminate the perturbations in the process of transmitting the data. ⌟

Prop. (28.2.3.2) [Error Correction via Lagrange Interpolation]. We can divide the data into n part and encode them in a polynomial f of degree $n-1$ over a (large)field $k\in\mathtt{Field}$. In this way, we can transmit the data $(u_i, f(u_i))$ for any $u_i\in k$. Then sending $n+l$ such pairs will be robust to the failure of losing l of them, by recovering the information via Lagrange's interpolation. ⌟

Notations

This chapter consists of definitions and notations that are used often. These notations will be used throughout this book without referring, so if you are confused about some notation, you might find it here.

Chapter/Section/Subsection/... are called classes. Sometimes in the beginning of a class, there are notation assignments. They influence only the propositions contained in the same smallest class.

In any proposition, for any symbol appeared, there will only be two cases:

1. This symbol appear without assigned meanings. Then its meaning is defined in this chapter.
2. This symbol has been assigned meanings. Then its meaning may be different from the notations here(which I will try to avoid it from happening).

When they contradict(which I will try to avoid from happening), they have ascending priorities(e.g. notations assigned in the beginning of a chapter can be overrode by the notation assigned in the beginning of a section in this chapter), and have higher priorities than notation assignments in this chapter.

27 General

Notation (28.3.27.1).

- $\in$ is an abbreviation for "in" or "be/is/are in", depending on the syntax. So I will use this symbol more casually than usual.
- i is a chosen square root of -1 in $\mathbb{C}$.
- a.e. is an abbreviation for "all but finitely many".
- e.g. is an abbreviation for "for example".
- f.m. is an abbreviation for "finitely many".
- i.e. is an abbreviation for "which means".
- resp. is an abbreviation for "respectively".
- s.t. is an abbreviation for "such that".
- "Sufficiently large" means "is an integer greater than a given integer N_0 that only depends on the parameters defined before".

⌟

28 Set Theory

Notation (28.3.28.1) [Sets]. For $X \in \mathcal{S}\mathrm{et}$,

- Use $\#X$ instead of $|X|$(obsolete) to denote the cardinality of a set X.

- $\mathscr{P}(X)$ is the power set of X.
- To avoid confusion with other structures on sets, use bijection of sets instead of isomorphism of sets to indicate an isomorphism in $\mathcal{S}\mathrm{et}$.
- Use $U \subset X$ to indicate U is a subset of X. Use $U \subsetneq X$ ot indicate U is a proper subset of X.
- Use `\dutchcal` capital to represent a property on a set.
- If $\mathcal{P}$ is a property on X, then use $\{x \in X : \mathcal{P}(x)\}$ or $\{x \in X | \mathcal{P}(x)\}$ to indicate the subset of X defined by the property $\mathcal{P}$, depending on which avoids confusion better.
- If $S \subset \mathscr{P}(X)$, we say a property $\mathcal{P}$ holds for elements of Y sufficiently large if it holds for all elements of Y containing a fixed subset $S_0 \subset X$. Notice this definition is compatible with the definition of numbers being sufficiently large, by taking $X = \aleph_0$ and $Y = \mathbb{N} \subset \mathcal{P}(\aleph_0)$.
- Use `\mathtt` capital to represent a set that is doesn't form a category with good properties. For example, `GField` represents the set of global fields.
- If $f : X \to X$ is a self-map and $S \subset X$, then f is said to fix S or stablizes S if $f(S) \subset S$.
- For $n \in \mathbb{Z}_+$, use $\underline{a}^n$ to denote an n-tuple of elements $(a_1, \ldots, a_n)$. And the superscript n can be omitted sometimes.

⌟

Notation (28.3.28.2) [Common Sets].

- For $n \in \mathbb{N}$, $[n]$ is the set $\{0, 1, \ldots, n\}$.
- For $n \in \mathbb{Z}_+$, $[n]_+$ is the set $\{1, \ldots, n\}$.
- $\mathbb{Z}$ is the ring of integers.
- $\mathbb{Z}_+ \subset \mathbb{Z}$ is the commutative multiplicative monoid of positive integers.
- $\mathbb{Z}_- \subset \mathbb{Z}$ is the commutative multiplicative monoid of negative integers.
- $\mathbb{N} \subset \mathbb{Z}$ is the commutative multiplicative monoid of non-negative integers.
- $\mathbb{Q}$ is the field of rational numbers.
- $\mathbb{R}$ is the ordered valued field of real numbers.
- $\mathbb{R}_+$ is the ordered commutative multiplicative monoid of positive real numbers.
- $\mathbb{C}$ is the complete valued field of complex numbers.

⌟

29 Categories

Notation (28.3.29.1) [Categories].

- Use `\mathscr` capital for symbols representing a category.
- Use pr for morphisms that look like projections.

⌟

Notation (28.3.29.2) [Common Categories]. To avoid the set-theoretical issue that the class of all sets is not a set, we fix a cardinal κ, which will be given in prior in each situation, and define

- $\mathcal{S}\mathrm{et}$ to be the category of sets with cardinality$< \kappa$.
- $\mathcal{G}\mathrm{rp}$ to be the category of groups with cardinality$< \kappa$.

- $\mathcal{A}$b to be the category of Abelian groups with cardinality$< \kappa$.
- $\mathcal{G}$rp$^{\text{fin}}$ to be the category of finite groups. $\mathcal{A}$b$^{\text{fin}}$ to be the category of finite Abelian groups.
- $\mathcal{CA}$lg to be the category of commutative unital rings with cardinality$< \kappa$.
- For $p \in \mathbf{P}$, $\mathcal{CA}\text{lg}^p$ to be the category of commutative unital rings of characteristic p with cardinality$< \kappa$.
- `Field` to be the category of fields(3.2.1.3) with cardinality$< \kappa$.
- `Field`^{p} to be the category of fields of characteristic p(3.2.1.4) with cardinality$< \kappa$, where $p \in \mathbf{P} \cup \{0\}$.
- $\mathcal{T}$op to be the category of topological spaces with cardinality$< \kappa$.
- $\mathcal{T}$op $\mathcal{G}$rp to be the category of topological groups with cardinality$< \kappa$.
- $\mathcal{C}$at to be the category of categories with cardinality$< \kappa$.
- In generally, whenever we define the category of some objects, we mean the category of objects with cardinality$< \kappa$. This applies to the whole book.

⌟

Remark (28.3.29.3). If the cardinal κ in(28.3.29.2) is chosen to be too small, some construction in the categories won't be possible. For example, if you take $\kappa = 2$, then $\{\varnothing\} \coprod \{\varnothing\}$ is not definable in $\mathcal{S}$et. If you take $\kappa = \aleph$, then $\coprod_{\aleph} \{\varnothing\}$ is not definable in $\mathcal{S}$et.

So usually κ is taken to be a large enough strongly inaccessible cardinal (whose existence depends on the large cardinal axiom). But in specific cases we can take κ to be smaller to show some proposition is invariant of the axiom of large cardinals, for example the Weil conjecture(Deligne's theorem). ⌟

Notation (28.3.29.4) [Categories]. For $\mathcal{C}, \mathcal{D} \in \mathcal{C}$at, $A \in \mathcal{C}$,

- $\mathcal{C}/A$ or $\mathcal{C}_{/A}$ is the slice category of objects over A, $\mathcal{C}_{A/}$ is the slice category of objects under A.
- Func$(\mathcal{C}, \mathcal{D})$ is the category of functors from $\mathcal{C}$ to $\mathcal{D}$.
- $\mathcal{C}^{\text{op}}$ is the category with the arrows reversed.

⌟

Notation (28.3.29.5) [Monoidal Categories]. For a monoidal category $(\mathcal{C}, \otimes)$

- $\mathcal{C}^{opp}$ is the monoidal category with the same underlying category and the tensor product $\otimes$ reversed.

⌟

Homological Algebra

Notation (28.3.29.6) [Homological Algebras].

- Use `^\bullet` capital for symbols representing a complex over an Abelian category.
- Use K-groups instead of K-groups.

⌟

30 Topology

Notation (28.3.30.1) [Topological Spaces].

- cntd is an abbreviation for "connected".
- For a metric space X and $x \in X, \delta \in \mathbb{R}_+$, denote $U(x,\delta) = \{y \in X : d(x,y) < \delta\}, \mathbb{D}(x,\delta) = \{y \in X : d(x,y) \leq \delta\}$.
- For $X \in \mathcal{T}\mathrm{op}$, let X_0 to denote the closed points of X.

⌟

Notation (28.3.30.2) [Common Spaces].

- For $n \in \mathbb{Z}_+$, $\mathbb{S}^n$ is the unit sphere $\{x \in \mathbb{R}^n | ||x|| = 1\}$.
- For $n \in \mathbb{Z}_+$, $\mathbb{D}^n$ is the unit disk $\{x \in \mathbb{R}^n | ||x|| \leq 1\}$. $\mathbb{D}^2$ is also denoted by $\mathbb{D}$.
- For $n \in \mathbb{Z}_+$, $\mathbb{I}^n$ is the unit cube $\{x = (x_i) \in \mathbb{R}^n | |x_i| \leq 1\}$. $\mathbb{I}^1$ is also denoted by $\mathbb{I}$.
- For $n \in \mathbb{Z}_+, a < b \in \mathbb{R}_{\geq 0}$, $\mathbb{D}^n(a,b)$ is the annulus $\{x \in \mathbb{R}^n | a < ||x|| < b\}$. Similarly, we can define $\mathbb{D}^n[a,b), \mathbb{D}^n(a,b], \mathbb{D}^n[a,b]$.
- For $K \in \{\mathbb{R}, \mathbb{C}, \mathbb{H}\}$, $\mathbb{S}^\infty_{\mathbb{K}}$ is the unit sphere in $\mathbb{K}^\infty$.

⌟

31 Algebras

Notation (28.3.31.1) [Groups]. For $G \in \mathcal{G}\mathrm{rp}$,

- G_{ab} is the abelianization of G.
- Use $H \leq G$ to indicate that H is a subgroup of G.
- Use $H \trianglelefteq G$ to indicate that H is a normal subgroup of G.

⌟

Notation (28.3.31.2) [Free Groups].

- For $n \in \mathbb{Z}_+$, F_n is the free group generated by $[n-1]$.

⌟

Notation (28.3.31.3) [Abelian Groups]. For $G \in \mathcal{A}\mathrm{b}$,

- $G^\vee = \mathrm{Hom}(G, \mathbb{C}^\times)$ is the dual group of G. This applies to topological groups. Try not to use $\widehat{G}$, because this may be confused with the Langlands dual group or the completion.
-

⌟

Notation (28.3.31.4) [Linear Algebras]. For $R \in \mathcal{CA}\mathrm{lg}, m, n \in \mathbb{Z}_+$,

- For $V \in \mathcal{V}\mathrm{ect}/R$, V^* is the dual space of R.
- $\mathrm{Mat}(m \times n; R)$ is the group of $m \times n$-matrices with coefficients in R. $\mathrm{Mat}(m \times n; R)$ is also denoted by $\mathrm{Mat}(n, R)$.
- $GL(n,R)$ is the group of invertible elements in $\mathrm{Mat}(n;R)$.
- For $A \in \mathrm{Mat}(m,n;R)$, $A^t \in \mathrm{Mat}(n \times m; R)$ is the transpose of A.
- For $A \in GL(n,R)$, $A^{-1} \in GL(n,R)$ is the inverse of A. A^{-t} denotes $(A^{-1})^t = (A^t)^{-1}$.

⌟

Prop. (28.3.31.5) [Algebras]. For $R \in \mathcal{R}\text{ing}$,

- $\mathcal{M}\text{od}_R$ is the category of left R-modules.
- $\mathcal{A}\text{lg}_R$ is the the category of R-algebras.
- $\mathcal{R}\text{ing}_R$ is the category of associative unital R-algebras.
- $\mathcal{CR}\text{ing}_R$ is the category of commutative unital R-algebras.

┘

Notation (28.3.31.6) [Lie Algebras].

- Use `\mathfrak` lowercase for symbols representing a Lie algebra.

┘

32 Commutative Algebras

Notation (28.3.32.1) [Fields]. For $k \in \texttt{Field}$,

- $\operatorname{char} k$ is the characteristic of k.
- $\overline{k}$ is a fixed algebraic closure of k.
- k^{sep} is the separable closure of k in $\overline{k}$.
- k^{perf} is the perfect closure of k in $\overline{k}$.
- For a Galois extension k'/k, use $\text{Gal}(k'/k)$ instead of $\text{Gal}_{k'/k}$ or $G(k'/k)$ or $G_{k'/k}$ to denote the Galois group of k'/k.
- $\text{Gal}_k = \text{Gal}(k^s/k)$.
- $\mathtt{c} \in \text{Gal}(\mathbb{C}/\mathbb{R})$ is the complex conjugation. For $a \in \mathbb{C}$, $\mathtt{c}(a)$ is also denoted by $\overline{a}$.
- For $p \in \mathbf{P}$, $\mathbb{F}_p$ is the a fixed finite field of order p.
- For $p \in \mathbf{P}$, $\mathbb{F}_{p^r}$ is the fixed finite field of order p^r contained in $\overline{\mathbb{F}}_p$.
- $\mu(k)$ is the group of roots of unity in k.

┘

Notation (28.3.32.2) [Commutative Algebras].

- Use `\mathfrak` lowercase for a first prime ideals. Use `\mathfrak` uppercase for a prime ideal that is over a given prime ideal.
- Let $R \in \mathcal{CR}\text{ing}$ and f a non-zero-divisor in R, then use $R[\frac{1}{f}]$ instead of R_f to denote the localization ring at f.

┘

Notation (28.3.32.3) [Integral Rings]. For $R \in \mathcal{CR}\text{ing}$,

- Use "let (R, K) be an integral ring to indicate that R is an integral ring with fraction field K.
- $R^\times$ is the commutative monoid of non-zero elements in R.
- R^* is the commutative group of units of R.

┘

Notation (28.3.32.4) [Local Rings].

- Use "let $(R, K, \mathfrak{m}, k)$ be an integral local ring" to indicate that R is a local ring with maximal ideal $\mathfrak{m}$, $\kappa(\mathfrak{m}) = k$, and $\text{Frac}(R) = K$.

- DVR is the synonym for "discrete valuation ring".
- CDVR is the synonym for "complete discrete valuation ring".

⌟

Notation (28.3.32.5) [Dedekind Domains].

- Use `\mathcal` uppercase for symbols representing a Dedekind domain.?
- Use $\mathfrak{D}$ to denote differents of extensions of Dedekind domains.
- Use $\mathfrak{d}$ instead of δ to denote discriminants of extensions of Dedekind domains.

⌟

33 Algebraic Geometry

Notation (28.3.33.1) [Sheaves].

- Use `\mathcal` capital for symbols representing a sheaf of sets or a complex of sheaves of sets.
- Use `\mathscr` capital for symbols representing a sheaf of ∞-categories.

⌟

Notation (28.3.33.2) [Schemes]. Let $(X, \mathcal{O}_X) \in \mathcal{S}\mathrm{ch}$,

- For brevity, we can use X to denote the the scheme $(X, \mathcal{O}_X)$.
- Use $|X|$ to denote the underlying topological space, and $|X|_0$ to denote the closed points of $|X|$.
- Use `\mathbf` capital for a relative scheme.
- Use `\mathcal` capital for symbols representing an integral model.
- Use $\kappa(x)$ to denote the residue field of a point $x \in X$ instead of $k(x)$.
- Use $R(x)$ instead of $K(X)$ to denote the function field of an integral scheme X.
- Use $\mathcal{O}_X(D)$ instead of $\mathcal{L}(D)$ to denote the line bundle associated to a Cartier divisor D.

⌟

Notation (28.3.33.3) [Categories of Schemes]. Let $X \in \mathcal{S}\mathrm{ch}$,

- $\mathcal{S}\mathrm{ch}$ is the category of schemes.
- $\mathrm{N}\,\mathcal{S}\mathrm{ch}$ is the category of locally Noetherian schemes.
- For $R \in \mathcal{CA}\mathrm{lg}$, use $\mathcal{S}\mathrm{ch}\,/R$ to denote $\mathcal{S}\mathrm{ch}\,/\operatorname{Spec} R$.
- $\mathcal{S}\mathrm{ch}_{\mathrm{int}}$ is the category of integral schetmes.
- $\mathcal{S}\mathrm{ch}^{\mathrm{ft}}\,/X$ is the category of schemes of f.t. over X.
- $\mathcal{S}\mathrm{ch}^{\mathrm{loc.ft}}\,/X$ is the category of schemes locally of f.t. over X.
- $\mathcal{S}\mathrm{ch}^{\mathrm{f\acute{e}t}}\,/X$ is the category of schemes finite étale over X. In general, use superscript to denote relative properties w.r.t. X, and superscript to denote absolute properties.
- Use `\underline` for a functor on the category $\mathcal{S}\mathrm{ch}\,/X$.

⌟

Notation (28.3.33.4) [Morphisms of Schemes].

- Use i for a closed immersion and j for an open immersion.

- For $R \in \mathcal{CA}\mathrm{lg}, S \in \mathcal{CA}\mathrm{lg}_R, X \in \mathcal{S}\mathrm{ch}\,/R$, $X \times_{\operatorname{Spec} R} \operatorname{Spec} S$ is denoted by $X \otimes_R S$ or X_S.

⌟

Notation (28.3.33.5) [Modules on Schemes]. Let $(X, \mathcal{O}_X) \in \mathcal{S}\mathrm{ch}$,

- $\mathcal{M}\mathrm{od}(\mathcal{O}_X)$ is the category of $\mathcal{O}_X$-modules.
- $\mathcal{QC}\mathrm{oh}(X)$ is the category of Qco $\mathcal{O}_X$-modules.
- $\mathcal{C}\mathrm{oh}(X)$ is the category of coherent $\mathcal{O}_X$-modules.
- $\mathcal{C}\mathrm{oh}^{\mathrm{free}}(X)$ is the category of locally free sheaves on X.
- For $k \in \mathbb{N}$, $\mathcal{C}\mathrm{oh}^{\leq k}(X)$ is the category of coherent $\mathcal{O}_X$-modules with $\dim \operatorname{Supp}(\mathcal{F}) \leq k$.
- $D(X) = D(\mathcal{O}_X) = D(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $D_{\mathcal{QC}\mathrm{oh}}(X) = D_{\mathcal{QC}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $D_{\mathcal{C}\mathrm{oh}}(X) = D_{\mathcal{C}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $\mathcal{D}(X) = \mathcal{D}(\mathcal{O}_X) = \mathcal{M}\mathrm{od}_{\mathcal{O}_X}(\mathcal{S}\mathrm{h}(X; \mathcal{D}(\mathbb{Z}))$.
- $\mathcal{D}_{\mathcal{QC}\mathrm{oh}}(X) = \mathcal{D}_{\mathcal{QC}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $\mathcal{D}_{\mathcal{C}\mathrm{oh}}(X) = \mathcal{D}_{\mathcal{C}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.

⌟

Notation (28.3.33.6) [Group Schemes].

- μ is the group scheme $X \mapsto \mu(\Gamma(X, \mathcal{O}_X))$.

⌟

Notation (28.3.33.7) [Formal Schemes].

- Use mathfrak uppercase(aka. `\mfk`) for symbols representing a formal scheme that is usually not representable.

⌟

34 Analysis

Notation (28.3.34.1) [Numbers].

- π represents the smallest $x \in \mathbb{R}_+$ s.t. $e^{\mathrm{i}\,x} + 1 = 0$.
- γ_0 is the Euler's constant.

⌟

Notation (28.3.34.2) [Functions].

- for any positive-valued function $f : S \to \mathbb{R}_+$, I use $O(f)$ in an equation to denote that the difference of the other part of the equation is bounded by Cf, where $C \in \mathbb{R}_+$ is a constant that doesn't depend on any variables appearing in this equation.
- for any positive-valued function $f : S \to \mathbb{R}_+$, I use $\widetilde{O}(f)$ in an equation to denote that the difference of the other part of the equation is bounded by $Cf \cdot (\log f)^k$, where $C, k \in \mathbb{R}_+$ is a constant that doesn't depend on any variables appearing in this equation.
- For any functions $f, g : S \to \mathbb{C}$, we use $f \sim g$ or $f = \Theta(g)$ to denote $\{f = O(|g|)$ and $g = O(|f|)\}$.

⌟

Notation (28.3.34.3) [Real Analysis].

- $\sqrt{} : \mathbb{R}_+ \to \mathbb{R}_+$ is inverse of the function $\mathbb{R}_+ \to \mathbb{R}_+ : x \mapsto x^2$.
- For a differentiable function f, write $f^\backprime$ instead of f' to denote the derivative of f. For $p \in \mathbb{Z}_+$ and a p-th differentiable function f, write $f^{(p)}$ to denote the p-th derivative of f.
- Use $\mathscr{S}$ to denote the space of Schwartz-Bruhat functions.

⌟

Notation (28.3.34.4) [Complex Analysis].

- For $\alpha \in \mathbb{D}$, denote $\psi_\alpha(z) = \psi_\alpha(z) = \frac{\alpha - z}{1 - \overline{\alpha} z} \in \mathcal{M}(\mathbb{C})$.
- For $z \in \mathbb{C} \setminus (-\mathbb{R}_+)$, $\log z$ stands for the the principle branch of $\log z$, and for any $n \in \mathbb{Z}_+$, $\sqrt[n]{z}$ stands for $\exp(\frac{1}{n} \log z)$.
- For $n \in \mathbb{Z}_+$ and $\xi \in \mathbb{C}^n$, $e_\xi \in (\mathbb{C}^n)^\vee$ is the multiplicative character

  $$e_\xi : \mathbb{C}^n \to \mathbb{C}^* : x \mapsto \exp(2\pi\,\mathrm{i}(x, \xi)).$$

  Similarly, if $V \in \mathcal{V}\mathrm{ect}^n/\mathbb{C}$ and $\xi \in V^*$, then $e_\xi \in V^\vee$ is the multiplicative character

  $$e_\xi : \mathbb{C}^n \to \mathbb{C}^* : x \mapsto \exp(2\pi\,\mathrm{i}\langle x, \xi \rangle).$$

-

⌟

Notation (28.3.34.5) [Special Functions].

- $\Gamma(s) \in \mathcal{M}(\mathbb{C})$ is the Gamma function.
- $\zeta(s) \in \mathcal{M}(\mathbb{C})$ is the Riemann zeta function.
- $\wp(\tau) \in \mathcal{M}(\mathbb{C})$ is the Weierstrass $\wp$ function.

⌟

Notation (28.3.34.6) [Fourier Transforms].

- Use $f^\vee$ or $\mathscr{F}(f)$ to denote the Fourier transform of a function f on a locally compact Abelian group.
- Sometimes, use $f^\wedge$ to denote the inverse Fourier transform, which is just $(x \mapsto -x) \circ f^\vee$.

⌟

Notation (28.3.34.7) [Functional Analysis].

- Use `dutchcal` capital to denote a subset of the space of continuous functions on a topological space.

⌟

35 Geometry

Notation (28.3.35.1).

- Use Γ instead of Λ for a lattice.

⌟

36 Differential Geometry

Notation (28.3.36.1) [Manifolds].

-

⌟

Notation (28.3.36.2) [Lie Groups].

- For $\theta \in \mathbb{R}/(2\pi)$, denote $\kappa_\theta = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$.

⌟

37 Algebraic Number Theory

Notation (28.3.37.1) [Numbers].

- For $X \in \mathbb{N}$, $[X]$ is the set of non-negative integers no greater than X.
- For $X \in \mathbb{Z}_+$, $\{X\}$ is the set of positive integers no greater than X.
- $\mathbf{P}$ is the set of rational primes.
- $\mathbb{P}$ is the algebra consisting of periods.
- Don't use "#" as an abbreviation of "number" or "numbers".
- $\square$ is an abbreviation of "square" or "a square number". This is obsolete and I strongly suggest not using this notation, for one reason it doesn't specify square of what numbers, and for the other reason it may be confused with unrecognizable codes.
- For $n \in \mathbb{Z}^\times$, use $\mathbb{Z}/(n)$ instead of $\mathbb{Z}/n$ or $\mathbb{Z}/n\mathbb{Z}$.
- Use p to denote a prime number.
- Use ℓ instead of l or q to denote a second prime number <u>when p is present</u>.

⌟

Notation (28.3.37.2) [Common Functions]. For $n \in \mathbb{Z}_+$,

- $\phi(n) = \#(\mathbb{Z}/(n))^*$.

⌟

Notation (28.3.37.3) [Number Theory].

- Use ϖ instead of π to denote a uniformizer in a valuation ring to avoid confusion with the frequently used π.
- In number theory/arithmetic geometry, try to use F to denote a global field, K a CDVR and k a finite field or general field.
- For $p \in \mathbf{P}$, use $\overline{\mathbb{Q}_p}$ instead of $\overline{\mathbb{Q}}_p$ to denote the fixed algebraic closure of $\mathbb{Q}_p$.
- For $p \in \mathbf{P}$, $\mathbb{Q}_{p^n}$ is the unique unramified extension of $\mathbb{Q}_p$ of the degree n contained in $\overline{\mathbb{Q}}_p$, and $\mathbb{Z}_{p^r} = \mathcal{O}_{\mathbb{Q}_{p^n}}$.
- $\{\zeta_n, n \in \mathbb{Z}_+\}$ is a compatible system of roots of unity in $\overline{\mathbb{Q}}$, and $\zeta_4 = \mathrm{i}$.

⌟

Notation (28.3.37.4) [Global Fields]. For an extension of global fields E/F,

- F_0 is the constant field of F.

- Use `GField` to denote the set of global fields. Use `FField` to denote the set of global function fields, use `NField` to denote the set of global number fields. `GField` $/F$ is the set of global fields over F.
- $\mathcal{O}_F$ is the ring of integers of F.
- Σ_F is the set of places of F. Σ_F^{fin} is the set of finite places of F. Σ_F^{∞} is the set of infinite places of F. $\Sigma_F^{\mathbb{R}}$ is the set of real places of F, $\Sigma_F^{\mathbb{C}}$ is the set of complex places of F.
- For a finite extension L/F and $v \in \Sigma_F^{\mathrm{fin}}$, Σ_L^v is the set of finite places over v.
- For $x \in \mathcal{O}_F$, let $\Sigma_F^x \subset \Sigma_F^{\mathrm{fin}}$ denote the set of finite places dividing x.
- For $v \in \Sigma_F^{\mathrm{fin}}$, $(R_v, \mathfrak{m}_v, k_v)$ is the valuation ring of v, and $||v|| = \#k_v$.
- $\mathrm{Unr}_{E/F}, \mathrm{Ram}_{E/F}, \mathrm{Spl}_{E/F}$ is the set of finite places of F unramified, ramified, splitting in E resp.. $\mathrm{Spl}_{E/F/F_0}$ is the set of finite places of F_0 s.t. every place of F over p splits in E.

⌟

Notation (28.3.37.5) [Local Fields].

- Use `LField` to denote the set of local fields. Use p-`LField` to denote the set of p-adic local fields. Use p-`FField` to denote the set of p-adic number fields. Use p-`NField` to denote the set of p-adic number fields. Use `ArchField` to denote the set $\{\mathbb{R}, \mathbb{C}\}$.

⌟

Notation (28.3.37.6) [Analysis on Adeles and Ideles].

- For a local field K, $V \in \mathcal{V}\mathrm{ect}/K$, $\mathcal{S}(V)$ is the space of Bruhat-Schwartz Functions on V.
- For a global field F, V a finite free module over $\mathbf{A}_F$, $\mathcal{S}(V)$ is the space of Bruhat-Schwartz functions on V.

⌟

38 Arithmetic Geometry

Notation (28.3.38.1) [Perfectoid Spaces].

- Use old `\mathcal`(aka. `\mrs`) to denote adic spaces.

⌟

39 Representation Theory

Notation (28.3.39.1) [Representations]. Let $G \in \mathcal{T}\mathrm{op}\,\mathcal{G}\mathrm{rp}$, $L \in \mathcal{T}\mathrm{op}\,\mathcal{CR}\mathrm{ing}$,

- $\mathrm{Rep}_L(G)$ is the category of continuous representations of G with coefficients in L. $\mathrm{Rep}_{\mathbb{C}}(G)$ is also denoted by $\mathrm{Rep}(G)$.
- $\mathrm{Irr}_L(G)$ is the category of irreducible representations of G with coefficients in L. $\mathrm{Irr}_{\mathbb{C}}(G)$ is also denoted by $\mathrm{Irr}(G)$.
- $\mathrm{Rep}^{\mathrm{alg}}(G)$ is the category of smooth complex representations of G. $\mathrm{Irr}^{\mathrm{alg}}(G)$ is the category of irreducible smooth complex representations of G.
- For $(\rho, V) \in \mathrm{Rep}_L^{\mathrm{alg}}(G)$, let $(\rho^\vee, V^\vee)$ denote the contragradient representation: $\rho^\vee(g) = \rho(g)^{-t}$.

⌟

40 L-Functions

Notation (28.3.40.1) [L-Functions].

- Use ζ for a zata-function, i.e. a function that is usually a rational function in the indeterminant T.
- Use L for an L-function, i.e. a function that is usually a meromorphic function in $s \in \mathbb{C}$ with Euler products.

⌟

41 Combinatorics

Notation (28.3.41.1) [Combinatorics Numbers].

- For $n, m \in \mathbb{N}, m \leq n$,

$$n! = \begin{cases} 1 & , n = 0 \\ \prod_{k=1}^{n} k & , n > 0 \end{cases}, \quad \binom{n}{m} = \frac{n!}{(n-m)!m!}$$

- For $n, m \in \mathbb{N}, m \leq n$ and $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$,

$$[n]_p = \begin{cases} 1 & , n = 0 \\ \frac{q^n - 1}{q - 1} & , n > 0 \end{cases}, \quad [n]!_q = \begin{cases} 1 & , n = 0 \\ \prod_{k=1}^{n} [k]_q & , n > 0 \end{cases}, \quad \begin{bmatrix} n \\ m \end{bmatrix} = \frac{[n]!_q}{[n-m]!_q [m]!_q}$$
