Def. (13.14.2.5) [Modular Heights]. Consider the Siegel modular varieties $\mathcal{M}_{g,d}/\mathbb{Q}$ parametrizing Abelian schemes(17.1.3.1), then for any number field K, $(A,\lambda)\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^{\mathrm{dim}=g,\mathrm{polar}=d}/K$ defines a K-point $j((A,\lambda))$ of $\mathcal{M}^{g,d}$. Then we can define the **modular height** $h_M(A,\lambda)$ to be $h(j((A,\lambda)))$, where h is the Weil height associated to the canonical ample divisor on $\mathcal{M}^{g,d}$(17.1.3.2), which is defined up to a bounded function on $\mathcal{M}^{g,d}$.

Prop. (13.14.2.6) [Comparison of Heights]. Let F be a number field, then there are constants c_1,c_2,c_3 s.t. for any $(A,\lambda)\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^{\mathrm{polar}}/F$,

$$|h_F(A)-c_1h_M(A,\lambda)|<c_2\log h_M(A,\lambda)+c_3.$$

Proof: **?** Hard. Cf. [Chai and Faltings, 1990]. □

Prop. (13.14.2.7) [Height I]. Let F be a number field and $g,d,C\in\mathbb{Z}_+$, then up to isomorphism, there are only f.m. semistable $(A,\lambda)\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^{\mathrm{dim}=g,\mathrm{polar}=d}/k$ s.t. $h_M(A,\lambda)<C$.

Proof: By the definition of Siegel modular varieties, two objects in $(A,\lambda)\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^{\mathrm{dim}=g,\mathrm{polar}=d}/F$ corresponds to the same point of $\mathcal{M}^{g,d}$(13.14.2.5) iff they are isomorphic over $\overline{F}$. And by Northcott's theorem(13.2.3.24) the image of polarized Abelian varieties with bounded modular heights is finite. Thus the assertion follows from(13.14.3.2). □

Cor. (13.14.2.8) [Height II]. Let F be a number field and $g,C\in\mathbb{Z}_+$, then up to isomorphism, there are only f.m. semistable $A\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^g/F$ s.t. $h(A)<C$, by(13.14.2.6).

Proof: By the proposition(13.14.2.7) and(13.14.2.6), the set of isomorphism classes of semistable Abelian varieties $(B,\lambda)\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}^{\mathrm{dim}=g,\mathrm{polar}=d}/F$ is finite. Now notice for any $A\in\mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/F$, $B=(A\times A^\vee)^4$ is principally polarized by(13.5.7.2), and $h(B)=8h(A)$ by(13.14.2.3), so we are done. □

3 Finiteness Theorems

Prop. (13.14.3.1). Let L/F be a Galois extension of number fields, then for any $A \in \mathcal{A}b\mathcal{V}ar/F$, there exists f.m. isomorphism classes of $B \in \mathcal{A}b\mathcal{V}ar/F$ s.t. $A_L \cong B_L$.

Proof: Cf.[Conrad note, L14]**?** □

Prop. (13.14.3.2) [Finiteness Theorems]. Let F be a number field and $(A, \lambda) \in \mathcal{A}b\mathcal{V}ar^{\dim=g,\text{polar}=d}/F$, then there exists only f.m. isomorphism classes of $(B, \lambda') \in \mathcal{A}b\mathcal{V}ar^{\dim g,\text{polar}=d}/F$ s.t. $(A_{\overline{F}}, \lambda) \cong (B_{\overline{F}}, \mu)$.

Proof: Firstly, by(13.5.10.10), any such B is also semistable, so the set of good reductions are stable under base change, thus the set of good reductions of A and B in Σ_F are the same.

Then by(13.13.1.1) and(12.4.2.27), for $\ell \in \mathbf{P}\backslash\{2\}$, there is a finite extension L/F s.t. every ℓ-torsion points of such B are in $B(L)$.

Now any such B are isomorphic to A over L as above: Given any isomorphism $\alpha : (A_{\overline{F}}, \lambda) \cong (B_{\overline{F}}, \mu)$, for $\alpha \in \mathrm{Gal}_L$, α and $\sigma(\alpha)$ has the same action on ℓ-torsion points, as all these points are L-rational, so $\sigma(\alpha)^{-1} \circ \alpha$ acts trivially on $A[\ell]$, which implies by(13.5.7.5) that $\sigma = \alpha(\sigma)$, so σ is defined over L and we are done.

Finally we finish using(13.14.3.1) and(13.5.7.3). □

Thm. (13.14.3.3) [Finiteness of Heights in an Isogeny class]. Let F be a number field and $A \in \mathcal{A}b\mathcal{V}ar/F$ be semistable, then the set of Faltings height of $B \in \mathcal{A}b\mathcal{V}ar/F$ isogenous to A is finite.

Proof: This is the hardest part of the proof.**?** Cf.[Conrad Seminar, L20]. □

Thm. (13.14.3.4) [Finiteness I]. Let F be a number field and $A \in \mathcal{A}b\mathcal{V}ar/F$, then there are only f.m. isomorphism classes of Abelian varieties $B \in \mathcal{A}b\mathcal{V}ar/k$ isogenous to A.

Proof: If A is semistable, then by(13.5.10.10), any $B \in \mathcal{A}b\mathcal{V}ar/k$ isogenous to A is also semistable. Then we are done by(13.14.2.8) and(13.14.3.3).

For a general A, there exists a finite extension L/K s.t. A_L is semistable by(13.5.10.15). Then the general case reduced to the semistable case by using(13.14.3.1). □

Thm. (13.14.3.5) [Finiteness II, Shafarevich/Faltings]. Let F be a number field, $S \subset \Sigma_F$ be a finite set of places, then there are only f.m. isomorphism classes of $A \in \mathcal{A}b\mathcal{V}ar^{\dim=g}/F$ having good reduction at all finite places outside S.

Proof: By(13.14.3.4), it suffices to show that there are only f.m. isogeny classes of $A \in \mathcal{A}b\mathcal{V}ar^{\dim=g}/F$ having good reduction at all finite places outside S. But then we can use(13.5.10.14) and the fact there are only f.m. such polynomials $P_\ell(A_v, t)$ because of Weil conjecture. □

4 Curves

Prop. (13.14.4.1) [Genus 0 Curves]. For $F \in$ `GField` of characteristic$\neq 2$ and any smooth complete curve C/F genus 0 is a conic in $\mathbb{P}^2$. Thus by(5.11.8.2), it is isomorphic to $\mathbb{P}^1$ iff it has a rational point. But by Hasse-Weil principle, this is equivalent to it having a rational point over each local field of F, and this can be understood via Hilbert symbol.

Thm. (13.14.4.2) [Shafarevich's Conjecture, Faltings]. Let F be a global field, $S \subset \Sigma_F$ be a finite set of places, $g \in \mathbb{Z}_+$, then there are only f.m. isomorphism classes of smooth curves over k of genus g having good reduction at all non-Archimedean places outside S.

Proof: This follows from(13.5.13.16)(13.5.13.15) and(13.5.7.3)(13.14.3.5). □

Prop. (13.14.4.3) [Kodaira-Parshin]. Let $F \in \texttt{NField}$ and S is a finite set of places of F containing all places over 2, then for any complete non-singular curve C/F of genus≥ 1 having good reduction at non-Archimedean places outside S, there exists a finite extension L/F and a constant N, s.t.: For any $P \in C(F)$, there exists a complete smooth curve C^P over L and a finite map $\varphi^P : C^P \to C_L$, that satisfies

- C^P has good reduction at places not above S.
- $g(C^P) \leq N$.
- φ_P is ramified exactly at P.

Proof: Cf.[Mil08]P115, 145.? □

Thm. (13.14.4.4) [Mordell Conjeture, Faltings]. Let $F \in \texttt{NField}$ and C/F be a complete non-singular curve of genus $g \geq 2$, then $C(F)$ is finite.

Proof: Using the construction of Kodaira-Parshin(13.14.4.3), there is a finite extension L/F s.t. any $P \in C(F)$ corresponds to a curve C^P over L and a map $\varphi_P : C^P \to C_L$. By Shafarevich's conjecture applied to L(13.14.4.2), there are only f.m. isomorphism classes of C^P. But for different P, Q s.t. $C^P \cong C^Q$, the maps φ_P, φ_Q are non-isomorphic, as they are ramified at different places. So we are done by de Franchis' theorem(5.11.1.34). □

Conj. (13.14.4.5) [Mordell-Lang]. Let X be a closed geometrically integral subvariety of a semi-Abelian variety A defined over a field K of characteristic 0. Let Γ be a f.g. subgroup of $A(\overline{K})$ and Γ' be a subgroup of the divisible hull of Γ. If X is not a translate of a semi-Abelian subvariety of A, then $X(\overline{K}) \cap \Gamma'$ is not Zariski dense in X.

Proof: □

Cor. (13.14.4.6) [Manin-Mumford]. Let $F \in \texttt{NField}$ and C/F be a complete non-singular curve of genus $g \geq 2$, and J the Jacobian of C. Fix an embedding $C \hookrightarrow J$ over F, then $\#C(\overline{F}) \cap J(\overline{F})_{\text{tor}} < \infty$.

Proof: □

13.15 Tate Conjecture & Hodge Conjecture

Main references are [Tat91], [Tat65b], [RECENT PROGRESS ON THE TATE CONJECTURE, Totaro] and [Tate Conjecture over Finite Fields, Milne].

1 Statements

Prop. (13.15.1.1) [ℓ-adic Cycle Classes]. Let $k \in \texttt{Field}$ and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$, $\overline{X} = X \otimes_k k^s$, $\ell \in \mathbf{P} \setminus \operatorname{char} k$, then there exists a cycle map

$$c^r : \mathrm{CH}^r(\overline{X}) \to \mathrm{H}^{2r}_{\text{ét}}(\overline{X}, \mathbb{Q}_\ell(r)),$$

as étale cohomology is a Weil cohomology theory**?**. Let $A^r_{\text{ét},\ell}(\overline{X})$ be the image, and $A^r_{\text{ét},\ell}(X)$ be the image of $\mathrm{CH}^r(X) \subset \mathrm{CH}^r(\overline{X})$ under this map. Then there are maps

$$A^r_{\text{ét},\ell}(\overline{X}) \otimes \mathbb{Q}_\ell \subset H^{2r}(\overline{X}, \mathbb{Q}_\ell(r)), \quad A^r_{\text{ét},\ell}(X) \otimes \mathbb{Q}_\ell \subset H^{2r}(\overline{X}, \mathbb{Q}_\ell(r))^{\mathrm{Gal}_k}.$$

Conj. (13.15.1.2) [Tate]. Situation as in(13.15.1.1), if k is f.g. over its prime field, then
$(T^r(X/k), \ell)$: $A^r_{\text{ét},\ell}(X) \otimes \mathbb{Q}_\ell = H^{2r}(\overline{X}, \mathbb{Q}_\ell(r))^{\mathrm{Gal}_k}$.
$(E^r(X/k), \ell)$: $A^r_{\text{ét},\ell}(\overline{X}) \cong GH^r(\overline{X})$. In particular, $A^r_{\text{ét},\ell}(\overline{X})$ doesn't depend on ℓ.
$(S^r(X/k), \ell)$: Fr_X acts semisimply on the 1-eigenpart $\mathrm{H}^{2r}_{\text{ét}}(X, \mathbb{Q}_\ell(r))_1$.

Proof: □

Conj. (13.15.1.3) [Integral Tate Conjecture]. Situation as in(13.15.1.1), if k is f.g. over its prime field, then we may ask if

$$A^r_{\text{ét},\ell}(X) \otimes \mathbb{Z}_\ell = H^{2r}(\overline{X}, \mathbb{Z}_\ell(r))^{\mathrm{Gal}_k}.$$

Cf.[Tate Conjecture, Milne, P3].

Prop. (13.15.1.4) [(E^1) Holds]. The Kummer exact sequence of étale sheaves on $\overline{X}$: $0 \to \mu_{\ell^n} \to \mathbb{G}_m \xrightarrow{\ell^n} \mathbb{G}_m \to 0$ induces an injection $\mathrm{Pic}(\overline{X})/\ell^n \mathrm{Pic}(\overline{X}) \hookrightarrow H^2(\overline{X}, \mu_{\ell^n})$. Taking limits gives an injection $\mathrm{Pic}(\overline{X}) \otimes \mathbb{Q}_\ell \hookrightarrow H^2(\overline{X}, \mathbb{Q}_\ell(1))$. And c^1 is just

$$c^1 : Z^1(\overline{X}) \to \mathrm{Pic}(\overline{X}) \to \mathrm{Pic}(\overline{X}) \otimes \mathbb{Q}_\ell \hookrightarrow \mathrm{H}^2_{\text{ét}}(\overline{X}, \mathbb{Q}_\ell(1)).$$

Thus the kernel of c^1 is just the $\mathrm{Pic}(X)$ modulo ℓ^∞-divisible elements and torsion elements, but $\mathrm{Pic}^0(\overline{X})$ is ℓ^∞-divisible as it is the k^s-points of an Abelian variety over k^s. And also $\mathrm{Pic}(\overline{X})/\mathrm{Pic}_{\mathrm{num}=0}(\overline{X}) \to \mathrm{Pic}(X_{\overline{k}})/\mathrm{Pic}^\tau(X_{\overline{k}}) = N^1(X_{\overline{k}})$ is injective by[Sta]0CC5**?**, and $N^1(X_{\overline{k}})$ is finite free, so $\mathrm{Pic}_{\mathrm{num}=0}(\overline{X}) = \mathrm{Pic}(\overline{X})_{\mathrm{tor}}$, and $A^1_{\text{ét},\ell}(\overline{X}) = GH^1(X)$.

Remark (13.15.1.5) [Hodge & Tate Conjecture]. In characteristic 0, we can embed k into $\mathbb{C}$ and use étale-singular comparison to see the Hodge conjecture implies the Tate conjecture.**?**

Prop. (13.15.1.6). Situation as in(13.15.1.2), let $X, Y \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}/k$, then $(T^1(X \times_k Y)) \iff (T^1(X)) + (T^1(Y))$.

Proof:

□

Prop. (13.15.1.7). Situation as in(13.15.1.2), let $f : X \to Y \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}\,/k$ be a dominant rational map, then $(T^1(X/k)) \Rightarrow (T^1(Y/k))$.

Proof: □

Cor. (13.15.1.8). The Fermat curve $S_n : z_0^n + z_1^n + z_2^n + z_3^n = 0$ is dominated by the product of two curves

$$C_1 : x_0^n + x_1^n = x_2^n, \quad C_2 : y_0^n + y_1^n = -y_2^n$$

by

$$C_1 \times C_2 \to S : ([x_0, x_1, x_2], [y_0, y_1, y_2]) \mapsto [x_0 y_2, x_1 y_2, y_0 x_2, y_1 x_2],$$

so $(T^1(S_n))$ holds.

2 over Finite Fields

Main references are [Milne, Tate Conjecture over Finite Fields], and [Endomorphisms of abelian varieties over finite fields, Tate, 1966].

Prop. (13.15.2.1) [(T^1)]. Let $\#k < \infty$ and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}\,/k$, Tate proved that $H^{2r}(\overline{X}, \mathbb{Q}_\ell(r))^{\mathrm{Gal}_k} \cong \mathrm{H}^{2r}_{\text{ét}}(X, \mathbb{Q}_\ell(r))$, and the Kummer sequence gives an exact sequence?

Proof: □

Connection with B-S.D

Prop. (13.15.2.2) [Tate]. Let $\#k < \infty, X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\mathcal{V}\mathrm{ar}\,/k$, then $(T^r(X/k))$ and $(E^r(X/k))$ hold iff

$$\mathrm{ord}_{s=r}(Z(X, s)) = -\operatorname{rank} GH^r(X).$$

Proof: □

Prop. (13.15.2.3) [(T^1) and BSD]. Let $\#k < \infty$ and C a smooth complete curve over k with function field K, $\mathcal{E}/C$ is a regular elliptic surface with generic fiber $E \in \mathcal{E}\mathrm{ll}\,/K$, then $(T^1(\mathcal{E}/k))$ is equivalent to the BSD conjecture for E/K.

Proof: □

Prop. (13.15.2.4) [Grothendieck]. Let $\#k < \infty$ and C a smooth complete curve over k with function field K, $\mathcal{E}/C$ is a regular elliptic surface with generic fiber $E \in \mathcal{E}\mathrm{ll}\,/K$, then

$$\mathrm{Br}(\mathcal{E}/k) \cong Ш(E/K).$$

$\acute{k}$

Proof: Cf.[Grothendieck, Alexander, Le groupe de Brauer. III. 1968]. □

3 K3 Surfaces

Main references are [The Tate Conjecture For K3 Surfaces In Odd Characteristic, Pera], [The Tate Conjecture For K3 Surfaces—A Survey Of Some Recent Progress], [2-adic integral canonical models and the Tate conjecture in characteristic 2].

Thm. (13.15.3.1) [Pera]. $(T^1(X))$ holds if X is a K3 surface.

Proof: Cf.[The Tate Conjecture For K3 Surfaces In Odd Characteristic, Pera] and [2-adic integral canonical models and the Tate conjecture in characteristic 2].? □

Cor. (13.15.3.2) [Lieblich-Maulik-Snowden]. There are only finitely many isomorphism classes of K3 surfaces over a finite field of characteristic ≥ 5.

Proof: [Finiteness Of K3 Surfaces And The Tate Conjecture, Lieblich-Maulik-Snowden]. □

Kuga-Satake construction

4 Hodge Conjecture

Main references are [Hodge cycles on abelian varieties, Deligne].

Def. (13.15.4.1) [Hodge Classes]. For $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{C}$, define $\mathrm{Hdg}^{2k}(X) = H^{2k}_{\mathrm{Betti}}(X, \mathbb{Q}) \cap H^{k,k}_{\mathrm{Betti}}(X)$, called the **Hodge classes** of X of degree $2k$.

Prop. (13.15.4.2). If $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{C}$ and $Z \subset Z^r(X)$, then $[Z] \subset \mathrm{Hdg}^k(X)$.

Proof: ?? □

Conj. (13.15.4.3) [Hodge]. For $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{C}$, every Hodge class is algebraic.

Proof: □

Arithmetic Theory

Thm. (13.15.4.4) [Deligne]. Let $k \in \mathtt{Field}^0, k = \overline{k}$, $X \in \mathcal{A}\mathrm{b}\mathcal{V}\mathrm{ar}/k$, and let $t \in H^{2p}_{\mathbb{A}}(X)(p)$. Then if t is a Hodge cycle w.r.t. one embedding $\sigma : k \to \mathbb{C}$, then it is absolutely Hodge.

Proof: □

Def. (13.15.4.5) [Hodge Classes]. Let $k \in \mathtt{Field}^0, k = \overline{k}$, and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/k$, then for any embedding $\sigma : k \hookrightarrow \mathbb{C}$, $H^n_{\mathrm{dR}}(X/k)$ satisfies

$$H^n_{\mathrm{dR}}(X/k) \otimes_{k,\sigma} \mathbb{C} \cong H^n_{\mathrm{dR}}(X, \mathbb{C}) \cong H^n_{\mathrm{Betti}}(X, \mathbb{C}).??$$

Thus we can define the space $\mathrm{Hdg}^{2k}(X)$ of **Hodge cycle** on X of degree $2k$ w.r.t. σ as the subspace of elements in $H^{2k}_{\mathrm{dR}}(X/k)$ that are mapped to $(2\pi\,\mathrm{i})^k$ times a Hodge class of σX of degree $2k$(13.15.4.1).

This notion is independent of the embedding σ.

Proof: ? □

Dynamical Mordell-Lang Conjecture

References are [Poo14].

Prop. (13.17.2.1)[p-adic Interpolation of Iterates, Poonen]. Let K be a valued field s.t. $|p| = 1/p$, and $f \in \mathcal{O}_K\langle X_1, \ldots, X_d\rangle^d$ satisfies $f(\underline{X}) \equiv \underline{X} (\mathrm{mod}\ p^c)$ for some $c > 1/(p-1)$. Then there exists $g \in \mathcal{O}_K\langle X_1, \ldots, X_d, T\rangle$ s.t. $g(\underline{X}, n) = f^{\circ n}(n) \in \mathcal{O}_K\langle \underline{X}\rangle^d$ for any $n \in \mathbb{N}$. Moreover, $g(\underline{X}, T+1) = f(g(\underline{X}, T))$ holds.

Proof: The hypothesis implies that $h(f(\underline{X})) \equiv f(\underline{X}) (\mathrm{mod}\ p^c)$ for any $h(\underline{X}) \in \mathcal{O}_K[\underline{X}]^d$, and by taking limits this is also true for any $h \in \mathcal{O}_K\langle \underline{X}\rangle^d$. Thus if we define the linear operator

$$\Delta(h)(\underline{X}) = h(f(\underline{X})) - f(\underline{X}),$$

then for any $m \in \mathbb{N}$, Δ^m maps $\mathcal{O}_K\langle \underline{X}\rangle^d$ into $p^{mc}\mathcal{O}_K\langle \underline{X}\rangle^d$. Then because $|m!| > p^{-m/(p-1)}$(24.1.3.17), so the Mahler series

$$g(\underline{X}, T) = \sum_{m \in \mathbb{N}} \binom{T}{m} \Delta^m(\underline{X})$$

converges in $\mathcal{O}_K\langle \underline{X}\rangle^d$. And

$$g(\underline{X}, n) = \sum_{m=0}^{n} \binom{n}{m} \Delta^n(\underline{X}) = (\Delta + \mathrm{id})^n(\underline{X}) = f^{\circ n}(\underline{X}).$$

For the last assertion, the equation clearly holds for $T \in \mathbb{N}$, so by comparing coefficients, it holds for any T. □

14 | p-Adic Geometry

14.1 $\mathbb{F}_p$-Schemes

1 Perfect Schemes

Def. (14.1.1.1)[Perfect Schemes]. An $\mathbb{F}_p$-scheme is called **perfect** if the Frobenius is an isomorphism on it. Equivalently, this means every affine subscheme is the spectrum of a perfect scheme.

Let Perf be the category of perfect qcqs $\mathbb{F}_p$-schemes endowed with the V-topology(5.1.4.43).

Def. (14.1.1.2)[Perfection]. There is a **perfection** functor $X \mapsto X_{perf}$ from the category of schemes to the category of perfect schemes, it is defined as the glueing of the perfection $R \to R_{perf}$(4.5.1.3) as it commutes with colimits.

Prop. (14.1.1.3)[Perfection and Properties]. Let $f : X \to Y$ be a morphism of $\mathbb{F}_p$-schemes, then the following properties holds true for f iff it holds true for f_{perf}:

1. Qco.
2. Quasiseparated.
3. Affine.
4. Separated.
5. Integral.
6. Universally closed.
7. Universal homeomorphism.

The following properties holds for f_{perf} if it holds for f:

1. Closed immersion.
2. Open immersion.
3. immersion
4. Étale
5. (Faithfully)Flat.

Proof: Cf.[Projectivity of Witt Vectors Affine Grassmannian, 3.4]. □

Prop. (14.1.1.4). If X is an $\mathbb{F}_p$-scheme and $\mathcal{L}$ is a line bundle on X, then $\mathcal{L}$ is ample iff the pullback to X_{perf} is ample.

Proof: Cf.[Projectivity of Witt Vectors Affine Grassmannian, 3.6]. □

Prop. (14.1.1.5). If X is an $\mathbb{F}_p$-scheme, then $X_{ét} \to X_{perf,ét} : Y \to Y_{perf}$ is an equivalence of sites.

Proof: □

Prop. (14.1.1.6) [Perfectly Finitely Presented Morphisms]. Let $f : X \to Y$ be a morphism in Perf(14.1.1.1), then f is called a **perfectly finitely presented morphism** if it satisfies the following equivalent conditions:

- Any open affine subscheme $\operatorname{Spec} B \subset X$ mapping to an open affine subscheme $\operatorname{Spec} A \subset Y$, $A \to B$ is perfectly f.p.(4.5.1.5).
- There is an open affine covering $\operatorname{Spec} A_i \to X$ mapping to an open affine covering $\operatorname{Spec} B_i \to Y$ that $B_i \to A_i$ are all perfectly f.p.
- For any cofiltered system $\{Z_i\} \in \mathrm{Perf}_{/Y}$ with affine transition maps, there is a bijection $\operatorname{colim} \operatorname{Hom}_Y(Z_i, X) \cong \operatorname{Hom}_Y(\lim Z_i, X)$.

In particular, perfectly finitely presented is local on the base and target.

Proof: Cf.[Projectivity of Witt Vectors Affine Grassmannian, 3.11]. □

Prop. (14.1.1.7) [Perfect Base Change]. If

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow{\scriptstyle f'} & & \downarrow{\scriptstyle f} \\ Y' & \xrightarrow{g} & Y \end{array}$$

is a pullback diagram of perfect $\mathbb{F}_p$-schemes, then for any complex $K^\bullet$ of Qco sheaves on X, the base change map(5.3.3.18)

$$Lg^* Rf_* K \to Rf'_* Lg' K$$

is an isomorphism.

Proof: It is clearly we need only check for the affine case, then let $X = \operatorname{Spec} B, Y = \operatorname{Spec} A, Y' = \operatorname{Spec} A'$, and $X' = \operatorname{Spec} B \otimes_A A'$, then it suffices to prove that

$$K \otimes^L_A A' \cong K \otimes^L_B B'.$$

This follows from the fact $B \otimes_A A' = B \otimes^L_A A'$, by(4.5.1.7). □

Prop. (14.1.1.8) [Cartier Isomorphism]. If

Proof: □

Cor. (14.1.1.9) [Affine Line case]. Let R be an $\mathbb{F}_p$-algebra and

Fontaine's Ring $A_{\inf}$

Def. (14.2.1.1)[Fontaine's Ring $A_{\inf}$]. Let $C^\flat$ be a perfectoid field of characteristic p, for any untilt K of $C^\flat$, the Fontaine's ring $A_{\inf} = A_{\inf}(\mathcal{O}_K)$ is defined to be the ring of Witt vectors $W(\mathcal{O}_{C^\flat})$(4.5.1.15). Also denote $B_{\inf} = A_{\inf}[\frac{1}{p}]$.

the set of all the char0 untilts K of $C^\flat$ is denoted by Y. and $Y_{[a,b]}$ denotes those untilts that $a \leq |p|_K \leq b$.

Prop. (14.2.1.2). By(10.3.9.7), if $K \in \mathrm{Perfd}, \mathrm{char}\, K = 0$, with tilt $C^\flat$, then there is a diagram

$$\begin{array}{ccc} A_{\inf} & \xrightarrow{\theta} & \mathcal{O}_K \\ \downarrow & & \downarrow \\ \mathcal{O}_{C^\flat} & \xrightarrow{\sharp} & \mathcal{O}_K/(p) \end{array}.$$

Then θ is surjective, and $\ker\theta$ is generated by some distinguished element $\xi = [t] - pu$ where $u \in A_{\inf}$ is invertible. Moreover, any distinguished element in the kernel is a generator.

Proof: θ is surjective by(4.5.1.16). By(10.3.8.11), there exists $t \in A_{\inf}$ s.t. $t^\sharp = pu'$ for some u' invertible in $\mathcal{O}_K$. Thus $u' = \theta(u)$ for some invertible $u \in A_{\inf}$, then $\theta([t] - pu) = 0$. And ξ generates the kernel because it generates after modulo ϖ, and and use the fact $\mathcal{O}_K$ is p-complete.

For the last assertion, use(14.2.1.4), which shows that if ξ' is another distinguished element in $\ker\theta$, $A_{\inf}/(\xi')$ is an integral domain of dimension 1. So $(\xi) = (\xi')$ as $\mathcal{O}_K$ is not a field. □

Lemma (14.2.1.3). If R is a commutative ring, $x, y \in R$, if x is not a zero-divisor in R and R is x-adically complete Hausdorff, and y is not a zero-divisor in R/x and R/x is y-adically complete Hausdorff, then the same is true with x, y interchanged.

Proof: ? □

Prop. (14.2.1.4) [Untilts and Distinguished Elements]. (14.2.1.2) shows that for any untilt K of $C^\flat$, the kernel is generated by a distinguished element. Conversely, for any distinguished element ξ, $A_{\inf}/(\xi)$ can be identified with the valuation ring $\mathcal{O}_K$ of a perfectoid field K. and

$$\mathcal{O}_C^\flat = A_{\inf}/p \to A_{\inf}/(\xi, p) \cong \mathcal{O}_K/p$$

exhibits K as an untilt of $C^\flat$.

Proof: May assume $\xi = [t] - up$ and $t \neq 0$. Consider the mapping $\theta : A_{\inf} \to A_{\inf}/(\xi) = \mathcal{O}_K$, and denote $\theta([x])$ by $x^\sharp$.

Firstly, we can apply lemma(14.2.1.3) to ξ and p to conclude that $A_{\inf}$ is ξ-complete and ξ-torsion-free, and $\mathcal{O}_K$ is p-adically complete and p-torsion-free.

Now for any $y \in \mathcal{O}_K$ is p-adically complete, there is a $x \in \mathcal{O}_C^\flat$ that $(y) = (x^\sharp)$: multiplying p-power, we can assume y is not divisible by p, and there is a x that $y \equiv x^\sharp \mod p$, thus x is not divisible by t. Now $t = xx'$ for some $x' \in \mathfrak{m}_C^\flat$, thus $y = x^\sharp + t^\sharp w = x^\sharp(1 + x'w)$, and $1 + x'w$ is invertible in $\mathcal{O}_K$.

Next we prove $\mathcal{O}_K$ is an integral domain: It suffices to show any $y \neq 0 \in \mathcal{O}_K$ is not a zero-divisor. We can assume $y = x^\sharp$, by what just proved, and then x divides t^n for some n, so it suffices to consider $y = t^{n\sharp} = p^n$, and p^n is not a zero-divisor by what just proved.

Now we can endow $\mathcal{O}_K$ with the valuation $|y| = |x|_{C^\flat}$ for $y = x^\sharp u$, and extend it to the quotient field K. Then this is a Non-Archimedean valuation and the residue field has char p because $|p| < 1$, and K has char0, because $p \neq 0$ in K. And it is p-adically complete.

Finally, $\mathcal{O}_K/p\mathcal{O}_K \cong A_{\inf}/(\xi, p) = \mathcal{O}_{C^\flat}/\pi$, so the Frobenius is surjective, thus $K = K(\mathcal{O}_K)$ is a perfectoid field. □

Cor. (14.2.1.5). The correspondence $\xi \mapsto \mathrm{Frac}(A_{\inf}/(\xi))$ induces a bijection

$$\{\text{Distinguished elements}\}/\text{units} \cong \{\text{Untilts of } C^\flat\}/\text{isomorphisms}.$$

Prop. (14.2.1.6)[$A_{\inf}$ as Holomorphic Function in p]. Any element in $A_{\inf}$ can be written uniquely as a unique Teichmuller representation $[c_0] + [c_1]p + [c_2]p^2 + \ldots +$. Now we can regard these elements as holomorphic functions on $B(0,1)$, and any untilts K of $\mathcal{O}_{C^\flat}$ can be regarded as points in $B(0,1)$, where $A_{\inf}$ take value $c_0^\sharp + c_1^\sharp p + \ldots \in \mathcal{O}_K$ at the point K.

This map can in fact be extended to $A_{\inf}[\frac{1}{[t]}, \frac{1}{p}]$ s.t.

$$A_{\inf} \hookrightarrow A_{\inf}[\frac{1}{[t]}] \hookrightarrow A_{\inf}[\frac{1}{[t]}, \frac{1}{p}] \to K.$$

called the **evaluation map**.

Fontain's Ring B

Def. (14.2.1.7) [Fontaine's Ring B]. If compared to the complex case, the elements of $A_{\inf}$ are just elements $\sum a_n z^n$ that $|a_n| \leq 1$, this are not all the holomorphic functions on $B(0,1)$, which is

$$\{\sum_{n\in\mathbb{Z}} a_n z^n | \limsup_{n>0} |a_n| \leq 1, \quad \lim_{n\to\infty} |a_{-n}|^{1/n} = 0\}.$$

This leads to a enlargement of $A_{\inf}$:

For $0 < a \leq b < 1$ in the value group of $C^\flat$, $\pi_a, \pi_b \in C^\flat$ with $|\pi_a| = a, |\pi_b| = b$, define

$$B_{[a,b]} = A_{\inf}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}]^\wedge[p^{-1}],$$

this is definable at any untilts K that $a \leq |p|_K \leq b$.

Then $B_{[a,b]}$ is an algebra over $A_{\inf}[\frac{1}{[t]}, \frac{1}{p}]$, and define $B = \varprojlim B_{[a,b]}$.

Prop. (14.2.1.8) [Gauss Norm]. Any element f in $A_{\inf}[\frac{1}{[t]},\frac{1}{p}]$ is of the form $\sum_{n>>-\infty}[c_n]p^n$, where $\{|c_n|\}$ is bounded. So we can define the valuation $|f|_\rho=\sup\{|c_n|\rho^n\}$, it is realizable by some term $|a_n|\rho^n$. Notice that for an until $y=(K,\iota)$, if $\rho=|p|_K$, then $|f(y)|\leq|f|_\rho$.

Then this is a non-Archimedean valuation on $A_{\inf}[\frac{1}{[t]},\frac{1}{p}]$.

Proof: Firstly $|f+g|_\rho\leq\max\{|f|_\rho,|g|_\rho\}$ for every ρ that is generic for $f+g$ and in the value group of $C^\flat$: In this case,

$$|f+g|_\rho=|(f+g)(y)|\leq\max\{|f(y)|,|g(y)|\}\leq\max\{|f|_\rho,|g|_\rho\}$$

for some point y by(14.2.1.8), then by continuity and(14.2.1.9), this is true for any ρ.

The same method shows that $|f|_\rho|g|_\rho=|fg|_\rho$. □

Lemma (14.2.1.9) [Generic Norms]. ρ is called **generic** for f iff the valuation is realized exactly once. Notice if ρ is generic for f and in the value group of $C^\flat$, then $|f|_\rho=|f(y)|$ for some y(Choose $K=A_{\inf}/([c]-p)$ where $|c|_{C^\flat}=\rho$).

For any f, the numbers ρ that ρ is not generic for f is discrete in ρ.

Proof: Consider the Newton polygon of f, then only the slopes of the Newton polygon are not generic. □

Lemma (14.2.1.10). If $y=(K,\iota)\in Y$ and $|p|_K=\rho$, then $|f(y)|\leq|f|_\rho$, and equality holds if either ρ is generic or f is invertible.

Prop. (14.2.1.11) [Valuation Map]. For $0<a\leq b<1$ in the value group of $C^\flat$, $|\pi_a|=a$, $|\pi_b|=b$,

$$A_{\inf}[\frac{[\pi_a]}{p},\frac{p}{[\pi_b]}]=\{f\in A_{\inf}[\frac{1}{[t]},\frac{1}{p}]||f|_a\leq 1,|f|_b\leq 1\}=V_0,$$

Thus the ring $B_{[a,b]}$ is identified with the completion of $A_{\inf}[\frac{1}{[t]},\frac{1}{p}]$ w.r.t the valuation $|\cdot|_a+|\cdot|_b$(12.2.4.4). In particular, for any point y that $a\leq|p|_K\leq b$, the valuation map(14.2.1.6) can be extended to a map

$$B_{[a,b]}\to K.$$

Proof: Notice V_0 is a subring by(14.2.1.8), so clearly $A_{\inf}[\frac{[\pi_a]}{p},\frac{p}{[\pi_b]}]\subset V_0$.

For the reverse containment, notice that $\{|c_n|\}$ is bounded, so there is an m that $\pi_b^m c_n\in C^\flat$ for any n. Now

$$f=\sum_{n<m}[c_n]p^n+(\sum_{n\geq 0}[c_{n+m}\pi_b^m]p^n)(\frac{p}{[\pi_b]})^m,$$

so it suffices to prove the case f has finite presentation. Now $c_n\pi_a^n,c_n\pi_b^n\in\mathcal{O}_C^\flat$, thus $[c_n]p^n=[c_n\pi_a^n](\frac{\pi_n}{p})^{-n}=[c_n\pi_b^n](\frac{p}{\pi_b})^n\in A_{\inf}[\frac{[\pi_a]}{p},\frac{p}{[\pi_b]}]$, where $n\geq 0$ or $n\leq 0$. Thus the inverse containment is true. □

Prop. (14.2.1.12) [Topology of B]. For $0<a\leq c\leq b<1$, $|f|_c\leq\max\{|f|_a,|f|_b\}$(trivial), thus the Fontaine's ring B can be realized as the completion of $A_{\inf}$ w.r.t. all these norms, and endowed with the topology of p-adic Fréchet space.

Proof: Cf.[Conrad, P65].**?** □

Prop. (14.2.1.13) [Teichmuller Expansion]. An infinite sum $f = \sum [a_n]p^n$ converges in B iff it converges in any norm $|\cdot|_\rho$ for $0<\rho<1$, which is equivalent to

$$\limsup_{n>0} |c_n|_{C^\flat}^{1/n} \leq 1, \quad \lim_{n\to\infty} |c_{-n}|_{C^\flat}^{1/n} = 0.$$

This is analogous to the complex case(10.5.3.4). However, for now, we don't know iff every element of B is of this form, and whether the representation is unique**?**.

Prop. (14.2.1.14) [Frobenius Action]. Notice the Frobenius action of $C^\flat$ extends to a Frobenius action on the Witt victor A_{inf}, and it satisfies

$$|\varphi(f)|_{\rho^p} = (|f|_\rho)^p,$$

Thus induces an isomorphism $B_{[a,b]} \cong B_{[a^p,b^p]}$. Passing to the limit, we get an automorphism of B, denoted also by φ.

the Field B_{dR}

Prop. (14.2.1.15)[Untilts with Roots of Unity]. Let $\mathbb{Q}_p^{\mathrm{cycl}} = \mathbb{Q}_p(\mu_{p^\infty})^\wedge$, and $\varepsilon = (1, \mu_p, \mu_{p^2}, \ldots)$ be a compatible p^n-th roots of unity that is an element of $(\mathbb{Q}_p^{\mathrm{cycl}})^\flat$. Then $\varepsilon - 1$ is a pseudo-uniformizer of $(\mathbb{Q}_p^{cyc})^\flat$, For any untilts K of $\mathbb{C}^\flat$ and an embedding of $\mathbb{Q}_p^{\mathrm{cycl}}$ in K, the tilting maps $\varepsilon - 1$ to a pseudo-uniformizer of $\mathbb{C}^\flat$. This induces a bijection:

$$\{\text{Untilts } (K,\iota) \text{ of } C^\flat \text{ with an embedding } \mathbb{Q}_p^{\mathrm{cycl}} \hookrightarrow K\} \cong \{x \in \mathbb{C}^\flat | 0 < |x-1| < 1\}.$$

Proof: In fact, the left hand side is equivalent to K has a compatible p^n-th roots of unity, and we want to prove that for any x in the right hand side, there is a unique untilts K that $(x^{\frac{1}{p^k}})^\sharp$ is a compatible primitive roots of unity, and this is equivalent to $(x^{\frac{1}{p}})^\sharp$ satisfies $1 + x + \ldots + x^{p-1} = 0$, and further equivalent to $\theta : A_{\mathrm{inf}} \to \mathcal{O}_K$ annhilalates $1 + [x^{\frac{1}{p}}] + \ldots + [x^{\frac{p-1}{p}}]$.

It suffices to show $\xi = 1 + [x^{\frac{1}{p}}] + \ldots + [x^{\frac{p-1}{p}}]$ is distinguished(14.2.1.5). Let $\xi = \sum [c_n]p^n$, consider reducing to the residue field: $W(\mathcal{O}_{C^\flat}) \to W(\mathcal{O}_{C^\flat}/\mathfrak{m}_{C^\flat})$, then $\overline{x} = 1$, and $\overline{\xi} = p$, thus $|c_0| < 1, |c_1 - 1| < 1$, so it is distinguished(4.5.4.20). □

Cor. (14.2.1.16). Considering different p^n-th roots of unities, there is a correspondence:

$$\{\text{Char 0 Untilts } (K,\iota) \text{ of } C^\flat \text{ with a compatible } p^n\text{-th roots of unity}\} \cong \{x \in \mathbb{C}^\flat | 0 < |x-1| < 1\}/\mathbb{Z}_p^*.$$

where $\mathbb{Z}_p^*$ acts by exponentiation(10.3.8.8).

Furthermore, there is a correspondence:

$$\{\text{Char 0 Untilts } (K,\iota) \text{ of } C^\flat \text{ with a compatible } p^n\text{-th roots of unity}\}/\varphi_{C^\flat}^{\mathbb{Z}} \cong \{x \in \mathbb{C}^\flat | 0 < |x-1| < 1\}/\mathbb{Q}_p^*.$$

where the inverse is given by $x \mapsto$ the vanishing locus of $\log([x]) \in B$.

Proof: The only thing needed to be proven is the inverse is given by $N(\log([x]))$. Notice for any untilts K, $|(x^{p^n})\sharp - 1| < |p|_K^{1/(p-1)}$ for n large, then $\log((x^{p^n})\sharp) = 0$ iff $(x^{p^n})\sharp = 1$ by Newton polygon. Now $x^\sharp \neq 1$ because $x \neq 1$ and $\sharp$ is injective. Hence composing φ^n for some unique n, we can assume $x^\sharp = 1, x^{\frac{1}{p}} \neq 1$, thus it corresponds an untilt as in(14.2.1.15). □

Def. (14.2.1.17)[B_{dR}^+]. p is not a zero-divisor in $A_{\inf}/(\xi^n)$, as in the proof pf(14.2.1.4), so we can define

$$B_{\mathrm{dR}}^+ = \varprojlim_n A_{\inf}/(\xi^n)[\frac{1}{p}]$$

Prop. (14.2.1.18)[Fontaine's Ring B_{dR}]. B_{dR}^+ is a CDVR with ξ a uniformizer and the residue field K. Hence we can define $B_{\mathrm{dR}} = \mathrm{Frac}(B_{\mathrm{dR}}^+)$.

Proof: Firstly ξ is not a zero divisor in B_{dR}^+, because if $\xi x = 0, x = (x_n)$, then for any $n > 0$, and some k that $p^k x_n \in A_{\inf}/(\xi^n)$, so $p^k x_n$ is annihilated by ξ in $A_{\inf}/(\xi^n)$, thus $p^k x_n = \xi^{n-1} y_n$ for some y_n, because ξ is a non-zero-divisor in $A_{\inf}$(14.2.1.4). So $p^{n-1}x_{n-1} = 0 \in A_{\inf}/(\xi^n)$, thus $x_{n-1} = 0$, because p is non-zero-divisor in $A_{\inf}/(\xi^n)$(14.2.1.4).

Next there is a map $B_{\mathrm{dR}}^+/(\xi^m) \to A_{\inf}/(\xi^m)[p^{-1}]$. This is an isomorphism: it is clearly a surjection, and if $x = (x_n)$ is mapped to 0, then for each $n \geq m$, we choose $p^{k(n)}x_n = 0 \in A_{\inf}/(\xi^n)$, then $p^{k(n)}x_n = \xi^m y_n$ for a unique $y_n \in A_{\inf}/(\xi^{n-m})$. So $x = \xi^m \cdot (\frac{y_n}{p^{k(n)}}) \in \xi^m B_{\mathrm{dR}}$.(Notice the uniqueness of y_n shows $(\frac{y_n}{p^{k(n)}})$ is an element in B_{dR}^+).

Then it follows $B_{\mathrm{dR}}^+ \cong \varprojlim_m B_{\mathrm{dR}}^+/(\xi^m)$, which shows that B_{dR}^+ is ξ-adically complete, and $m = 1$ shows the residue field is equal to K. □

Remark (14.2.1.19). $A_{\inf}/(\xi^n)[\frac{1}{p}] = A_{\inf}/(\xi^n)[\frac{1}{[t]}]$, so if $\mathrm{char}\, k = p$, then B_{dR}^+ is just $W(C^\flat)$.

Thus B_{dR}^+ should be thought as the completed local ring at the point $y = (K, \iota)$.

Prop. (14.2.1.20)[Topology on B_{dR}]. The Gauss norms give $A_{\inf}$ a topology, giving B_{dR} a topology. Then B_{dR} is complete in this topology, and $B_{\mathrm{dR}} \to K$ is continuous.

With this topology, B_{dR} is abstractly isomorphic to $\mathbb{C}_p((T))$, but not topological isomorphic to it.

Proof: Cf.[Conrad, P65] or [p-adic Period Rings]P42.?

B_{dR} is abstractly isomorphic to $\mathbb{C}_p((T))$ by Cohn structure theorem?, but [Colmez, Une construction de BdR] proved that $\overline{K}$ is dense in B_{dR}, so it cannot by topological isomorphic to $\mathbb{C}_p((T))$. □

Prop. (14.2.1.21) [The Stalk Map]. Notice $A_{\inf} = \varprojlim_n A_{\inf}/(\xi^n)$ as ξ is distinguished, thus there is a natural injection $A_{\inf} \to B_{\mathrm{dR}}^+$, whose composition with $B_{\mathrm{dR}}^+ \to B_{\mathrm{dR}}^+/\xi \cong K$ maps $p, [t]$ to $p, t^\sharp$, which shows $p, [t]$ are invertible in B_{dR}^+, so there is a map

$$e : A_{\inf}[\frac{1}{p}, \frac{1}{[t]}] \to B_{\mathrm{dR}}^+.$$

In case $a \leq |p|_K \leq b$, this can be further extended to a map $e : B_{[a,b]} \to B_{\mathrm{dR}}^+$(The stalk map).

Proof: It suffices to prove for $a = |p|_K = b$ because the topology is stronger. In this case, choose $t = p^\flat \in C^\flat$, then $|t|_{C^\flat} = |p|_K$, thus $\overline{e}_n$ determined a map

$$A_{\inf}[\frac{[t]}{p}, \frac{p}{[t]}] \to B_{\mathrm{dR}}^+/(\xi^n) \cong (A_{\inf}/\xi^n)[p^{-1}],$$

It suffices to prove the image is contained in $p^{-k}(A_{\inf}/\xi^n)$ for some $k = k(n)$, because then $\overline{e}_n$ is p-adically continuous, and extends to map of $B_{[a]} = (A_{\inf}[\frac{[t]}{p}, \frac{p}{[t]}])^\wedge_p \to (A_{\inf}/(\xi^n))[p^{-1}]$, which is compatible w.r.t n, thus gives a map $B_{[a]} \to B_{\mathrm{dR}}^+$.

For this, consider $f=\bar{e}_n(\frac{[t]}{p}), g=\bar{e}_n(\frac{p}{[t]})$, then their reduction under $B_{\mathrm{dR}}^+/(\xi^n)\to B_{\mathrm{dR}}^+/\xi\cong K$ is in $\mathcal{O}_K\cong A_{\inf}/(\xi)$, thus

$$f=f_1+\frac{\xi}{p^c}f_2,\quad g=g_1+\frac{\xi}{p^c}g_2$$

for $f_1,f_2,g_1,g_2\in A_{\inf}/(\xi^n)$ for some c. Then any

$$f^m=(f_1+\frac{\xi}{p^c}f_2)^m=\sum_{i=0}^{n-1}C_m^i f_1^{m-i}(\frac{\xi}{p^c}f_2)^i\in p^{-nc}(A_{\inf}/(\xi^n)).$$

Thus $\bar{e}_n(A_{\inf}[\frac{[t]}{p},\frac{p}{[t]}])\in p^{-nc}(A_{\inf}/(\xi^n))$. □

Cor. (14.2.1.22). The stalk map $e:B_{[a,b]}\to B_{\mathrm{dR}}^+$ composed with the map $B_{\mathrm{dR}}^+/(\xi)\cong K$ are in fact equivalent to the valuation map(14.2.1.11).

$\underline{B_{\mathrm{crys}}}$

Cf.[Notes on p-adic Hodge, Serin Hong].

Def. (14.2.1.23) $[B_{\mathrm{crys}}]$**.**

$\underline{B_{\mathrm{st}},B_e}$

2 Fargues-Fontaine Curve

Def. (14.2.2.1) [Fargues-Fontaine Curve]. The sum $\oplus_n B^{\varphi=p^n}$ is a graded ring. In fact, it is non-negatively graded(14.2.2.33), and we define the **Fargues-Fontaine curve** as the scheme

$$\mathrm{Proj}(\oplus_{n\geq 0}B^{\varphi=p^n}).$$

Def. (14.2.2.2)[Formal Logarithm]. For $x\in 1+\mathfrak{m}_{C^\flat}$, $[x]-1=[x-1]+\sum_{n>0}[c_n]p^n$, thus $|[x]-1|_\rho\geq |x-1|>0$, thus the formal logarithm

$$\log([x])=\sum_{k>0}\frac{(-1)^{k+1}}{k}([x]-1)^k$$

converges for every Gauss norm $|\cdot|_\rho$, thus converges to some element in B. And clearly $\varphi(\log([x]))=p\log([x])$, thus $\log([x])\in B^{\varphi=p}$. And $\log([xy])=\log([x])\log([y])$.

Prop. (14.2.2.3)[Artin-Hasse Exponential]. There is another way of constructing elements in $B^{\varphi=p}$, which is

$$T:a\in\mathfrak{m}_{C^\flat}\mapsto\sum_n\frac{[a^{p^n}]}{p^n}.$$

We want to relate this one to the formal logarithm:

There is a bijection of sets $\mathfrak{m}_{C^\flat}\cong 1+\mathfrak{m}_{C^\flat}^b$ that $\log([E(a)])=T(a)$, which is defined by the **Artin-Hasse exponential**

$$E(x)=\prod_{(d,p)=1}(\frac{1}{1-x^d})^{\frac{\mu(d)}{d}}.$$

Proof: Firstly, it has coefficients in $\mathbb{Z}_{(p)}$, because $(1-x^d)^{\frac{1}{d}} = \sum(-1)^k C^k_{\frac{1}{n}} x^{kd}$ has coefficient in $\mathbb{Z}_{(p)}$. And $[1-x] = \lim_k (1-[x^{p^{-k}}])^{p^k}$, so

$$\log([\prod_{(d,p)=1}(\frac{1}{1-x^d})^{\frac{\mu(d)}{d}}]) = \sum_{(d,p)=1}\frac{\mu(d)}{d}\log(\frac{1}{[1-d]}) = \sum_{(d,p)=1}\mu(d)\sum_{\alpha\in p^{-n}\mathbb{Z}}\frac{[x^{d\alpha}]}{d\alpha}$$

Notice the right hand side stablizes for any term $[x^\beta]$, and if $\beta \neq \frac{1}{p^k}$, it will vanish, thus for $x \in \mathfrak{m}_{C^\flat}$, it converges, and the sum equals $\sum_n \frac{[x^{p^n}]}{p^n}$. □

Cor. (14.2.2.4). The set of elements of the form $\sum_n \frac{[a^{p^n}]}{p^n}$ is closed under addition.

Valuation Function

Def. (14.2.2.5) [Exponential Valuation]. For any positive real number s, define a valuation on $A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$ by the formula $v_s(f) = -\log|f|_{\exp(-s)}$, then it is a valuation by(14.2.1.8).

If f has a Teichmuller expansion $\sum_{n>>-\infty}[c_n]p^n$, then

$$|f|_\rho = \sup\{|c_n|_{C^\flat}\rho^n\}, \quad v_s(f) = \inf\{v(c_n)+ns\}.$$

Prop. (14.2.2.6). For any $f \neq 0 \in A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$, $s \mapsto v_s(f)$ is a concave function in s which is piecewise linear with integral slopes.

Proof: Consider the Newton Polygon. □

Lemma (14.2.2.7). If $s > 0$ and f_n is a Cauchy sequence in $A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$ for the norm $|\cdot|_{\exp(-s)}$ and doesn't converge to 0, then the sequences

$$v_s(f_n), \quad \partial_- v_s(f_n), \quad \partial_+ v_s(f_n)$$

stablize.

Proof: Easy, Cf.[ff Curve Lurie P44]. □

Prop. (14.2.2.8). If $0 < a \leq b < 1$, and f_n is a Cauchy sequence in $A_{\inf}[\frac{1}{p},\frac{1}{[t]}]$ and doesn't converge to 0 for either the norm $|\cdot|_a$ or $|\cdot|_b$, then the sequence of functions $s \mapsto v_s(f)$ stablizes on $[-\log(b),-\log(a)]$.

Proof: Assume f_n doesn't converge to 0 for the form $|\cdot|_b$, then by(14.2.2.7), the sequences $v_s(f_n), \partial_+ v_s(f_n)$ converges, thus $v_s(f_n)$ is bounded uniformly, thus $v_s(f)$ is bounded.

Then choose N large that $|f-f_m|_\rho$ very small for any $m > N$ and $a \leq \rho \leq b$, then $v_s(f) = v_s(f_m)$ for any $a \leq s \leq b$, thus it stablizes. □

Cor. (14.2.2.9). Let f be a non-zero element in B, then the construction $s \mapsto v_s(f)$ is a concave function in s with piecewise linear function with integral slopes. This is analogous to the Hadamard three circle theorem(10.6.2.13).

Proof: This is true for $f \in B_{[a,b]}$, because any f is a limit of a sequence f_n in both the norm $|\cdot|_a$ and $|\cdot|_b$, so by the proposition, there for n large, $v_s(f) = v_s(f_n)$ on $[-\log(b),-\log(a)]$, thus the conclusion is true by(14.2.2.6). And for $f \in B$, for any interval $[a,b]$ we can do the same, thus the conclusion is true on each interval, thus it is true. □

Metric Structures on Y

Def. (14.2.2.10) [Metric on $\overline{Y}$]. Let $\overline{Y} = Y \cup \{0\}$ be the isomorphism classes of untilts of $C^\flat$, where 0 corresponds to $C^\flat$ itself.

(14.2.1.5) show $\overline{Y}$ corresponds to distinguished elements in A_{inf} up to units. So for any $x, y \in \overline{Y}$, we let $d(x, y) = |\xi_x(y)|_{K_y} \le 1$. Then this is a metric, and it is non-Archimedean.

Proof: Firstly, if $d(x, y) = 0$, then ξ_x divides ξ_y, which is equivalent to $(\xi_x) = (\xi_y)$, by(4.5.4.21).

Secondly, for any x, y, since $C^\flat$ is alg.closed, we can assume $\xi_x(y) = c^\sharp$ for some $c \in C^\flat$. Notice $\xi(y) = t^\sharp + pu(y)$ is in $\mathfrak{m}_K$, thus $c \in \mathfrak{m}_{C^\flat}$. So $\xi_x - [c]$ is also a distinguished element and vanishes at y, so we may assume that $\xi_y = \xi_x - [c]$ by(4.5.4.21) again. Then

$$d(y, x) = |\xi_y(x)|_{K_x} = |c^\sharp|_{K_x} = |c|_{C^\flat} = |c^\sharp|_{K^y} = d(x, y).$$

Finally it is non-Archimedean because any valuation field K is non-Archimedean. □

Prop. (14.2.2.11) [$\overline{Y}$ is Complete]. $\overline{Y}$ is complete w.r.t this metric.

Proof: Given a Cauchy sequence of points y_n in $\overline{Y}$, as in the proof of(14.2.2.10), we can assume that $\xi_{y_n} = \xi_{y_{n-1}} + [c_n]$ for some $c_n \in \mathfrak{m}_{C^\flat}$, and $|c_n|_{C^\flat} = d(y_{n-1}, y_n)$. Now A_{inf} is $[t]$-adically complete for a uniformizer $t \in C^\flat$, thus $\sum [c_n]$ is definable in A_{inf}, and $\xi = \xi_0 + \sum [c_n]$ is also distinguished, and corresponds to a point y which y_n clearly converges to. □

Divisors

Lemma (14.2.2.12). $B_{[a,b]}$ is an integral domain.

Proof: By(14.2.2.9), the valuation function $v_s(f)$ and $v_s(g)$ are bounded, thus it is clear that $v_s(fg)$ is also finite, so $fg \neq 0$. □

Prop. (14.2.2.13) [Divisors]. Assume $C^\flat$ is alg.closed, then for any $f \in B_{[a,b]}$ and $y = (K, \iota) \in Y_{[a,b]}$, we define the **order of vanishing** $\text{ord}_K(f) \in \mathbb{Z} \cup \{\infty\}$ as the valuation of $e_K(f) \in B^+_{\text{dR}}(K)$. Then

- if $f \neq 0 \in B_{[a,b]}$, then $\text{ord}_K(f) < \infty$ for each $K \in Y_{[a,b]}$, and there are only f.m. K that $\text{ord}_K(f) \neq 0$. In particular, $B_{[a,b]}$ is an integral domain.
- if $x, y \neq 0 \in B_{[a,b]}$, then x divides y iff $\text{ord}_K(x) \ge \text{ord}_K(y)$ for each $K \in Y_{[a,b]}$.

Thus for each $f \in B_{[a,b]}$, we can define the **divisor** of K as the formal sum $\sum_{K \in Y_{[a,b]}} \text{ord}_K(f) K$, and this is also definable for $f \in B$, but it may be an infinite but locally finite sum.

Proof: Firstly, by(14.2.2.17) and(14.2.2.18), if $\text{div}(f) \cap Y_{[a,b]} \neq 0$, then there is a distinguished element ξ that $f = \xi f_1$. And we can iterate this, and eventually end up with $f = \xi_1 \ldots \xi_n f_n$ that $\text{div}(f_n) \cap Y_{[a,b]} = 0$, by(14.2.2.19), so by(14.2.2.20), f_n is invertible in f, so $\text{div}(f)$ is finite. And if $\text{div}(g) \ge \text{div}(f)$, then g also divides $\xi_1 \ldots \xi_n$, so g divides f. □

Remark (14.2.2.14). Notice by(14.2.1.22), for a $f \in B_{[a,b]}$, $\text{ord}_K(f) > 0$ iff $f(y) = 0 \in K$.

Cor. (14.2.2.15) [B is Integral Domain]. B is an integral domain, and if $C^\flat$ is alg.closed, then x is divisible by y if and only if $\text{div}(x) \ge \text{div}(y)$.

Cor. (14.2.2.16). B is integrally closed.

Proof: B is an integral domain by(14.2.2.15), it is integrally closed because if f/g is integral over B, then there image in $B_{\mathrm{dR}}^+(y)$ is integral over $B_{\mathrm{dR}}^+(y)$ for all $y\in Y$, thus in $B_{\mathrm{dR}}^+(y)$ because it is a valuation ring, and then f is divisible by g by(14.2.2.15). □

Prop. (14.2.2.17) [Examples of Divisors].

- For a distinguished element ξ, if $\xi=up$, then ξ is invertible in B, thus $\mathrm{div}(\xi)=0$. Otherwise ξ defines a char0 untilts K of $C^\flat$, and ξ is a uniformizer of $B_{\mathrm{dR}}^+(K)$, and it doesn't divides other distinguished elements(4.5.4.21), thus $\mathrm{div}(\xi)=K$.
- $\mathrm{div}(\log([x]))=\sum_{n\in Z}\varphi^n(K)$.

Proof: 2: $\log([x])$ vanishes at a single φ-orbits of Y, and one of them is given by the distinguished element $\xi=1+[x^{1/p}]+\ldots+[x^{p-1/p}]=\frac{[x]-1}{[x^{1/p}]-1}$. Notice $[x^{1/p}]-1$ is mapped to an invertible element in K, thus it is invertible in $B_{\mathrm{dR}}^+(K)$, so $[x]-1$ is associated to ξ, and notice

$$\log([x])=\sum_{k>0}\frac{(-1)^{k+1}}{k}([x]-1)^k\equiv[x]-1 \mod ([x]-1)^2,$$

so $\mathrm{ord}_K(\log([x]))=1$, and because $\varphi(\log([x]))=p\log([x])$, $\mathrm{ord}_{\varphi^n(K)}(\log([x]))=1$ for any n, so we are done. □

Lemma (14.2.2.18). Let $C^\flat$ be alg.closed. If ξ is a distinguished element of $A_{\inf}$ vanishes at a point $y\in Y_{[a,b]}$ and $g\in B_{[a,b]}$ also vanishes at y, then g is divisible by ξ in $B_{[a,b]}$.

Proof: If $g\in A_{\inf}[\frac{1}{p},\frac{1}{[\pi]}]$, then this is easy by(14.2.2.14) and $A_{\inf}/(\xi)=\mathcal{O}_K$(14.2.1.4).

Now generally g is a limit of $g_n\in A_{\inf}[\frac{1}{p},\frac{1}{[\pi]}]$, so $g(y)$ is the limit of $g_n(y)\in K$. Now $g(y)=0$, so $\lim_n g_n(y)=0$. Now K is alg.closed by(10.3.8.16), so we can let $g_n(y)=c_n^\sharp$, so c_i converges to 0 in $C^\flat$. So $\{[c_n]\}$ converges to 0 in norm $|\cdot|_a$ and $|\cdot|_b$, so we can replace g_n by $g_n-[c_n]$ and assume $g_n(y)=0$.

Now the first part shows $g_n=\xi h_i$, and now h_i is a Cauchy sequence for both $|\cdot|_a$ and $|\cdot|_b$, so converges to some h, and then $g=\xi h$. □

Lemma (14.2.2.19). Given this lemma(14.2.2.18), we have a strategy of proving(14.2.2.13), that is, decomposing f,g into distinguished elements, but we need to show this decomposition is finite. And this is true:

If $f\neq 0\in B_{[a,b]}$, denote $\beta=-\log(b),\alpha=-\log(a)$ and let $N=\partial_-v_\beta(f)-\partial_+v_\alpha(f)\geq 0$, then f cannot be divisible by a product of $\xi_1,\ldots,\xi_{N+1}$ of $N+1$ distinguished elements.

Proof: By(4.5.4.20), if ξ is distinguished, then $v_s(\xi)=\max\{s,v(v_0)\}$. Now $v(v_0)=v(t^\sharp)=v(|p|_K)$ in $\mathcal{O}_K=A_{\inf}/([t]-up)$, so if K corresponding to ξ belongs to $Y_{[a,b]}$, then $v(v_0)\in[\beta,\alpha]$, so $\partial_-v_\beta(\xi)=1,\partial_+v_\alpha(\xi)=0$.

So if $f=\xi_1,\ldots,\xi_{N+1}u$, then $N(f)\geq\sum N(\xi_i)\geq N+1$. □

Lemma (14.2.2.20) [Valuation Funtion And Invertibility]. Let $C^\flat$ be alg.closed and $f\neq 0\in B_{[a.b]}$, then the following are equivalent:

- f is invertible.
- $\partial_-v_\beta(f)=\partial_+v_\alpha(f)$.
- $\mathrm{div}(f)\cap Y_{[a,b]}=\varnothing$.

Proof: $2\to 3$: by(14.2.2.19).

$1\to 2$: Because $N(f)+N(f^{-1})=0$, and $N(f)\geq 0, N(f^{-1})\geq 0$, so $N(f)=0$.

$2\to 1$: Assume first that $f=\sum_{n>>-\infty}[c_n]p^n\in A_{\inf}[\frac{1}{p},\frac{1}{[\pi]}]$, then the hypothesis just says that $s\to v_s(f)$ is linear in a small nbhd of $[\beta,\alpha]$, that is, there is a n_0 that $v(c_n)+ns>v(c_{n_0})+n_0 s$ for all $n\neq n_0$ and $s\in[\beta,\alpha]$.

Now we can normalize f that $n_0=0$ and $c_0=1$, so $|f-1|_\rho<1$ for all $\rho\in[\beta,\alpha]$, so $f-1$ is topologically nilpotent in $B_{[a,b]}$, and thus f is invertible.

Generally, f is a limit of a sequence $f_n\in A_{\inf}[\frac{1}{p},\frac{1}{[\pi]}]$, and by(14.2.2.8) we can assume the hypothesis holds for all f_n. Then f_n is invertible, and it is easily shown that f_n^{-1} is a Cauchy sequence in $B_{[a,b]}$, so converges to some f^{-1}.

$3\to 2$: Firstly, if $\partial_- v_\beta(f)>\partial_+ v_\alpha(f)$, then we must have $\partial_- v_\rho(f)>\partial_+ v_\rho(f)$ for some s, so wlog, we can assume $a=b=s$, and we need to show f vanishes at some point in $Y_{\exp(s)}$. Now combining with(14.2.2.18) and(14.2.2.19), this is equivalent to another statement that any element $y\in B_{[\rho,\rho]}$ has a decomposition $y=g\xi_1\ldots\xi_n$ where ξ_k corresponds to points in Y_ρ and g is invertible in B_ρ. The proof is finished at(14.2.2.30). □

Primitive Elements and the Proof of $3\to 2$ of The Lemma on Valuation Function and Invertibility

Def. (14.2.2.21). Let $C^\flat$ be alg.closed, an element in $B_{[\rho,\rho]}$ is called **good** iff it has a decomposition as in the proof of $3\to 2$ of(14.2.2.20).

Prop. (14.2.2.22) [Approximating Zero]. If f is a good element having n-zeros on Y_ρ, and $g\in B_\rho$ that $|f-g|_\rho<|f|_\rho$, then for any zero y of g on Y_ρ, there exists a zero y' of f on Y_ρ that $d(y',y)<\rho(\frac{|f-g|_\rho}{|g|_\rho})^{1/n}$.

Proof: $|f-g|_\rho\geq|(f-g)(y)|_K=|f(y)|_K$. Now $f=g\xi_1\ldots\xi_n$, and ξ corresponds to y_i, then

$$|f(y)|_K=|g(y)|_K|\xi_1(y)|_K\ldots|\xi_n(y)|_K=\frac{|f|_\rho}{\prod_i|\xi_i|_\rho}\prod_i d(y_i,y)=|f|\prod_i\frac{d(y_i,y)}{\rho}.$$

(Notice $|g|_\rho=|g(y)|_K$ because g is invertible(14.2.1.10)) and $d(y_i,y)\leq\rho$. So at least one ξ satisfies the desired inequality. □

Cor. (14.2.2.23). If $f\in B_\rho$ is given by a Cauchy sequence of good elements, and $\partial_- v_\rho(f)>\partial_+ v_\rho(f)$, then f has a root on Y_ρ.

Proof: By(14.2.2.7), passing to a subsequence, we may assume

$$v_s(f)=v_s(f_n),\quad \partial_- v_s(f)=\partial_- v_s(f_n),\quad \partial_+ v_s(f)=\partial_+ v_s(f_n),\quad |f_{n+1}-f_n|_\rho<|f|_\rho.$$

Let $n=\partial_- v_s(f)-\partial_+ v_s(f)>0$, then each f_i has exactly n roots on Y_ρ, and applying(14.2.2.22), we can find successively roots y_n of f_n that $d(y_{n+1},y_n)\leq\rho(\frac{|f_{n+1}-f_n|_\rho}{|f|_\rho})^{1/n}$, so the sequence $\{y_n\}$ is Cauchy and converges to some point $y\in\overline{Y}$, so

$$|f_i(y)|_K\leq|f_i|_\rho\frac{d(y_i,y)}{\rho}=|f|_\rho\frac{d(y_i,y)}{\rho}\to 0.$$

so $f(y)=0$. □

Def. (14.2.2.24) [Primitive Elements]. An element $f = \sum_{n\geq 0}[c_n]p^n \in A_{\inf}$ is called **primitive of degree** d if $c_0 \neq 0, |c_d| = 1$ for some smallest element d.

Clearly an element is distinguished of degree 1 iff it is distinguished and corresponds to an untilts of $X^\flat$ of char0.

Prop. (14.2.2.25).

- Any element $f \in A_{\inf}$ of finite Teichmuller expansion can be written uniquely as a $f = p^m[c]g$, where $c \in C^\flat$ and g is primitive.
- For an element $f \in A_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$, f can be written as $p^m[c]g$ iff $v_s(f)$ consists of f.m. line segments iff $\sup\{|c_n|\}$ is achieved by some n.
- If $f = gh$ in $A_{\inf}$ is primitive, then g, h are also primitive, and $\deg(f) = \deg(g) + \deg(h)$.

Prop. (14.2.2.26). Let $f = \sum[c_n]p^n \in A_{\inf}$ be primitive of degree $d > 0$, and let $\lambda \in (0,1)$ be the number that $s = -\log(\lambda)$ is the minimal number that $v_s(f)$ is non-differentiable at, i.e. s is -1 times the slope of the line segment on the left of $v(c_d)$. Then f has a zero on Y_λ.

Proof: By(14.2.2.27) there is a $y \in Y_\lambda$ that $|f(y_1)| \leq \lambda^{d+1}$, and then(14.2.2.28) shows we can find successively y_n that

$$d(y_n, y_{n+1}) \leq \lambda^{1+\frac{d}{n}}, \quad |f(\lambda_n)| \leq \lambda^{d+m}.$$

So y_n is a Cauchy sequence thus converges to some y, and then $f(y) = 0$. □

Lemma (14.2.2.27) [Lemma for Approaching a Zero]. If $C^\flat$ is alg.closed and $f \in A_{\inf}$ is primitive of degree $d > 0$, and let λ as in(14.2.2.26), then there is a point $y \in Y_\lambda$ that $|f(y)|_{K_y} \leq \lambda^{d+1}$.

Proof: Let $f = \sum[c_n]p^n$, we may assume $c_d = 1$, and let $F = x^d + c_{d-1}x^{d-1} + \ldots + c_0$, then the largest valuation of the roots of F on $C^\flat$ is λ, by Newton polygon. Let r be such a root, then c_i is divisible by r^{d-i}, and let $\xi = p - [r]$ be a distinguished element of $A_{\inf}$ and corresponds to an untilt K, then $|p|_K = \lambda$, and

$$p^{-d}f(y) = \sum_{n\geq 0} c_n^\sharp p^{n-d} \equiv \sum_{i=0}^{d} (\frac{c_i}{r^{d-i}})^\sharp \mod p = (r^{-d}F(r)) \mod p = 0$$

thus $f(y)$ is divisible by p^{d+1}, which is equivalent to $|f(y)|_K \leq \lambda^{d+1}$. □

Lemma (14.2.2.28) [Lemma for Approaching a Zero]. Situation as in(14.2.2.27), if $y \in Y_\lambda$ and $|f(y)| = \lambda^d \cdot \alpha$, then there is a y' that $d(y, y') \leq \lambda \cdot \alpha^{1/d}$ that $|f(y')| \leq \lambda^{d+1}\alpha$.

Proof: Since $A_{\inf}$ is ξ-complete and every element of $A_{\inf}/\xi \cong \mathcal{O}_K$ belongs to the image of $\sharp : \mathcal{O}_C^\flat \to \mathcal{O}_K$, thus by induction, we can write $f = \sum_{n\geq 0}[c_n]\xi^n$. Because f is primitive of degree d, we may assume $c_d = 1$, and $|c_0|_{C^\flat} = |f(y)|_K = \lambda^d\alpha$.

Let $F(x) = c_0 + c_1x + \ldots + c_{d-1}x^{d-1} + x^d$, because $C^\flat$ is alg.closed, let r be a root of minimal absolute value, then $|r|_{C^\flat}^m |c_m|_{C^\flat} \leq \lambda^n\alpha$, in particular $|r|_{C^\flat} \leq \lambda\alpha^{1/n}$. So let $\xi' = \xi - [r]$, then ξ is also distinguished, and $d(y', y) = |r|_{C^\flat} \leq \lambda\alpha^{1/n}$(14.2.2.10), and $d(0, y') = \lambda$, and $\xi(y') = r^\sharp$.

Now

$$\frac{(f(y'))^\sharp}{c_0^\sharp} = \sum_{n\geq 0} \frac{c_n^\sharp}{c_0^\sharp}\xi(y')^n = \sum_{n\geq 0}(\frac{c_n r^n}{c_0})^\sharp \equiv \sum_{i=0}^{n}(\frac{c_n r^n}{c_0})^\sharp \mod p = (\frac{F(r)}{c_0})^\sharp = 0,$$

So $|f(y')|_{K'} \leq |c_0^\sharp|_{K'}|p|_{K'} = |c_0|_{C^\flat}\lambda = \lambda^{d+1}\alpha$. □

Cor. (14.2.2.29) [Primitive Elements Decompose as Distinguished Elements]. If $f \in A_{\inf}$ is a primitive element of degree $d > 0$, then f admits a factorization as products of distinguished elements ξ corresponding to points in Y.

Proof: Use induction on d. If $d = 1$, then f is distinguished by(14.2.2.24), and if $d > 1$, then by(14.2.2.26), $f = \xi g$, so g is primitive of degree $d - 1$ by(14.2.2.25), so induction is finished. □

Prop. (14.2.2.30) [Finite Teichmuller Expansion is Good]. Any element of finite Teichmuller expansion is good.

In particular, because any element of B_ρ can be approximated by elements in $A_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$, and such element can be approximated by elements of finite Teichmuller expansion, by(14.2.2.23), we finishes the proof of $3 \to 2$ of(14.2.2.20).

Proof: If f has finite Teichmuller expansion, then $f = p^m[c]g$, where g is primitive of degree d. If $d = 0$, then g is invertible in $A_{\inf}$, thus f is invertible in B_ρ. Otherwise, we can use(14.2.2.29) to factorize g into distinguished elements, and the elements that corresponds to points outside Y_ρ is invertible in B_ρ because $v_s(\xi) = \max\{s, v(v_0)\}$ and $2 \to 1$ of(14.2.2.20), so f is good. □

Bounded Meromorphic Functions

Prop. (14.2.2.31). If $f \in B$, then $f \in A_{\inf}$ iff $|f|_\rho \le 1$ for any $0 < \rho < 1$.

Easily we can get characterization of f being in $A_{\inf}[\frac{1}{p}], A_{\inf}[\frac{1}{[t]}]$ or $A_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$.

Proof: One direction is trivial, for the other, by(14.2.2.32), we can find successively f_n that $f = \sum_{i<n}[c_i]p^i + f_n$, and $|f_n|_\rho \le \rho^n$ for all $0 < \rho < 1$. So f_n converges to 0 in any norm ρ, thus it converges to 0 in B, and $f = \sum_{n\ge 0}[c_n]p^n \in A_{\inf}$. □

Lemma (14.2.2.32). If $f \in B$ satisfies $|f|_\rho \le \rho^m$ for all $0 < \rho < 1$, then there is a $c \in \mathcal{O}_{C^\flat}$ that $f = [c]p^m + g$ that $|g|_\rho \le \rho^{m+1}$ for all $0 < \rho < 1$.

Proof: Replace f by $\frac{f}{p^m}$, we may assume $m = 0$. Choose a sequence f_i in $A_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$ converging to f in B, where $f_i = \sum_{n>>-\infty}[c_{n,i}]p^n$.

Firstly we want to truncate f_i with the positive part f_i^+. Notice for each ρ and any $0 < \varepsilon < 1$, because $\lim |f_i - f|_{\varepsilon\rho} = 0$, thus for i large, $|f_i|_{\varepsilon\rho} = |f|_{\varepsilon\rho} \le 1$, thus $|c_{-n,i}|_{C^\flat}\rho^{-n} \le \varepsilon^n < \varepsilon \le \varepsilon$, so $|f_i - f_i^+|_\rho < \varepsilon$ for i large, so $\lim f_i^+ = f$ also in B.

Secondly, $|c_{0,i} - c_{0,j}|_{C^\flat} \le |f_i - f_j|_\rho$ for each ρ, thus $c_{0,i}$ is Cauchy in $C^\flat$ thus converges to some $c \in C^\flat$, and when i is large, $|c_{0,i}|_{C^\flat} \le |f_i|_\rho = |f|_\rho \le 1$, so $c \in \mathcal{O}_{C^\flat}$. Now let $g_i = \sum_{n>0}[c_{n,i}]p^n$, then g_i is also Cauchy in B for any norm $|\rho|$ and converges to some g, and $f = g + [c]$.

It's left to check $|g|_\rho \le \rho$: each $v_s(g_i)$ has positive slopes, then so does $v_s(g)$ because by(14.2.2.7), $v_s(g_i)$ stablizes to $v_s(g)$ uniformly on compact intervals. So if $v_s(g) < s - \varepsilon$ for some s, then $v_\varepsilon(g) \le v_s(g) - (s - \varepsilon) < 0$, but this cannot happen because $v_\varepsilon(g) \le \max\{v_\varepsilon(f), -\log|c|_{C^\flat}\} \ge 0$. □

Eigenspaces of Frobenius

Prop. (14.2.2.33).

- The vector space $B^{\varphi=p^n}$ vanish for $n < 0$.
- The canonical map $\mathbb{Q}_p \to B^{\varphi=\mathrm{id}}$ is an isomorphism.

Proof: 1: Consider $v_{ps}(\varphi(f)) = pv_s(f)$(14.2.1.14), $v_s(p^n f) = ns + v_s(f)$, so if $\varphi(f) = p^n f$, then

$$pv_{s/p}(f) = v_s(\varphi(f)) = v_s(p^n f) = ns + v_s(f).$$

Let $h(s) = \partial_+ v_s(f)$, then $h(s/p) = n + h(s)$, but h must by non-increasing(14.2.2.6), so $n \geq 0$.

2: Firstly we prove $B^{\varphi=\mathrm{id}}$ is a field: by(14.2.2.15), it suffices to show that $\mathrm{div}(f) = 0$ for $f \neq 0 \in B^{\varphi=\mathrm{id}}$. If $\mathrm{div}(f) \neq 0$, because f is fixed by φ, so $\mathrm{div}(f) \geq \sum_{n\in\mathbb{Z}} \varphi^n(y)$ for some y, and $\sum_{n\in\mathbb{Z}} \varphi^n(y) = \mathrm{div}(\log([\varepsilon])$ for some $\varepsilon \in 1 + \mathfrak{m}_{C^\flat}$ because K is alg.closed and by (14.2.1.16). So by(14.2.2.15) again $f = g\log([\varepsilon])$, and $g \in B^{\varphi=p^{-1}}$ by(14.2.2.2), then $g = 0$ by item1.

3: From(14.2.2.34) and(14.2.2.31), $f \in A_{\inf}[\frac{1}{p}]$, thus $f = \sum_{n>>\infty}[c_n]p^n$, so $\varphi(f) = f$ shows $c_n^p = c_n$, which is equivalent to $c_n \in \mathbb{F}_p$. So $f \in W(\mathbb{F}_p)[\frac{1}{p}] = \mathbb{Q}_p$. □

Lemma (14.2.2.34). If $f \neq 0 \in B^{\varphi=\mathrm{id}}$, then there is an integer n that $|f|_\rho = \rho^n$.

Proof: Notice $|f|_\rho^p = |\varphi(f)|_{\rho^p} = |f|_{\rho^p}$, so $v_{ps}(f) = pv_s(f)$, differentiation shows that $\partial_- v_{ps}(f) = \partial_- v_s(f)$. This is for all $s < 0$, and $\partial_- v_s(f)$ is non-decreasing, thus it is constant, and $v_{ps}(f) = pv_s(f)$ shows $v_s(f) = ns$ for some integer n. □

Cor. (14.2.2.35). For $n \geq 0$, any element $f \in B^{\varphi=p^n}$ factors uniquely up to action of $\mathbb{Q}_p^*$ as $\lambda\log([\varepsilon_1])\ldots\log([\varepsilon_n])$ where $\lambda \in B^{\varphi=\mathrm{id}}$, $0 < |\varepsilon_i - 1| < 1$.

Proof: The existence is by(14.2.2.30)

For the uniqueness: it suffices to prove $\log([\varepsilon])$ is a prime element in $\oplus_{n\geq 0}B^{\varphi=p^n}$. For this, notice for any $f \in B^{\varphi=p^n}$, $\mathrm{div}(f)$ is fixed by φ, and $\mathrm{div}(\log([\varepsilon]))$ is a single orbit of φ, thus by(14.2.2.15), if $\log([\varepsilon])$ divides fg, then $\log([\varepsilon])$ divides f or g. □

Applications

Cor. (14.2.2.36). If $C^\flat$ is alg.closed, then every untilts K of $C^\flat$ belongs to the vanishing locus of $\log([x])$ for some $x \in C^\flat$ that $0 < |x - 1| < 1$, and the map

$$\psi : 1 + \mathfrak{m}_{C^\flat} \to K : y \mapsto \log(y^\sharp)$$

is surjective with kernel generated by x (as a $\mathbb{Q}_p$-subspace of $1 + \mathfrak{m}_{C^\flat}$).

Proof: By(10.3.8.16), any untilts of $C^\flat$ is alg.closed, thus it has a compatible p^n-th roots of unity. So it belongs to some locus of $\log([x])$ by(14.2.1.16). Now if $|z| < |p|_K^{1/(p-1)}$, then $z = \log(\exp(z))$, and $\exp = y^\sharp$ for some y because K is alg.closed. So ψ contains sufficiently small elements, but it is a map of $\mathbb{Q}_p$-vector spaces, thus it is surjective. For the kernel, if $\log(y^\sharp) = 0$, then $\log([y])$ vanish on K, thus by(14.2.1.16), y, x is in the same $\mathbb{Q}_p$-vector space. □

Cor. (14.2.2.37). If $C^\flat$ is alg.closed, then the map

$$1 + \mathfrak{m}_{C^\flat} \xrightarrow{\log([x])} B^{\varphi=p}$$

is an isomorphism.

Proof: Firstly any untilts of $C^\flat$ is alg.closed by(10.3.8.16). It is injective because of the correspondence(14.2.1.16), and for the surjectivity, for each $f \in B^{\varphi=\mathrm{id}}$, if $f = 0$, then $f = \log([1])$, and if $f \neq 0$, then notice $\mathrm{div}(f) \neq \varnothing$, because in this case f is invertible in B by(14.2.2.15), thus $f^{-1} \in B^{\varphi=p^{-1}}$, so $f^{-1} = 0$ by(14.2.2.33), contradiction.

Now if $\mathrm{ord}_K(f) \geq 1$, then $\mathrm{ord}_{\varphi^n(K)}(f) \geq 1$ for any $n \in \mathbb{Z}$ since $\varphi(f) = pf$. Consider $\mathrm{div}(\log([x])) = \sum_{n\in\mathbb{Z}} \varphi^n(K)$(14.2.2.17), then f is divisible by $\log([x])$ by(14.2.2.15), $f = \log([x])g$, then $g \in B^{\varphi=\mathrm{id}}$, then $g \in \mathbb{Q}_p^*$ by(14.2.2.33), thus $f = \log([x^g])$. □

Cor. (14.2.2.38) [Filtration on B_{dR}]. By(14.2.2.17) and(14.2.2.36), we see that for any untilt K of $C^\flat$, there is a unique up to $\mathbb{Q}_p$-constant ε that $t = \log([\varepsilon])$ is the uniformizer of $B_{\mathrm{dR}}(y)$. In fact, this ε can be to be $\varepsilon = (1, \xi_p, \ldots, x_{p^n}, \ldots)$, where ξ_{p^n} is a compatible roots of unity in the alg.closed field K.

Now we prefer to use the filtration $Fil^n = t^{-n}B_{\mathrm{dR}}^+$ on B_{dR} because it is $G_{\mathbb{Q}_p}$ invariant, as ε does.

Prop. (14.2.2.39). Let $C^\flat$ be alg.closed, then any point x of the Fargues-Fontaine curve X_{FF} that is not the generic point corresponds to the prime $x_K = (\log([\varepsilon]))$(14.2.2.35) where $K \in \mathrm{div}(\log([\varepsilon]))$(14.2.2.36). And the residue field of x_K can be identified to K.

Proof: By(14.2.2.35), we can cover X_{FF} by affine schemes of the form $\mathrm{Spec}(R_f = B[f^{-1}]^{\varphi=\mathrm{id}})$ for $f \in B^{\varphi=p}$, now for any prime $\mathfrak{p} \subset R_f$, let $\frac{g}{f^n} \in \mathfrak{p}$, then $g = \lambda \log([\varepsilon_1]) \ldots \log([\varepsilon_n])$, thus some $\frac{\log([\varepsilon])}{f} \in \mathfrak{p}$. Let K be a point that $\log([\varepsilon])$ vanish(14.2.1.16), then we claim $(\log([\varepsilon])/f)$ is maximal.

In fact, we may assume f doesn't vanish on K, otherwise $\log([\varepsilon])/f$ is a unit, then there is a map $\rho : B[f^{-1}]^{\varphi=1} \subset B[f^{-1}] \to K$, and this map is surjective with kernel $(\log([\varepsilon])/f)$: it is surjective even on $f^{-1}B^{\varphi=p}$ by(14.2.2.36), and if $\log([\varepsilon_1])/f$ is mapped to 0, then $\log([\varepsilon_1])$ differs from $\log([\varepsilon])$ by some Q_p^* by(14.2.1.16). □

Cor. (14.2.2.40). If $C^\flat$ is alg.closed, there is a bijection of sets:

$$Y/\varphi_{C^\flat}^{\mathbb{Z}} \cong \{\text{Closed points of } X_{FF}\}.$$

by(14.2.1.16).

Cor. (14.2.2.41). X_{FF} is a Dedekind scheme(5.4.2.14).

Proof: Let $\mathrm{Spec}(R_f = B[f^{-1}]^{\varphi=\mathrm{id}})$, two elements $f = \log([\varepsilon]), g = \log([\mu])$ can cover it. The proof of(14.2.2.39) shows that every prime ideals of R_f is maximal principal, in particular f.g, thus by(4.1.1.47), it is Noetherian. And it has Krull dimension 1 and it is regular because all of its maximal ideals are principal, hence normal(4.3.5.32). So X_{FF} is a Dedekind scheme. □

3 Line Bundles and Filtrations

Def. (14.2.3.1). By(14.2.2.35), the graded algebra $\oplus_{n\geq 0} B^{\varphi=p^n}$ is generated over $\mathbb{Q}_p$ by $B^{\varphi=p}$, so we can define the Serre twisting sheaf $\mathcal{O}(1)$ on X_{FF}, which is a line bundle, and on an open affine scheme $U = X - \{x\}$, where x corresponds to $\log([\varepsilon])$, $\mathcal{O}(1)(U) = (B[\frac{1}{\log([\varepsilon])}])^{\varphi=p}$. Similarly we can define $\mathcal{O}(m)$, and $\mathcal{O}(m) = \mathcal{O}(1)^m$.

Lemma (14.2.3.2). There is an isomorphism $\mathrm{Div}(X) \to \mathrm{Pic}(X)$ that maps each x to the inverse of its ideal sheaf(5.5.3.15)(4.3.5.20). And there is also a degree map $\mathrm{Div}(X) \to \mathbb{Z}$. Then:

$$\begin{array}{ccc} \mathrm{Div}(X) & \xrightarrow{\deg} & \mathbb{Z} \\ & \searrow & \downarrow \rho \\ & & \mathrm{Pic}(X) \end{array}$$

commutes.

Proof: It suffices to show that any $\mathcal{O}(x)$ is isomorphic to $\mathcal{O}(1)$. As $\log([\varepsilon])$ is a global section of $\mathcal{O}(1)$ that vanishes of order 1 at x, it induces an isomorphism $\mathcal{O}(1) \cong \mathcal{O}(x)$ by(5.5.3.15). □

Lemma (14.2.3.3) [Cohomology of Line Bundles]. For any integer m, $B^{\varphi=p^m} \to H^0(X, \mathcal{O}(m))$ is an isomorphism and $H^i(X, \mathcal{O}(m)) = 0$ for $i > 0, m > 0$.

Proof: This is trivial using Cech cohomology, as $\oplus_{n\geq 0} B^{\varphi=p^n}$ is PID, so X is separated. □

Prop. (14.2.3.4). The construction induces an isomorphism $\rho : \mathbb{Z} \cong \mathrm{Pic}(X) : m \mapsto \mathcal{O}(m)$.

Proof: By lemma(14.2.3.2), ρ is surjective because $\mathrm{Div}(X) \to \mathrm{Pic}(X)$ does, and it is injection because if $\mathcal{O}(m) \cong \mathcal{O}(n)$, then tensoring $\mathcal{O}(-m)$, we can assume $\mathcal{O} \cong \mathcal{O}(-k)$, but they have different global sections by lemma(14.2.3.3) and(14.2.2.33)(14.2.2.35). □

Harder-Narasimhan Filtration of Vector Bundles

Prop. (14.2.3.5)[Harder Narasimhan Formalism for Bun_X]. For a vector bundle L on X, we can define $\deg(L) = n$ iff $L \cong \mathcal{O}(n)$(14.2.3.2), and for a vector bundle E, define $\deg(E) = \deg(\wedge(E))$. And define the generic rank on the category of coherent sheaves on X. Then this is a Harder-Narasimhan formalism on $\mathcal{C} = \mathrm{Bun}_X$ with $\mathcal{A} = \mathcal{V}\mathrm{ect}_{K(X)}$.

Proof: Only the last axiom needs proof, but if $\mathcal{E}' \subsetneq \mathcal{E}$, notice $\wedge\mathcal{E}' \subsetneq \wedge\mathcal{E}$(The stalks are PID), so by taking their top exterior power product, we reduce to the case of line bundles.

But $\mathcal{O}(m)$ cannot map into $\mathcal{O}(n)$ if $m > n$ and must by isomorphism if $m = n$, by tensoring $\mathcal{O}(-m)$ and looking at global sections(14.2.3.3), so the assertion is true. □

Cor. (14.2.3.6). Every vector bundle $\mathcal{E}$ on X has a unique functorial Harder-Narasimhan filtration, by(3.2.4.22).

4 Base Change of Fields

Prop. (14.2.4.1) [Base Change]. Let $C^\flat$ be alg.closed. For any finite extension E of $\mathbb{Q}_p$ of degree n, $\mathrm{Spec}\, E \to \mathrm{Spec}\, \mathbb{Q}_p$ is finite étale, and finite locally free of degree n, so does $X_E = X \otimes_{\mathbb{Q}_p} E \to X$(5.6.2.24).

In particular, X_E is also a Dedekind scheme**?**. For any closed point x of X corresponding to an untilt K of $C^\flat$, which is alg.closed, the fiber of X_E over x is identical to the spectrum of $E \otimes_{\mathbb{Q}_p} K \cong K^n$ as K is alg.closed.

In this situation and use(14.2.2.40), we see that the closed points of X_E are in bijection with isomorphism classes of (K, ι, u) module φ-actions, where (K, ι) is an untilt of $C^\flat$, and $u : E \to K$ is an embedding of E into K over $\mathbb{Q}_p$, isomorphism classes of these triples are denoted by Y_E.

Prop. (14.2.4.2). By(14.2.4.1) and flat base change(5.7.5.1), we know $H^0(X_E, \mathcal{O}_{X_E}) = E$, in particular X_E is connected.

Lemma (14.2.4.3). If E is unramified of degree n over $\mathbb{Q}_p$, then $E \cong W(\mathbb{F}_{p^n})[\frac{1}{p}]$. In particular,

$$\mathrm{Hom}_{\mathbb{Q}_p}(E, K) \cong \mathrm{Hom}_{\mathbb{Z}_p}(W(\mathbb{F}_{p^n}), \mathcal{O}_K) \cong \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, \mathcal{O}_K/p) \cong \mathcal{O}_{C^\flat}/[t]) \cong \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)$$

where the last isomorphism is by Henselian lemma.

Therefore, $Y_E \cong Y \otimes \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)$, and

$$\text{Closed points of } Y_E \cong Y_E/\varphi^{\mathbb{Z}} \cong (Y \otimes \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C))/\varphi^{\mathbb{Z}} \cong Y/\varphi^{n\mathbb{Z}}.$$

Prop. (14.2.4.4). If E is unramified of degree n over $\mathbb{Q}_p$ and $U \neq X$ is an affine open defined by a homogenous element t, then

$$U_E = \mathrm{Spec}((B[t^{-1}] \otimes_{\mathbb{Q}_p} E)^{\varphi=\mathrm{id}}) = \mathrm{Spec}(B[t^{-1}]^{\varphi^n=1}).$$

where φ acts trivially on E.

Proof: Each $u \in \mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C^\flat)$ induces a map $W(\mathbb{F}_p) \to W(\mathcal{O}_{C^\flat}) = A_{\mathrm{inf}} \to B$, which extends to a map $\overline{u} : E \to B[t^{-1}]$. and induces a map $q_u : B[t^{-1}] \otimes_{\mathbb{Q}_p} E \to B[t^{-1}]$. Now

$$B[t^{-1}] \otimes_{\mathbb{Q}_p} E \to \prod_{\mathrm{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)} B[t^{-1}]$$

is an isomorphism, which is just because $x^{p^n} - x$ splits in $B[t^{-1}]$.

And under this isomorphism, the action of φ is

$$\varphi((f_0, \ldots, f_{n-1}) = (\varphi(f_{n-1}), \varphi(f_0), \ldots, \varphi(f_{n-2})),$$

so proposition is clear. □

Cor. (14.2.4.5). Fix now a finite extension $E/\mathbb{Q}_p$ with uniformizer π that has ramification degree e and inertia degree d, and E_0 is the maximal unramified subextension, then there are maps $E_0 \to B$ by(14.2.4.4), fix forever one of them p_u, this induces a map

$$B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E \to B[\frac{1}{t}] \otimes_{E_0} E$$

and this induces an isomorphism

$$(B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E)^{\varphi=\mathrm{id}} = (B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E_0)^{\varphi=\mathrm{id}} \otimes_{E_0} E = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=\mathrm{id}}$$

Def. (14.2.4.6)[Y_E^0]. Define $Y_E^0 \subset Y_E =$ triples (K, ι, u), where (K, ι) is an untilt of $C^\flat$, and $u : E \to K$ is an embedding that $u|_{E_0}$ is identical to $e_K \circ p_u : E_0 \to B \to K$. Notice Y_E^0 is not stable under the Frobenius, but it is stable under φ^d, and induces an isomorphism

$$Y_E^0/\varphi^{d\mathbb{Z}} \cong Y_E/\varphi^{\mathbb{Z}}.$$

Prop. (14.2.4.7). Notice for an element y of Y_E^0, the map $u : E \to K_y = B_{dR}^+(y)/\xi$ extends uniquely to a map $E \to B_{dR}^+(y)$ that is compatible with $e_K \circ p_u : E_0 \to B_{\mathrm{dR}}^+(y)$, because E is separable over E_0. i.e.

$$\begin{array}{ccc} E_0 & \xrightarrow{e_K\circ p_u} & B^+_{\mathrm{dR}}(y) \\ \downarrow & \overset{\widetilde{u}}{\nearrow} & \downarrow \\ E & \xrightarrow{u} & K \end{array}$$

Then this defines a map $B \otimes_{E_0} E \to B_{\mathrm{dR}}^+(y)$, also called the stalk map.

Prop. (14.2.4.8). For any finite extension $E/\mathbb{Q}_p$, the degree map $\deg : \mathrm{Pic}(X_E) \cong \mathbb{Z}$ is an isomorphism.

Proof: It suffices to show that $\mathcal{O}_{X_E}(x) \cong \mathcal{O}_{X_E}(x')$ for each pair of closed points x, x' of X_E.

We attempt to construct a line bundle $\mathcal{O}_{X_E}(1)$ on X_E that $\mathcal{O}_{X_E}(1)(U_E) = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=\pi}$, because $\mathcal{O}_{X_E}(U_E) = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=1}$.

We show simultaneously that $\mathcal{O}_{X_E}(1)$ is a line bundle and it is isomorphic to $\mathcal{O}_{X_E}(x)$ for any closed point $x \in X_E$: For any $x \in X_E$ corresponding to a φ^d-orbit of Y_E^0, let f be the element constructed by lemma(14.2.4.9) below, we show that for any affine open $U = D(t)$, multiplying by $f : \mathcal{O}_{X_E}(x)(U_E) \to \mathcal{O}_{X_E}(1)(U_E)(\star)$ is an isomorphism:

Notice $B \otimes_{E_0} E$ is free over B, let $N(f) \in B$ be its norm, the norm is local, so for each $y \in Y$, $N(f)_y = \prod_{\overline{y}} f_{\overline{y}}$, where $\overline{y} \in Y_E$ are over y, so it vanishes with order 1 in a φ^d-orbit of Y(order 1 because f only vanishes at $\overline{y}$ in the orbit corresponding to x), and then $N(f)\varphi(N(f))\ldots\varphi^{d-1}(N(f))$ vanishes at a single φ-orbit of Y with order 1, thus equals $u\log([\varepsilon])$ for some $\varepsilon \in \mathfrak{m}_{C^\flat}$, by(14.2.2.17)(14.2.2.13). In particular, y divides $\log([\varepsilon])$.

Now if $x \notin U_E$, then $\log([\varepsilon])$ divides t, so f divides t, thus f is invertible in $B[\frac{1}{t}] \otimes_{E_0} E$, thus $(\star)$ is an isomorphism.

Otherwise if $x \in U_E$, then choose some x' not in U_E, then the same argument shows that f' is invertible in $B[\frac{1}{t}] \otimes_{E_0} E$, so $f/f' \in (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi=\mathrm{id}}$ that vanishes with a single zero at x, so multiplying by f'/f defines an isomorphism $\mathcal{O}_{X_E}(U_E) \cong \mathcal{O}_{X_E}(x)(U_E)$, so it suffices to show the composition

$$\mathcal{O}_{X_E}(U_E) \xrightarrow{f'/f} \mathcal{O}_{X_E}(x)(U_E) \xrightarrow{f} \mathcal{O}_{X_E}(1)(U_E)$$

is an isomorphism, but this reduces to the first case. □

Lemma (14.2.4.9) [Uniformizer Existence]. If x be a closed point of X_E corresponding to an orbit of φ in Y_E thus an orbit S of φ^d in Y_E^0, then there is an element $f \in (B \otimes_{E_0} E)^{\varphi^d=\pi}$ that $\mathrm{ord}_{\overline{y}}(f) = 1$ if $\overline{y} \in S$, and 0 otherwise.

Proof: The map defined (14.2.4.18) composed with the Teichmuller section(14.2.4.16) in fact has image in $(B \otimes_{E_0} E)^{\varphi^n=\pi}$ because $[\pi] = \pi t + t^{p^n} = \varphi^n$ on $\mathcal{O}_{C^\flat}$, and it is an isomorphism of $\mathcal{O}_E$ modules. Now there are commutative diagrams:

$$\begin{array}{ccccc} G_{LT}(\mathcal{O}_{C^\flat}) & \xrightarrow{\sigma} & G_{LT}(A_{\mathrm{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\log_G} & B \otimes_{E_0} E \\ & & \downarrow & & \downarrow \\ & & G_{LT}(\mathcal{O}_K) & \xrightarrow{\log_G} & K \end{array}$$

The map $G_{LT}(\mathcal{O}_{C^\flat}) \to G_{LT}(\mathcal{O}_K)$ has kernel $\mathcal{O}_E u$ for some u, thus we can let $f = \log_G(\sigma(u))$, then the image of $f \in K$ is 0, which means f has a zero at the point $y \in Y_E^0$. And(14.2.4.13) shows the the zeros of f is just the φ^d-orbit containing y. □

Lubin-Tate Formal Groups and the Proof of the Lemma of Uniformizer

Prop. (14.2.4.10). The ring $B \otimes_{E_0} E$ is an integral domain.

Proof: Cf.[Lurie P95]. In fact this is the ramified Witt vector, which is by the same reason as before an integral domain, Cf.[FF Curve Johannes]. □

Cor. (14.2.4.11). If $f \neq 0 \in B \otimes_{E_0} E$, then $N_{E/E_0}(f) \neq 0 \in B$, in particular, the vanishing locus of f is finite.

Cor. (14.2.4.12). If $f, g \in B \otimes_{E_0} E$, then f is divisible by g iff for each $\overline{y} \in Y_E^0$, $\mathrm{ord}_{\overline{y}}(f) \geq \mathrm{ord}_{\overline{y}}(g)$.

Proof: If $\mathrm{ord}_{\overline{y}}(f) \geq \mathrm{ord}_{\overline{y}}(g)$, suppose $N_{E/E_0}(g) = gh$, then multiplying by h, we can assume $g \in B$. Now f is written uniquely as $f_0 + f_1\pi + \ldots + f_{e-1}\pi^{e-1}$ where $f_k \in B$, thus it suffices to show f_i is divisible by g, which is equivalent to $\mathrm{ord}_y(f) \geq \mathrm{ord}_y(g)$ for each $y \in Y$, by(14.2.2.15). Now if $\mathrm{ord}_y(g) = n$, the hypothesis shows f vanishes in

$$\prod_{\overline{y}\to y} B_{\mathrm{dR}}^+(y)/\xi^n = (B_{\mathrm{dR}}^+(y)/\xi^n) \otimes_{E_0} E = B_{\mathrm{dR}}^+(y)/\xi^n + \pi B_{\mathrm{dR}}^+(y)/\xi^n + \ldots + \pi^{e-1} B_{\mathrm{dR}}^+(y)/\xi^n$$

thus $\mathrm{ord}_y(f) \geq n = \mathrm{ord}_y(g)$. □

Cor. (14.2.4.13). If $f \in (B \otimes_{E_0} E)^{\varphi^n = \pi}$, then the vanishing locus of f is a single φ^d-orbit, and all zeros are simple.

Proof: Set $N_{E/E_0}(f) = f'$ and $N_{E/E_0}(\pi) = \pi'$, then f belongs to $B^{\varphi^d = \pi'}$, and its divisor is just the image of divisor of f in Y_E^0. So it suffices to show that f' vanishes on a single $\varphi^{d\mathbb{Z}}$-orbit.

Now for $0 < \rho < 1$,

$$\rho^{p^d} |f'|_{\rho^{p^d}} = |\pi' f'|_{\rho^{p^d}} = |f'^{\varphi^d}|_{\rho^{p^d}} = |f'|_\rho^{p^d},$$

thus

$$p^d s + v_{p^d s}(f') = p^d v_s(f')$$

for each $s > 0$, differentiating, we get

$$1 + \partial_- v_s(f') = \partial_- v_s(f')$$

Now the divisor of f' is $\varphi^{d\mathbb{Z}}$-invariant, and it has exactly one zero on any annulus $(\rho^n, \rho]$(14.2.2.19), thus its divisor is a single φ^d-orbit. □

Def. (14.2.4.14)[Universal Lubin-Tate Formal Group]. Recall that if E is a finite extension of Q_p with uniformizer π, for a $\mathcal{O}_E$-algebra A complete w.r.t π, $G_{LT}(A)$ is the Lubin-Tate formal group, with elements the topological nilpotent elements of A3.

Now we define the **universal cover of Lubin-Tate formal group** $\widetilde{GT}$ as the functor

$$A \mapsto \lim\{\cdots \xrightarrow{[\pi]} G_{LT}(A) \xrightarrow{[\pi]} G_{LT}(A)\}.$$

Prop. (14.2.4.15).

- Notice for K an alg.closed extension of E, $G_{LT}(\mathcal{O}_K)$ is in bijection with $\mathfrak{m}_K$, and the kernel of $[\pi^n]$ on $G_{LT}(\mathcal{O}_K)$ has order $\mathcal{O}_E/\pi^n$, thus the kernel of $\widetilde{G}_{LT}(\mathcal{O}_K) \to G_{LT}(\mathcal{O}_K)$ is a 1-dimensional $\mathcal{O}_E$-module.
- If π vanishes on A and A is perfect, then $[\pi] = \pi t + t^q = t^q$ on A, so it is just the Frobenius, and $\widetilde{G}_{LT}(A) \to G_{LT}(A)$ is a bijection.
- $\widetilde{G}_{LT}(A) \to \widetilde{G}_{LT}(A/I)$ is an isomorphism for $\pi \in I$ and A is I-adic.
- $\widetilde{G}_{LT}(A) \to \widetilde{G}_{LT}(A/I)$ is an isomorphism for any ideal I that $I + (\pi) \neq (1)$, because both of them is isomorphic to $\widetilde{G}_{LT}(A/(I + (\pi))$.

Proof: For 3, it suffices to prove that $\widetilde{G}_{LT}(A/I^{n+1}) \to \widetilde{G}_{LT}(A/I^n)$ for $n \geq 1$. Notice $F(u,v) \equiv u+v \mod I^{2n}$, so we have an exact sequence

$$0 \to I^n/I^{n+1} \to G_{LT}(A/I^{n+1}) \to G_{LT}(A/I^n) \to 0.$$

In particular the kernel is annihilated by π, so there is a commutative diagram

$$\begin{array}{ccccc} \cdots \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) \\ \nearrow & \downarrow & \nearrow & \downarrow \\ \cdots \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) \end{array}$$

which show that $\widetilde{G}_{LT}(A/I^{n+1}) \cong \widetilde{G}_{LT}(A/I^n)$. □

Cor. (14.2.4.16) [Teichmuller Section]. Consider the $\mathcal{O}_E$-algebra $A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E$. Because there are isomorphism $\mathcal{O}_{E_0}/p \cong \mathcal{O}_E/\pi$, we have an isomorphism

$$C^\flat \cong A_{\text{inf}}/p \cong (A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)/\pi$$

Now(14.2.4.15) shows the diagram

$$\begin{array}{ccc} \widetilde{G}_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\cong} & \widetilde{G}_{LT}(\mathcal{O}_{C^\flat}) \\ \downarrow & & \downarrow \cong \\ G_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \longrightarrow & G_{LT}(\mathcal{O}_{C^\flat}) \end{array}$$

So the lower horizontal map is surjective, and it even has a canonical section σ, called the **Teichmuller section**.

Cor. (14.2.4.17). Given a point of Y_E^0 which corresponds to an untilt of $C^\flat$ together with a E_0-map $E \to K$, then this gives a commutative diagram

$$\begin{array}{ccc} \widetilde{G}_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\cong} & \widetilde{G}_{LT}(\mathcal{O}_K) \\ \downarrow & & \downarrow \\ G_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \longrightarrow & G_{LT}(\mathcal{O}_K) \end{array}$$

where the right vertical arrow is surjective with kernel free of rank 1 over $\mathcal{O}_E$. So this together with(14.2.4.16) shows there is a surjection $G_{LT}(\mathcal{O}_{\mathcal{O}_{C^\flat}}) \to G_{LT}(\mathcal{O}_K)$ with kernel a rank-1 $\mathcal{O}_E$-module.

Prop. (14.2.4.18). There is a canonical $\mathcal{O}_E$-module map

$$G_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) \xrightarrow{\log_G} B \otimes_{E_0} E.$$

and it is equivariant w.r.t φ.

Proof: $G_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)$ are in bijection with the maximal ideal of $A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E$, and $\log_G(x)$ is of the form $x + \frac{c_2}{2}x^2 + \ldots + \frac{c_n}{n}x^n + \ldots$, with $c_n \in \mathcal{O}_E$.

Now for $x \in G_{LT}(A_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)$, we show that $\log_G(x)$ converges in $B \otimes_{E_0} E = B + \pi B + \ldots + \pi^{e-1}B$: Let $c_n x^n = \sum a_{n,i}\pi^i$, then we need to show $a_{n,i}/n$ converges to 0 for each of the norm $|\cdot|_\rho$. And this is because if $x = x_0 + \pi y_0$, then for $n \geq em$, $|x|_\rho \leq \max\{|x_0|_\rho^{em}, \rho^m$, which decays exponential in n, and $|\frac{1}{n}|_\rho$ decays linearly in n. □

Prop. (14.2.4.19). The map $\log_G(\sigma(\cdot)) : G_{LT}(\mathcal{O}_{C^\flat}) \to (B \otimes_{E_0} E)^{\varphi^n=\pi}$ as in(14.2.4.9) is an isomorphism.

Proof: For surjectivity, as any $f \in (B \otimes_{E_0} E)^{\varphi^n=\pi}$ vanishes at a single $\varphi^{d\mathbb{Z}}$-orbit, then by(14.2.4.9) we can find a $\log_G(u)$ that vanishes at the same locus, so $f = \log(u)\lambda$ where λ is a unit in $B \otimes_{E_0} E$(14.2.4.12), so

$$\lambda \in (B \otimes_{E_0} E)^{\varphi^n=\mathrm{id}} = (B \otimes_{\mathbb{Q}_p} E)^{\varphi=\mathrm{id}}(14.2.4.5) = B^{\varphi=\mathrm{id}} \otimes_{\mathbb{Q}_p} E = E.$$

For injectivity, we proved in(14.2.4.9) that each $\log_G(\sigma(u))$ only vanishes at a single φ^d-orbit in Y_E^0, so it cannot by 0, which vanishes at all points. □

Cor. (14.2.4.20). There are canonical bijections

$$\{\text{Closed Points of } X_E\} \cong \{\varphi^{d\mathbb{Z}}\text{orbits of } Y_E^0\} \cong ((B \otimes_{E_0} E)^{\varphi^n=\pi} - \{0\})/E^* \cong (G_{LT}(\mathcal{O}_{C^\flat}) - \{0\}/E^*$$

by(14.2.4.9)(14.2.4.19),(14.2.4.12).

Vector Bundles and Base Change

Prop. (14.2.4.21) [Vector Bundles on the Cover]. Let $\pi : X_E \to X$ be the covering map, for any vector bundle $\mathcal{E}$ on X_E, $\pi_*(\mathcal{E})$ is a vector bundle on X, and this induces an isomorphism

$$\{X_E\text{-Bundles}\} \cong \{X - \text{Bundles with an } E\text{-action}\}.$$

Now define $\deg(\mathcal{E}) = \deg(\pi_*\mathcal{E})$, and $\mathrm{slope}(\mathcal{E}) = \frac{\deg(\mathcal{E})}{\mathrm{rank}(\mathcal{E})} = \frac{1}{n}\mathrm{slope}(\pi_*\mathcal{E})$.

Then $\mathcal{E}$ is semistable of slope λ iff $\pi_*\mathcal{E}$ is semistable of slope λ/n.

Proof: One direction is clear, for the other, if $\mathcal{F} = \pi_*\mathcal{E}$ is not semistable, choose its HN-filtration, then $\lambda_1 > \lambda/n$. Now the action of E on $\mathcal{F}$ preserves the HN-filtration, thus $\mathcal{F}_1$ is an E-vector bundle, thus by the correspondence above, $\mathcal{F}_1 = \pi_*\mathcal{E}'$ for some subbundle $\mathcal{E}' \subset \mathcal{E}$, and clearly this contradicts the semistablity of $\mathcal{E}$. □

Cor. (14.2.4.22). For any integral number d, n with $n > 0$, there exists a semistable vector bundle on X with rank n and degree d.

Proof: Let E be an extension of $\mathbb{Q}_p$ of degree n, then $\pi_*(\mathcal{O}_{X_E}(d))$ is semistable of rank n and degree d, by(14.2.4.1)(5.6.2.23), because $\mathcal{O}_{X_E}(d)$ is a line bundle(14.2.4.8) so clearly semistable, and it is of degree d because **?**. □

Isocrystals and Classification of Semistable Vector Bundle over X

Remark (14.2.4.23). Recall the Dieudonné-Manin Classification(7.6.4.10)(7.6.4.13): Any isocrystal over k is a finite sum of modules pure of slopes λ_i. And if k is alg.closed, then any isocrystal over k has a unique decomposition as sums of E_{λ_i}.

Prop. (14.2.4.24). Let $k = \overline{\mathbb{F}}_p \in C^\flat$, then there is an inclusion $W(k) \to A_{\mathrm{inf}}$, which extends to a map $K \to B$. Now given an isocrystal V over k, denote $\mathcal{E}_V$ the coherent sheaf on X defined by the graded module $\oplus_{n\geq 0} \mathrm{Hom}_K(V, B)^{\varphi=p^n}$. In other words, on an affine open subscheme $U = D(t)$, $\mathcal{E}_V(U) = \{\varphi - \text{equivariant } K\text{-linear maps } V \to B[\frac{1}{t}]\}$.

And when $V = E_{m/n}$ is the simple isocrystal, then $\mathcal{E}_V$ is denoted by $\mathcal{O}(\frac{m}{n})$.

Prop. (14.2.4.25). In fact we have $\mathcal{O}(\frac{m}{n})(U) \cong (B[t^{-1}])^{\varphi^n=p^m} = (\rho_*\mathcal{O}(m))(U)$, where $\rho : X_E \to X$, and E is an unramified extension of $\mathbb{Q}_p$.

Prop. (14.2.4.26)[Classification of Semistable Vector Bundles over X]. For every vector bundle on X, the HN-filtration splits non-canonically, and the construction $V \to \mathcal{E}_V$ induces an equivalence of categories between

$$\{\text{Isoclinic Isocrystals of slope } \mu\}^{\text{op}} \to \{\text{Semistable vector bundles on } X \text{ of slope } \mu\}$$

Proof: Cf.[FF Curve Johannes].**?** □

Cor. (14.2.4.27). Any two semistable vector bundles of slope λ over X is isomorphic, and a semistable vector bundle of slope 0 is trivial.

Prop. (14.2.4.28). If $\mathcal{E}, \mathcal{E}'$ be semistable vector bundles on X of slopes μ, μ', then $\mathcal{E} \otimes \mathcal{E}'$ is semistable of slope $\mu + \mu'$.

Proof: We can assume $\mathcal{E} = \rho_*\mathcal{O}_{X_E}(d)$ for an unramified extension $E/\mathbb{Q}_p$ by(14.2.4.27), and then $\mathcal{E} \otimes \mathcal{E}' = \rho_*(\mathcal{O}_X(d) \otimes \rho^*\mathcal{E}')$. Since ρ_*, ρ^* preserves semistability(by(14.2.4.21) and**?**). So it suffices to prove $\mathcal{O}(d) \otimes -$ preserves semistablity, but this is clear, as $\mathcal{O}(d)$ shifts degree. □

Diamonds Definitions

Def. (14.2.4.29)[Diamond]. Let Perf denote the site of perfectoid spaces of characteristic p equipped with the pro-étale topology. A **diamond** X is a sheaf (of sets) on Perf of the form $X = Hom_{Perf}(,Z)/R$, where $Z \in Perf$ and $R \in Z \times Z$ is a reasonable representable equivalence relation.

Prop. (14.2.4.30)[Scholze]. Let $\underline{R} = (R, R^+)$ be a Huber pair, then

$$\text{Spd}(\underline{R}) = \mathcal{Z} \mapsto \{\text{untilts of} \text{Spa}(\underline{R}) \text{ over } Z\}$$

is a diamond.

And this construction can be glued to give diamond $X^\diamond$ of any adic space X, which is a sheaf.

Def. (14.2.4.31)[Adic Fargues-Fontaine Curve]. Let $\mathcal{Y}$ be the adic space $\text{Spa}(A_{\text{inf}})$ removing the vanishing locus of p and $[t]$, then by what we proved, the Frobenius act totally discontinuous on $\mathcal{Y}$, thus the quotient $\mathcal{X}^{FF}$ is an adic space, the FF-curve.

Prop. (14.2.4.32). There is an isomorphism of diamonds:

$$\mathcal{Y}^\diamond \cong \text{Spd}(C^\flat) \times \text{Spd}(\mathbb{Q}_p), \quad \mathcal{X}^{FF,\diamond} \cong \text{Spd}(C^\flat)/\varphi^{\mathbb{Z}} \times \text{Spd}(\mathbb{Q}_p)$$

More generally, over any Huber pair $\underline{R}$, there is a relative FF-curve which is defined by

$$\text{Spd}(\underline{R}) \times \text{Spd}(\mathbb{Q}_p)/\varphi^{\mathbb{Z}}$$

Proof: $C^\flat$ is a perfectoid of char$p$, so for a perfect Huber pair, $\underline{S}$ point of $C^\flat$ is just a morphism $u : (C^\flat, \mathcal{O}_{C^\flat} \to (S, S^+)$. And a $\mathbb{Q}_p$ point is just a char0 untilts $\underline{T}$ of $\underline{S}$.

So for each pairs (T, u), we need to find a morphism $A_{\text{inf}}[\frac{1}{p}, \frac{1}{[t]} \to T$. For this, consider

$$A_{\text{inf}} = W(\mathcal{O}_{C^\flat}) \to W(S^+) \cong W(T^\flat) \xrightarrow{\theta_T} T$$

This is a bijection, as we proved in the beginning(14.2.1.2). □

Prop. (14.2.4.33). There is a morphism of ringed spaces $\mathcal{X}^{FF} \to X^{FF}$ that regard $\mathcal{X}^{FF}$ as the rigid analytification of $\mathcal{X}$, so they have the same category of vector bundles and cohomology, prove by Kedlaya-Liu.

5 Applications

Prop. (14.2.5.1). The FF curve X is geometrically simply connected, i.e. the projection defines an isomorphism of étale groups $\pi_1(X) \to \pi_1(\operatorname{Spec}\mathbb{Q}_p) = \mathrm{Gal}_{Q_p}$.

Equivalently, the pullback defines an equivalence of étale sites.

Proof: Let $\widetilde{X} \to X$ be an finite étale morphism, we want to prove that $\widetilde{X} = X \otimes_{\operatorname{Spec}\mathbb{Q}_p} \operatorname{Spec}(E)$ for some étale $\mathbb{Q}_p$-algebra. Let $\mathcal{A} = \rho_* \mathcal{O}_{\widetilde{X}}$, and $E = H^0(X, \mathcal{A}) = H^0(\widetilde{X}, \mathcal{O}_{\widetilde{X}})$. Now it suffices to show $\mathcal{A} = E \otimes_{\mathbb{Q}_p} \mathcal{O}_X$, which shows $\widetilde{X} = X \otimes_{\operatorname{Spec}\mathbb{Q}_p} \operatorname{Spec}(E)$, and forces E be an étale $\mathbb{Q}_p$-algebra by fpqc descent?. Equivalently, $\mathcal{A}$ is trivial, and this is equivalent to $\mathcal{A}$ being semistable of slope 0 by(14.2.4.27).

Because ρ is finite étale, the trace pairing $\mathcal{A} \times \mathcal{A} \to \mathcal{A} \xrightarrow{tr} \mathcal{O}_X$ is non-degenerate(check on stalks), which induces an isomorphism $\mathcal{A} \cong \mathcal{A}^\vee$, so $\deg(\mathcal{A}) = 0$, and if $\mathcal{A}$ is not semistable, let $\mathcal{A}'$ be the first term of the HN-filtration of $\mathcal{A}$, then it is of slope $\lambda > 0$, So $\mathcal{A}' \otimes \mathcal{A}'$ is of slope 2λ by(14.2.4.28), so the composite $\mathcal{A}' \otimes \mathcal{A}' \hookrightarrow \mathcal{A} \otimes \mathcal{A} \to \mathcal{A}$ must by 0(3.2.4.32), which is impossible, because if U is an affine open that $\mathcal{A}$ has a section, then this says $U \otimes_X \widetilde{X}$ has a section s that $s^2 = 0$. But $U \otimes_X \widetilde{X}$ is reduced(check on stalks). □

Cor. (14.2.5.2).

- The projection map induces equivalence of categories between Finite Abelian groups with $Gal(Q_p)$-action and étale Local system on X.
- If M is a finite Abelian group with a $Gal(\mathbb{Q}_p)$-action, then
$$H^*(Gal(\mathbb{Q}_p), M) \to H^*_{\acute{e}t}(X, u^*M)$$
is an isomorphism for $* = 0, 1$.

Proof: 1 is trivial, and 2 Cf. [Lurie P102]. □

6 Weakly Admissible⇒Admissible

Def. (14.2.6.1) [Notations]. Let K be a finite extension of $\mathbb{Q}_p$, and $K_0 = W(k)[\frac{1}{p}]$ be the maximal unramified subextension in K, let $C = \widehat{\overline{K}}$ and $F = C^\flat$. Denote by $\infty \in X$ the closed point determined by C, which is just the vanishing locus of the Galois stable line $\mathbb{Q}_p t$, where $t = \log([\varepsilon])$ and $\varepsilon = (1, \xi_p, \xi_{p^2}, \ldots) \in C^\flat$(14.2.2.36).

Notice G_K acts on $\mathbb{Q}_p \log([\varepsilon])$ by the cyclotomic character χ_{cycl}. Recall
$$B^+_{\mathrm{dR}} = \widehat{\mathcal{O}}_X(\infty), \quad B^+_{\mathrm{crys}}, \quad B_{\mathrm{crys}} = B^+_{\mathrm{crys}}[t^{-1}], \quad B_e = H^0(X - \{\infty\}, \mathcal{O}_X) = (B_{crys})^{\varphi = \mathrm{id}}$$

Def. (14.2.6.2) [Equivariant Action of G_K on Vector Bundles]. Recall an equivariant action of G_K on a bundle $\mathcal{E}$ on X is a data of isomorphisms $\sigma^*(\mathcal{E}) \cong E$ that $c_{\sigma\tau} = c_\tau \circ \tau^*(c_\sigma)$. Notice any equivariant action of G_K on $\mathcal{E}$ induces a semilinear G_K action on $\mathcal{E}^\wedge_\infty = \mathcal{E} \otimes_{\mathcal{O}_X} B^+_{\mathrm{dR}}$, and here we require this action is continuous. The category of equivariant G_K-bundles are denoted by $Bun_X^{G_K}$.

Cor. (14.2.6.3). By the slope 0 case of the classification of vector bundles on X(14.2.4.26) and(15.4.5.1), we see that the functor:
$$\mathrm{Rep}_{\mathbb{Q}_p} G_K \to \mathrm{Bun}_X^{G_K} : V \mapsto V \otimes_{\mathbb{Q}_p} \mathcal{O}_X$$
is fully faithful with essential image the category $\mathrm{Bun}_X^{G_K, sst, 0}$ of all G_K vector bundles on X that the underlying bundle is semistable of slope 0, i.e. trivial(14.2.4.27).

Prop. (14.2.6.4). There is a pullback diagram of categories:

$$\begin{array}{ccc} \varphi-FilMod_{K/K_0} & \longrightarrow & \varphi-Mod_{K_0} \\ \downarrow{\scriptstyle \mathcal{E}(-)} & & \downarrow{\scriptstyle \mathcal{V}} \\ \mathrm{Bun}_X^{G_K} & \longrightarrow & \mathrm{Rep}_{B_e} G_K \end{array}$$

Where $\mathcal{E}(-)$ maps a φ-filtered module (D, φ_D, Fil) to the bundle that is the bundle $\widetilde{(D, \varphi_D)}$ modified so that the fiber at ∞ is $Fil^0(D_K \otimes_K B_{\mathrm{dR}})$.

Proof: 1: By lemma(15.4.4.9), $\varphi - FilMod_{K/K_0}$ is equivalent to a φ-module V with a G_K-stable B_{dR}^+-lattice in $(V \otimes_{K_0} K) \otimes_K B_{\mathrm{dR}}^+ = V \otimes_{K_0} B_{\mathrm{dR}}^+$.

2: By(15.4.7.5), φ-Mod is a full subcategory of $\mathrm{Rep}_{B_e} G_K$, where the G_K-stable B_{dR}^+-lattice is choose to be $V \otimes_{K_0} B_{\mathrm{dR}}^+$.

3: Clearly there is a functor

$$Bun_X^{G_K} \to \mathrm{Rep}_{B_e} G_K : \mathcal{E} \to H^0(X - \{\infty\}, \mathcal{E}).$$

, and(5.4.2.15) says in this case $Bun_X^{G_K}$ is equivalent to a B_e-module with continuous G_K-actions and and a B_{dR}^+-module with continuous G_K-actions that they corresponds as a B_{dR}-module with continuous G_K-actions.

4: The compatibility in 3 just says that the B_{dR}^+-lattice choosen in the definition of(15.4.4.11) just comes from that of 2, so this diagram is clearly a pullback. □

Lemma (14.2.6.5). Let $FilV \in VectFil_K$ and $W = Fil(V \otimes_K B_{\mathrm{dR}})$, if $V \otimes B_{\mathrm{dR}}^+ = \{e_1, \ldots, e_n\}$ and $Fil^0(V \otimes_K B_{\mathrm{dR}}) = \{t^{-a_1} e_1, \ldots, t^{-a_n} e_n\}$, then the Hodge polygon of $FilV$ has slopes $(a_1, \ldots, a_n)$.

Proof: Use(15.4.4.9), notice $(t^a B_{\mathrm{dR}}^+)^{G_K} = 0$ for $a > 0$, as in the proof of(15.4.4.8). □

Lemma (14.2.6.6). The functor

$$\mathcal{E}(-) : \varphi - FilMod_{K/K_0} \to Bun_X^{G_K}$$

defined in(14.2.6.4) preserves degree and HN-filtration, where the HN-filtration on the RHS is induces by the HN-filtration on Bun_X by canonicity.

Proof: $\deg(\mathcal{E}((D, \varphi_D, Fil)) = \deg(\mathcal{E}(D, \varphi_D)) - \dim_K[D \otimes_{K_0} B_{\mathrm{dR}}^+ : Fil^0(D_K \otimes_K B_{\mathrm{dR}})]$ $= \deg(D_K, Fil) - \deg(D, \varphi_D)$.

Now the degree correspond, for the invariance of HN-filtration, it suffices to prove the subobjects are in bijection: Given a subobjects of $\mathcal{E}(V)$, we want to show it is a $\mathcal{E}(V')$, but this is because on the affine open $\mathrm{Spec}(B_e)$, by(15.4.7.5) any subbundle is also crysatalline, i.e. comes from $\varphi - Mod_{K_0}$. □

Prop. (14.2.6.7) [Weakly Admissible implies Admissible]. The category of crystalline Galois representations of G_K is equivalent to the category $\varphi - FilMod^{wa}_{K/K_0}$ of weakly admissible filtered φ-modules for K.

Proof: By definition of weakly admissible and(14.2.6.6), there is a pullback diagram

$$\begin{array}{ccc} \varphi-FilMod^{wa}_{K/K_0} & \longrightarrow & \varphi-FilMod_{K/K_0} \\ \downarrow & & \downarrow{\scriptstyle \mathcal{E}(-)} \\ \mathrm{Rep}_{\mathbb{Q}_p} G_K \cong Bun_X^{G_K, sst, 0} & \longrightarrow & Bun_X^{G_K} \end{array}$$

Adjunction with(14.2.6.4), we get another pullback diagram

$$\begin{array}{ccccc} \varphi - FilMod^{wa}_{K/K_0} & \longrightarrow & \varphi - FilMod_{K/K_0} & \longrightarrow & \varphi - Mod_{K_0} \\ \downarrow & & \downarrow \mathcal{E}(-) & & \downarrow \mathcal{V} \\ \mathrm{Rep}_{\mathbb{Q}_p} G_K \cong Bun_X^{G_K, sst, 0} & \longrightarrow & Bun_X^{G_K} & \longrightarrow & \mathrm{Rep}_{B_e} G_K \end{array}$$

But this pullback is just the category of crystalline representations: by(14.2.6.3), for $V \in \mathrm{Rep}_{\mathbb{Q}_p} G_K$, the condition $\mathcal{V}(\mathcal{D})(M) \cong M$ in(15.4.7.5) is just saying that V is in the image of $\mathcal{V}$ iff

$$(V \otimes_{\mathbb{Q}_p} B_{crys})^{\varphi=\mathrm{id}} \otimes_{B_e} B_{crys} \cong V \otimes_{\mathbb{Q}_p} B_{crys}$$

which is equivalent to V being crystalline. □

14.3 p-adic Hodge Theory

Main references are [Berger, Galois representations and (φ,Γ)-modules], [Car19]. and [notes on p-adic Hodge, Conrad]. [notes on p-adic Hodge, Serin Hong].

Notation (14.3.0.1).

- Use notations from p-adic Local Galois Representations.

1 C_{dR}-Theorem

Thm. (14.3.1.1) [C_{dR}, Faltings/Tsuji]. If $X\in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$, then for any $r\in\mathbb{N}$, there exists a canonical isomorphism

$$\gamma_{\mathrm{dR}}(X): B_{\mathrm{dR}}\otimes_K H^r_{\mathrm{dR}}(X/K)\cong B_{\mathrm{dR}}\otimes_{\mathbb{Q}_p}\mathrm{H}^r_{\text{ét}}(X_{\overline{K}},\mathbb{Q}_p).$$

which identifies filtrations and Gal_K-actions on both sides. Moreover γ_{dR} is functorial in X.

Proof: Cf.[Faltings, p-adic Hodge Theory]. or [p-adic Hodge for Rigid Analytic Varieties, Scholze], [BMS18]P104. □

Cor. (14.3.1.2) [deRham Comparison for Étale Cohomologies]. $\mathrm{H}^r_{\text{ét}}(X_{\overline{K}},\mathbb{Q}_p)\in\mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, and

$$H^r_{\mathrm{dR}}(X)\cong D_{B_{\mathrm{dR}}}(\mathrm{H}^r_{\text{ét}}(X_{\overline{K}};\mathbb{Q}_p)),\quad H^{n-p}(X;\Omega^p_X)\cong \mathrm{gr}^p H^r_{\mathrm{dR}}(X).$$

Also by taking the gradation of(14.3.1.1), by(15.4.5.5), there is a Hodge-like decomposition

$$\mathbb{C}_K\otimes_{\mathbb{Q}_p}\mathrm{H}^r_{\text{ét}}(X_{\overline{K}},\mathbb{Q}_p)\cong\bigoplus_{a+b=r}\mathbb{C}_K(-a)\otimes_K H^b(X,\Omega^a_X).$$

This shows we can recover the de Rham cohomology of X from the étale cohomology, and the Hodge-Tate weights of $\mathrm{H}^r_{\text{ét}}(X_{\overline{K}},\mathbb{Q}_p)$ lies in in $[-r,0]$.

Example (14.3.1.3) [Elliptic Curve Case, Tensoring $\mathbb{C}_K$ Lost Informations]. For $E\in\mathcal{E}\mathrm{ll}/K$ with multiplicative reduction and $j(E)>1$, by(13.9.5.11) and(13.9.5.9),

$$E(\overline{K})\cong\overline{K}^\times/q^{\mathbb{Z}}$$

as Gal_K-representations for some $q\in K^\times$. Thus $T_p(E)\cong q^{\mathbb{Q}_p/\mathbb{Z}_p}$ and there exists an exact sequence

$$0\to\mathbb{Z}_p(1)\to T_p(E)\to\mathbb{Z}_p\to 0.$$

Then this sequence doesn't split when tensoring $\overline{K}$, but split when tensoring $\mathbb{C}_K$, by(14.3.2.3).

Proof: Suppose it splits ofter tensoring $\overline{K}$, then it splits after tensoring some finite extension K'. Then by projection of K' onto $\mathbb{Q}$, we see

$$0\to\mathbb{Q}_p(1)\to V_p(E)\to\mathbb{Q}_p\to 0$$

is splitting as a $\mathrm{Gal}_{K'}$-representations. But this is not true, as any system of roots of p □

C_{dR}-theorem(14.3.1.1) implies any representation of Gal_K of the form $\mathrm{H}^r_{\text{ét}}(X_{\overline{K}},\mathbb{Q}_p)$ is deRham, thus it is natural to consider the converse:

2 C_{crys}-Theorem

Thm. (14.3.2.1) [Hyodo-Kato Isomorphism]. If $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$ has good reduction $\mathcal{X}/\mathcal{O}_K$, let $\overline{\mathcal{X}} = \mathcal{X}_k$, then for any $r \in \mathbb{N}$, $H^r_{\mathrm{crys}}(\overline{\mathcal{X}}) \in \varphi\text{-}\mathcal{M}\mathrm{od}_{W(k)}$, and there is an isomorphism

$$K \otimes_{W(k)} H_{\mathrm{crys}}(\overline{\mathcal{X}}) \cong H^r_{\mathrm{dR}}(X).$$

Then this isomorphism descends $H^r_{\mathrm{dR}}(X)$ to K_0, and this K_0-structure is independent of the smooth model $\mathcal{X}/\mathcal{O}_K$.

Proof: □

Thm. (14.3.2.2) [C_{crys}, **Faltings].** If $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$ has good reduction $\mathcal{X}/\mathcal{O}_K$, let $\overline{\mathcal{X}} = \mathcal{X}_k$, then for any $r \in \mathbb{N}$, there exists a canonical isomorphism

$$\gamma_{\mathrm{dR}}(X) : B_{\mathrm{dR}} \otimes_K H^r_{\mathrm{dR}}(X/K) \cong B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} \mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p).$$

which respect Gal_K-actions and Frobenius-actions on both sides. Moreover γ_{crys} is functorial in X, and $B_{\mathrm{dR}} \otimes \gamma_{\mathrm{crys}} = \gamma_{\mathrm{dR}}$(14.3.1.1).

Proof: Cf.[Faltings, Crystalline Representations and p-adic Galois Representations].? □

Cor. (14.3.2.3) [Crystalline Comparison for Étale Cohomologies]. If $X \in \mathcal{S}\mathrm{ch}^{\mathrm{sm},proper}/K$ has good reduction $\mathcal{X}/\mathcal{O}_K$, let $\overline{\mathcal{X}} = \mathcal{X}_k$, then for any $r \in \mathbb{N}$, $\mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p) \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, and

$$H^r_{\mathrm{crys}}(\overline{\mathcal{X}}) \cong D_{\mathrm{crys}}(\mathrm{H}^r_{\text{ét}}(X_{\overline{K}}, \mathbb{Q}_p)).$$

?

3 Rigid Analytic Varieties

Main references are [Scholze, p-adic Hodge on Rigid Analytic Varieties] and [P. Scholze, p-adic Hodge theory for rigid-analytic varieties—corrigendum. Forum Math. Pi 4 (2016), e6, 4 pp.].

14.4 p-adic Modular Forms

Main references are [p-adic Modular Forms]

14.5 Formal and Rigid Geometry

Main references are [Bos15] and [BGR84], but there are other approaches, such as given by Berkovich, or given by Huber, and used in Scholze's work, which is most natural because it behaves well w.r.t. the formal model.

1 Affinoid K-Spaces

Def. (14.5.1.1) [Affinoid K-Space]. an affinoid algebra A can be viewed as the function ring on the space $\operatorname{Sp} A$ of maximal ideals of A with the usual Zariski topology called the **affinoid K-space associated to A**. A morphism of affinoid algebras induce a map on their $\operatorname{Sp} A$. This is because residue fields of maximal ideals are finite over K. So we *define* the category of affinoid K-spaces as the opposite category of affinoid K-algebras.

Cor. (14.5.1.2). The category of affinoid spaces admits fiber products, because of(10.3.4.30).

Prop. (14.5.1.3). By the properties of a Jacobson space(3.11.3.24)(3.11.3.21), the affinoid K-space has good properties w.r.t. closed, open hence irreducible compared to $\operatorname{Spec} A$ in Zariski topology. In particular, it is a Noetherian space.

Def. (14.5.1.4) [Canonical Topology]. The affinoid K-space has another topology, called the **canonical topology**, generated by $X(f,\varepsilon) = \{x | f(x) \leq \varepsilon\}$ as a subbasis. And this topology is in fact generated by $X(f) = X(f,1)$ as a subbasis.

Proof: For the last assertion, notice $f(x)$ assume value in $|\overline{K}|$, which is dense in $\mathbb{R}_+$, so we can assume $\varepsilon \in |\overline{K}|$(by approximation from below), hence $\varepsilon^n = |c|$, where $c \in K$, so $X(f,\varepsilon) = X(f^n, c) = X(c^{-1}f^n)$. □

Prop. (14.5.1.5). $\{x | f(x) = \varepsilon\}$ is open in $\operatorname{Sp} A$.

Proof: We let $f(x) = \varepsilon$ and $k = A/\mathfrak{m}_x$, let the minipoly of f in $A/\mathfrak{m}_x$ be P of degree n, and let $g = P(f)$, then $g(x) = 0$, and if $|g(y)| < \varepsilon^n$, then $|f(y)| = \varepsilon$, otherwise $|f(y) - \alpha_i| \geq |\alpha_i| = \varepsilon$ for every root α_i of P, hence $|P(f(y))| \geq \varepsilon^n$, contradiction. □

Cor. (14.5.1.6). By the proof, we have, $X(f_1, \ldots, f_r)$, $f_i \in \mathfrak{m}_x$ forms a basis of x in $\operatorname{Sp} A$.(Replace every $X(f_i)$ by $\{y || f_i(y)| = \varepsilon\}$, then by some $X(g_i)$ for $g_i \in \mathfrak{m}_x$.

Def. (14.5.1.7) [Affinoid Subdomain]. For an affinoid K-space X, a subset U is called a **affinoid subdomain** of X if there is an closest affinoid space map $X' \to X$ with image in U, i.e. any other these maps factor through it. The definition is weird but the situation is clarified by the following proposition.

Prop. (14.5.1.8). For an affinoid subdomain $i : X' \to X$,

- i is injective and $\operatorname{Im} i = U$.
- i^* induce an isomorphism $A/\mathfrak{m}_{i(x)}^k \cong A'/\mathfrak{m}_x^k$.
- $\mathfrak{m}_x = \mathfrak{m}_{i(x)} A'$.

Proof: Consider a point $y \in U$, there is a commutative diagram $\begin{array}{ccc} A & \xrightarrow{i^*} & A' \\ \downarrow & \swarrow_{\alpha} & \downarrow \\ A/\mathfrak{m}_y^n & \xrightarrow{\sigma} & A'/\mathfrak{m}_y^n A' \end{array}$. Then there is a map $\alpha : A' \to A/\mathfrak{m}_y^n$ that makes the upper diagram commutative by universal property of subdomain, and the lower triangle is commutative by universal properties again. Then we see σ is surjective and notice the kernel of the projection is $\mathfrak{m}_y A'$ is in the kernel of α, thus σ is injective.

Now the case $n = 1$ shows $\mathfrak{m}_y A'$ is maximal, hence i is surjective and the inverse image is just one point. □

Prop. (14.5.1.9) [Special Subdomains]. There are three special affinoid subdomain of X: **Weierstrass domain** $X(f_1, \ldots, f_r)$, **Laurent domain** $X(f_1, \ldots, f_r, g_1^{-1}, \ldots, g_s^{-1})$, **rational domain** $X(\frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0}) = \{x | |f_i(x)| \leq |f_0(x)|\}$ for $(f_0, \ldots, f_r) = (1)$. They are all open by(14.5.1.5).

Proof: The Weierstrass domain corresponds to $A \to A\langle X_1, \ldots, X_r\rangle/(X_i - f_i)$.

The Laurent domain corresponds to $A \to A\langle X_1, \ldots, X_{r+s}\rangle/(X_i - f_i, 1 - X_{r+j}g_j)$.

The rational domain corresponds to $A \to A\langle X_1, \ldots, X_r\rangle/(f_i - f_0 X_i)$.

They are affinoid subdomains is in fact, easily checked. □

Lemma (14.5.1.10). Weierstrass domain are Laurent, and Laurent domain are rational, this is because intersection of rational domains are rational.

Any rational domain is a Weierstrass domain of a Laurent domain.

Proof: Notice a Laurent subdomain is a finite intersections of $X(\frac{f}{1})$ and $X(\frac{1}{g})$, so it is rational.

For a rational domain U, f_0 is a unit in $\mathcal{O}(U)$, hence its inverse has a bounded value, then $|cf_0| > 1$ for some $c \in K^*$. Hence U is Weirerstrass in $X((cf_0)^{-1})$. □

Cor. (14.5.1.11) [Pullback & Composition of Affinoid Subdomain]. The pullback(hence intersections) of affinoid subdomains is affinoid subdomain and it is just the set-theoretic inverse image, and specialness are preserved.

The affinoid subdomain of an affinoid subdomain is affinoid subdomain, and Weierstrassness and rationalness are preserved(while Laurentness not).

Proof: Pullback: fiber product exist in the category of affinoid K-spaces, then the universal property is checked. The set-theoretic property follows from(14.5.1.8).

Speciality: Clear.

Transitivity: Clear by universal property.

For the speciality, if $V = X(f_i)$, $U = V(g_j)$ is Weierstrass, then because by(10.3.4.26) A is dense in $A\langle f_i\rangle$, we can replace g_j by elements from A, by adding elements of small sup-norm, because valuation is non-Archimedean. Then $U = X(f_i, g_j)$. For the rational subdomain $V = X(\frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0})$, use(14.5.1.10), it suffices to prove for $U = V(g)$ or $U = V(g^{-1})$. For this, notice the image of $A[f_0^{-1}]$ is dense in $A\langle\frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0}\rangle$, by(10.3.4.26), so as before, we change g that it $g_0 f_0^n g \in A$ for some n. Now

$$V(g) = V \cap \{x \in X | |g_0(x)| \leq |f_0^n(x)|\}, \quad V(g^{-1}) = V \cap \{x \in X | |g_0(x)| \geq |f_0^n(x)|\}.$$

But now f_0^n is a unit in $A\langle\frac{f_1}{f_0}, \ldots, \frac{f_r}{f_0}\rangle$, so $|f(x)|_{\sup} \geq |c|$ for some $c \in K^*$, so

$$V(g) = V \cap X(\frac{g_0}{f_0^n}, \frac{c}{f_0^n}), \quad V(g^{-1}) = V \cap X(\frac{f_0^n}{g_0}, \frac{c}{g_0}).$$

is rational in X. □

Cor. (14.5.1.12). For a special subdomain U of X, the canonical topology induces the canonical topology of U, by the transitivity property of affinoid subdomains and(14.5.1.10). In fact, by(14.5.1.14), any affinoid subdomain is open and the topology coincides.

Prop. (14.5.1.13). Let $\varphi : Y = \operatorname{Sp} B \to X = \operatorname{Sp} A$ be a morphism, if x is a point of X that $A/\mathfrak{m}_x \to B/\mathfrak{m}_x B$ is a surjection, then there is an affinoid nbhd U of x that φ restricts to a closed immersion on $\varphi^{-1}(U)$. If $A/\mathfrak{m}_x^n \cong B/\mathfrak{m}^n$ for all n, then there is an affinoid nbhd U of x that φ restricts to an isomorphism $\varphi^{-1}(U) \cong U$.

Proof: Cf.[Rigid and Formal Geometry P57]. □

Cor. (14.5.1.14). Every affinoid subdomain of X is open and has the restriction topology of X(canonical topology), because it satisfies the second condition of(14.5.1.13), by(14.5.1.8).

Lemma (14.5.1.15). If $f \subset A\langle X_1, \ldots, X_n\rangle$ is X_n-distinguished of order $\leq s$ for each element of $\operatorname{Sp} A$, then the set of elements that f is X_n-distinguished of exact order s is a rational subdomain of A.

Proof: Let $f = \sum f_v X_n^v$, let the constant coefficient of f_v be a_v, then the set is in fact $U = \{x \in \operatorname{Sp} A || a_v(x)| \leq |a_s(x)|\}$. This is because, if f is distinguished of order s_x at x, then $a_{s_x} \neq 0$ because f_{s_x} is a unit, and $|a_v|_x \leq |f_v| \leq |f_{s_x}| = |a_{s_x}|_x$ for $v \leq s_x$ and strict inequality holds for $v > s_x$. In particular, $a_0, \ldots, a_s$ cannot have a common zero, so it is truly a rational subdomain. □

Prop. (14.5.1.16). If $f \subset A\langle X_1, \ldots, X_n\rangle$ is X_n-distinguished of order s for each element of $\operatorname{Sp} A$, then the map

$$A\langle X_1, \ldots, X_{n-1}\rangle \to A\langle X_1, \ldots, X_n\rangle/(f)$$

is finite.

Proof: Cf.[Rigid And Formal Geometry P79]. □

Presheaf of Affinoid Functions

Def. (14.5.1.17). The **weak Grothendieck category**(affine topology) on an affinoid space X has coverings defined by the finite cover by affinoid subdomains, called **affinoid covering**.

The **strong Grothendieck category**(fpqc topology) on an affinoid space X is defined by: objects are unions of affinoid subdomains $U = \cup U_i$ that for any morphism from an affinoid space $\varphi : Z \to U \subset X$, the pullback covering $\cup \varphi^{-1}(U_i)$ has a finite subcover by affinoid subdomains. A covering is defined by the same finiteness property.

The strong Grothendieck topology satisfies completeness conditions G_0, G_1, G_2 defined in(5.1.1.10), as easily verified.

The weak Grothendieck topology is a temporary notion, it will be obsolete after Tate's acyclicity theorem is proved. Admissible opens and admissible covers are notions w.r.t. the strong Grothendieck topology.

Proof: The weak Grothendieck category is a Grothendieck category by(14.5.1.11). The strong Grothendieck category is a Grothendieck category because: the finiteness condition lifts along base change, and also for base change, because we can first choose a finite subcover, then choose a finite subcover of the base change covering of that finite covering. □

Def. (14.5.1.18). For n functions $f_1, \ldots, f_n$ without common zeros, the rational subdomains $U_i = X(\frac{f_1}{f_i}, \ldots, \frac{f_n}{f_i})$ is an affinoid covering, called the **rational covering**. For n functions $f_1, \ldots, f_n$, there is a **Laurent covering** $X(\prod f_i^{\varepsilon_i}), \varepsilon_i = \pm 1$.

Prop. (14.5.1.19). Morphisms of affinoid spaces are continuous in weak Grothendieck topology by(14.5.1.11). It is also continuous in the strong Grothendieck topology, as one can check the finiteness conditions.

Prop. (14.5.1.20). Let X be an affinoid K-space, for any $f \in \mathcal{O}_X(X)$, consider the following sets:

$$U_1 = \{x||f(x)| < 1\}, \quad U_2 = \{x||f(x)| > 1\}, \quad U_3 = \{x||f(x)| > 0\}.$$

Then any finite union of sets of the form is admissible, and any finite cover by finite union of sets of the form is an admissible covering.

Proof: We first show that U_1 is admissible open, the others are similar. Let ε_n be an ascending sequence of elements in $\sqrt{|K^*|}$ converging to 1, then $U_1 = \cup_n X(\varepsilon_n^{-1} f)$ is a union of open subsets because $\varepsilon_n \in \sqrt{|K^*|}$. Now for any affinoid space Z mapping into U_1, $|\varphi^*(f)(z)|_{\sup} < 1$ for all $z \in Z$, thus by maximal principle(10.3.4.21), $|f|_{\sup} < 1$, thus the cover $U_1 = \cup_n X(\varepsilon_n^{-1} f)$ can be refined by a finite cover, thus it is admissible open.

For the admissibility of covering, the proof is similar, but use the following lemma(14.5.1.21). □

Lemma (14.5.1.21). For any affinoid K-algebra A, if f_i, g_j, h_k are system of functions on A that: for every $x \in A$, either $|f_i(x)| < 1, |g_j > 1$ or $h_k(x) > 0$, then we can replace $>, <$ by $\geq, \leq$ and elements in $\sqrt{|K^*|}$ that the same condition is true.

Proof: Cf.[Rigid and Formal Geometry P97]. □

Cor. (14.5.1.22). The strong Grothendieck category is finer than the Zariski category, because any standard affine open set is of the form U_3 and also Zariski covering is open covering because $\mathrm{Sp}(A)$ is Noetherian(10.3.4.16).

Def. (14.5.1.23) [Presheaf of Affinoid Functions]. There is a **presheaf of affinoid functions** defined on the weak Grothendieck topology because of the universal property of the affinoid subdomains.

Then the stalk $\mathcal{O}_{X,x}$ are local ring with maximal ideal $\mathfrak{m}_x \mathcal{O}_{X,x}$. Hense let $X = \mathrm{Sp}\, A$, the stalk map factor thorough $A \to A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X}$, and

$$A/\mathfrak{m}_x^n \cong A_{\mathfrak{m}_x}/\mathfrak{m}_x^n A_{\mathfrak{m}_x} \cong \mathcal{O}_{X,x}/\mathfrak{m}_x^n \mathcal{O}_{X,x}$$

so it induces isomorphisms between their $\mathfrak{m}_x$-adic completions.

Proof: By(14.5.1.8), there is an isomorphism $K' = \mathcal{O}_X(X)/\mathfrak{m}_x \cong \mathcal{O}_X(U)/\mathfrak{m}_x \mathcal{O}(U)$. Take the converse and pass to direct colimit(it is exact), $\mathcal{O}_{X,x}/\mathfrak{m}_x O_{X,x} \cong K'$. This map will be regarded as evaluation at x. The kernel $\mathfrak{m}_x \mathcal{O}_{X,x}$ is a maximal ideal. There are no other maximal ideals in $\mathcal{O}_{X,x}$ because if f in not in the kernel, then $f(x) \neq 0$, and multiply by an element in K^*, it can be made $|f(x)| \geq 1$, and then $U(f^{-1})$ is an affinoid subdomain containing x that f is invertible in it.

For the second assertion, for an affinoid subdomain $\mathrm{Sp}\, A'$, there are maps

$$A/\mathfrak{m}^n \to A'/\mathfrak{m}^n \to \mathcal{O}_{X,x}/\mathfrak{m}^n \mathcal{O}_{X,x}.$$

We first show these are isomorphisms: the first map is an isomorphism by(14.5.1.8), then take direct colimit, the composition map is also isomorphism.

$A/\mathfrak{m}_x^n \cong A_{\mathfrak{m}_x}/\mathfrak{m}_x^n A_{\mathfrak{m}_x}$ is classical.

$A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X}$ is injective because by Krull's intersection theorem(4.2.2.15), $A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X} \to \widehat{\mathcal{O}_{X,x}} \cong \widehat{A_{\mathfrak{m}}}$ is injective. □

Cor. (14.5.1.24). $f \in A = \mathcal{O}_X(X)$ vanish iff it vanish at every stalk, this is because $A \to \prod_{\mathfrak{m}} A_{\mathfrak{m}} \to \prod \mathcal{O}_{X,x}$ is injective.

Cor. (14.5.1.25). Giving a covering of affinoid subdomain of an affinoid space $X_i \to X$, then $\mathcal{O}_X(X) \to \prod \mathcal{O}_{X_i}(X_i)$ is an injection. (This is because the kernel vanishes at each stalk.)

Cor. (14.5.1.26). For a subdomain of an affinoid space X, the corresponding ring map is flat.

Proof: Cf.[Formal and Rigid Geometry P68]. □

Prop. (14.5.1.27). The stalk $\mathcal{O}_{X,x}$ is Noetherian, in particular it is $\mathfrak{m}$-adically separated by Krull's intersection theorem(4.2.2.15).

Proof: First it is $\mathfrak{m}$-adically separated, because by(14.5.1.23), for a $f \in \cap \mathfrak{m}^n \mathcal{O}_{X,x}$, we can choose an affinoid subdomain $\operatorname{Sp} A$ that $f \in A$(14.5.1.8), then $f \in \mathfrak{m}^n A$, so by Krull's intersection theorem(4.2.2.15), we have $f = 0$ in $A_{\mathfrak{m}}$.

In the same way, any f.g. ideal $\mathfrak{a}$ of $\mathcal{O}_{X,x}$ is $\mathfrak{m}$-adically closed, this is because it is generated by an ideal in the affinoid algebra of a nbhd, and then $\mathcal{O}_{x,X}/\mathfrak{a}$ is separated as the stalk of an affinoid algebra $A'/\mathfrak{a}'$.

Now pass a chain of f.g. ideals to their completion, then that chain is stationary because $\widehat{\mathcal{O}}_{X,x} = \widehat{A}_{\mathfrak{m}_x}$ is Noetherian(4.1.1.42). And now this chain is also stationary because ideals are closed in $\mathfrak{m}$-adic topology. □

Locally Closed Immersions

Def. (14.5.1.28) [Immersions]. A morphism of affinoid spaces is called a **closed immersion** iff the corresponding ring map is surjective. It is called a **locally closed immsetion** iff it is injective and the stalk map are all surjective. It is called an **open immersion** iff it is injective and the corresponding stalk maps are isomorphism. All these notions are stable under compositions.

An affinoid subdomain is an open immersion by(14.5.1.8)(14.5.1.23) and(14.5.1.27).

Lemma (14.5.1.29). Base change by affinoid subdomain of closed/locally closed/open immersions are of the same type.

Proof: This is obvious for locally close and open, because affinoid subdomains are open(14.5.1.14), for the closed immersion, use(10.3.4.32). □

Prop. (14.5.1.30). A closed immersion of affinoid spaces is equivalent to a locally closed immersion that the corresponding ring map is finite.

Proof: Cf.[Rigid and Formal Geometry P70]. A closed immersion $X' \to X$ is a locally closed immersion because the canonical topology of $\operatorname{Sp} A$ restricts to the canonical topology on $\operatorname{Sp} A/\mathfrak{a}$(14.5.1.4), then use(10.3.4.32), and the fact direct limit is exact. □

Prop. (14.5.1.31) [Clopen Immersion]. The image of an open and closed immersion is Zariski closed and open. In particular, it is a Weierstrass subdomain.

Proof: Cf.[Rigid and Formal Geometry P71]. □

Def. (14.5.1.32). A **Runge immersion** is a closed immersion followed by an open immersion of Weierstrass subdomain. Runge immersion is table under base change of affinoid subdomains by(14.5.1.29)

Prop. (14.5.1.33) [Equivalent Definition of Runge Immersions]. For a morphism $\sigma : A \to A'$, $\mathrm{Sp}\,A' \to \mathrm{Sp}\,A$ is a Runge immersion iff $\underline{\sigma(A) \text{ is dense in } A'}$ iff $\sigma(A)$ contains a set of affinoid generator of A' over A.

Proof: For a Runge immersion, $\sigma(A)$ is dense in A', because this is true for Weierstrass subdomain and closed immersion.

If $\sigma(A)$ is dense in A', then by(10.3.4.28), we can modify a set of affinoid generators by a set of affinoid generators in $\sigma(A)$.

If h_i is a set of affinoid generators in $\sigma(A)$, then $A \to A\langle h_i\rangle \to A'$ is a Runge immersion. □

Cor. (14.5.1.34). Runge immersion is stable under composition.

Prop. (14.5.1.35). An open and Runge immersion is an immersion of Weierstrass subdomain.

Proof: By localizing on this Weierstrass subdomain, and notice Weierstrass subdomain is stable under composition(14.5.1.11), we reduce to clopen immersion case, and result follows by(14.5.1.31). □

Lemma (14.5.1.36) [Extension of Runge Immersion]. For a morphism of affinoid spaces $X' \to X = \mathrm{Sp}\,A$, if $f_1, \ldots, f_n, g$ generate A, for $\varepsilon \in \sqrt{\{|K^*|\}}$, denote $X_\varepsilon = \{x||f_i(x)| \le \varepsilon|g|\}$, this is a rational subdomain. The inverse image of X_ε is X'_ε, then if $X'_{\varepsilon_0} \to X_{\varepsilon_0}$ is a Runge immersion for some ε_0, then there is a $\varepsilon > \varepsilon_0$ that $X'_\varepsilon \to X_\varepsilon$ is also a Runge immersion.

Proof: Cf.[Rigid and Formal Geometry P73]. □

Prop. (14.5.1.37) [Gerritzen-Grauert]. For a locally closed immersion $\varphi : X' \to X$, there is a finite cover of X of rational subdomains X_i that $\varphi^{-1}(X_i) \to X_i$ are Runge immersions.

Proof: Cf.[Formal and Rigid Geometry P79]. □

Cor. (14.5.1.38) [Gerritzen-Grauert]. Any affinoid subdomain is equivalent to a finite union of rational subdomains.

Proof: An affinoid subdomain is an open immersion by(14.5.1.28), so $\varphi^{-1}(X_i) \to X_i$ is open and Runge, so it is Weierstrass by(14.5.1.35). In particular, $X \cap X_i$ is rational in X by transitivity, thus the result. □

Tate's Acyclicity

Lemma (14.5.1.39) [Reduction of Weak Grothendieck Topology].

- Every affinoid covering has a refinement of rational covering.
- For every rational covering, there is a Laurent covering $\{V_i\}$ that restriction on each V_i is rational covering generated by units.
- Every rational covering generated by units has a refinement of Laurent covering.

Proof: 1: By(14.5.1.38), we can assume the covering consists of rational subdomains $U_i = X(\frac{f_{i1}, \ldots, f_{ii_k}}{f_{i0}})$, then consider the elements $f_{v_1 \ldots v_n} = \prod_{i=1}^n f_{iv_i}$, where at least some $v_i = 0$. Denote the set of these elements by I.

Firstly, these elements has no common zero on X, thus generating a rational covering of X: for any $x \in U_i$, f_{i0} doesn't vanish at x, thus the product $\prod_{j\neq i} f_{jv_j}$ vanishes for all choices of v_j, but this is impossible because for each j, $(\{f_{ik}\}_k) = (1)$.

Secondly, this is a refinement of U_i: We show $X_{f_{v_1\dots v_n}}\subset U_k$ where $v_k=0$. For this, consider $x\in X_{f_{v_1\dots v_n}}$, then $x\in U_j$ for some j. If $j=k$, we are done, otherwise,

$$|f_{v_1\dots\mu_k\dots v_n}(x)|\leq |f_{v_1\dots 0\dots\mu_k\dots v_n}(x)|\leq |f_{v_1\dots v_n}(x)|.$$

Where the last inequality is because $(v_1,\dots,0,\dots,\mu_k,\dots,v_n)$ has a 0, thus $f_{v_1\dots 0\dots\mu_k\dots v_n}\in I$.

2: For a rational covering, f_i is invertible in the ring of $U=X(\frac{f_0}{f_i},\dots,\frac{f_n}{f_i})$, thus it has a inverse that attains maximum value on U(10.3.4.21). Hence there is a $c\in K^*$ that $|c|^{-1}<\inf(\max\{|f_i(x)|\})$.

I claim the Laurent covering w.r.t. the elements $cf_0,\dots,cf_n$ satisfies the requirement. Because for example, on $V=X((cf_0)\cdots(cf_s)(cf_{s+1})^{-1}\cdots(cf_n)^{-1})$, $|f_i(x)|<|f_j(x)|$ for $i\leq s<j$, so the covering restricted to V is just the rational covering generated by $f_{s+1},\dots,f_n$, and they are all invertible in $\mathcal{O}(V)$.

3: In fact the Laurent covering generated by the element $f_if_j^{-1}$ for $i<j$ is a refinement of the rational covering generated by $f_1,\dots,f_n$, because in any one of this Laurent subdomains V, for any two i,j, either $|f_i(x)|<|f_j(x)|$ or $|f_j(x)|<|f_i(x)|$ for all $x\in V$, so there is a maximal one f_s, then $V\subset X(\frac{f_0}{f_s},\dots,\frac{f_n}{f_s})$. □

Prop. (14.5.1.40) [Tate's Acyclicity Theorem]. The presheaf of affinoid functions on an affinoid space $X=\operatorname{Sp}A$ is a sheaf w.r.t the weak Grothendieck category. In fact, for any A-module M, the presheaf $\widetilde{M}=M\otimes_A\mathcal{O}_X$ is a sheaf w.r.t. the weak Grothendieck topology, called the **quasi-coherent** sheaf on X.

Moreover, for any finite cover of affinoid subdomains, the Čech cohomology group $\check{H}^q(\operatorname{Sp}A,\widetilde{M})$ vanish for $q\neq 0$.

Proof: It suffices to prove the last assertion. First reduce to the case of Laurent covering by(14.5.1.39) and(5.3.2.10)(5.3.2.11). Noticing the base change invariance of the specialities of affinoid subdomains(14.5.1.11). Even more, by(5.3.2.12) and an induction process, it suffices to prove for the simple Laurent covering $X(f),X(f^{-1})$.

It suffices to prove for the sheaf of affinoid functions $\mathcal{O}_X$, because for any Qco sheaf $\widetilde{M}$, choose a free resolution of M, then use dimension shifting, notice the covering is finite(the flatness of the algebra map(14.5.1.26) is used to deduce the long exact sequence).

For the sheaf $\mathcal{O}_X$, the main tool is the following commutative diagram:

$$\begin{array}{ccccccccc}
 & & & & 0 & & 0 & & \\
 & & & & \downarrow & & \downarrow & & \\
 & & & & (X-f)A\langle X\rangle\times(1-fY)A\langle Y\rangle & \xrightarrow{\delta''} & (X-f)A\langle X,X^{-1}\rangle & \longrightarrow & 0\\
 & & & & \downarrow & & \downarrow & & \\
0 & \longrightarrow & A & \xrightarrow{\varepsilon'} & A\langle X\rangle\times A\langle Y\rangle & \xrightarrow{\delta'} & A\langle X,X^{-1}\rangle & \longrightarrow & 0\\
 & & \| & & \downarrow & & \downarrow & & \\
0 & \longrightarrow & A & \xrightarrow{\varepsilon} & A\langle f\rangle\times A\langle f^{-1}\rangle & \xrightarrow{\delta} & A\langle f,f^{-1}\rangle & \longrightarrow & 0
\end{array}$$

where δ' is given by $(h_1(X),h_2(Y))\mapsto h_1(X)-h_2(X^{-1})$, and δ'' is induced by δ'. The columns are all exact, and the first row and the second row are exact. ε is injective by(14.5.1.25). Then the last row is also exact, by spectral sequence. □

Prop. (14.5.1.41) [Strong/Weak Topos The same]. If X is an affinoid K-space, the category of sheaves w.r.t the strong Grothendieck topology is equivalent to the category of sheaves w.r.t. the weak Grothendieck topology by pushforward and pullback of sheaves by(5.1.2.25) because the strong and weak Grothendieck category satisfies the conditions.

In particular, this applies to the case $\mathcal{O}_X$ by(14.5.1.40), the resulting sheaf is called the **sheaf of rigid analytic functions** on X, also denoted by $\mathcal{O}_X$.

2 Rigid Analytic Spaces

Def. (14.5.2.1). A **G-ringed K-space** is a pair $(X, \mathcal{O}_X)$ where X is a G-topological space and $\mathcal{O}_X$ is a sheaf of K-algebras. It is called **local G-ringed K-space** if the stalks are all local rings. Their morphisms are defined routinely.

Prop. (14.5.2.2) [Morphisms Between Affinoid Spaces]. An affinoid K-space with the sheaf of analytic functions $(X, \mathcal{O}_X)$(14.5.1.41) is an example of local G-ringed K-space(14.5.1.23).

A continuous homomorphism of rings induces a local G-ringed morphism. And all morphisms come from these.

Moreover, an affinoid K-space is a complete G-ringed K-space(i.e. rigid)(5.1.1.10).

Proof: It is a G-space by(14.5.1.40)(14.5.1.41), morphisms by(14.5.1.19), notice the $\mathfrak{m}_x$ generate the maximal ideal of $\mathcal{O}_{X,x}$(14.5.1.23), so the morphism is local.

To show all morphisms are like these, we need to show a morphism $\sigma : A \to B$ gives at most one $\operatorname{Sp} B \to \operatorname{Sp} A$: the morphism is local, so it maps $\mathfrak{m}_{\varphi(x)}$ to $\mathfrak{m}_x$, and from the commutative diagram

$$\begin{array}{ccc} A/\mathfrak{m}_{\varphi(x)} & \longrightarrow & B/\mathfrak{m}_x \\ \downarrow\cong & & \downarrow\cong \\ \mathcal{O}_{\varphi(x),\operatorname{Sp} A}/\mathfrak{m}_{\varphi(x)}\mathcal{O}_{\varphi(x),\operatorname{Sp} A} & \longrightarrow & \mathcal{O}_{x,\operatorname{Sp} B}/\mathfrak{m}_x\mathcal{O}_{x,\operatorname{Sp} B} \end{array}$$

(14.5.1.23) shows $\mathfrak{m}_{\varphi(x)}$ is mapped into $\mathfrak{m}_x$, so $\mathfrak{m}_{\varphi(x)} = (\sigma^*)^{-1}\mathfrak{m}_x$, which shows φ is unique set-theoretically, and on the level of structure sheaf, the uniqueness of $\mathcal{O}_{\operatorname{Sp} A}(V) \to \mathcal{O}_{\operatorname{Sp} B}(\varphi^{-1}(V))$ is unique by the definition of affinoid subdomain(14.5.1.7). □

Def. (14.5.2.3) [Rigid Spaces]. The category of **rigid (analytic) space** is a full subcategory of local G-ringed K-spaces that it is complete G_0, G_1, G_2, and it has an admissible covering $\{X_i \to X\}$ that $(X_i, \mathcal{O}_X|_{X_i})$ are affinoid K-spaces.

It follows easily that an admissible open subset of a rigid space is again rigid.

Prop. (14.5.2.4) [Glueing Rigid Spaces]. Glueing rigid analytic spaces is legitimate, so does glueing morphisms on the source.

Proof: First glue the set, then use(5.1.1.12) to glue G-topology, finally the glue of structure sheaf is similar to(5.1.5.3). □

Cor. (14.5.2.5) [Spectrum Adjointness]. If X is rigid and Y is affinoid, then $\operatorname{Hom}(X, Y) \cong \operatorname{Hom}(\mathcal{O}_Y(Y), \mathcal{O}_X(X))$. This follows from(14.5.2.2) and glue(14.5.2.4).

Prop. (14.5.2.6) [Fiber Products]. Fiber products exist in the category of rigid analytic space. This is fiber product of affinoid spaces are affinoid so we can glue them by universal property, the same as(5.2.7.15).

Prop. (14.5.2.7). An affinoid space is connected in the weak Grothendieck topology iff it is connected in the strong Grothendieck topology iff it is connected in the Zariski topology.

Proof: Firstly the weak and strong are equal because any strong covering of X has a refinement of weak covering, and a weak covering is a strong covering. So it suffices to prove the equivalence of the last two.

One direction is trivial, for the other direction, use Tate's acyclicity, if $X_1, X_2 \to \mathrm{Sp}\, A$, $X_1 \cap X_2 = 0$, then $A = \mathcal{O}_X(X_1) \times \mathcal{O}_X(X_2)$, so $\mathrm{Spec}\, A$ is not connected, neither do $\mathrm{Sp}\, A$. □

Prop. (14.5.2.8). We can define the connected components of X as the equivalence classes of elements that can be reached using connected admissible open subsets of X. Then the connected components are admissible and forms an admissible cover of X.

Proof: Notice that there exists a finite covering consisting of connected Zariski subsets, by(14.5.2.7) and the fact $\mathrm{Sp}\, A$ has f.m. connected components because $\mathrm{Spec}\, A$ does as A is Noetherian(10.3.4.12) and(14.5.1.3).

Thus we are done, because by(14.5.1.22), a Zariski covering is admissible, and clearly the connected components of X are just this Zariski covering. □

Rigid GAGA

Lemma (14.5.2.9). Let Z be an affine scheme algebraic over K, and Y a rigid K-space, then the set of morphisms of local G-ringed spaces $(Y, \mathcal{O}_Y) \to (Z, \mathcal{O}_Z)$ corresponds to K-algebra morphisms from $\mathcal{O}_Z(Z)$ to $\mathcal{O}_Y(Y)$.

Proof: Cf.[Formal and Rigid Geometry P111]. □

Def. (14.5.2.10)[Rigid Analytification]. There is a partial functor X^{rig} from the category of schemes X locally algebraic over a valued field K to the category of rigid K-spaces that are right adjoint to the forgetful functor from the category of rigid K-spaces to local ringed K-space, called the **GAGA functor**.

The existence of this functor is proven in(14.5.2.14).

Def. (14.5.2.11)[Analytification of Affine Schemes]. Let $T_n(r)$ be the elements $\sum a_v \zeta^v$ in T_n that $\lim a_v r^{|v|} = 0$. Then choose a $c \in K$, $|c| > 1$, define $T_n^{(i)} = T_n(|c|^i)$. Then $T_n^{(i)} = K\langle c^{-i} X_1, \ldots, c^{-i} X_n \rangle$, so clearly $\mathrm{Sp}(T_n^{(i)})$ is an affinoid subdomain of $\mathrm{Sp}(T_n^{(i+1)})$ by(14.5.1.9). Thus there is a chain of inclusions of affinoid subdomains:

$$B^n = \mathrm{Sp}(T_n^{(0)}) \hookrightarrow \mathrm{Sp}(T_n^{(1)}) \hookrightarrow \mathrm{Sp}(T_n^{(2)}) \hookrightarrow \ldots$$

Then we can use(14.5.2.4) to glue them together as $\mathbb{A}_K^{n,rig}$.

Prop. (14.5.2.12). The maximal spectrum $\mathrm{Max}(K[X_i]) = \cup_n \mathrm{Spa}(T_n^{(i)})$ as sets.

Proof: It suffices to show the following two.

- For any maximal ideal $\mathfrak{m} \subset T_n$, $\mathfrak{m}' = \mathfrak{m} \cap K[X_i]$ is maximal.
- For any maximal ideal $\mathfrak{m}' \subset K[X_i]$, there is some N that $\mathfrak{m}' T_n^{(i)}$ is maximal in $T_n^{(i)}$ for all $i > N$.

For 1: Consider the $K \subset K[X_i]/\mathfrak{m}' \subset T_n/\mathfrak{m}$, $T_n/\mathfrak{m}$ is a finite extension of K by(10.3.4.10), then so does $K[X_i]/\mathfrak{m}'$, by(4.2.1.3). To prove $\mathfrak{m}' = \mathfrak{m} \cap K[X_i]$, consider the following diagram:

$$\begin{array}{ccc} K[X_i]/\mathfrak{m}' & \longrightarrow & T_n/\mathfrak{m}' T_n \\ \| & & \downarrow \\ K[X_i]/\mathfrak{m}' & \longrightarrow & T_n/\mathfrak{m} \end{array}$$

As $K[X_i]/\mathfrak{m}'$ is finite over K, it is complete, but $K[X_i]$ is dense in T_n, thus the horizontal maps are surjective. But then the lower horizontal is isomorphism, then the upper horizontal is also isomorphism, and then the vertical map is isomorphism, thus we are done.

For 2, $K[X_i]/\mathfrak{m}'$ is a finite extension of K, thus has a unique valuation, let N be large that $|\overline{X}_i| \leq |c|^N$, then for $i > N$, the quotient map factors uniquely as $K[X_i] \to T_n^{(i)} \to K/\mathfrak{m}'$. Then the kernel $\mathfrak{m}$ of $T_n^{(i)}$ is a maximal ideal(same reason as before) that satisfies $\mathfrak{m} \cap K[X_i] = \mathfrak{m}'$. Then we finish by item1. □

Cor. (14.5.2.13) [Analytification for Affine Schemes]. Similarly, for an affine scheme $Z = \operatorname{Spec} K[X_i]/\mathfrak{a}$ of f.t over K, we construct its analytification Z^{rig} as the glue of the inclusions:

$$\mathrm{Sp}(T_n^{(0)}/\mathfrak{a}) \hookrightarrow \mathrm{Sp}(T_n^{(1)}/\mathfrak{a}) \hookrightarrow \dots$$

Then Z^{rig} is the analytification of $K[X_i]/\mathfrak{a}$.

And we see from the proof of(14.5.2.12) the maximal spectrum $\mathrm{Max}(K[X_i]/\mathfrak{a}) = \cup_n \mathrm{Spa}(T_n^{(i)}/\mathfrak{a})$ as sets.

Proof: The canonical map $K[X_i]/\mathfrak{a} \to T_n^{(i)}/\mathfrak{a}$ glue together to be a morphism $\mathcal{O}_Z(Z) \to O_{Z^{rig}}(Z^{rig})$, which by(14.5.2.9) corresponds to a map $Z^{rig} \to Z$ of local ringed spaces.

Now any other morphism $Y \to Z$ from a rigid K-space Y to Z, choose an affinoid K-space covering Y_i of Y, then the map $Y_i \to Z$ corresponds by(14.5.2.9) to a morphism $\sigma : K[X_i]/\mathfrak{a} \to \mathcal{O}_{Y_i}(Y_i)$, thus if we choose i large enough that $|\sigma(X_i)| \leq |c|^i$, then σ can be extended uniquely to

$$K[X_i]/\mathfrak{a} \to T_n^{(i)}/\mathfrak{a} \xrightarrow{\sigma} \mathcal{O}_{Y_i}(Y_i),$$

By the universality of affinoid subdomains. This σ corresponds to a morphism $Y_i \to \mathrm{Sp}(T_n^{(i)}) \to Z^{rig}$, and these clearly glue together to give a morphism $Y \to Z^{rig}$, thus proving the universal property. □

Prop. (14.5.2.14) [General Analytification]. For any locally algebra scheme X over K, choose an affine covering Z_i, consider the analytification of Z_i by(14.5.2.13), then $Z_i \cap Z_j$ obviously has the inverse image as the rigid analytification by universal property, thus unique, so the analytifications of Z_i can be glued to an analytification of X.

Moreover, the underlying set of X^{rig} is identified with the closed pts of the scheme X, because this is the case of Z_i(14.5.2.11).

Prop. (14.5.2.15). Rigid analytification preserves fiber products.

Proof: This follows from the construction of fibered product of schemes(5.2.7.15), so we only need to prove the affine case. For this, Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr, Satz 1.8]. □

Prop. (14.5.2.16) [Stalks]. For a point $z \in Z^{rig}$, the completion of $\mathcal{O}_{Z^{rig},z}$ and $\mathcal{O}_{Z,z}$ are the same.

Proof: Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr, Satz 2.1]. □

3 Coherent Sheaves on Rigid Spaces

Prop. (14.5.3.1). For an affinoid K-space X, there is a Qco module construction $M \to M \otimes_A \mathcal{O}_X$ as in(14.5.1.40) in the weak Grothendieck topology, and it extends uniquely to a sheaf w.r.t. the strong Grothendieck topology by(14.5.1.41), also denoted by $M \otimes_A \mathcal{O}_X$. This is a faithfully exact, fully faithful functor between Abelian categories from $\mathcal{A}b$ to $\mathcal{O}_X$-modules, and it preserves tensor product and direct sums.

Proof: Because $\Gamma(X, M \otimes_A \mathcal{O}_X) = M$ and obviously fully faithful, this map is fully faithful, and it is exact because the restriction map of an affinoid subdomain is flat(14.5.1.26), and shifification is exact. □

Def. (14.5.3.2)[Coherent Sheaves]. For an $\mathcal{O}_X$-module $\mathcal{F}$ on a rigid space X, **finite type, of finite presentation, coherence** are defined w.r.t the strong topology as X is a ringed site. All these notions are stable under passing to an admissible open subspaces.

Proof: For the passing of coherence to admissible open subspaces, use the fact that restriction maps are flat(14.5.1.26). □

Cor. (14.5.3.3). Notice $\mathcal{O}_X^n = A^n \otimes_A \mathcal{O}_X$, by(14.5.3.1) and the fact A is Noetherian, passing to a refinement covering, $\mathcal{F}$ is coherent iff there is an admissible affinoid covering $\mathfrak{U} : X_i \to X$ that $F|_{X_i}$ is associated to a finite $\mathcal{O}_{X_i}$-module. In this case, $\mathcal{F}$ is said to be **$\mathfrak{U}$-coherent**. Thus the coherent sheaves form a weak Serre subcategory of $\mathcal{O}_X$-modules.

In particular, $\mathcal{O}_X$ is coherent.

Prop. (14.5.3.4). If $\mathcal{F}, \mathcal{G}$ are all $\mathfrak{U}$-coherent modules, then:

- $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ and $\mathcal{F} \oplus \mathcal{G}$ are $\mathfrak{U}$-coherent,
- if $\mathcal{F} \to \mathcal{G}$ is a $\mathcal{O}_X$-module morphism, then the kernel and image are all $\mathfrak{U}$-coherent.
- If $\mathcal{I}$ is a $\mathfrak{U}$-coherent sheaf of ideal of $\mathcal{O}_X$, then $\mathcal{I}\mathcal{F}$ is $\mathfrak{U}$-coherent.

Proof: The first and the second are consequences of(14.5.3.1), noticing A_i is Noetherian. The third is an image of $\mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$. □

Lemma (14.5.3.5). If $\mathcal{F}$ is $\mathfrak{U}$ coherent for a simple Laurent covering $\mathfrak{U}$, then $H^1(\mathfrak{U}, \mathcal{F}) = 0$.

Proof: The goal is to show any element in $\mathcal{F}(U_1 \cap U_2)$ can be represented by $u_1 + u_2$, where $u_i \in \mathcal{F}(U_i)$. Let $U_1 = \operatorname{Sp} A\langle f\rangle, U_2 = \operatorname{Sp} A\langle f^{-1}\rangle, U_1 \cap U_2 = \operatorname{Sp} A\langle f, f^{-1}\rangle$. Now $A\langle f\rangle = A\langle X\rangle/(X - f), A\langle f^{-1}\rangle = A\langle Y\rangle/(Yf - 1), A\langle f, f^{-1}\rangle = A\langle X, Y\rangle/(X - f, Yf - 1)$, and we endow them with the residue norm.

Now we want to give norms to $M_1 = \mathcal{F}(U_1), M_2 = \mathcal{F}(U_2), M_{12} = \mathcal{F}(U_1 \cap U_2)$. M_i are finite $\mathcal{O}_X(U_i)$-modules, so there are elements $v_i, w_j, i \le m, j \le n$ that generate M_1, M_2 respectively. So there are attached morphisms

$$(A\langle f\rangle)^m \to M_1, \quad (A\langle f^{-1}\rangle)^n \to M_2, \quad (A\langle f, f^{-1}\rangle)^m \to M_{12}$$

And endow them with the residue norm, which is complete..

Notice that to prove the assertion, it suffice to show for each $\varepsilon > 0$, there is an α that for each $u \in_{12}$, there are u_1 and u_2 in M_i respectively that $|u_i| < \alpha|u|$ and $|u - u_1 - u_2| < \varepsilon|u|$, because then we can use iteration and completeness to get the result.

Giving $\beta > 1$, any $g \in A\langle f, f^{-1}\rangle$ can be lifted to an element $\sum c_{ij}X^iY^j$ that $|c_{ij}| \le \beta|g|$. Then by regrouping terms that $i \ge j$ or $i < j$, there are two element $g^+ \in A\langle f\rangle$ and $g^- \in A\langle f^{-1}\rangle$ that $g^+ + g^-$ restricts to g on $U_1 \cap U_2$, and $|g^+|, |g^-| \le \beta|g|$.

Now that $\mathcal{F}$ is coherent, so v_i and w_j both generate M_{12} separately. Then there are equations $v_i = \sum c_{ij}w_j$ and $w_i = \sum d_{ij}v_j$, where $c_{ij}, d_{ij} \in A\langle f, f^{-1}\rangle$. The image of $A\langle f\rangle$ is dense in $A\langle f, f^{-1}\rangle$(10.3.4.26), so there are elements $c'_{ij} \in A\langle f^{-1}\rangle$ s.t. $\max_{ijl}|c_{ij} - c'_{ij}||d_{jl}| < \beta^{-2}\varepsilon$.

Now I claim the above approximation process is true for $\alpha = \beta^2\max(|c'_{ij}| + 1)$. For this, notice for any $u = \sum a_i v_i$ with $a_i \in A\langle f, f^{-1}\rangle$, which we may assume $|a_i| \le \beta|u|$ by the definition of the norm on M_{12}, then $a_i = a_i^+ + a_i^-$, that $|a_i^*| \le \beta|a_i|$. Consider the following element

$$u^+ = \sum a_i^+ v_i \in M_1, \quad u^- = \sum a_i^- \sum c'_{ij}w_j \in M_2$$

Then it is easily verified that $|u^*| < \alpha|u|$, and

$$u - u^- - u^+ = \sum\sum a_i^-(c_{ij} - c'_{ij})w_j = \sum\sum\sum a_i^-(c_{ij} - c'_{ij})d_{jl}v_l.$$

which has norm smaller than $\max|a_i^-(c_{ij} - c'_{ij})d_{jl}| \le \beta^2|u| \cdot \beta^{-2}\varepsilon = \varepsilon|u|$, finishing the proof. □

Prop. (14.5.3.6)[Kiehl]. An $\mathcal{O}_X$-module $\mathcal{F}$ on an affinoid K-space $\operatorname{Sp} A$ is coherent iff it is associated to a finite A-module.

Proof: The converse is obvious, for the other direction, by(14.5.1.39), it suffices to prove for $\mathfrak{U}$ a Laurent covering, and further, it suffices to prove for the simplest Laurent covering $X(f), X(f^{-1}) \to X$ because: $U(f,g) \cup U(f,g^{-1}) \cup U(f^{-1},g) \cup U(f^{-1},g^{-1}) = (U(f,g) \cup U(f,g^{-1})) \cup (U(f^{-1},g) \cup U(f^{-1},g^{-1}))$.

Thus the above lemma shows that $H^1(\mathfrak{U}, \mathcal{F}) = 0$. Now I prove that for any finite affinoid covering $\mathfrak{U} = \cup \operatorname{Sp} A_i$, if $H^1(\mathfrak{U}, \mathcal{F}) = 0$ for any coherent sheaf $\mathcal{F}$, then any $\mathfrak{U}$-coherent sheaf $\mathcal{F}$ is associated to a finite A-module, this will finish the proof.

Consider any maximal ideal $\mathfrak{m}_x$ of A, $\mathfrak{m}_x \otimes_A \mathcal{O}_X$ is a coherent sheaf as $\mathfrak{m}_x$ is finite because A is Noetherian, so there is a short exact sequence

$$0 \to \mathfrak{m}_x\mathcal{F} \to \mathcal{F} \to \mathcal{F}/\mathfrak{m}_x\mathcal{F} \to 0$$

of $\mathfrak{U}$-coherent sheaves, because $A/\mathfrak{m}_x$ is a field, thus flat.

Now for any affinoid space U' in U_i for some i, the section of this exact sequence is exact, because the ring morphism associated to an affinoid subdomain is flat(14.5.1.26). In particular, this can be applied to any intersections of U_i, in particular the Čech complex of these sheaves. Then the long exact sequence and the fact $H^1(\mathfrak{U}, \mathfrak{m}_x\mathcal{F}) = 0$ shows

$$0 \to \mathfrak{m}_x\mathcal{F}(X) \to \mathcal{F}(X) \to \mathcal{F}/\mathfrak{m}_x\mathcal{F}(X) \to 0$$

Next we want to show $\mathcal{F}/\mathfrak{m}_x\mathcal{F}(X) \to \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U_i)$ is isomorphism for any $x \in U_i$. To prove this, first for any affinoid subspace $U' = \operatorname{Sp} B$ contained in some U_j, let $U' \cap U_i = \operatorname{Sp} B_i$, $\mathcal{F}|_{U'} = M' \otimes_A \mathcal{O}_{U'}$, we show $\mathcal{F}/\mathfrak{m}_x\mathcal{F}(U') \cong \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U' \cap U_i)$, this is equivalent to

$$M'/\mathfrak{m}_xM' \to M'/\mathfrak{m}_xM' \otimes_B B_i = M'/\mathfrak{m}_xM' \otimes_{B/\mathfrak{m}_xB} B_j/\mathfrak{m}_xB_j$$

is an isomorphism. But $B/\mathfrak{m}_xB \cong B_j/\mathfrak{m}_xB_j$: This is true when $x \in U'$ by(14.5.1.8), and they are both trivial ring if $x \notin U'$. Then look at the morphism of Čech complex induced by $\mathcal{F}/\mathfrak{m}_x\mathcal{F} \to$

$\mathcal{F}/\mathfrak{m}_x\mathcal{F}|_{U_i}$, then it is an isomorphism, by what we just proved, so its H^0 is also isomorphism, which is $\mathcal{F}/\mathfrak{m}_x\mathcal{F}(X)\cong\mathcal{F}/\mathfrak{m}_x\mathcal{F}(U_i)$.

Finally, by the commutative diagram $\begin{array}{ccc}\mathcal{F}(X) & \longrightarrow & \mathcal{F}/\mathfrak{m}_x\mathcal{F}(X)\\ \downarrow & & \downarrow\\ \mathcal{F}(U_i) & \longrightarrow & \mathcal{F}/\mathfrak{m}_x\mathcal{F}(U_i)\end{array}$, the right vertical arrow is isomorphism, so if denote $\mathcal{F}(U_i)$ by M_i, then $\mathcal{F}(X)$ generate $M_i/\mathfrak{m}_xM_i$ for every x, then consider $L=M_i/\mathcal{F}(X)$, then $\mathfrak{m}_xL=L$ for every x, then by Nakayama, for each maximal ideal $\mathfrak{m}$, there is a $m\in\mathfrak{m}$ that $(1+m)L=0$, so $Ann(L)=(1)$, so $L=0$, i.e. $\mathcal{F}(X)$ generate M_i for each i.

Now choose f_i in $\mathcal{F}(X)$ that generate M_i simultaneously, then the map $\mathcal{O}_X^n\to\mathcal{F}$ is a surjection of $\mathfrak{U}$-coherent sheaves, its kernel $\mathcal{G}$ is also coherent by(14.5.3.4), now all the above argument works for $\mathcal{G}$, so there is a surjection $\mathcal{O}_X^m\to\mathcal{G}$, so $\mathcal{O}_X^m\to\mathcal{O}_X^n\to\mathcal{F}\to 0$, so $\mathcal{F}$ is associated to the cokernel of the map $A^m\to A^n$. □

Cor. (14.5.3.7). Coherence for a $\mathcal{O}_X$-module on a rigid K-space is affinoid local on the target.

Cohomology on Rigid Analytic Spaces

Lemma (14.5.3.8). The category of $\mathcal{O}_X$-modules on a rigid K-space is a Grothendieck category by(3.7.3.29).

Def. (14.5.3.9) [Derived Cohomologies]. Consider the right derived functor for Γ and more general f_*, these are left exact by(5.1.2.9). Then $R^pf_*\mathcal{F}=(f_*\mathcal{H}^p(\mathcal{F}))^\sharp$ by Grothendieck spectral sequence.

The Cech-to-Derived spectral sequence(5.3.2.13) is applied: $H^p(\{U_i\to U\},\mathcal{H}^q(F))\Rightarrow H^{p+q}(U,F)$, $\check{H}^p(U,\mathcal{H}^q(F))\Rightarrow H^{p+q}(U,F)$ and $\check{H}^1(U,F)\cong H^1(U,F)$.

In particular, if $H^q(U_{i_0i_1\dots i_r},\mathcal{F})=0,q>0$, then $H^p(\{U_i\to U\},\mathcal{F})=H^p(U,\mathcal{F})$(5.3.2.15). And it is enough to have $\check{H}^q(U_{i_0i_1\dots i_r},\mathcal{F})=0,q>0$ by(5.3.2.16).

Cor. (14.5.3.10). A Qco sheaf on an affinoid space has vanishing higher sheaf cohomology by Tate's acyclicity(14.5.1.40) and(5.3.2.16).

Properties of Rigid K-Spaces

This subsubsection is strongly suggested to read after reading the parallel part of schemes.

Def. (14.5.3.11). A morphism is called a **closed immersion** if there is an admissible affinoid covering that it restricts to a closed immersion of affinoid spaces(It is compatible with definition(14.5.1.28) before by(14.5.3.15)). It is called an **open immersion** iff it is injective and the corresponding stalk maps are isomorphisms. The **(quasi-)separatedness, quasi-compactness, finiteness** are defined similarly as for schemes.

Lemma (14.5.3.12) [Nike's Trick]. In a rigid analytic K-space X and $\operatorname{Sp}A$, $\operatorname{Sp}B$ be affinoid subspaces, then there is an admissible affinoid covering of $\operatorname{Sp}A\cap\operatorname{Sp}B$.

Proof: This is analogous to the scheme case(5.4.1.1), but the proof is different: X has an admissible covering, this restricts to an admissible covering of $\operatorname{Sp}A\cap\operatorname{Sp}B$, and any admissible covering can be refined by an affinoid admissible covering. □

Prop. (14.5.3.13) [Affinoid Communication Theorem]. A property P of affinoid open subsets of X is called **affiniod local** if: $\operatorname{Sp}A$ has $P\Rightarrow$ all affinoid subdomains of $\operatorname{Sp}A$ has P, and any admissible affinoid cover of $\operatorname{Sp}A$ has $P\Rightarrow\operatorname{Sp}A$ has P. Notice a stalk-wise property is obviously affine-local.

Now if we call X has $\widetilde{P}$ if there is an admissible affinoid covering $A_i \to X$ that A_i has P. Then the following are equivalent:

- all open affinoid subsets of X has P.
- all open subspace of X has $\widetilde{P}$.
- X has a cover of open subspaces that has $\widetilde{P}$.
- X has $\widetilde{P}$.

Proof: The proof is the same as the scheme case(5.4.1.2). □

Prop. (14.5.3.14). Separated morphism is quasi-separated because closed immersion is affinoid hence quasi-compact(14.5.1.3).

Prop. (14.5.3.15) [Finite Morphism]. For a morphism $\varphi : X \to Y$ of rigid K-spaces

- It is finite iff the inverse image of any affinoid space is affinoid, and $\varphi_* \mathcal{O}_Y$ is a coherent $\mathcal{O}_X$-module. In particular, finiteness is local on the target because coherence do.
- It is closed immersion iff it is finite and $\mathcal{O}_Y \to \varphi_* \mathcal{O}_X$ is surjective, this shows the definition of closed immersion is compatible with before.

Proof: Coherence is affinoid local on the target by Kiehl's theorem, so it suffices to prove the inverse image of any affinoid space is affinoid for a finite morphism: Consider any affinoid subdomain $U \subset X$ with inverse image $\varphi^{-1}(U)$, by Kiehl's theorem, $B = \mathcal{O}_X(f^{-1}(U))$ is finite over $A = \mathcal{O}_Y(U)$, thus can be given an affinoid K-algebra structure(10.3.4.33). Now

$$\varphi^{-1}(U) \xrightarrow{\chi} \operatorname{Sp} B \xrightarrow{\rho'} \operatorname{Sp} A$$

χ is locally an isomorphism, as ρ is finite, so χ is an isomorphism.

The second assertion is because locally $\mathcal{O}_Y, \varphi_* \mathcal{O}_X$ are both Qco so surjectivity is equivalent to the global section is surjective(14.5.3.1). □

Prop. (14.5.3.16). Closed/Open immersion, quasi-compactness, (quasi-)separatedness are all local on the target, and stable under base change.

Proof: Closed immersion is local on the target because finiteness do and surjectiveness of $\mathcal{O}_Y \to \varphi_* \mathcal{O}_X$ is checked locally. Open immersion is local on the target because stalk and injectivity are all checked locally.

Then Closed/Open immersion are stable under base change because the affinoid case is true(14.5.1.29).

Quasi-compact is easily seen local on the target and stable under base change.

(Quasi-)Separateness is local on the target because closed immersion and quasi-compact do.

(Quasi-)Separateness is stable under base change because closed immersion and quasi-compact do, because diagonal commutes with base change(3.1.1.48). □

Prop. (14.5.3.17). Morphisms between affinoid K-spaces are separated. Moreover, because of localness, any finite morphism is separated.

Proof: The diagonal is $\operatorname{Sp} A \to \operatorname{Sp} A \widehat{\otimes}_B A$, whose ring map is surjective. □

Prop. (14.5.3.18). By(3.1.1.50), for $X \to S$ and $Y \to S$, the map $X = X \times_Y Y \to X \times_S Y$ is an immersion. It is closed immersion if $Y \to S$ is separated, and it is qc if $Y \to S$ is quasi-separated.

Cor. (14.5.3.19). If $s : S \to X$ is a section of $f : X \to S$, the above proposition applies to this case, because $S = S \times_X X \to S \times_S X = X$.

Prop. (14.5.3.20). A morphism is quasi-separated iff there is an admissible affinoid covering W_i that, for any two affinoid open U, V that are mapped to an affinoid open, their intersection is quasi-compact. This is because quasi-compact is local on the target.

A morphism is separated iff there is an admissible affinoid covering W_i that, for any two affinoid open U, V that are mapped to an affinoid open, their intersection is affinoid open and $\mathcal{O}(U)\widehat{\otimes}_{\mathcal{O}(W_i)}\mathcal{O}(V) \to \mathcal{O}(U \cap V)$ is surjective. This is because closed immersion is local on the target(14.5.3.16).

Cor. (14.5.3.21). If $g \circ f$ is (quasi-)separated, then so is f.

Cor. (14.5.3.22). If X is (quasi-)separated, then $X \to Y$ is (quasi-)separated.

4 Proper Mapping Theorem

Def. (14.5.4.1). For a rigid space X over affinoid space Y, if $U \subset U' \subset X$ be affinoid subspaces, U is called **relatively compact** in U' iff there is a set of affinoid generators f_i of $\mathcal{O}_X(U')$ over $\mathcal{O}_Y(Y)$ that $|f_i(x)| < 1$ on U. This is denoted by $U \Subset_Y U'$.

Prop. (14.5.4.2). If X_1, X_2 are affinoid spaces over an affinoid space Y, and U_i are affinoid space of X_i, then

- if $U_1 \Subset_Y X_1$, then $U_1 \times_Y X_2 \Subset_{X_2} X_1 \times_Y X_2$.
- if $U_i \Subset_Y X_i$, then $U_1 \times_Y U_2 \Subset_Y X_1 \times_Y X_2$.
- If $U_i \Subset_Y X_i$, and X_i are affinoid subspaces of a rigid space separable over Y, then $U_1 \cap U_2 \Subset_Y X_1 \cap X_2$.
- If $U_1 \Subset_Y X_1$, and $i : T \to X_1$ is a closed immersion, then $i^{-1}(U_1) \Subset_Y i^{-1}(X_1)$.

The proof is easy. For the last one, should notice $|f(x)| = |f(i(x))|$, because it is closed immersion, so the residue field is the same.

Def. (14.5.4.3)[Proper Morphism]. A **proper** morphism $\varphi : X \to Y$ of rigid K-spaces is a separated morphism that there is an admissible affinoid covering Y_i of Y that there are two admissible affinoid coverings X_{ij}, X'_{ij} of $\varphi^{-1}(Y_i)$ that $X_{ij} \Subset_{Y_i} X'_{ij}$ for any i, j.

Prop. (14.5.4.4). Properness is stable under base change and composition

Proof: The base change follows directly from(14.5.4.2).
For the composition, Cf.[Formal and Rigid Geometry P131](difficult). □

Prop. (14.5.4.5). Properness is local on the target.

Proof: This is because separatedness is local on the target(14.5.3.16) and the second condition of properness is itself local. □

Prop. (14.5.4.6). If $g \circ f : X \to Y \to Z$ is proper and g is separated, then f is proper.

Proof: By(14.5.3.18), $\tau : X \to X \times_Z Y$ is closed immersion, and f is separated by(14.5.3.21). Now proper is local, so we may assume Z is affinoid, so there are two admissible covering X_i, X'_i of X that $X_i \Subset_Z X'_i$, and choose an admissible affinoid covering $Y_i \to Y$, then $X_j \times_Z Y_i, X'_j \times_Z Y_i$ are admissible coverings of Y_i that is $X_j \times_Z Y_i \Subset_{Y_i} X'_j \times_Z Y_i$. And it can be pulled back to an affinoid admissible coverings of $f^{-1}(Y_i)$ that $\tau^{-1}(X_j \times_Z Y_i) \Subset_{Y_i} \tau^{-1}(X'_j \times_Z Y_i)$, because τ is closed immersion. So $X \to Y$ is proper. □

Prop. (14.5.4.7). Finite morphism is proper, in particular, closed immersion is proper.

Proof: Finite morphism is separated by(14.5.3.17), and locally, assume both space are affinoid, $X = \mathrm{Sp}\,B \to \mathrm{Sp}\,A = Y$, then B is a finite A-module, in priori a f,g, A-algebra, so there is a set of generators f_i of B over A that (by multiplying a constant in K^*) $|f_i|_{sup} < 1$(10.3.4.21), so $X \Subset_Y X$, hence it is proper. □

Prop. (14.5.4.8)[Proper and Analytification]. For a morphism between schemes locally of f.t. over K, it is proper iff its rigid analytification is proper.

Proof: Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr. Math. Inst. Univ. Münster, 2. Serie, Heft 7 (1974) Satz 2.16]. □

For the following: Cf.[Formal and Rigid Geometry P132].

Prop. (14.5.4.9)[Proper Mapping theorem, Kiehl]. The higher direct images of a proper map of rigid analytic spaces takes coherent sheaves to coherent sheaves.

Proof: □

Prop. (14.5.4.10). For a scheme X locally of f.t. over K, an $\mathcal{O}_X$-module $\mathcal{F}$ on X gives rise to an $\mathcal{O}_{X^{rig}}$-module on X^{rig}, and it is coherent iff $\mathcal{F}$ is coherent.

Proof: □

Prop. (14.5.4.11). For a proper scheme over K, $H^q(X,\mathcal{F}) \cong H^q(X^{rig},\mathcal{F}^{rig})$ for $\mathcal{F}$ coherent.

Proof: □

Prop. (14.5.4.12). When X is proper, coherent sheaves on X^{rig} corresponds to coherent sheaves on X. This gives an analog of Chow's theorem when applied to $X = \mathbb{P}^n_K$ and $\mathcal{F}'$ is a sheaf of ideals in $\mathcal{O}_{X^{rig}}$.

Proof: □

5 Formal Geometry

Main references for this subsection is [Bos15], [Hartshorne] and [Topics in Algebraic Geometry, Illusie].

Def. (14.5.5.1) [Formal Spectrum Spf A]. Let A be a complete adic ring(10.3.1.8) with an ideal of definition $\mathfrak{a}$ that the A is $\mathfrak{a}$-adically complete and separated. Then we let $\mathrm{Spf}\,A$ be the ringed space with underlying topological space $\mathrm{Spec}(A/\mathfrak{a})$(open primes of A), and the structure sheaf $\mathcal{O}$ that $\mathcal{O}(D(f)) = A\langle f^{-1}\rangle$(10.3.1.10).

Proof: To construct this sheaf, we first check that $\mathcal{O}(D(f)) = A\langle f^{-1}\rangle = \varprojlim_n (A/\mathfrak{a}^n[f^{-1}])$ defines a sheaf on the site of subspaces of $\mathrm{Spf}\,A$ of the form $D(f)$: For any open covering $\{D(f_i)\}$ of $D(f)$, there are exact sequences:

$$0 \to (A/\mathfrak{a}^n)_f \to \prod_i (A/\mathfrak{a}^n)_{f_i} \to \prod_{i,j} (A/\mathfrak{a}^n)_{f_i f_j}$$

by(4.4.2.3). Then we take inverse limit, which is exact by Mittag-Leffler(4.9.3.2), to get an exact sequence, which is just the sheaf condition of $\mathcal{O}$. Then, we can use(5.1.2.25) to extend this sheaf to a sheaf on $\mathrm{Spf}\,A$. □

Prop. (14.5.5.2) [Stalks of Spf A**].** Let $x \in \operatorname{Spf} A$ correspond to a prime $\mathfrak{p}_x$ in A. Then the stalk of Spf A at x is just $\mathcal{O}_x = \varinjlim_{x\in D(f)} A\langle f^{-1}\rangle$, which is a local ring with maximal ideal $\mathfrak{m}_x$ containing $\mathfrak{p}_x\mathcal{O}_x$. Moreover, $\mathfrak{m}_x = \mathfrak{p}_x\mathcal{O}_x$ iff $\mathfrak{a}$ is f.g.. So Spf A is a local ringed space, called the **affine formal scheme** of A.

Proof: Cf.[Bos15]P159.? □

Remark (14.5.5.3). In many case, for example in Scholze's treatment of the p-adic geometry, the ideal of definition $\mathfrak{a}$ is assumed to be f.g., because we need this to show that the $\mathfrak{a}$-adic completion of $A[f^{-1}]$ is $(\mathfrak{a})$-adically complete(4.2.3.6), so that we can interpret $D(f) \subset \operatorname{Spf} A$ as an affine formal scheme $\operatorname{Spf}(A\langle f^{-1}\rangle)$(10.3.1.11).

Another way to get around this finiteness condition is to consider formal spectrum for a larger class of rings, called the **admissible rings**, which is a complete and separated topological ring with a basis consisting of open ideals, and with an ideal of definition $\mathfrak{a}$ that $\mathfrak{a}^n \to 0$ for $n \to 0$.

Prop. (14.5.5.4) [Affine Formal Adjointness]. Morphisms between local topologically ringed spaces Spf $B \to$ Spf A corresponds to continuous homomorphisms $A \to B$.

Def. (14.5.5.5) [Formal Schemes]. The category of **formal schemes** is the full subcategory of the category of local topologically ringed topological spaces $(X, \mathcal{O}_X)$ consisting of objects that is locally isomorphic to an affine formal scheme Spf A.

The category of formal schemes contains the category of schemes, by mapping Spec A to Spf A, where A is endowed with the discrete topology.

Prop. (14.5.5.6) [Glueing and Fiber Products]. Formal Schemes can easily be glued, and also spectrum adjointness holds as in(14.5.2.5). Finally there are fibered products, constructed as in(5.2.7.15), where the affine case corresponds to completed tensor product(10.3.1.12).

Def. (14.5.5.7) [Formal Completion of Schemes Along a Closed Subscheme]. Let X be a scheme and Y a closed subscheme of X defined by a Qco ideal $\mathcal{I} \subset \mathcal{O}_X$, then consider the sheaf $\mathcal{O}_Y$ defined by restricting the projective limit $\varprojlim_n \mathcal{O}_X/\mathcal{I}^n$ to Y, then $(Y, \mathcal{O}_Y)$ is a locally topologically ringed space, called the **formal completion** of X along Y.

Noetherian Adic Formal Schemes

Cf.[Hartshorne Chap2.9] and [Sta]30.23. and Illusie.

Def. (14.5.5.8) [Noetherian Formal Adic Schemes].

Def. (14.5.5.9) [Coherent Sheaves on Noetherian Formal Adic Schemes].

Prop. (14.5.5.10). Let A be a Noetherian ring and I an ideal, let X be a proper scheme over A and $\mathcal{F}$ a coherent sheaf on X, then for any $p \geq 0$, the inverse systems $(H^p(X, I^n\mathcal{F}))$ and $(I^nH^p(X, \mathcal{F}))$ are isomorphic pro-A-modules.

Proof: Cf.[Sta]02OA. □

Thm. (14.5.5.11) [Theorem of Formal Functions]. Let A be a Noetherian ring with an ideal I, X be a proper scheme over A and $\mathcal{F}$ a coherent scheme on X. Then for any $p \geq 0$, the system of maps

$$H^p(X, \mathcal{F})/I^nH^p(X, \mathcal{F}) \to H^p(X, \mathcal{F}/I^n\mathcal{F})$$

induce an isomorphism of limits

$$H^p(X, \mathcal{F})^\wedge \cong \varprojlim_n H^p(X, \mathcal{F}/I^n\mathcal{F}).$$

Proof: Cf.[Sta]02OC. □

Prop. (14.5.5.12) [Grothendieck's Existence Theorem]. Cf.[Sta]0883.

Prop. (14.5.5.13) [Grothendieck's Algebrization Theorem]. Cf.[Sta]089A.

6 Admissible Formal Schemes

Remark (14.5.6.1) [Setup]. For a good theory of Admissible formal schemes, let the base ring R be an adic ring with an ideal of definition I that satisfies either one of the following situation:

- R is an adic valuation ring with a principal ideal of definition.
- R is Noetherian and has no I-torsion.

Def. (14.5.6.2) [Admissible Formal Schemes]. Let R be an adic ring, then a formal R-scheme X is called **locally of topologically finite type/finite presentation/admissible** if there is an open affine covering $\operatorname{Spf} A_i$ of X that A_i satisfies those properties(10.3.1.13).

X is called **topologically of finite type** if it is locally of topologically finite type and quasi-compact. It is called **topologically of finite presentation** if it is locally of topologically finite presentation, quasi-compact and quasi-separated.

Prop. (14.5.6.3) [Induced Admissible Formal Subscheme]. Let X be a formal R-scheme that is locally of topologically finite type, and let $\mathcal{O}_X$ be its structure sheaf. Then we can look at the ideal sheaf $\mathcal{I} \subset \mathcal{O}_X$ consisting of all elements locally killed by a power of I^n. This is a qco sheaf, as $\mathcal{I}(U) = \{f \in \mathcal{O}(U) | I^n f = 0 \text{ for some } n\}$, because the quotient by the RHS is locally topologically of finite type and has no I-torsion, thus admissible, by(10.3.1.15), and admissibility is local(10.3.1.16).

In particular we can take the closed subscheme $X_{adm} \subset X$ corresponding to $\mathcal{I}$, then it is an admissible formal scheme, called the **induced admissible formal subscheme** of X.

7 Formal Models

Prop. (14.5.7.1) [Generic Fiber Functor]. Let R be a complete valuation ring of height 1 with field of fraction 1 with field of fraction K, then the functor $A \mapsto A \otimes_R K$ from the category of R-algebras topologically of finite type to the category of affinoid K-algebras

Proof: Cf.[Bos15]P174. □

Def. (14.5.7.2) [Formal Models]. In view of(14.5.7.1), one would like to describe all formal R-schemes that the generic fiber X_{rig} is isomorphic to a given rigid K-space X_K. But first notice $A \mapsto A \otimes_R K$ kills all R-torsion, in particular the generic fiber functor only depends on the induced admissible formal scheme X_{adm}(14.5.6.3). So given any rigid K-space X_K, any admissible formal R-scheme X satisfying $X_{rig} \cong X_K$ is called a **formal R-model** of X_K.

Def. (14.5.7.3) [Admissible Formal Blowing-up].

14.6 p-adic Uniformizations

1 Mumford Curves

References are [Schottky Groups and Mumford Curves, 1980], [Mihran Papikian, Non-archimedean uniformization and monodromy pairing].

Def. (14.6.1.1) [p-adic Schottky Groups]. For $p \in \mathbf{P}$, a **p-adic Schottky group** is a discrete, f.g. free subgroup $\Gamma \subset PGL_2(\mathbb{Q}_p)$.

Prop. (14.6.1.2). A subgroup $\Gamma \subset PGL(2, \mathbb{Q}_p)$ is a p-adic Schottky group if it is discrete, f.g. and torsion-free.

Proof: Γ acts on the Bruhat-Tits building Δ of $PGL(2, \mathbb{Q}_p)$, and the stabilizer is $\Gamma \cap PGL(2, \mathbb{Z}_p)$, which is a finite group as Γ is discrete and $PGL(2, \mathbb{Z}_p)$ is compact. Thus it is trivial as Γ is torsion-free. Thus Γ acts freely on Δ, so Γ must be a free group.? □

Def. (14.6.1.3). A p-adic Schottky group Γ acts on $\mathbb{P}^1(\mathbb{C}_p)$. Denote $\mathcal{L}_\Gamma$ is the set of limit points of this action, $\Omega_\Gamma = \mathbb{P}^1(\mathbb{C}_p) - \mathcal{L}_\Gamma$.

Thm. (14.6.1.4) [Mumford]. Let Γ is a p-adic Schottky group of rank g, then there is a smooth complete curve $X_\Gamma/\mathbb{Q}_p$ of genus g with an analytic isomorphism $\Omega_\Gamma/\Gamma \cong X_\Gamma(\mathbb{C}_p)$. Such a curve X_Γ is called a p-adic **Mumford curve**.

Proof:

□

Thm. (14.6.1.5) [Mumford]. Let Γ is a p-adic Schottky group of rank $g \geq 2$, then the corresponding Mumford curve X_Γ has split degenerate stable reduction. Conversely, and smooth complete curve over $\mathbb{Q}_p$ with split degenerate stable reduction is a Mumford curve.

Where split degenerate reduction means that the normalization of all components of $\widetilde{X}$ are $\mathbb{F}_p$-rational, and all nodes are $\mathbb{F}_p$-rational with two $\mathbb{F}_p$-rational branches.

Proof:

□

Prop. (14.6.1.6) [Herrlich]. Suppose $p \in \mathbf{P}$ and $X/\mathbb{Q}_p$ is a Mumford curve with genus $g \geq 2$, then

$$\# \operatorname{Aut}(X) \leq \begin{cases} 84(g-1) & , p = 2 \\ 24(g-1) & , p = 3 \\ 30(g-1) & , p = 5 \\ 12(g-1) & , p = 3 \end{cases}$$

Proof: □

14.7 Rapoport-Zink Spaces

Main references are [Period Spaces for p-Divisible Groups, Rapoport-Zink], [Kot85], [On the Classification and Specialization of F-Isocrystals with Additional Structure, Rapoport-Richartz, 1996] and [Rap95].

Notation (14.7.0.1).
- Use notations from15.4.

1 $B(G)$ and Isocrystals with Structures

Notation (14.7.1.1).
- Let $L = K_0E$ where $E \in p - \texttt{LField}$. Thus $e(L) = e(E)$.
- Let $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\mathbb{Q}_p$ be a linear algebraic group.

Remark (14.7.1.2). The σ-conjugacy classes of $GL(n; K_0)$ are in bijection with the isomorphism classes of n-dimensional isocrystals, so the Dieudonné-Manin classification of isocrystals can be translated to a classification of σ-conjugacy classes of $GL(n; K_0)$. And this generalizes to other connected reductive group G/K as well, and the description of the set of σ-conjugacy classes $B(G)$ are useful in studying the points mod p of Shimura varieties.

Def. (14.7.1.3)[$B(G)$]. Denote $B(G) = H^1(\langle\sigma\rangle, G(K_0))$, which is equal to the set of φ-conjugate classes of $G(K_0)$, i.e. $x \sim y \in G(K)$ iff $x = gx\sigma(g)^{-1}$ for some $g \in G(K)$.

<u>The Newton Map</u>

Def. (14.7.1.4) [Equivalent Pairs]. Two pairs $(\mu, b), (\mu', b')$ as in(14.7.1.24) are called **equivalent** if there exists $g \in G(K_0)$ s.t. $b' = gb\sigma(g)^{-1}$, and the cocharacters $\mu', g\mu g^{-1}$ define the same filtration on $\mathrm{Rep}_{\mathbb{Q}_p}(G)$. Equivalent, $\mathcal{I}_{b,\mu} = \mathcal{I}_{b',\mu'}$.

Def. (14.7.1.5) [Slope Morphisms]. Let $\mathbb{D} = \operatorname{Spec}\mathbb{Q}_p[\{T^{1/k}\}_{k\in\mathbb{Z}}] = \mathbb{D}(\mathbb{Q})_{\mathbb{Q}_p}$ be the pro-algebraic torus over $\mathbb{Q}_p$ with character group $\mathbb{Q}$, and $b \in G(K_0)$, then there is a morphism $\nu_b : \mathbb{D}_{K_0} \to G_{K_0}$, called the **slope morphism** associated to b, which is defined as follows:

For any $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$, there is an associated isocrystal defined in(14.7.1.20), then there is a morphism $\nu_\rho \in \mathrm{Hom}_{K_0}(\mathbb{D}, \mathrm{GL}(V))$ that $\mathbb{D}$ acts on the isotypical component V_λ of V by the character $\lambda \in \mathbb{Q} = X^*(\mathbb{D})$. Then for any $x \in \mathbb{D}(R)$, the mapping $\rho \to \nu_\rho(x)$ gives an automorphism of the standard fiber functor on $\mathrm{Rep}_{\mathbb{Q}_p}(G)$, so by Tannakian duality corresponds to a unique element $y \in G(R)$ that $\rho(y) = \nu_\rho(x)$ for any ρ. The homomorphism $x \mapsto y$ is functorial in R and thus defines an element $\nu \in \mathrm{Hom}_L(\mathbb{D}, G)$.

Remark (14.7.1.6). Notice the group $\mathbb{Q}^*$ acts on $\mathbb{D}$, and for $s \in \mathbb{Q}^*$ and $v \in \mathrm{Hom}_{K_0}(\mathbb{D}, G)$, denote by v^s the composite $\mathbb{D}_{K_0} \xrightarrow{s} \mathbb{D}_{K_0} \xrightarrow{v} G_{K_0}$, and $\mathbb{D} \to \mathbb{G}_m$ the natural morphism, then for any v, there is a suitable s that sv factors through a morphism also denoted by $\nu^s : \mathbb{G}_{m,K_0} \to G_{K_0}$, as G is algebraic.

Prop. (14.7.1.7) [Characterizing the Slope Morphism]. The slope morphism associated to $b \in G(K_0)$ can be characterized intrinsically to be the unique morphism $\nu \in \mathrm{Hom}_L(\mathbb{D}, G)$ s.t.: There exists some $s \in \mathbb{Z}_+, c \in G(L)$ that
- $s\nu \in \mathrm{Hom}_L(\mathbb{G}_m, G)$,
- $c\nu^s c^{-1}$ is defined over $\mathbb{Q}_{p^s}$.

- $c(b\sigma)^s c^{-1} = c\nu^s(p)c^{-1}\sigma^s$.

Proof: Cf.[Kottwitz, P13]. □

Cor. (14.7.1.8). σ acts on $\nu_b \in \mathrm{Hom}_{K_0}(\mathbb{D}, G)$, and it satisfies the following properties:

- $\nu_{\sigma(b)} = \sigma(\nu_b)$.
- $\nu_{gb\sigma(g)^{-1}} = g\nu_b g^{-1}$.
- $b\nu^\sigma b^{-1} = \nu$.

Proof: 1 follows from the fact $(V \otimes_{\mathbb{Q}_p} K_0, b\sigma) \xrightarrow{\sigma,\cong} (V \otimes_{\mathbb{Q}_p} K_0, \sigma(b)\sigma)$.

2 follows from the fact $(V \otimes_{\mathbb{Q}_p} K_0, b\sigma) \xrightarrow{\rho(g),\cong} (V \otimes_{\mathbb{Q}_p} K_0, gb\sigma(g)^{-1}\sigma)$by(14.7.1.20).
3 follows from 2 as $b = b\sigma(b)\sigma(b)^{-1}$. □

Cor. (14.7.1.9) [Newton Map]. If G/F is a connected reductive group with a maximal torus T and Weyl group W_T, we get a map of sets

$$\nu : B(G) \to \mathcal{N}(G) = (\mathrm{int}(G(K_0))\backslash \mathrm{Hom}_{K_0}(\mathbb{D}, G)^{\langle\sigma\rangle}) = (X_*(T)_{\mathbb{Q}}/W_T)^{\mathrm{Gal}_{\mathbb{Q}}}$$

called the **Newton map**, and it is functorial in G. It follows from the Dieudonné-Manin classification(7.6.4.13) that when $k = \overline{k}$ and $G = \mathrm{GL}(n)$, this Newton map is injective.

Def. (14.7.1.10) [Kottwitz-Decent Elements]. $[b] \in B(G)$(14.7.1.3) is called **Kottwitz-decent** if there is some $s \in \mathbb{Z}_+$ and some $b \in [b]$ that $\nu_b^s : \mathbb{D} \to G$ factors through $\mathbb{D} \to \mathbb{G}_m$ and

$$(b\sigma)^s = \nu_b^s(p)\sigma^s \in G(K_0) \rtimes \langle\sigma\rangle.$$

it can be verified that this doesn't depends on the choice of b.

Prop. (14.7.1.11). If G is connected, then any $[b] \in B(G)$ is Kottwitz decent(14.7.1.10).

Proof: Cf.[Kottwitz]. □

Prop. (14.7.1.12). If $b \in G(K_0)$ satisfies the descent condition for s in(14.7.1.10), then $b \in G(\mathbb{Q}_{p^s})$ and ν is defined over $\mathbb{Q}_{p^s}$.

Proof: Set $b_s = b\sigma(b)\ldots\sigma^{s-1}(b)$, then iterating(14.7.1.8), $b_s\nu^{\sigma^s}b_s^{-1} = \nu$. And we have $b_s = \nu^s(p)$, so $\nu^{\sigma^s} = \nu$, so ν is defined over $\mathbb{Q}_{p^s}$.

To show the first assertion, notice $(b\sigma)(b\sigma)^s = (b\sigma)^s(b\sigma)$ shows

$$\nu^s(p)\sigma^s b\sigma = b\sigma\nu^s(p)\sigma^s = \nu^s(p)b\sigma^{s+1}(14.7.1.8).$$

and then $b\sigma^s = \sigma^s b$. □

Cor. (14.7.1.13). If $b_1, b_2 \in [b]$ are Kottwitz-decent w.r.t the same $s \in \mathbb{Z}_+$, then they are conjugate w.r.t. $G(K_0 \cap \mathbb{Q}_{p^s})$.

In particular, for any descent $b \in G(\mathbb{Q}_{p^s})$ and any $V \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$, the induced isocrystal(14.7.1.20) is defined over the field $\mathbb{Q}_{p^s}$, and it only depends on $[b] \in B(G)$.

Proof: Suppose $b_2 = gb_1\sigma(g)^{-1}$, then $\nu_2 = g\nu_1 g^{-1}$, and the descent equations are

$$(b_1\sigma)^2 = s\nu_1(p)\sigma^s, \quad g(b_1\sigma)^s g^{-1} = gs\nu_1(p)g^{-1}\sigma^s.$$

Comparing these two, g commutes with σ^s, so $g \in G(K_0 \cap \mathbb{Q}_{p^s})$. □

Prop. (14.7.1.14) [Scheme J and Conjugacy Classes]. For $b_1, b_2 \in G(K_0)$, then the functor

$$J(R) = \{g \in G(R \otimes_{\mathbb{Q}_p} K_0) | g(b_1\sigma) = (b_2\sigma)g\}$$

is representable by a smooth affine scheme over $\mathbb{Q}_p$. When $b_1 = b_2 = b$, denote the scheme by J_b.

Assume $b_1, b_2 \in G(W(k')[\frac{1}{p}])$ where $k' = \overline{k'} \subset k$, and J' the corresponding smooth affine scheme, then $J' \to J$ is an isomorphism. In particular, $B(G) \to B'(G)$ is injective, and it is surjective if G is connected and $k = \overline{k}$.

Proof: Choose an embedding $G \subset \mathrm{GL}(n)_{\mathbb{Q}_p}$ and let G be defined by functions $f_1, \ldots, f_k$, consider the functor:

$$F(R) = \{g \in \mathrm{Mat}(n; R \otimes_{\mathbb{Q}_p} K_0) | g = b\sigma(g)b^{-1}\},$$

then it is representable by an affine space by(14.7.1.15) applied to the σ-linear map $g \mapsto b\sigma(g)b^{-1}$.

So there is a f.d. $\mathbb{Q}_p$-vector space $W \subset \mathrm{Mat}(n; K_0)$ that $F(R) = W \otimes_{\mathbb{Q}_p} R$. Choose a basis (A_i) of W, then $J(R)$ is just the subfunctor of $r_i \in R$ that

$$f_k(\sum r_i A_i) = 0, \quad \det(\sum r_i A_i) \neq 0.$$

Taking a basis of K_0 over $\mathbb{Q}_p$, then these are polynomials with coefficients in $\mathbb{Q}_p$. It is automatically smooth by Cartier's theorem(8.1.4.2).

The assertion about base change follows from(14.7.1.15).

The surjectivity follows from(14.7.1.11) and(14.7.1.12). □

Lemma (14.7.1.15). Let N be a f.d. isocrystal over K_0 w.r.t. σ^s for some $s \neq 0$, then the following functor

$$F : \mathcal{CR}\mathrm{ing}_{\mathbb{Q}_p} \to \mathcal{A}\mathrm{b} : R \mapsto (V \otimes_{\mathbb{Q}_p} R)^{\varphi = \mathrm{id}}$$

is representable by a vector space over $\mathbb{Q}_p$.

Proof: $F(R) = V^{\varphi=\mathrm{id}} \otimes_{\mathbb{Q}_p} R$, so it suffices to show $\dim_{\mathbb{Q}_p} V^{\varphi=\mathrm{id}} < \infty$. Firstly assume that L is alg.closed, then this is a consequence of Dieudonné-Manin classification(7.6.4.13). This functor F doesn't depend on k as long as $k = \overline{k}$: if k'/k is a field extension and $k' = \overline{k'}$, then the corresponding functor F' defined by $N \otimes_{W(k)[\frac{1}{p}]} W(k)[\frac{1}{p}]$ coincide with F.(This is also by Dieudonné-Manin classification.) □

Cor. (14.7.1.16). Assume $[b] \in B(G)$ is Kottwitz-decent for $s \in \mathbb{Z}_+$(14.7.1.10), then J_b is a $\mathbb{Q}_{p^s}/\mathbb{Q}_p$-inner form of the centralizer $G_{\nu^s(p)}$(14.7.1.12).

Proof: The descent equation shows $b_s = s\nu(p)$, so the adjoint $b_{ad} : g \mapsto (b\sigma)g(b\sigma)^{-1} = b\sigma(g)b^{-1}$ defines an element in $H^1(G(\mathbb{Q}_{p^s}/\mathbb{Q}_p), \mathrm{Aut}(G_{s\nu(p)}(\mathbb{Q}_{p^s})))$, because

$$\sigma^k b_{ad} : g \mapsto ((\sigma(b\sigma^{-1}(g))b^{-1})) = \sigma^k(b)\sigma(g)\sigma^k(b)^{-1}.$$

so

$$b_{ad} \circ \sigma(b_{ad}) \circ \ldots \circ \sigma^{s-1}(b_{ad}) : g \mapsto b_s g b_s^{-1} = s\nu(p)g(s\nu(p))^{-1} = g.$$

So it defines an inner form, which is just

$$J'(R) = G_{s\nu(p)}(\mathbb{Q}_{p^s})^{b_{ad}\sigma} = \{g \in G_{s\nu(p)}(R \otimes_{\mathbb{Q}_p} \mathbb{Q}_{p^s}) | g(b\sigma) = (b\sigma)g\}$$

Now it suffices to show $J'(R)$ is just $J(R)$ defined in(14.7.1.14). For this, notice any $g \in J(R)$ commutes with $b\sigma$ thus commutes with $s\nu(p)$ by(14.7.1.8), and the descent condition $(b\sigma)^n = s\nu(p)\sigma^n$ shows it commutes with σ^n, so $g \in J'(R)$. □

Prop. (14.7.1.17) [Basic Elements]. Let G be a connected reductive group and $k = \overline{k}$, then the following are equivalent for $b \in G(K_0)$:

- The slope morphism ν factors through the center $Z(G)$ of G.
- b is σ-conjugate to an element in $T(K_0)$ where T is an elliptic maximal torus of G.
- J_b in(14.7.1.14) is an inner form on G.

In this case, b and its conjugacy class $\overline{b}$ are called **Kottwitz-basic**. The set of Kottwitz-basic classes in $B(G)$ is denoted by $B(G)_b$.

Proof: Cf.[Kottwitz]. □

Prop. (14.7.1.18). Situation as in(14.7.1.17), if $[G,G]$ is simply-connected, then $G \to G_{\text{ab}}$ induces a bijection $B(G)_b \cong B(G_{\text{ab}})$. In particular, $B(G)_b$ is trivial if G is semisimple and simply-connected.

Proof: Cf.[Kottwitz, P17]. □

F-Isocrystals with G-Structures

Def. (14.7.1.19) [Isocrystals with G-structures]. Given $S \in \mathcal{S}\text{ch}^p$, an **Isocrystal with G-structures** over S is an exact faithful tensor functor(3.1.6.2)

$$M : \text{Rep}_{\mathbb{Q}_p}(G) \to \text{F-Isoc}(S)(7.6.4.2).$$

The category of isocrystals with G-structures over S is denoted by $\text{F-Isoc}_G(S)$.

Prop. (14.7.1.20) [Associated Isocrystals with G-Structure]. For $b \in G(K_0)$, there is a functor

$$\mathcal{I}_b : \text{Rep}_{\mathbb{Q}_p}(G) \to \text{F-Isoc}(k) : V \mapsto (V \otimes_{\mathbb{Q}_p} K_0, \rho(b) \circ (\text{id} \otimes \sigma)).$$

this is an isocrystal with G-structures over K_0 associated to b.

If $g \in G(K_0)$ and $b' = gb\sigma(g)^{-1}$, then multiplying by g implies a natural isomorphism between $\mathcal{I}_b$ and $\mathcal{I}_{b'}$.

Cor. (14.7.1.21) [Isocrystals and $B(G)$]. From any isocrystal with G-structures on S, we get a function

$$S \to B(G) : s \mapsto [b]_s.$$

And if $k = \overline{k}$ and $S = \operatorname{Spec} k$, then the isomorphism classes of isocrystals with G-structure over S are in bijection with $B(G)$.

Proof: ? Cf.[RR96, P171]. □

Prop. (14.7.1.22) [Newton Map Constency]. If S is connected locally Noetherian, and $M \in \text{F-Isoc}_G(S)$ s.t. $\nu \circ b_M$ is constant, then b_M is constant.

Proof: Cf.[RR96, P173].? □

Cor. (14.7.1.23). If S is locally Noetherian, then $M \in \text{F-Isoc}_G(S)$, and $[b_0] \in B(G)_b$, then

$$\{s \in S | [b_M(s)] = [b_0]\} \subset S$$

is closed.

Proof: □

Weakly-Admissible Pairs

Prop. (14.7.1.24) [Associated Filtered Isocrystals]. Let K be a field extension of K_0, and $\mu : \mathbb{G}_{m,K} \to G_K$ be a cocharacter over K, then the associated isocrystal over K_0 prolongs to a filtered isocrystal over K(15.4.6.22),

$$\mathcal{I}_{b,\mu} : \mathrm{Rep}_{\mathbb{Q}_p}(G) \to \varphi\text{-}\mathcal{M}\mathrm{od}\,\mathrm{Fil}_K : V \mapsto (V \otimes_{\mathbb{Q}_p} K_0, \rho(b) \circ (\mathrm{id} \otimes \sigma), \mathrm{Fil}^\bullet_\mu),$$

where the filtration comes from μ by weight-filtrations(because $\mathbb{G}_m$ is diagonalizable(8.2.3.1)).

Def. (14.7.1.25) [Weakly-Admissible Pairs]. Let G be a reductive group, then a pair (μ, b) as in(14.7.1.24) is called a **(weakly)admissible pair** if for any $V \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$, the filtered isocrystal $\mathcal{I}_b(V)$ is weakly admissible**??**(15.4.4.10).

It suffices to check this condition for one faithful representation V.

Proof: This is because for a faithful representation V, any $\mathbb{Q}_p$-representation appears as a direct summand of $V^{\otimes n} \otimes \widehat{V}^{\otimes m}$(15.5.1.16). Then the assertion follows from the fact direct summands and tensor products of weakly admissible filtered isocrystals are weakly admissible(15.4.6.26). □

2 Period Domain

Def. (14.7.2.1) [Associated Partial Flag Variety]. Let $[\mu] : \mathbb{G}_m \to G$ be a conjugacy class of cocharacters defined over a finite extension field $E/\mathbb{Q}_p$(15.5.2.5), then there is associated a faithful tensor functor

$$\mathrm{Rep}_{\mathbb{Q}_p} \to \mathrm{gr}_E^{\mathbb{Z}} \to \mathrm{Fil}_E$$

Now call two cocharacters equivalent if their associated functor are isomorphic. Consider the functor

$$\mathcal{CR}\mathrm{ing}_E \to \mathcal{S}\mathrm{et} : R \mapsto \{\text{the equivalence classes in the } G(R)\text{-conjugacy class of } \mu_R\}$$

and also consider the closed algebraic subgroup $P(\mu) \subset G$ over E:

$$P(\mu)(R) = \{g \in G(R) | g\mu_R g^{-1} \text{ is equivalent to } \mu_R\}$$

then the functor above is representable by the G_E-homogenous variety $\mathcal{F} = G_E/P(\mu) \in \mathcal{S}\mathrm{ch}/E$.

Prop. (14.7.2.2). $\mathcal{F}$ is a projective variety, or equivalently, $P(\mu)$ is a parobolic subgroup.

Proof: If V is a faithful representation in $\mathrm{Rep}_{\mathbb{Q}_p}(G)$, we denote $\mathrm{Flag}(V)$ the partial flag variety over $\mathbb{Q}_p$ which associates to any $\mathbb{Q}_p$-algebra R the filtration $\mathrm{Fil}^\bullet$ of $V \otimes_{\mathbb{Q}_p} R$ s.t. $\mathrm{gr}^i(R)$ are direct summands and $\mathrm{rank}\,\mathrm{Fil}^i = \dim_E \mathrm{Fil}^i_\mu(V_E)$. Then $\mathrm{Flag}(V)$ is a projective variety, by classical results, and there is a closed immersion

$$\mathcal{F} \hookrightarrow \mathrm{Flag}(V)_E$$

because the isocrystal on other representations are determined by this faithful representation. □

Def. (14.7.2.3)[p-adic Period Space]. Let $\breve{E} = E(\mathbb{Q}_p^{\mathrm{ur}})^\wedge$ be the completion of the maximal unramified extension of E, then there is a rigid-analytic structure on $\breve{\mathcal{F}} = \mathcal{F}_{\breve{E}}$. define the **$p$-adic period space** $(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}} \subset \breve{\mathcal{F}}^{\mathrm{rig}}$ associated to $(G, b, [\mu])$ the set of points ξ conjugate to μ that (ξ, b) is weakly admissible.

Let J_b be the algebraic group associated to b as in(14.7.1.14), then $J_b(\mathbb{Q}_p)\subset G(K_0)$ acts on $\breve{\mathcal{F}}^{\mathrm{rig}}$, and it preserves the set $(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$.

$(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$ has a natural structure of an admissible open subset of $\breve{\mathcal{F}}^{\mathrm{rig}}$. if $b'=gb\sigma(g)^{-1}$, then $\mu\mapsto g^{-1}\mu g$ induces an isomorphism from $(\breve{\mathcal{F}}_b^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$ to $(\breve{\mathcal{F}}_{b'}^{\mathrm{weak.\,adm}})^{\mathrm{rig}}$. Moreover, if b is Kottwitz-decent w.r.t. $s\in\mathbb{Z}_+$, then this admissible open subset is defined over $E\mathbb{Q}_{p^s}$.

Proof: Cf.[Rapoport Zink, P26]. □

3 Groups of EL/PEL Types

Def. (14.7.3.1) [Algebraic Groups of EL/PEL Types]. Let F be a finite étale algebra over $\mathbb{Q}_p$, B a finite central algebra over F, and $V\in\mathcal{M}\mathrm{od}_B^{\mathrm{fg}}$.

An **algebraic group of EL type** over $\mathbb{Q}_p$ is an algebraic group of the form $GL_B(V)$. They are related to the classification of p-divisible groups with an endomorphism and level structures.

Let $(-,-)$ be a non-degenerate alternating $\mathbb{Q}_p$-bilinear form on V together with a formal involution $*$ on B that
$$(bv,w)=(v,b^*w).$$
Let F_0 be the field of elements of F fixed by $*$.

An **algebraic group of PEL type** over $\mathbb{Q}_p$ is an algebraic group over $\mathbb{Q}_p$ given by
$$G(R)=\{g\in GL_B(V\otimes_{\mathbb{Q}_p}R)|\exists c\in X(G),\quad (gv,gw)=c(g)(v,w),\quad \forall v,w\}$$

Prop. (14.7.3.2) [Setups]. If G is an algebraic group of EL/PEL type, $K_0=W(\overline{\mathbb{F}_p})[\frac{1}{p}]$, $b\in G(K_0)$, then we associate to b and the natural representation of G on V the isocrystal
$$(N(V),\Phi)=(V\otimes_{\mathbb{Q}_p}K_0,b(1\otimes\sigma)).$$

This isocrystal is equipped with an action of B, and in the PEL case an alternating bilinear form
$$\psi:N(V)\otimes N(V)\to 1(n).$$
where $n=v_p(c(b))$. In fact, we can find some unit u that $c(b)=p^nu\sigma(u)^{-1}$, then the pairing is defined as
$$\psi(v,v')=u^{-1}(v,v'),$$
any other choices of u multiplies ψ by an element in $\mathbb{Z}_p^*$.

We will fix in addition a conjugacy class of cocharacters $\mu:\mathbb{G}_m\to G$ defined over a field E, and the associated homogenous algebraic variety $\mathcal{F}$ defined over E of filtrations(14.7.2.1). $\mathcal{F}$ is equipped with a B-action, as $G\in GL_B(V)$.

Notice in the PEL case, these filtrations satisfy $\mathcal{F}^i=(\mathcal{F}^{m-i+1})^\perp$, where $m=c\circ\mu\in\mathrm{Hom}(\mathbb{G}_m,\mathbb{G}_m)\cong\mathbb{Z}$. This is due to the fact $(kv,kw)=k^m(v,w)$ and the fact the pairing is non-degenerate.

Prop. (14.7.3.3) [Shimura Field]. Fix a conjugacy class of cocharacters $\{\mu\}$ defined over E and $\mu_0\in\{\mu\}$, its corresponding filtration $\mathcal{F}_0^\bullet$, The field E in(14.7.3.2) can be described as the field of definition of the isomorphism class of $\mathcal{F}_0^\bullet$ as a B-invariant filtration, or equivalently as the finite extension of $\mathbb{Q}_P$ generated by the traces
$$\mathrm{tr}(d;\mathrm{gr}^i_{\mathbb{F}_0}(V\otimes_{\mathbb{Q}_p}\overline{\mathbb{Q}_p})),d\in B,i\in\mathbb{Z}.$$

And the filtration $\mathcal{F}$ is described as the functor that for any E-algebra R, $\mathcal{F}(R)$ is the set of filtrations $\mathcal{F}^\bullet$ of $V\otimes_{\mathbb{Q}_p}R$ by R-modules that are direct summands that

$$\mathrm{tr}(d;\mathrm{gr}^i_{\mathcal{F}}(V\otimes_{\mathbb{Q}_p}R))=\mathrm{tr}(d;\mathrm{gr}^i_{\mathbb{F}_0}(V\otimes_{\mathbb{Q}_p}\overline{\mathbb{Q}_p})).$$

and moreover in the PEL case satisfies $\mathcal{F}^i=(\mathcal{F}^{m-i+1})^\perp$.

Proof: 1: The field of definition E of the conjugacy class $\{\mu\}$ is determined by Tannakian duality, so it suffices to check over which field these two filtrations are isomorphic as G-filtrations, but G is just the group fixing the B-module structure, so it suffices to show they are equivalent as B-modules, which is then determined by the traces, by(2.4.1.27).

2: It suffices to show $\mathcal{F}$ is a homogenous space under G. We restrict to the PEL case, the EL case is simpler. After base change from $\mathbb{Q}_p$ to $\overline{\mathbb{Q}_p}$, the data decomposes to the following types:

- $(A): B=\mathrm{End}(W)\times\mathrm{End}(W^\vee)$ where W is a f.d. $\overline{\mathbb{Q}_p}$-vector space and $(u,v)^*=(v^t,u^t)$. And $V=W\otimes V'\bigoplus W^\vee\otimes V'^\vee$ where the pairing is natural and makes the sum orthogonal.

$$G=\{(1\otimes g,c\cdot(1\otimes g^{-t})|g\in GL(V'),c\in X(G)\}$$

- $(C): B=\mathrm{End}(W)$ where W is a f.d. $\overline{\mathbb{Q}_p}$-vector space equipped with a symmetric bilinear form $(-,-)_W$ and $*$ is the transposition w.r.t it.
  And $V=W\otimes V'$ where V' is equipped with an alternating form $(-,-)_{V'}$ that $(-,-)_V=(-,-)_W\otimes(-,-)_{V'}$.

$$G=\{cg|g\in\mathrm{Sp}(V'),c\in X(G)\}$$

- (BD): As in (C), except that $(-,-)_W$ is skew-symmetric and $(-,-)_{V'}$ is symmetric.

$$G=\{cg|g\in SO(V'),c\in C(G)\}$$

Under this decomposition, the functor $\mathcal{F}$ in the proposition is represented by products of partial flags of V:

- $(A): \mathcal{F}^i=W\otimes(\mathcal{F}')^i\bigoplus W^\vee\otimes((\mathcal{F}')^{m+1-i})^\perp$ and the correspondence $\mathcal{F}^\bullet\mapsto(\mathcal{F}')\bullet$ identifies $\mathcal{F}$ with the partial flag variety of V' with fixed dimensions $\dim((\mathcal{F}')^i)$.
- $(B,CD): \mathcal{F}^\bullet=W\otimes(\mathcal{F}')^\bullet$ and $\mathcal{F}$ is identified with the partial flag variety of V' of fixed dimensions $\dim((\mathcal{F}')^i)$ and $(\mathcal{F}')^i=((\mathcal{F}')^{m+1-i})^\perp$.
  The (A) case G clearly acts transitively on $\mathcal{F}$, and the (B,CD) case $(\mathcal{F}')^i$ is isotropic for $i\geq(m+1)/2$, and it determines all other components, so G acts transitively, by Witt's theorem(12.5.2.3).

The reason is(2.4.3.27) and the fact representations of B is semisimple, then contemplating on the pairing condition. □

Prop. (14.7.3.4) [Examples of PEL Type]. Let $B=D$ be the quaternion algebra over $\mathbb{Q}_p$ and $*$ be the involution, i.e.

$$D=\mathbb{Q}_{p^2}[\Pi],\quad\Pi^2=p,\quad\Pi a=\sigma(a)\Pi$$

and

$$a^*=\sigma(a),a\in\mathbb{Q}_{p^2},\quad,\Pi^*=\Pi.$$

Let (V,ι) be a free D-module of rank n with a non-degenerate bilinear form satisfying the conditions in(14.7.3.1). Then G is a non-trivial inner form of the group GSp_{2n} of symmetric similitudes:

Firstly $\mathbb{Q}_{p^2} \otimes K_0 \cong K_0 \oplus K_0$, then $\mathbb{Q}_{p^s}$ acts on $K_0 \oplus K_0$ by $a(x,y) = ax, \sigma(a)y)$. As V is a $\mathbb{Q}_{p^2}$-vector space, there is a decomposition

$$V = V_0 \oplus V_1$$

where $\mathbb{Q}_{p^2}$ acts on V_i by $a(v) = v.\sigma^i(a)$, then G_{K_0} is just GSp_{2n,K_0}, and $G \neq GSp_{2n}$ as the Galois action σ on $\mathbb{Q}_{p^2} \otimes K_0$ and $K_0 \cong K_0 \oplus K_0$ are different.

Take $b \in G(K_0)$ the element with $c(b) = p$ and the corresponding isocrystal (N, Φ) is isotypical of slope $1/2$. N decomposes as $N_0 \oplus N_1$. Notice now Π and $\Phi = b\sigma$ interchanges N_i, and $\Pi\Phi = \Phi\Pi$. Also N_i is isotropic: For $v, w \in N_i, a \in \mathbb{Q}_{p^2}$,

$$a(v,w) = (av, w) = (\iota(\sigma^i(a))v, w) = (v, \iota(\sigma^{i+1}(a))w) = (v, \sigma(a)w) = \sigma(a)(v,w)$$

so $(v,w) = 0$.

We can define a new non-degenerate alternating form

$$\langle -,- \rangle : N_0 \times N_0 \to K_0 : \langle v, v' \rangle = (v, \Pi v')$$

and also a σ-linear endomorphism of N_0: $\Phi_0 = \Pi^{-1} \circ \Phi|_{N_0}$. From the condition, $v_p(\det \Phi_0) = 0$, and Φ has all the slopes 0. Also $\langle \Phi_0 v, \Phi_0 w \rangle = \sigma(\langle v, w \rangle)$, as

$$\langle \Phi_0 v, \Phi_0 w \rangle = (\Pi^{-1}\Phi v, \Phi w) = (\Pi^{-1} b\sigma v, b\sigma w) = \sigma(v, \Pi w) = \sigma(\langle v, w \rangle).$$

so this alternating form is defined over $\mathbb{Q}_p$, denoted by $(V_0, \langle -,- \rangle)$, and Φ_0 corresponds to σ. Then $J_b = GSp(V_0, \langle -,- \rangle)$.

Next we consider

$$(0) = \mathcal{F}_0^2 \subset \mathcal{F}_0^1 \subset \mathcal{F}_0^0 = V \otimes \overline{\mathbb{Q}_p}$$

be a filtration where $\mathcal{F}_0^1$ be a D-invariant Lagrangian subspace. This corresponds to a cocharacter $\mu \to G$, and $\mathcal{F}$ is just the $\mathbb{Q}_{p^2}$ variety of D-invariant Lagrangian subspaces of $V_{\mathbb{Q}_{p^2}}$. By(14.7.3.3), the Shimura field is $\mathbb{Q}_p$.

Let $\mathcal{F} \subset \mathcal{F}(K)$ where K/K_0 is a field extension, then

$$\mathcal{F} = \mathcal{F}_0 \oplus \mathcal{F}_1$$

where $\mathcal{F}_i \in N_0 \otimes_{K_0} K$, as $\mathcal{F}$ is Π-invariant. Now $\mathcal{F}_0$ is also a Lagrangian subspace of $(V_0, \langle -,- \rangle)$. $\mathcal{F}(K)$ identifies the K-points of the Grassmannian of Lagrangian subspaces of $(V_0, \langle -,- \rangle)$.

Cor. (14.7.3.5). Under the above identification, the subset $\mathcal{F}^{wa}(K)$ of the Grassmannian of Lagrangian spaces $\mathcal{F}$ of $(V_0 \otimes K, \langle -,- \rangle)$ is characterized by $\mathcal{F}$ satisfying the the following conditions:

For all totally isotropic subspaces $W_0 \subset V_0$, we have $\dim_K \mathcal{F} \cap (W_0 \otimes K) \leq 1/2 \dim W_0$.

Proof: It's clear $\mu(N, \Phi, \mathcal{F}) = 0$, so weakly-admissibility is equivalent to semi-stability. The uniqueness of the HN-filtration of $\mathcal{F}$ implies its D-invariance, thus semi-stability is equivalent to the fact that for any subspace $P \subset N$ stable under Φ and D-action, we have

$$\dim_K(\mathcal{F} \cap (P \otimes_{K_0} K)) \leq v_p(\det(\Phi; P)).$$

Now Φ is isotypical with slope $1/2$, $v_p(\det(\Phi; P)) = \frac{1}{2}\dim P$, and the D-invariance of P is equivalent to $P = P_0 \oplus P_1$ and the Φ-invariance of P is equivalent to the Φ_0-invariance of P_0, i.e. P_0 is a $\mathbb{Q}_p$-rational subspace $W_0 \subset V_0$.

Finally we show it suffices to check for totally isotropic subspaces: Let W_0' be the radical of W_0, then there is a non-singular alternating form on W_0/W_0', then the image of $\mathcal{F}_0' \cap (P \otimes_{K_0} K)$ in this quotient is a totally isotropic space, thus has dimension$\leq \frac{1}{2}\dim(W_0/W_0')$. then it suffices to check the condition for W_0'. ∎

14.8 Adic Spaces and Perfectoid Spaces(Scholze)

Main References are [Hub93], [Hub96], [Mor19], [Bha17], [Wed14], [S-W20], and [Sch12].

1 (Continuous)Valuation Spectrums

Main references are [Mor19]. Notice this should be prior to the definition of adic spaces.

Def. (14.8.1.1) [Riemann-Zariski Space]. Let K be a field and A be a subring, the Riemann-Zariski space $RZ(K,A)$ is defined to be the set of all valuation subrings of K containing A that has the topology generated by

$$U(x_1,\ldots,x_n)=\{P\in RZ(K,A)|x_1,\ldots,x_n\in P\}.$$

$RZ(K,0)$ is also denoted by $RZ(K)$. $RZ(K,A)$ is just isomorphic to $\mathrm{Spa}(K,A^{itc})$, so it is spectral by(14.8.2.24).

Cor. (14.8.1.2). Clearly the specialization relations of $RZ(K,A)$ is identical to inclusion relations.

Def. (14.8.1.3) [Valuation Spectrum]. Let A be a ring, the **valuation spectrum** $\mathrm{Spv}(A)$ is the set of equivalent classes of valuations on A, topologized by the open subsets

$$\mathrm{Spv}(A)(\frac{f}{g})=\{x\in \mathrm{Spa}(A)||f(x)|\leq |g(x)|\neq 0\}.$$

$\mathrm{Spv}(A)$ is spectral, with sub-basis generated by $\mathrm{Spv}(\frac{f}{g})$

There is a kernel map $\ker:\mathrm{Spv}(A)\to\mathrm{Spec}\,A$ sending a valuation to its kernel(support). Then this map is continuous, and the fiber of this map over $\mathfrak{p}$ is just isomorphic to the Riemann-Zariski space $RZ(k(\mathfrak{p}))$.

Moreover, the map $\ker:\mathrm{Spv}(A)\to\mathrm{Spec}\,A$ is spectral, as the kernel of $D(f)$ is $U(\frac{f}{f})$.

Specialization Relations in $\mathrm{Spv}(A)$

Def. (14.8.1.4) [Vertical Specializations]. Let $x,y\in\mathrm{Spv}(A)$. We say that x is a vertical specialization of y if x is a specialization of y and $\mathfrak{p}_x=\mathfrak{p}_y$.

Valuations with Support Conditions

Def. (14.8.1.5) [$\mathrm{Spv}(A,J)$]. We define a space $\mathrm{Spv}(A,J)\subset\mathrm{Spv}(A)$ by

$$\mathrm{Spv}(A,J)=\{x\in\mathrm{Spv}(A)|r(x)=x\}=\{x\in\mathrm{Spv}(A)|c\Gamma_x(J)=\Gamma\}.$$

with the subset topology from $\mathrm{Spv}(A)$.

Prop. (14.8.1.6).

- $\mathrm{Spv}(A,J)$ is a spectral space.
- A basis of quasi-compact open subsets for the topology is given by the sets $U(\frac{f_1,\ldots,f_n}{g})$ where $J\subset\sqrt{(f_1,\ldots,f_n)}$.
- The retraction $r:\mathrm{Spv}(A)\to\mathrm{Spv}(A,J)$ is a spectral map.

Proof: Cf.[Mor19]P52. □

Continuous Valuation Spectrum

Def. (14.8.1.7) [Continuous Valuations]. Let A be a Huber ring, then we define $\mathrm{Cont}(A)$ as the subspace of Spv consisting of continuous valuations on A, then

$$\mathrm{Cont}(A)=\{x\in \mathrm{Spv}(A,A^{00}A)|x(A^{00})<1\}$$

Proof: Cf.[Mor19]P64. □

Cor. (14.8.1.8) [Cont(A) is Spectral]. For any Huber ring A, $\mathrm{Cont}(A)$ is a spectral space, with a basis of quasi-compact open subsets given by $U(\frac{f_1,\ldots,f_n}{g})$, where $A^{00}\subset\sqrt{(f_1,\ldots,f_n)}$, or equivalently $(f_1,\ldots,f_n)$ is open**??**.

Proof: This is because

$$\mathrm{Cont}(A)=\mathrm{Spv}(A,A^{00}A)-\bigcup_{g\in A^{00}}U(\frac{1}{g}),$$

which is an open subset of $\mathrm{Spv}(A,A^{00}A)$, thus the assertion follows from(14.8.1.6) and(3.11.4.7). □

2 Adic Spectrums

Def. (14.8.2.1)[Adic Spectrums]. Let (A,A^+) be a Huber ring, the **adic spectrum** is defined to be

$$\mathrm{Spa}(A,A^+)=\{x\in \mathrm{Cont}(A)||A^+|_x\leq 1\}$$

For a Huber ring A, denote $\mathrm{Spa}\,A=\mathrm{Spa}(A,A^0)$, where A^0 is the ring of power-bounded elements(10.3.5.8).

The shape of these open sets is dictated by the desired properties that both $\{x|f(x)\neq 0\}$ and $\{x|f(x)\leq 1\}$ be open. These desiderata combine features of classical algebraic geometry and rigid geometry, respectively.

Prop. (14.8.2.2). The adic spectrum construction defines a contravariant functor from the category of Huber pairs to the category of topological spaces. And for any ring of integers A^+, $\mathrm{Spa}\,A=\mathrm{Spa}(A,A^0)\hookrightarrow \mathrm{Spa}(A,A^+)$ is an immersion of spaces, by(10.3.5.13).

Def. (14.8.2.3) [Kernel map]. Taking kernels of valuations gives a map $\ker:\mathrm{Spa}(A,A^+)\to \mathrm{Spec}\,A$. This map is continuous, as the inverse image of $D(f)$ is $\mathrm{Spa}(A,A^+)(\frac{f}{f})$. We call a subset a **Zariski open subset** of $\mathrm{Spa}(A,A^+)$ iff it is open in the initial topology along ker.

Def. (14.8.2.4)[Rational Subsets]. A **rational subset** of $\mathrm{Spa}(A,A^+)$ is defined to be

$$\mathrm{Spa}(A,A^+)(\frac{f_1,\ldots,f_n}{g})=\{x\in \mathrm{Spa}(A,A^+)|x(f_i)\leq x(g)\},$$

where (f_i) is an open ideal.

Prop. (14.8.2.5) [Adic Spectrums are Spectral]. The adic spectrum $\mathrm{Spa}(A,A^+)$ is spectral, and a basis of quasi-compact open subsets are given by rational subsets. And the Spa functor is naturally a functor from the category of Huber rings to the category of spectral spaces.

Proof: Firstly $\mathrm{Spa}(A, A^+)$ is closed in the constructible topology of $\mathrm{Cont}(A)$: for any $a \in A$,

$$\{x \in \mathrm{Cont}(A) | |a|_x \leq 1\} = U(\frac{1, a}{1})$$

is a quasi-compact open subset of $\mathrm{Cont}(A)$, so constructible, thus $\mathrm{Spa}(A, A^+) = \cap_{a\in A^+}\{x \in \mathrm{Cont}(A) | |a|_x \leq 1\}$ is closed in the constructible topology.

So the assertions follow from(3.11.4.7) and(14.8.1.8). □

Remark (14.8.2.6). In spite of the proposition that adic spaces are spectral, it is very different from classical algebraic geometry. For example, the generalizations of a point y is totally ordered(localization of the valuation ring), but this nearly never happen for an affine variety.

Remark (14.8.2.7). The rational subsets forms a basis for the topology of $\mathrm{Spa}(A, A^+)$. But in general $\mathrm{Spa}(\frac{f}{g})$ is not quasi-compact, in particular, $\ker : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}\, A$ is not quasi-compact.

Def. (14.8.2.8) [Specialization Map]. The **specialization map**

$$\mathrm{Sp} : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}(A^+/A^{00})$$

that maps a point x to the inverse image of the maximal ideal of R_x along the valuation map $A^+ \to R_x$ it corresponds. It clearly lies in $\mathrm{Spec}(A^+/A^{00})$ as any pseudo-uniformizer is mapped to a pseudo-uniformizer in R_x thus in the maximal ideal.

This map is continuous and spectral, unlike that the kernel map(14.8.2.23): the inverse image of a $D(f)$ for $f \in A^+$ is the set of points $x \in \mathrm{Spa}(A, A^+)$ that $x(f)$ is a unit, i.e. $|x(f)| = 1$. As $|x(f)| \leq 1$ for all $f \in A^+$, this set is just $\mathrm{Spa}(A, A^+)(\frac{1}{f})$, so specialization map sp is both continuous and spectral.

Completed Residue Fields

Def. (14.8.2.9) [Completed Residue Fields]. Let $x \in \mathrm{Spa}(A, A^+)$, then we denote by $k(x)$ the fraction field of $A/\mathfrak{p}_x$, with a valuation ring $k^+(x)$. If x is not analytic, we set $\kappa(x) = k(x), \kappa^+(x) = k^+(x)$. If x is analytic, we set $\kappa(x) = k(x)^\wedge, \kappa^+(x) = k^+(x)^\wedge$. $(\kappa(x), \kappa(x)^+)$ is called the **completed residue field** of x.

Prop. (14.8.2.10) [Vertical Generalizations]. The morphism

$$\mathrm{Spa}(\kappa(x), \kappa(x)^+) \to \mathrm{Spa}(A, A^+)$$

induces a homeomorphism onto the set of vertical generalizations of x.

x is analytic iff $\kappa(x)$ is microbial.

Proof: For the first assertion, if x is not analytic, then $\mathrm{Spa}(k(x), k(x)^+) \cong RZ(k(x), k(x)^+)$ is homeomorphic to the vertical generalizations of x.

If x is analytic, then by(14.8.2.17), $\mathrm{Spa}(\kappa(x), \kappa(x)^+) \to \mathrm{Spa}(k(x), k(x)^+)$ is a homeomorphism. And now we need to check more that if $R \in RZ(k(x), k(x)^+)$ corresponds to a vertical generalization y, then $|\cdot|_R$ is continuous iff $|\cdot|_y$ is continuous. For this, see[Mor19]107.

The second assertion follows from(10.3.6.7). □

Prop. (14.8.2.11) [Residue of Rational Subsets]. Let $f : (A, A^+) \to (A\langle\frac{T}{s}\rangle, A\langle\frac{T}{s}\rangle^+)$ be a rational subset, and $y \in \mathrm{Spa}(A\langle\frac{T}{s}\rangle, A\langle\frac{T}{s}\rangle^+)$ with $x = \mathrm{Spa}(f)(y)$, then the canonical map $(k(x), k(x)^+) \to (k(y), k(y)^+)$ induces an isomorphism of Huber pairs $(\kappa(x), \kappa(x)^+) \cong (\kappa(y), \kappa(y)^+)$ after completion.

Proof: Cf.Morel P108.? □

Def. (14.8.2.12) [Adic Points]. An **adic point** is $\mathrm{Spa}(K, K^+)$ where (K, K^+) is a Huber pair that K is either a complete non-Archimedean field or a discrete field, and K^+ is an open and bounded valuation subring(hence integrally closed). An **analytic adic point** is one that K is complete non-Archimedean.

Prop. (14.8.2.13). The adic point is not a point in general. In fact, if K is non-Archimedean, $\mathrm{Spa}(K, K^+)$ is totally ordered by inclusion?, with a unique closed point corresponding to K^+ and a unique generic point corresponding to $\mathcal{O}_K$.

Prop. (14.8.2.14) [Valuation Ring Characterization of Spa]. For a Huber pair (A, A^+), there is a natural bijection between $\mathrm{Spa}(A, A^+)$ and the set of maps $\varphi : (A, A^+) \to (K, K^+)$ that $\mathrm{Spa}(K, K^+)$ is an adic point where $K_x = \kappa(x)$ and x corresponds to the image of the closed point of $\mathrm{Spa}(K, K^+)$ under the map $\mathrm{Spa}(\varphi)$. And x is analytic iff the corresponding adic point $\mathrm{Spa}(K, K^+)$ is analytic.

Proof: Let $\varphi : (A, A^+) \to (K, K^+)$ be a map of Huber pairs, then correspond the maps gives a continuous valuation on A which is in $\mathrm{Spa}(A, A^+)$ and $\mathfrak{p}_x = \ker(\varphi)$. Notice x is the image of the closed point of $\mathrm{Spa}(K, K^+)$. And we get a map $k(x) \to K$ such that $k(x)^+ = k(x) \cap K^+$, and that has dense image by assumption, so after completion(when non-Archimedean) induces an isomorphism $(\kappa(x), \kappa(x)^+) \cong (K, K^+)$. Thus this is a bijection of sets. □

Prop. (14.8.2.15) [Uniformity]. If A is uniform, then the map

$$A \to \prod_{x \in \mathrm{Spa}(A, A^+)} \kappa(x)$$

is a homeomorphism of A onto its image, where $\kappa(x)$ is the completed residue field(14.8.2.9).

Proof: Berkovich, Étale cohomology for non-Archimedean analytic spaces.? □

Cor. (14.8.2.16). Let $\widetilde{\mathcal{O}}_X$ be the sheafification of $\mathcal{O}_X$, then if A is uniform, $A \to H^0(X, \widetilde{\mathcal{O}}_X)$ is injective.

Proof: In fact, $A \to H^0(X, \widetilde{\mathcal{O}}_X) \to \prod_x \kappa(x)$ is injective. □

Properties of Adic Spectrums

Prop. (14.8.2.17) [Properties of Adic Spectrums].

- The completion map $(A, A^+) \to (\widehat{A}, \widehat{A}^+)$ induces an homeomorphism on the adic spectrums that preserves rational subsets.
- $\mathrm{Spa}(A, A^+)$ vanishes iff its completion $\widehat{A}$ vanishes.
- (Adic Nullstellensatz)$A^+ = \{f \in A | x(f) \leq 1, \forall x \in \mathrm{Spa}(A, A^+)\}$.
- If A is complete, then $f \in A$ is a unit iff $|f|_x \neq 0$ for all $x \in \mathrm{Spa}(A, A^+)$.
- If A is Tate, then f is topologically nilpotent iff $|f|_x^n \to 0$ for any $x \in \mathrm{Spa}(A, A^+)$.)

Proof: 1: Use the valuation ring characterization(14.8.2.14), a point of x determined a continuous map $(A, A^+) \to (K, K^+)$. Now this extends to a map under completion, thus determines a point of $\mathrm{Spa}(\widehat{A}, \widehat{A}^+)$, so the Spa map is surjective. And injectivity follows from the fact A is dense in $\widehat{A}$.

For the homeomorphism, just notice that if $f_i - f_i', g - g' \in t^{N+1}\widehat{A}$, then

$$\mathrm{Spa}(\frac{f_1,\ldots,f_n}{g}) = \mathrm{Spa}(\frac{f_1',\ldots,f_n'}{g'}).$$

where $f_n = t^N$. So now A is dense in $\widehat{A}$, if we choose $f_i, g \in A$, then this rational subset is clearly induced from A.

2: Cf.[Mor19]P104.
3: Cf.[Mor19]P91.
4: Cf.[Mor19]P106.
5: Cf.[Mor19]P106. □

Cor. (14.8.2.18) [Generalizations in Adic Spectrum]. The above proposition shows that the generalization relations of Spa are easily determined, for an element y, all generalizations of y are in bijection with $\mathrm{Spec}(R_y/(t))$ as a poset, thus totally ordered, and each y has a unique generic point as generalization, because it is microbial.

Moreover, $\mathrm{Spa}(A, A^0)$ is closed under generalization in $\mathrm{Spa}(A, A^+)$, and they have the same set of generic points.

Proof: The last assertion is because the generalizations of a point y is just valuation rings containing R_y, and R_y contains $A^0/\mathfrak{p}_y$, so does its generalizations. And for any generic point $x \in \mathrm{Spa}(A, A^+)$, A^0 is mapped to the valuation ring R_x, because it is a rank 1 valuation, so if $t^k f^{\mathbb{N}} \subset R_x$, then $f \in R_x$ because otherwise we have $|t| < |f^{-n}|$ for n large. □

Def. (14.8.2.19) [Specialization Map]. The **specialization map**

$$\mathrm{Sp} : \mathrm{Spa}(A, A^+) \to \mathrm{Spec}(A^+/A^{00})$$

that maps a point x to the inverse image of the maximal ideal of R_x along the valuation map $A^+ \to R_x$ it corresponds. It clearly lies in $\mathrm{Spec}(A^+/A^{00})$ as any pseudo-uniformizer is mapped to a pseudo-uniformizer in R_x thus in the maximal ideal.

This map is continuous and spectral, unlike that the kernel map(14.8.2.23): the inverse image of a $D(f)$ for $f \in A^+$ is the set of points $x \in \mathrm{Spa}(A, A^+)$ that $x(f)$ is a unit, i.e. $|x(f)| = 1$. As $|x(f)| \leq 1$ for all $f \in A^+$, this set is just $\mathrm{Spa}(A, A^+)(\frac{1}{f})$, so specialization map sp is both continuous and spectral.

Prop. (14.8.2.20) [Maximal Hausdorff Quoteint]. Let $X = \mathrm{Spa}(A, A^+)$ be an affinoid Tate space, the if $\overline{X}$ is the quotient of X by the equivalence relation generated by specialization, then $\overline{X}$ is the Hausdorffization of X, i.e. $\overline{X}$ is Hausdorff.

Proof: To show $\overline{X}$ is Hausdorff, if $x, y \in X$ is not mapped to the same point in $\overline{X}$, then by(14.8.2.18), we may assume x, y is generic in X, and $\overline{\{x\}} \cap \overline{\{y\}} = \varnothing$. Now we must find two disjoint open subsets of x, y that is stable under specialization. Cf.[Bhatt Perfectoid Spaces P75]. □

Spectrality of Adic Spectrums

Def. (14.8.2.21) [Rational Subsets]. A **rational subset** of $\mathrm{Spa}(A, A^+)$ is defined to be

$$\mathrm{Spa}(A, A^+)(\frac{f_1,\ldots,f_n}{g}) = \{x \in \mathrm{Spa}(A, A^+) | x(f_i) \leq x(g)\},$$

where $(f_i) = (1)$.

Prop. (14.8.2.22). Rational subsets are stable under intersection(Easy).

Prop. (14.8.2.23). The rational subsets forms a subbasis for the topology of $\mathrm{Spa}(A, A^+)$.**?** But in generally $\mathrm{Spa}(\frac{f}{g})$ is not quasi-compact, in particular, $\mathrm{Spv}(A) \to \mathrm{Spa}(A, A^+)$ is not quasi-compact(proper).

Prop. (14.8.2.24) [Adic Spectrums are Spectral]. The adic spectrum $\mathrm{Spa}(A, A^+)$ is spectral, and a basis of quasi-compact open subsets are given by rational subsets. And the Spa functor is naturally a functor from the category of Huber rings to the category of spectral spaces.

Proof: Firstly $\mathrm{Spa}(A, A^+)$ is closed in the constructible topology of $\mathrm{Cont}(A)$: for any $a \in A$,

$$\{x \in \mathrm{Cont}(A) | |a|_x \leq 1\} = U(\frac{1, a}{1})$$

is a quasi-compact open subset of $\mathrm{Cont}(A)$, so constructible, thus

$$\mathrm{Spa}(A, A^+) = \cap_{a \in A^+}\{x \in \mathrm{Cont}(A) | |a|_x \leq 1\}$$

is closed in the constructible topology.

So the assertions follow from(3.11.4.7) and(14.8.1.8). □

Remark (14.8.2.25). In spite of the proposition that adic spaces are spectral, it is very different from classical algebraic geometry. For example, the generalizations of a point y is totally ordered(localization of the valuation ring), but this nearly never happen for an affine variety.

Cor. (14.8.2.26) [Detecting Nilpotence Locally]. If (A, A^+) is an affinoid Tate ring and $f \in A$, then $f \in A^{00}$ iff $|f(x)|^n \to 0$ for all x.

Proof: If f is topological nilpotent, then $f^N \in tA^+$ for some n, so $|f(x)|^{nN} \leq |t(x)|^n \to 0$ because x is continuous. Conversely, if $|f(x)|^n \to 0$ for all x, then $X = \cup_n X(\frac{f^n}{t})$. But X is quasi-compact, so $|f(x)|^n \leq |t(x)|$ for all x, for some n. So by(14.8.2.17) $f^n \in tA^+$. Now A^+ is a filtered colimits of rings of definitions(10.3.5.14), so $f^n \in tA_0$ for some tA_0, which shows that $f \in A^{00}$. □

Constructions of Adic Spectrums

Prop. (14.8.2.27) [Direct Limits of Uniform Affinoids]. The direct limits exists in the category of uniform affinoid Tate rings. and $A^+ = \mathrm{colim}\, A_i^+$.

Moreover,

$$|\mathrm{Spa}(A, A^+)| \cong \varprojlim_i |\mathrm{Spa}(A_i, A_i^+)|$$

as a homeomorphism of spectral spaces, and each rational subset of $\mathrm{Spa}(A, A^+)$ is pulled back from some rational subset of $\mathrm{Spa}(A_i, A_i^+)$.

The same conclusion also hold in the category of complete uniform affinoid Tate rings(For the homeomorphism, (14.8.2.17) is used).

Proof: Suppose the colimit index has a minimal element i_0, let t be a pseudo-uniformizer, then each A_i^+ is a ring of definition with pseudo-uniformizer t. Now we set $A = \mathrm{colim}\, A_i$ with ring of definitions $A^+ = \mathrm{colim}\, A_i^+$, then A^+ is integrally closed in A, thus (A, A^+) is truly a uniform affinoid Tate ring. Now we check it is the colimit: For any compatible map $(A_i, A_i^+) \to (B, B^+)$, there is a map $f:(A,A^+)\to(B,B^+)$ as abstract rings. We check it is continuous: we may assume B^+ is the ring of definition, then $t^nA^+\subset f^{-1}(t^nB^+)$, thus it is continuous.

For the adic spectrum, now a point $x\in\mathrm{Spa}(A,A^+)$ is determined by the map of uniform affinoid Tate rings $(A,A^+)\to(k(\mathfrak{p}),R_x)$, and by the universal property, it is defined by a compatible set of maps $(A_i,A_i^+)\to(k(\mathfrak{p}),R_x)$. Now it is easy to see the desired bijection of topological spaces, as the elements defining rational subsets are pullbacks from some A_i. □

Prop. (14.8.2.28) [Perfection of Adic Spectrum]. Let (A,A^+) be an affinoid Tate ring of char$p$, then

- The Frobenius map induces a homeomorphism on the adic spectrum of (A,A^+).
- If (A,A^+) is uniform, then there is a perfection functor, which is left adjoint to the forgetful functor from the category of perfect uniform affinoid Tate rings to the category of affinoid Tate rings. And it is just (A_{perf},A^+_{perf}).
- The natural map $(A,A^+)\to(A_{perf},A^+_{perf})$ induces a homeomorphism on the adic spectrum.

Proof: 1: The Frobenius pulls a valuation a multiple of itself, thus equals itself.

2: Clearly A^+_{perf} is integrally closed in A^+ and is in A^0_{perf}. It suffices to show (A_{perf},A^+_{perf}) is uniform, but this is because $A^0_{perf}=(A_{perf})^0\subset(t^{-n}A_0)_{perf}=t^{-n}(A_0)_{perf}$.

3: The Spa map is checked to be continuous and injective, for the converse, using the microbial valuation ring characterization, a point x of $\mathrm{Spa}(A,A^+)$ corresponds to a map A^+ to a complete field $k^+(x)$, thus a map $A^+_{perf}\to k^+(x)_{perf}$, now $k^+(x)\to k^+(x)_{perf}$ is faithfully flat that preserves pseudo-uniformizers, thus it is a point y that maps to y. □

3 Structure Presheaf and Adic Spaces

Lemma (14.8.3.1) [Functions on Rational Subsets]. If $X=\mathrm{Spa}(A,A^+)$ is a Huber ring, and U is a rational subset, then there is a unique complete affinoid Tate ring $(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ over (A,A^+) that the the Spa map

$$\mathrm{Spa}(\mathcal{O}_X(U),\mathcal{O}_X^+(U))\to\mathrm{Spa}(A,A^+)$$

is universal in all the complete affinoid Tate algebras that has image in U.

And in this case, this Spa map is a homeomorphism identifying the rational subsets contained in U to rational subsets of $\mathrm{Spa}(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$. In particular, U is quasi-compact.

Proof:

? See Hub94 P1.3 for the proof in the Huber ring case.

Choose a ring of definition (A_0,t), and $U=\mathrm{Spa}(A,A^+)(\frac{f_1,\ldots,f_n}{g})$ for $f_i,g\in A_0$, and $f_n=t$**??**, and let $B=A[g^{-1}]$ and $B_0=A_0[\frac{f_i}{g}]$. Then $B=B_0[t^{-1}]$(notice that $A_0[t^{-1}]=A$). So B is a Tate A-algebra with ring of definition (B_0,t). Now if B^+ is the integral closure of the subring of B generated by $A^+[\frac{f_i}{g}]$, then (B,B^+) is an affinoid Tate ring. Set $(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ to be its completion.

By construction $\mathrm{Spa}(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ maps into U, because $x(g)\neq0$ because g is a unit, and $|x(f_i)|\leq|x(g)|$ as $f_i/g\in B^+$.

Now check universal property: if $\mathrm{Spa}(C,C^+)$ maps into U, then g is a unit in C by(14.8.2.17), and then $f_i/g\in C^+$ by(14.8.2.17) again. Now C^0 is the filtered colimit of all rings of definition, so there is a ring of definition C_0 that contains A_0 and all f_i/g((10.3.5.17) is used). Then this gives a map of affinoid Tate rings that maps B_0 into C_0, and when passed to completion, induces a map

$\mathcal{O}_X(U) \to C$ of Tate algebras. Now also B^+ is mapped into C^+ because C^+ is integrally closed, so we are done.

For the last assertion, by(14.8.2.17), we only have to prove $\mathrm{Spa}(B, B^+) \to U$ is a homeomorphism preserving rational subsets, for this, the injectivity is clear as B is a localization of A. And the surjectivity follows immediately from the valuation ring characterization and universal property. Continuity is also clear.

For the openness, for any rational subset $X(\frac{f_1,\ldots,f}{g})$ of $X = \mathrm{Spa}(B, B^+)$, because $B = A[g^{-1}]$, g is unit in B, we can assume that $f_i, g \in A_0$. Now we show $U \cap \mathrm{Spa}(A, A^+)(\frac{f_1,\ldots,f}{g})$ is rational, for this, it suffices to add a t^N to f_i, and this is possible, as $X(\frac{f_1,\ldots,f}{g})$ is quasi-compact by(14.8.2.24). (This is in fact similar to the proof that continuous bijection from compact to Hausdorff is homeomorphism). □

Remark (14.8.3.2). The proof goes through with complete replaced by Zariski or Henselian, because we only use item5 of(14.8.2.17), which is true for all Zariski pairs.

And by looking at the construction, if a rational subset U has a representation $X(\frac{f_1,\ldots,f_n}{g})$, then $f_i \in \mathcal{O}_X^+(U)$, and g is invertible in $\mathcal{O}_X(U)$.

Stalks

Def. (14.8.3.3) [Stalks]. The **stalks of an affinoid adic space** is defined as in the case of schemes, i.e. the colimit of the function ring of rational subsets containing x, without topology, and similarly for the **integral stalk**. notice that the function rings are defined by universal property w.r.t to complete Huber pairs, so the stalks only depend on the completion of (A, A^+).

Lemma (14.8.3.4). Let U be an open subset of $X = \mathrm{Spa}(A, A^+)$ and $f, g \in \mathcal{O}_X(U)$, then $V = \{x \in U || f|_x \leq |g|_x \neq 0\}$ is an open subset of X.

Proof: Cf. Morel P116.? □

Prop. (14.8.3.5) [Valuations on the Stalks]. Let $X = \mathrm{Spa}(A, A^+)$ be an affinoid adic ring, and $x \in X$, then:

- There is a valuation x on $\mathcal{O}_{X,x}$ extending that on A, and $\mathcal{O}_{X,x}^+ = \{f \in \mathcal{O}_{X,x} || f(x)| \leq 1\}$.
- $\mathcal{O}_{X,x}$ is local with maximal ideal $\mathfrak{m}_x = \ker x$, and $\mathcal{O}_{X,x}^+$ is local with maximal ideal $\{f \in \mathcal{O}_{X,x} || f(x)| < 1\}$.
- If $k(x)$ is the residue field of $\mathcal{O}_{X,x}$ and $k(x)^+$ be the image of $\mathcal{O}_{X,x}^+$ in $k(x)$, then $k^+(x)$ is naturally a valuation ring, and (k, k^+) is an affinoid field over (A, A^+). In particular, there is an isomorphism between the residue fields of $\mathcal{O}_{X,x}^+$ and $k^+(x)$.
- If $\varphi : (A, A^+) \to (B, B^+)$ is a morphism of Huber pairs and $y \in \mathrm{Spa}(B, B^+)$ is a point that $\mathrm{Spa}(\varphi)(y) = x$, then the morphism of rings $\mathrm{Spa}(\varphi)_x^\flat : \mathcal{O}_{X,x} \to \mathcal{O}_{Y,y}$ induced by $\mathrm{Spa}(\varphi)$ is such that $|\cdot|_x \circ \mathrm{Spa}(\varphi)_x^\flat = |\cdot|_y$. In particular, $\mathrm{Spa}(\varphi)_x^\flat$ is a morphism of local rings. Also it sends $\mathcal{O}_{X,x}^+$ to $\mathcal{O}_{Y,y}^+$ and this is a morphism of local rings.

If moreover A is Tate, then we have:

- The ring $\mathcal{O}_{X,x}^+$ is t-adically Henselian, and $\mathcal{O}_{X,x}^+ \to k^+(x)$ induces an isomorphism after t-adic completion.
- The pairs $(\mathcal{O}_{X,x}^+, \mathfrak{m}_x)$ and $(\mathcal{O}_{X,x}, \mathfrak{m}_x)$ are Henselian.

Proof: ? Morel P115.

1: Consider the t-adic completion of the valuation ring R_x corresponding to x, then $(\widehat{k}(\mathfrak{p}_x), \widehat{R}_x)$ is an affinoid Tate ring over (A, A^+) that is mapped to x(and its generalizations), thus by universal property, there are unique maps from every rational subsets containing x to $(\widehat{k}_x, \widehat{R}_x)$, thus inducing a map $(\mathcal{O}_{X,x}, \mathcal{O}^+_{X,x}) \to (\widehat{k}_x, \widehat{R}_x)$, which induces the desired valuation. And also we have $\mathcal{O}^+_{X,x} \subset \{f \in \mathcal{O}_{X,x} ||f(x)| \leq 1\}$, for the converse, if $|f(x)| \leq 1$, then $U(\frac{f,1}{1})$ is rational subsets in U containing x, so by(14.8.3.2), $f \in \mathcal{O}_X(V)^+$, thus $f \in \mathcal{O}^+_{X,x}$.

2: for g not in $\mathfrak{m}_x$, $|g(x)| > |t(x)|^n$ for some n, so g is invertible in $U(\frac{t^n}{g})$ by(14.8.3.2), hence invertible in $\mathcal{O}_{X,x}$. Similarly for $\mathcal{O}^+_{X,x}$, as g is invertible in $U(\frac{1}{g})$.

3: This is clear from the construction of the valuation on $\mathcal{O}_{X,x}$ in item1.

4:

5: As filtered colimits of Henselian pair is Henselian(4.3.10.3) and the function ring is complete, the stalk is Henselian. As for the completion, notice $\mathfrak{m}_x \subset \mathcal{O}^+_{X,x}$ and is t-divisible, thus $\mathcal{O}^+_{X,x}$ has the same t-adic completion as $k^+(x)$.

6: We first prove $(\mathcal{O}^+_{X,x}, t)$ is Henselian, for this, it suffices to prove $(\mathcal{O}^+_X(U), t)$ is Henselian, by(4.3.10.3). And $\mathcal{O}^+_X(U)$ is a filtered colimits of rings of definitions(10.3.5.14) and they are t-adically complete hence Henselian, so we are done by(4.3.10.3) again. Then so does $(\mathcal{O}_{X,x}, \mathfrak{m}_x)$ because the property of being Henselian only depends on I(4.3.10.10). □

Cor. (14.8.3.6). By the construction of the valuation on the stalk, we have an inclusion of rings $k(\mathfrak{p}_x) \subset k(x) \subset \widehat{k}(x)$ that has the same completions, where the first is induced by the compatible map $A \to \mathcal{O}_X(X) \to \mathcal{O}_X(U)$.

Def. (14.8.3.7) [Huber's Presheaf]. Now by the universal property of function ring, we have a map between them induced by inclusion of rational subsets, so we can define the **structure presheaf** to be

$$\mathcal{O}_X(W) = \lim_{U \subset W \text{ rational}} \mathcal{O}_X(U),$$

and similarly for the **integral structure sheaf** $\mathcal{O}^+_X$.

Then there is a valuation of a point on $\mathcal{O}_X(W)$ by passing to the stalk, and

$$\mathcal{O}^+_X(W) = \{f \in \mathcal{O}_X(W) ||f(x)| \leq 1, \forall x \in W\}.$$

because this is true for all rational subsets by adic nullstellensatz(14.8.2.17).

A Huber ring (A, A^+) is called **sheafy** iff the structure sheaf $\mathcal{O}_X$ on $X = \mathrm{Spa}(A, A^+)$ is a sheaf. In this case, $\mathcal{O}^+_X$ is also a sheaf by the above formula, so sheafyness is a property that only depends on A.

Criterion for Sheafyness

Def. (14.8.3.8) [Stably Uniform Huber Pair]. Let (A, A^+) be a Huber pair that A is analytic, then it is called **stably uniform** if $\mathcal{O}_X(U)$ is uniform for all rational subsets $U \subset X = \mathrm{Spa}(A, A^+)$.

Prop. (14.8.3.9). Let $A \to B$ be a continuous map of Huber rings which splits in the category of topological A-modules, then A is stably uniform.

Proof: The splitting means the map is strict(10.3.1.4), so A is also uniform. Also the splitting is preserved under completed tensor product with rational localization, so A is stably uniform. □

Prop. (14.8.3.10) [Examples of Sheafy Huber Rings]. Let (A, A^+) be a complete Huber pair,

1. (Schemes)If A is discrete, then A is sheafy.
2. (Formal Schemes)If A has a Noetherian ring of definition, then A is sheafy.
3. (Rigid Spaces, Fargues-Fontaine Curves)If A is Tate and Strongly Noetherian(10.3.4.25), then A is sheafy.
4. (Perfectoid Spaces)A is analytic and (A, A^+) is stably uniform(14.8.3.8), then A is sheafy and acyclic.

Proof: Cf. Hub94 T2.2, [Ked19]1.7.

We use the arguments following(14.8.4.30).

If A is analytic and (A, A^+) is stably uniform. Firstly the ideals $(f - gT), (g - fT)$ are closed in their rings, Cf.[Ked19]L1.5.26.

Then we have a diagram

$$\begin{array}{ccccccccc}
0 & \longrightarrow & 0 & \longrightarrow & B\langle T\rangle \oplus B\langle T^{-1}\rangle & \xrightarrow{\cdot + T^{-1}\cdot} & B\langle T, T^{-1}\rangle & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow{\scriptstyle (f-gT, g-fT^{-1})} & & \downarrow{\scriptstyle \times(f-gT)} & & \\
0 & \longrightarrow & B & \longrightarrow & B\langle T\rangle \oplus B\langle T^{-1}\rangle & \xrightarrow{\cdot - \cdot} & B\langle T, T^{-1}\rangle & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & \\
0 & \longrightarrow & B & \longrightarrow & B\langle \frac{f}{g}\rangle \oplus B\langle \frac{g}{f}\rangle & \longrightarrow & B\langle \frac{f}{g}, \frac{g}{f}\rangle & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & \\
 & & 0 & & 0 & & 0 & &
\end{array}$$

where the columns and the first two rows are exact, thus the third row are exact in the middle and right by spectral sequence. Also it is exact at the left by(14.8.2.16). □

Remark (14.8.3.11). Notice that these contains nearly everything of interest, so Scholze comments that we can somehow pretend that non-sheafy Huber rings doesn't appear in nature.

Remark (14.8.3.12). Stably uniform is hard to check in practice, so a recent paper of Hansen-Kedlaya [Sheafyness Criterion for Huber Rings] studied another class of sousperfectoid rings which can be splitly embedded into a perfectoid ring, and another class of diamaintine rings, which involves a condition on the cohomology of pro-étale site of A, closely related to properties of diamonds.

Prop. (14.8.3.13) [Non-examples of Sheafy Huber Rings]. Cf. Hub94 end of section1.?

4 Adic Spaces

Def. (14.8.4.1) [Huber category]. The category $\mathcal{V}^{pre}$ is a category that the objects are triples $(X, \mathcal{O}_X, v_x)$ that X is a topological space, $\mathcal{O}_X$ is a , and $\mathcal{O}_X$ has the structure of sheaf of complete topological rings, and v_x are continuous valuations on the stalk $\mathcal{O}_{X,x}$ with support $\mathfrak{m}_x$.

And a morphism in V^{pre} is a pair $(f, f^\flat)$ where $f : X \to Y$ is a map of topological spaces and $f^\flat : \mathcal{O}_X \to f_*\mathcal{O}_Y$ is a morphism of presheaves of topological rings, and the induced morphism of $f^\flat$ on the stalks are compatible with the valuations.

The **Huber category** V is the full subcategory of V^{pre} whose objects are triples $(X, \mathcal{O}_X, v_x)$ in V^{pre} that $\mathcal{O}_X$ is a sheaf.

Def. (14.8.4.2)[Open Immersions]. An **open immersion** in V^{pre} is a homeomorphism onto an open subset that induces an isomorphism of presheaves.

Def. (14.8.4.3) [Adic Spaces]. The category of **affinoid adic spaces** is the full subcategory of the Huber category whose objects are isomorphic to $\mathrm{Spa}(A, A^+)$ for some Huber pair (A, A^+), and the category of **adic spaces** is the full subcategory of Huber category whose objects are locally isomorphic to an affinoid adic space.

Prop. (14.8.4.4) [Adic Spectrum Adjointness]. For any affinoid adic space $X = \mathrm{Spa}(R, R^+)$ and Y an arbitrary adic space, then there is a natural isomorphism

$$\mathrm{Hom}(Y, X) \cong \mathrm{Hom}((R, R^+), (\mathcal{O}_Y(Y), \mathcal{O}_Y^+(Y))).$$

Proof: It suffices to show for $Y = (S, S^+)$ affine, because an morphism from $Y \to X$ is glued from local morphisms, and $\mathcal{O}_Y$ is a sheaf.

For this, Cf.Huber94 Prop2.1(2).**?** □

Def. (14.8.4.5) [Uniform Adic Spaces]. An adic space X is called **uniform** if for all open affinoid $U = \mathrm{Spa}(R, R^+) \subset X$, the Huber ring R is uniform.

Cartier Divisors and Closed Immersions

Def. (14.8.4.6)[Cartier Divisors]. Let X be a uniform analytic adic space, then a (effective)**Cartier divisor** on X is an ideal sheaf $\mathcal{I} \subset \mathcal{O}_X$ that is locally free of rank 1. The support of a Cartier divisor is $\mathrm{Supp}(\mathcal{O}_X/\mathcal{I})$.

The support Z of a Cartier divisor is a nowhere dense closed subset of X, and the map $I \mapsto \mathcal{I} = i\mathcal{O}_X$ induces a bijection between invertible ideals $I \subset R$ that $V(I)$ is nowhere dense in X and Cartier divisors on X.

Proof: By(14.8.4.21), any Cartier divisor is of the form $I \otimes_R \mathcal{O}_X$ for some invertible ideal $I \subset R$. We need to show that $\varphi : I \otimes_R \mathcal{O}_X \to \mathcal{O}_X$ is injective iff $V(I) \subset X$ is nowhere dense.

By restriction, we can assume $I = (f)$ is principle, and if $V(f)$ contains an open subset, then on an open rational subset, $f = 0$ by uniformity(14.8.2.15), so φ is not injective. Conversely, if if $V(f)$ is nowhere dense, we show f is a nonzero-divisor: if $fg = 0$ and $g \neq 0$, then $U = U(\frac{g}{g})$ is contained in $V(f)$ and is open, so $U = 0$, which implies $g = 0$ by uniformity(14.8.2.15), contradiction. □

Prop. (14.8.4.7). Let X be a uniform analytic adic space and $\mathcal{I} \subset \mathcal{O}_X$ a Cartier divisor with support Z and $j : U = X \backslash Z \to X$. There are injective maps of sheaves

$$\mathcal{O}_X \hookrightarrow \varinjlim_n \mathcal{I}^{-n} \hookrightarrow j_* \mathcal{O}_U.$$

Proof: This is local, it suffices to check this is for any affine subscheme of X, so we can assume $X = \mathrm{Spa}(R, R^+)$ and $\mathcal{I} = f\mathcal{O}_X$ for some nonzero-divisor $f \in R$ whose vanishing locus Z is nowhere dense, and check the global sections:

$$R \to R[\frac{1}{f}] \to \Gamma(U, \mathcal{O}_U).$$

Then it suffices to show $R \to \Gamma(U, \mathcal{O}_U)$ is injective. But if g vanishes on U, then the vanishing locus of g is a closed subset containing U, which implies that it is all of X as Z is nowhere dense, so $g = 0$ by uniformity(14.8.2.15). □

Def. (14.8.4.8) [Meromorphic Along the Cartier Divisor]. A function $f \in H^0(U, \mathcal{O}_U)$ is **meromorphic along** the Cartier divisor $\mathcal{I} \subset \mathcal{O}_X$ if it lifts to $H^0(X, \varinjlim_n \mathcal{I}^{-n})$.

Def. (14.8.4.9) [Closed Cartier Divisors]. On a uniform analytic adic space X, a **closed Cartier divisor** is a Cartier divisor $\mathcal{I} \subset \mathcal{O}_X$ with support Z that $(Z, \mathcal{O}_X/\mathcal{I}, |\cdot|_x, x \in Z)$ is an adic space.

Prop. (14.8.4.10) [Closed Cartier Divisor and Closed Immersion]. On a uniform analytic adic space X, a Cartier divisor $\mathcal{I} \subset \mathcal{O}_X$ is closed iff the map $\mathcal{I}(U) \hookrightarrow \mathcal{O}_X(U)$ has closed image for all open affinoid $U \subset X$. In this case, for all open affinoid $U = \mathrm{Spa}(R, R^+) \subset X$, the intersection $U \cap Z = \mathrm{Spa}(S, S^+)$ is an affinoid adic space, where $S = R/I$ and S^+ is the integral closure of the image of R^+ in S.

Proof: The property of having closed image can be checked locally as affinoid subspace is quasi-compact. The fact $\mathcal{O}_X/\mathfrak{I}$ is a $(\mathcal{O}_X/\mathfrak{I})(U_i)$ is separated for an open covering $\{U_i\}$ of X, so at $\mathcal{I}(U_i)$ is closed in $\mathcal{O}_X(U_i)$.

Conversely, if $\mathcal{I}(U) \hookrightarrow \mathcal{O}_X(U)$ has closed image for all open affinoid $U \subset X$, we want to show $(Z, \mathcal{O}_X/\mathcal{I}, |\cdot|_x, x \in Z)$ is an adic space: We can construct this locally, so if $X = \mathrm{Spa}(R, R^+)$, $S = R/I$ is separated and complete, thus a complete Huber ring, and consider the quotient Huber ring(10.3.5.19) (S, S^+), then $\mathrm{Spa}(S, S^+) \to \mathrm{Spa}(R, R^+)$ is a closed immersion of topological spaces with image $V(I)$.

What's left to show is that the map of presheaves $\mathcal{O}_X/\mathcal{I} \to \mathcal{O}_Z$ is an isomorphism, and also $\mathcal{O}_X/\mathcal{I}(U) = \mathcal{O}_X(U)/\mathcal{I}(U)$. To show this, we first show the presheaf $\mathcal{O}_X/\mathcal{I}$ is a sheaf: this is by 3×3-lemma: $\mathcal{I}$ is locally (f), and for a rational covering $U_i \to X$,

$$\mathcal{O}_X(X)/f \to \prod_i \mathcal{O}_X(U_i)/f \rightrightarrows \prod_{ij} \mathcal{O}_X(U_{ij})/f$$

is exact.

And to show $\mathcal{O}_X/\mathcal{I} \to \mathcal{O}_Z$ is an isomorphism, it suffices to notice taking localization and taking quotient commutes, because they are both defined by universal properties.(10.3.5.19)(10.3.5.32). □

Remark (14.8.4.11). Even if A is Tate and stably uniform, and $f \in A$ is a nonzero-divisor that $fA \subset A$ is closed, it may not be true that $\mathcal{O} = f\mathcal{O}_X \hookrightarrow \mathcal{O}_X$ is a closed Cartier divisor on $X = \mathrm{Spa}(A, A^+)$. This is because there may be rational localization $(A, A^+) \to (B, B^+)$ that fB is not closed in B. Cf. [Ked19]P16.

Examples of Adic Spaces

Prop. (14.8.4.12) [Examples of Adic Spaces].

- (Adic Closed Unit Disk) The space $\mathrm{Spa}(\mathbb{Z}[T]) = \mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z}[T])$ represents the functor $X \mapsto \mathcal{O}_X^+(X)$.
- (Adic Affine Line) The functor $X \mapsto \mathcal{O}_X(X)$ is also representable, by $\mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z})$. Notice for any non-Archimedean field K,

$$\mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z}) \times \mathrm{Spa}\, K = \cup_{n \geq 1} \mathrm{Spa}\, K\langle \varpi^n T\rangle = \varinjlim_{n, T \mapsto \varpi T} \mathrm{Spa}\, K\langle T\rangle.$$

This is because For any Huber pair (R, R^+) over $(K, \mathcal{O}_K)$, $R = \cup_n \varpi^{-n} R^+$ because ϖ is topologically nilpotent.

- (The Open Unit Disk) Let $D = \operatorname{Spa}\mathbb{Z}[[T]]$, then for any non-Archimedean field K, $D_K = D \times \operatorname{Spa} K$ represents the functor that maps a K-algebra R to all its elements of norm ≤ 1. Then this the open disk over K. And D_K is also represented by

$$\cup_{n\geq 1} \operatorname{Spa} K\langle T, \frac{T^n}{\varpi}\rangle.$$

- (The Punctured Open Unit Disk) Let $D^* = \operatorname{Spa}\mathbb{Z}((T))$, then

$$D^*_K = D^* \times \operatorname{Spa} K = D_K\langle \frac{T}{T}\rangle = D_K\backslash\{0\}$$

Prop. (14.8.4.13) [The Open Unit Disk over $\mathbb{Z}_p$]. Consider $X = \mathbb{Z}_p[[T]]$ with the (p, T)-adic topology, there is exactly one non-analytic point $x = x_{\mathbb{F}_p}$. Let $X = \operatorname{Spa}(\mathbb{Z}_p[[T]])$ and $\mathcal{Y} = X\backslash\{x_{\mathbb{F}_p}\}$, then for a point $x \in \mathcal{Y}$, $T(x)$ and $p(x)$ cannot both be 0 by(10.3.6.2).

Then there exists a unique continuous map

$$\kappa : |\mathcal{Y}| \to [0, \infty]$$

characterized by the following property: For any rational number $m/n < r, |T(x)|^n > |p(x)|^m$, and for any rational number $m/n > r, |T(x)|^n < |p(x)|^m$. This map κ is surjective.

Proof: Let $\widetilde{x}$ be a maximal vertical generalization of x, then it has rank 1 and we can assume $\widetilde{x}$ is real valued by(10.3.3.8). Now we define

$$\kappa(x) = \frac{\log |T(\widetilde{x})|}{\log |p(\widetilde{x})|},$$

This is definable as $T(\widetilde{x})$ and $p(\widetilde{x})$ cannot both be 0.

The uniqueness of $\kappa(x)$ follows from the fact $|T(x)|^n > |p(x)|^m$ implies to $|T(\widetilde{x})|^n \geq |p(\widetilde{x})|^m$ because $\widetilde{x}$ is a generalization of x.

To show κ satisfies the condition, if $m/n < r$, then $|T(\widetilde{x})|^n > |p(\widetilde{x})|^m$, so $|T(x)|^n > |p(x)|^m$ because $x, \widetilde{x}$ define the same topology. And it is continuous because

$$\kappa^{-1}((-\infty, r)) = \cup_{m/n<r} U(\frac{T^n}{p^m}).$$

To show the surjectivity, if $\kappa = [x_0 : x_1]$, define the valuation as

$$v(\sum a_{ij}p^iT^j) = \sup_{a_{ij}\neq 0} e^{-x_0 i - x_1 j}$$

where $(a_{ij})^p = 1$. □

<u>**Construction of Adic Spaces**</u>

Def. (14.8.4.14) [Fiber Products of Adic Spaces and Schemes]. Cf.[Wed14]P91.

Def. (14.8.4.15) [Adic Spaces attached to Schemes].

Def. (14.8.4.16) [Adic Spaces attached to Formal Schemes]. Cf.[Wed14].

Def. (14.8.4.17) [Adic Spaces attached to Rigid Analytic Spaces]. Cf.[Wed14].

Sheaves and Vector Bundles

Def. (14.8.4.18). Let (A, A^+) be a Huber pair and $X = \mathrm{Spa}(A, A^+)$, let $\widetilde{M} = M \otimes_A \mathcal{O}_X$ be the presheaf on X.

Prop. (14.8.4.19). If A is sheafy, then for any finite projective A-module M, the presheaf $\widetilde{M}$ is a sheaf on $X = \mathrm{Spa}(A, A^+)$, and $H^i(U, \mathcal{F}) = 0$ for any rational subset of X and $i > 0$.

Proof: Because M is a direct sum of a finite free A-module, then we reduce to the case $\mathcal{O}_X$ is sheafy. □

Remark (14.8.4.20). This is a partial analogy with Tate's acyclicity theorem in rigid analytic geometry(14.5.1.40)(14.5.3.10), but it only holds for f.p. modules, not even f.g. modules. One impediment is that the rational localization map are generally not flat. To get around this, Kedlaya defined a category of pseudo-coherent modules, with the property that even when flatness fails, tensoring is also exact in this category.

Prop. (14.8.4.21) [Vector Bundles]. Let (A, A^+) be a sheafy analytic Huber pair and $X = \mathrm{Spa}(A, A^+)$, then the functor $M \to \widetilde{M}$ from the category of finite projective A-modules to the category Vect_X of locally finite free $\mathcal{O}_X$-modules is an equivalence of categories. In particular, Vect_X only depends on A.

Proof: Cf.[Ked19].P40? □

Pre-Adic Spaces

Main references are [S-W20]L3 and [Ked19].

Def. (14.8.4.22) [Pre-Adic Spaces].

Remark (14.8.4.23). Pre-adic spaces is an approach to work around the failure of sheafyness of general Huber pair, with techniques from algebraic stacks.

Analytic Points

Prop. (14.8.4.24) [Analytic and Tate Rings]. Let (A, A^+) be a complete Huber pair, then

- The Huber ring A is analytic iff all points of $\mathrm{Spa}(A, A^+)$ are analytic.
- A point $x \in \mathrm{Spa}(A, A^+)$ is analytic iff there is a rational nbhd $U \subset \mathrm{Spa}(A, A^+)$ that $\mathcal{O}_X(U)$ is Tate.

Proof: 1: x is non-analytic iff $A^{00} \subset \mathfrak{p}_x$ by(10.3.6.5), so all points are analytic iff $A^{00}A = A$, which means A is analytic.

2: Let x be an analytic point, then there exists $f \in I$ where I is an ideal of definition that $|f|_x \neq 0$. Now $\{g \in A | |g(x)| \leq |f(x)|\}$ is open(because $|\cdot|_x$ is continuous), so contains some I^n. Now let $I^n = (g_1, \ldots, g_k)$, then $U(\frac{g_1,\ldots,g_k}{f})$ is a rational subset. Then in $\mathcal{O}_X(U)$, f is a unit, but also it is topologically nilpotent, because it is contained in I.

Conversely, if $x \in X$ has a rational nbhd $U = U\langle \frac{T}{s} \rangle$ such that $\mathcal{O}_X(U)$ is Tate, and x is not analytic, then $\mathfrak{p}_x$ contains an ideal of definition $I \subset A_0$. Now let $f \in \mathcal{O}_X(U)$ be a topologically nilpotent unit, then there exists $m \geq 1$ that f^m lies in the closure of $IA_0[t/s | t \in T]$ in $\mathcal{O}_X(U)$. Since $x \in U$, the valuation $|\cdot|_x$ extends to $\mathcal{O}_X(U)$, and since $|\cdot|_x$ is continuous, $|f^m(x)| = 0$, contradiction, as f is a unit in $\mathcal{O}_X(U)$. □

Def. (14.8.4.25) [Analytic Points]. Let X be a pre-adic space, then a point $x \in X$ is called an **analytic point** if there is some open affinoid nbhd $U = \mathrm{Spa}(A, A^+) \subset X$ of x that A is Tate. And X is called **analytic** if all of its points are analytic.

Prop. (14.8.4.26). Let $f : X \to Y$ be a map of analytic pre-adic spaces, then $|f| : |X| \to |Y|$ is generalizing. If f is quasi-compact and surjective, then $|f|$ is a quotient map.

Proof: Cf.[Hub96]1.1.10. and [Étale Cohomology of Diamonds, L2.5].**?** □

Def. (14.8.4.27). A map $f : Y \to X$ of pre-adic spaces is called **analytic** if it carries analytic points to analytic points.

Proof of Acyclicity and Sheafyness by Cech Reduction

Def. (14.8.4.28) [Standard Rational Coverings]. Let $X = \mathrm{Spa}(A, A^+)$ and $f_1, \ldots, f_n \in A$ which generates the unit ideal, then the sets $X(\frac{f_1,\ldots,f_n}{f_i})$ covers X, called the **standard rational covering** of X. And if $n = 2$, it is called a **standard binary rational covering** of X.

There are special types of standard binary rational coverings: if $f_1 = f, f_2 = 1$, then it is called a **simple Laurent covering**. If $f_1 = f, f_2 = 1 - f$, then it is called a **simple balanced covering**.

Lemma (14.8.4.29) [Reduction of Coverings]. Let A be an analytic Huber ring,

- (Huber) Every open covering of X can be refined by some standard rational covering.
- (Gabber-Ramero) Every open covering of a rational subspace of X can be refined by some compositions of simple Laurent coverings and simple balanced coverings.

Proof: 1: Cf.[Ked19]P28.
2: Cf.[Ked19]P29. □

Prop. (14.8.4.30)[Cech Reduction]. By a Cech cohomological argument the same as Tate's acyclicity theorem in rigid geometry(14.5.1.40), it suffices to prove any presheaf is a sheaf or any sheaf is acyclic on simple Laurent coverings and simple balanced coverings.

That is, for every rational localization (B, B^+) over (A, A^+), every pair $f, g \in B$ that $g = f$ or $1 - f$, if the sequence

$$0 \to B \to B\langle\frac{f}{g}\rangle \oplus B\langle\frac{g}{f}\rangle \to B\langle\frac{f}{g}, \frac{g}{f}\rangle \to 0,$$

- is exact at exact at left and middle, then $\mathcal{O}_X$ is sheafy.
- is exact, then $\mathcal{O}_X$ is acyclic.

Also remember the following equations:

$$B\langle\frac{f}{g}\rangle = B\langle T\rangle/\overline{(f - gT)}, \quad B\langle\frac{g}{f}\rangle = B\langle T\rangle/\overline{(g - fT)}, \quad B\langle\frac{f}{g}, \frac{g}{f}\rangle = B\langle T, T^{-1}\rangle/\overline{(f - gT)}$$

Prop. (14.8.4.31) [Properties of (Finite)Étale Maps].

- (Finite)Étale maps are invariant under compositions and pullbacks.
- If g and gf are (finite)étale, then so does f.
- f is (finite)étale iff $f^\flat$ is (finite)étale.

Proof: Cf.[S-W20]P65. □

5 Perfectoid Spaces

Affinoid Perfectoid Spaces and Tilting

Prop. (14.8.5.1) [Tilting Rational Subsets]. For a perfectoid affinoid K-algebra (R, R^+) over a perfectoid field K,

- The $\sharp$ map induces an isomorphism $X = \mathrm{Spa}(R, R^+) \cong X^\flat = \mathrm{Spa}(R^\flat, R^{\flat 0})$ that identifies rational open subsets.
- For a rational subset U with tilting $U^\flat$, the complete affinoid Tate algebra $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is perfectoid over R with tilt $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$.

Proof: This follows from(14.8.5.5). □

Lemma (14.8.5.2) [Huber's Presheaf in Char p]. Assume $\mathrm{char} K = p$ and $U = X(\frac{f_1,\ldots,f_n}{g})$ is a rational subset that $f_i, g \in R^+$ and $f_n = \pi^N$, then:

- Consider the subring $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$, its π-adic completion $(R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle)^a$ is a perfectoid K^{0a}-algebra.
- The map $R^+[X_i^{\frac{1}{p^\infty}}] \to R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ has kernel containing and almost equal to $I = (g^{\frac{1}{p^m}} X_i^{\frac{1}{p^m}} - f_i^{\frac{1}{p^m}})$.
- $\mathcal{O}_X(U)$ is a perfectoid K-algebra and $\mathcal{O}_X(U)^{0a} \cong (R^+\langle(\frac{f_i}{g})^{\frac{1}{p^m}}\rangle)^a$.

Proof: 1: The ring $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ is perfect and π-torsion-free, and R^+ is semi-perfect, thus its completion is clearly a perfectoid K^{0a}-algebra by(10.3.9.1).

2: Clearly $I \subset \ker$ and notice $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}][\pi^{-1}] = R[g^{-1}]$ as $f_n = \pi^N$, so $I[\pi^{-1}] = \ker[\pi^{-1}]$. Now consider the mapping

$$P_0 = R^+[X_i^{\frac{1}{p^\infty}}]/I \to R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$$

Now this map is an isomorphism ofter inverting π, so the kernel is π^∞-torsion. But we have $I = I^{[p]}$ because R^+ is semi-perfect, so P_0 is perfect, so the kernel must be almost zero.

3: Consider the inclusion $R^+[\frac{f_i}{g}] \hookrightarrow R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$, we show the cokernel is killed by π^{nN}: as $f_n = \pi^N$,

$$\pi^{nN} \prod_{i=1}^n (\frac{f_i}{g})^{\frac{1}{p^{a_i}}} = \prod_{i=1}^n (f_i^{\frac{1}{p^{a_i}}} g^{1-\frac{1}{p^{a_i}}}) \frac{f_n}{g} \in R^+[\frac{f_i}{g}].$$

So these two ring has the same π-adic completion, the first one is just $\mathcal{O}_X(U)$ by the construction(14.8.3.1), so $\mathcal{O}_X(U)$ is perfectoid K-algebra, and the isomorphism is by tilting equivalence $\mathrm{Perf}_K \cong \mathrm{Perf}_{K^{0a}}$ (10.3.9.5). □

Lemma (14.8.5.3) [Huber's Presheaf in Char 0]. Let $U = X(\frac{f_1,\ldots,f_n}{g})$ is a rational subset that f_i, g are perfect elements in R^+, $f_i = a_i^\sharp, g = b^\sharp$, and $f_n = \pi^N$, so f_i, g have compatible p^n-th roots, then let $U^\flat = X^\flat(\frac{f_1,\ldots,f_n}{g})$ be the tilting of U, U is the inverse image of $U^\flat$ along the map $X \to X^\flat$. Then the conclusion of(14.8.5.2) is also true, and moreover, $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ tilts to $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$.

Proof: $1,2$ of(14.8.5.2): Notation as before, there is a map $P_0 = R^+[X_i^{\frac{1}{p^\infty}}]/I \to R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$, and an inclusion $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}] \to \mathcal{O}_X^+(U)$. Now write (S, S^+) for the untilt of the perfectoid $(R^\flat, R^{\flat+})$-algebra $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$, then by the tilting process(10.3.9.13), $\mathrm{Spa}(S, S^+)$ maps into U, so by the universal property, there is a map

$$\mu : (\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \to (S, S^+).$$

Consider the composition

$$P_0 \xrightarrow{a_0} R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}] \xrightarrow{d_0} S^+,$$

we prove their completion gives the same K^{0a}-algebras(notice S^+ is already complete): a_0 is surjective, thus so does its completion, the map $d_0 \circ a_0$ is almost isomorphism modulo π by(14.8.5.2) item2 and tilting equivalence, so does its completion. Now(4.7.3.2) tells us the completion of $d_0 \circ a_0$ is almost isomorphism, so does a and d as a is surjective.

By the way, we know that $R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle[\pi^{-1}]$ is the untilt of $\mathcal{O}_{X^\flat}^+(U^\flat)$.

3 of(14.8.5.2) is proved as before.

For the tilting, by the above, we already know $R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}$ tilts to the perfectoid $K^{\flat 0a}$-algebra $\mathcal{O}_{X^\flat}(U^\flat)^{0a}$, and by item3 $\mathcal{O}_X(U)$ tilts to the perfectoid $K^\flat$-algebra $\mathcal{O}_{X^\flat}(U^\flat)$. Now the question is the tilt of $\mathcal{O}_X^+(U)$, notice as in the proof of item1, there is a natural map

$$(R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle[\pi^{-1}], R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle) \to (\mathcal{O}_X(U), \mathcal{O}_X^+(U)),$$

whose tilting gives by university of Huber's presheaf a map

$$\xi : (\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat)) \to (\mathcal{O}_X(U), \mathcal{O}_X^+(U))^\flat.$$

These two map μ, ξ are inverse to each other, showing that the tilting of $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$. □

Lemma (14.8.5.4) [Approximation Lemma]. Assume $R = K\langle T_0^{\frac{1}{p^\infty}}, \ldots, T_0^{\frac{1}{p^\infty}}\rangle$, $f \in R^0$ is homogenous of degree $d \in \mathbb{N}[p^{-1}]$, then for any $c > 0, \varepsilon > 0$, there exists some $g_{c,\varepsilon} \in R^{\flat 0}$ homogeneous of degree d that

$$|(f - g^\sharp)(x)| \le |\pi|^{1-\varepsilon} \max\{|f(x)|, |\pi|^c\}.$$

In particular, if $\varepsilon < 1$, then

$$\max\{|f(x)|, |\pi|^c\} = \max\{|g_{c,\varepsilon}^\sharp(x)|, |\pi|^c\}.$$

Proof: Cf.[Sholze Perfectoid Spaces, Lemma6.5]**?**. □

Prop. (14.8.5.5). For an arbitrary perfectoid K-algebra R,

- The same conclusion of(14.8.5.4) holds.
- For $f, g \in R$, there exist $a, b \in R^\flat$ that $X(\frac{f,\pi^c}{g}) = X(\frac{a^\sharp,\pi^c}{b^\sharp})$. In particular, any rational subsets U of X comes from $X^\flat$, thus(14.8.5.3) applies for U.
- For any $x \in X$, the non-Archimedean field $\widehat{k(x)}$ is perfectoid.

- $X \to X^\flat$ is a homeomorphism preserving rational subsets.

Proof: 1: Using the tilting equivalence, we can write $f = g_0^\sharp + \pi g_1^\sharp + \ldots + \pi^c g_c^\sharp + f_{c+1}\pi^{c+1}$, let $f_0 = g_0^\sharp + \pi g_1^\sharp + \ldots + \pi^c g_c^\sharp$. Then notice that the solution $g_{c,\varepsilon}$ for f_0 is suitable for f as well. So now if we consider the mapping

$$\mu : K\langle T_0^{\frac{1}{p^\infty}}, \ldots, T_n^{\frac{1}{p^\infty}}\rangle \to R : T_i \to g_i^\sharp,$$

together with its tilting

$$\mu^\flat : K^\flat\langle T_0^{\frac{1}{p^\infty}}, \ldots, T_n^{\frac{1}{p^\infty}}\rangle \to R^\flat.$$

Then for the approximation $g_{c,\varepsilon}^\sharp$ for $f' = \sum \pi^i T_i$, $\mu^\flat(g)$ is what we are searching for.

2: Using 1, we find $a, b \in R^\flat$ that $|(g - b^\sharp)(x)| < \max\{|g(x)|, \pi^c\}$ and $\max\{|f(x)|, |\pi|^c\} = \max\{|a^\sharp(x)|, |\pi|^c\}$ for all $x \in \mathrm{Spa}(R, R^+)$. Then it is routine to check that $X(\frac{f,\pi^c}{g}) = X(\frac{a^\sharp,\pi^c}{b^\sharp})$.

3: By(14.8.3.5), $\widehat{k^+(x)}$ equals the completion of the colimit $\mathrm{colim}\,\mathcal{O}_X^+(U)$ over rational subsets U containing x. As these are all perfectoid K^{0a}-algebras(10.3.9.14), and completion of the filtered limits of perfectoid K^{0a}-algebras is perfectoid(10.3.9.10), we know that $\widehat{k^+(x)}$ is perfectoid over K^{0a}, thus inverting π shows $k(x)$ is also perfectoid over K.

4: this is injective because X is T_0 and a rational subset is the untilt of a ratinal subset of $X^\flat$ by item2. For surjectivity, a point of $X^\flat$ determines a continuous map $(R^\flat, R^{\flat+}) \to (\widehat{k(x)}, \widehat{k^+(x)})$, thus by untilting(10.3.9.13) corresponds to a map $(R, R^+) \to (L, L^+)$, then (L, L^+) is a perfectoid field, by(10.3.9.15), so it sorresponds to a point $y \in X$. Then it is clear that y maps to x, because the diagram $\begin{array}{ccc} R^\flat & \xrightarrow{\sharp} & R \\ \downarrow & & \downarrow \\ \widehat{k(x)} & \xrightarrow{\sharp} & L \end{array}$ is commutative. □

Def. (14.8.5.6) [Perfectoid Space]. Now for any perfectoid affinoid K-algebra R, we associated to it an affinoid adic space $\mathrm{Spa}(R, R^+)$, called an **affinoid perfectoid space**.

Tate's acyclicity(14.8.6.19) shows that the adic spectrum of a perfectoid affinoid K-algebra is sheafy, so we can defined the category of **perfectoid spaces** is defined to be the full subcategory of adic spaces that is locally isomorphic to an affinoid perfectoid space.

Remark (14.8.5.7). Notice that it is not true that if (A, A^+) is a Huber pair over a perfectoid field K and $\mathrm{Spa}(A, A^+)$ is a perfectoid space, then A is a perfectoid ring. Thus there is ambiguity to the term affinoid perfectoid spaces. But we always use this to mean the affinoid adic space associated to a perfectoid Huber pair.

Proof: Cf.[Ked19]P62. □

Prop. (14.8.5.8). The absolute product of two perfectoid spaces of char p is also a perfectoid space.

Proof: Cf.[Sch17]P71. □

Prop. (14.8.5.9) [Fiber Products of Perfectoid Spaces]. The category of perfectoid spaces over K admits fiber products.

Proof: Perfectoid spaces are constructed by glueing, thus it suffices to show that the category of perfectoid $K^\flat$-algebras has fiber pushouts, by tilting equivalence. For this, if $X = (A, A^+), Y = (B, B^+), Z = (C, C^+)$, define $X \otimes_Y Z = (D, D^+)$, where D is the completion of $A \otimes_B C$, and D^+ is the completion of the integral closure of $A^+ \otimes_{B^+} C^+$ in D. Then D is a perfect $K^\flat$-algebra, and it is truly the filtered colimits, by(10.3.5.23).

Notice that we don't even need a base field K, Cf.[Ked19]P57. □

Prop. (14.8.5.10) [Tilting Equivalence for Perfectoid Spaces]. Fix a perfectoid field K, then for any perfectoid space X/K, there is a unique perfectoid space $X^\flat/K^\flat$ that satisfies: $X(R, R^+) \cong X^\flat(R^\flat, R^{\flat+})$ functorially, called the **tilt** of X. Moreover, this $X^\flat$ satisfies naturally $|X| \cong |X^\flat|$.

When X is an affinoid perfectoid space, this tilting coincides with that of(14.8.5.1).

And this tilting induces an equivalence between the category of perfectoid spaces over K and perfectoid spaces over $K^\flat$.

Proof: Firstly, the universal property truly determines the tilt $X^\flat$ uniquely: if there are two tilts X_1, X_2, as they are locally affinoid perfectoid like $\mathrm{Spa}(R^\flat, R^{\flat+})$ by(14.8.5.1), the immersion map $\mathrm{Spa}(R^\flat, R^{\flat+}) \to X_1$ determines via the functorial isomorphism a morphism $\mathrm{Spa}(R^\flat, R^{\flat+}) \to X_2$. Now X_1 has a sheaf structure, so these morphisms glue to give a morphism $X_1 \to X_2$. The same argument shows conversely there is a morphism $X_2 \to X_1$, and they are clearly converse to each other, so $X_1 \cong X_2$.

The construction of X is just the glueing of the tilting of the affinoid perfectoid spaces, as the tilting defined in(14.8.5.1) is a functor. The universal property is verified by just checking on the affinoid perfectoid spaces, as we can glue using the sheaf property. For the affinoid case, we should use(14.8.4.4). The last assertion is by(14.8.5.1). □

6 Properties of Perfectoid Spaces

Totally Disconnected Spaces

Def. (14.8.6.1) [Totally Disconnected Spaces]. A perfectoid space X is called **totally disconnected** if it is qcqs and any open covering $\{U_i \to X\}$ splits, i.e. $\coprod U_i \to X$ splits, or equivalently, there is a refinement covering $\{V_i \to X\}$ that $X \cong \coprod V_i$.

A perfectoid space X is called **strictly totally disconnected** if it is qcqs and every étale cover splits.

Prop. (14.8.6.2). Let X be a qcqs perfectoid spaces, then X is totally disconnected iff all its connected components are of the form $\mathrm{Spa}(K, K^+)$ where (K, K^+) are perfectoid affinoid fields. And it is strictly totally disconnected if moreover K are all alg.closed.

Proof: Cf.[Sch17].P29, P35. □

Prop. (14.8.6.3). if X is a totally disconnected perfectoid space, then X is affinoid.

Proof: Cf.[Sch17].P30.? □

Injections

Def. (14.8.6.4) [Injections]. A map $f : X \to Y$ of perfectoid spaces is called an injection if for any perfectoid space Z, $f_* : \mathrm{Hom}(Z, X) \to \mathrm{Hom}(Z, Y)$ is an injection.

Prop. (14.8.6.5) [Residue Field Map is Injection]. Let X be a perfectoid space and $x \in X$, giving rise to a map of residue fields

$$i_x : \mathrm{Spa}(\kappa(x), \kappa(x)^+) \to X,$$

then i_x is an injection of perfectoid spaces.

Proof: To show this, firstly we can replace X with an affinoid nbhd of X. Then notice that $\mathrm{Spa}(\kappa(x), \kappa(x)^+)$ is the filtered limit over all rational nbhds U of x in X, and for each U, $U \to X$ is an injection by definition(14.8.3.1), so i_x is also an injection. □

Prop. (14.8.6.6) [Characterizations of Injections]. Let $f : Y \to X$ be a map of perfectoid spaces, then the following conditions are equivalent:

- f is an injection.
- For any perfectoid adic field (K, K^+), the map of sets $f_* : Y(K, K^+) \to X(K, K^+)$ is an injection.
- The map $|f| : |Y| \to |X|$ is injective, and for all rank 1 point $y \in Y$ with image $f(y) = x \in X$, the map of completed residue fields $\kappa(x) \to \kappa(y)$ is an isomorphism.
- The map $|f| : |Y| \to |X|$ is injective, and f is final in the category of maps $Z \to X$ that $|Z| \to |X|$ factors through the map $|Y| \to |X|$.

In particular, by item4, an injection of perfectoid spaces is determined by its topological map.

Proof: $4 \to 1 \to 2$ is trivial. For the rest, Cf.[Sch17]P21. □

Prop. (14.8.6.7) [Injection and Base Change].

- Let $f : Y \to X$ be an injection of perfectoid spaces, and $X' \to X$ any map of perfectoid spaces, then the pullback $f' : Y' = Y \times_X X' \to X'$ is also an injection, and the induced map

$$|Y'| \to |Y| \times_{|X|} |X'|$$

is a homeomorphism.

A map of perfectoids spaces is an injection iff it is universally injective.

Proof: Cf.[Sch17]P24. □

<u>**Immersions**</u>

Def. (14.8.6.8) [Immersions]. A map of perfectoid spaces $f : Y \to X$ is called an immersion if f is an injection and $|f| : |Y| \to |X|$ is a locally closed immersion. If $|f|$ is moreover closed or open, then it is called closed/open immersion.

Def. (14.8.6.9) [Zariski Closed Immersion]. Let $f : Z \to X$ be a map of perfectoid spaces where $X = \mathrm{Spa}(R, R^+)$ is affinoid perfectoid, then

- the map f is called Zariski closed immersion if f is a closed immersion and $|Z| = V(I) \subset |X|$, where $I \subset R$ is an ideal.
- the map f is called strongly Zariski closed immersion if $Z = \mathrm{Spa}(S, S^+)$ is affinoid perfectoid, $R \to S$ is surjective, and S^+ is the closure of R^+ in S.

Prop. (14.8.6.10).

- If f is strongly Zariski closed, then f is Zariski closed, in particular a closed immersion.

- If f is Zariski closed, then Z is affinoid.
- If X is of characteristic p, and f is Zariski closed, then f is strongly Zariski closed.

Proof: Cf.[Sch12] Section2.5. □

Prop. (14.8.6.11). For any map of perfectoid spaces $Y \to X$, the diagonal map $\Delta_f : Y \to Y \times_X Y$ is an immersion.

Proof: Clearly Δ_f is an injection, thus it suffices to show that $|\Delta_f|$ identifies Y with a locally closed subset of $|Y \times_X Y|$. This can be checked locally on the target, so we can assume $X = \mathrm{Spa}(R, R^+)$ and $Y = \mathrm{Spa}(S, S^+)$, then the diagonal map is strongly Zariski closed, as $S \widehat{\otimes}_R S \to S$ is surjective and maps the integral closure of $S^+ \widehat{\otimes}_{R^+} S^+ \to S^+$ onto S^+. Thus by(14.9.1.11), Δ_f is a closed immersion in this case. □

Def. (14.8.6.12) [Separated Map]. A map $f : Y \to X$ of perfectoid spaces is called separated if Δ_f is a closed immersion.

Prop. (14.8.6.13)[Valuation Criterion]. Let $f : Y \to X$ be a map of perfectoid spaces. The following are equivalent:

- f is separated.
- $|\Delta_f| : |Y| \to |Y \times_X Y|$ is a closed immersion.
- $|f|$ is quasi-separated, and for any perfectoid adic field (K, K^+) and any diagram

$$\begin{array}{ccc} \mathrm{Spa}(K, \mathcal{O}_K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow f \\ \mathrm{Spa}(K, K^+) & \longrightarrow & X \end{array},$$

Almost Acyclicity

Def. (14.8.6.14) [p-Finite Tate Ring]. Denote $L = \widehat{\mathbb{F}_p[[t]]_{perf}}[t^{-1}]$, an $\mathbb{F}_p[t]$ algebra A^+ is called **algebraically admissible** if it is f.p., reduced, t-torsion-free, and integrally closed in $A^+[t^{-1}]$. A perfectoid affinoid L-algebra (R, R^+) is called **p-finite** if it is the completion of the perfection(14.8.2.28) of a uniform Tate ring of the form $(A^+[t^{-1}], A^+)$, where A^+ is algebraically admissible.

Lemma (14.8.6.15) [Tate's Acyclicity for Classical Affinoid Algebra]. If A^+ is an algebraically admissible $\mathbb{F}_p[t]$-algebra, then $(A^+[t^{-1}], A^+)$ is a uniform affinoid Tate algebra(because it is finite), and:

- For any rational subset $U \subset X$, the structure presheaf $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ is also uniform, and it is a perfection of an algebraically admissible $\mathbb{F}_p[t]$-algebra, so $\mathcal{O}_X^+(U) = \mathcal{O}_X(U)^0$.
- For any covering $\mathfrak{U} : U_i \to X$ of rational subsets, the Čech cohomology groups $H^i(\mathfrak{U}, \mathcal{O}_X^+)$ are all killed by t^N for N large.
- (A, A^+) is sheafy, with $H^i(X, \mathcal{O}_X^+)$ being t^∞-torsion for all i.

Proof: ? □

Lemma (14.8.6.16) [Tate's Acyclicity for p-Finite Perfectoid Algebras]. Let (R, R^+) be a p-finite perfectoid L-algebra that comes from the completion of perfection of (A, A^+), then:

- The map $X=\mathrm{Spa}(R,R^+)\to Y=\mathrm{Spa}(R,R^+)$ is a homeomorphism.
- For rational subset $V\subset Y$ with preimage $U\subset X$, $(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ is the completion of the perfection of $(\mathcal{O}_Y(V),\mathcal{O}_Y^+(V))$.
- For any covering $\mathfrak{U}:U_i\to X$ of rational subsets, the Čech cohomology groups $H^i(\mathfrak{U},\mathcal{O}_X^0)$ are all almost zero.
- (R,R^+) is sheafy, with $H^i(X,\mathcal{O}_X^+)$ almost zero for all $i>0$.

Proof: 1: This is because the adic spectrum is insensitive for perfection(14.8.2.28) and completion(14.8.2.17).

2: This is by the universal property, as these two are both the universal elements for the complete and affinoid adic spaces mapping to X that factors through U.

3: The complex calculating $H^i(\mathfrak{U},\mathcal{O}_X^0)$ is just the complex calculating $H^i(\mathfrak{U},\mathcal{O}_Y^+)$ under completion of perfection((14.8.2.27) used). So(14.8.6.15) and(14.8.6.17)(applied to every element) shows that the perfection makes the complex almost acyclic, and this is preserved under completion as $(-)^a$ is exact.

4: The complex calculating $H^i(\mathfrak{U},\mathcal{O}_X)$ is just the complex calculating $H^i(\mathfrak{U},\mathcal{O}_X^+)$ inverting t, thus they are all 0 as localization is exact. For the second, it is because of item3 and the fact $\mathcal{O}_X^+$ is almost isomorphic to $\mathcal{O}_X^0$(10.3.9.14). □

Lemma (14.8.6.17). Let A be a ring with an element t that admits compatible p^n-th roots, then for an A-module M that $t^NM=0$, consider the Frobenius pushforward $M\to F_*M$, then the colimit $\mathrm{colim}_{F_*}F_*^nM$ is naturally a module over A_{perf}, and it is annihilated by $t^{\frac{1}{p^n}}$ for all n.

Proof: The A_{perf} structure is natural, and notice F_*^kM is annihilated by $t^{\frac{N}{p^k}}$, thus naturally the colimit is annihilated by $t^{\frac{1}{p^n}}$ for all n. □

Prop. (14.8.6.18) [Noetherian Approximation in Char$p$]. If K is a perfectoid field of char$p$ with pseudo-uniformizer t, then K is an extension of $L=\widehat{\mathbb{F}_p[[t]]_{perf}}[t^{-1}]$, and If A is an K^0-perfectoid algebra that is integrally closed in $A[t^{-1}]$, then:

- A is a completion of a filtered colimit $\widehat{\mathrm{colim}_i}\,B_i$ that B_i are p-finite, that induces an homeomorphism
$$\mathrm{Spa}(A[t^{-1}],A)\cong\lim_i\mathrm{Spa}(B_i[t^{-1}],B_i)$$
that each rational subset of $\mathrm{Spa}(A[t^{-1}],A)$ comes from a rational subset of some $\mathrm{Spa}(B_i[t^{-1}],B_i)$.
- If $U_i\subset\mathrm{Spa}(B_i[t^{-1}],B_i)$ is a compatible system of rational subsets that corresponds to $U\subset\mathrm{Spa}(A,A^+)=X$, then
$$(\mathcal{O}_X(U),\mathcal{O}_X^+(U))\cong\widehat{\varinjlim_j(\mathcal{O}_j(U_j),\mathcal{O}_j^+(U_j))}.$$

Proof: 1: $A=\mathrm{colim}_i A_i$, where A_i are all the f.p. $\mathbb{F}_p[t]$-algebras in A. Then each A_i is reduced(as A is complete and integrally closed in $A[t^{-1}]$) and t-torsion-free, and we can assume they are integrally closed in $A_i[t^{-1}]$ because A does, by passing to their integral closure.

Then applying the $(-)_{perf}$ functor gives $\mathrm{colim}_i(A_i)_{perf}=A$, as A is perfect, and applying the completion gives
$$(\mathrm{colim}_i\widehat{A_i})^\wedge=A,$$

as A is already complete, so we are done.

2: This is immediate from 1 and(14.8.2.27).

3: This is because by universal property for Huber presheaves, there are pushouts diagrams

$$\begin{array}{ccccccc} (B_i[t^{-1}],B_i) & \longrightarrow & (B_j[t^{-1}],B_j) & \longrightarrow & \dots & \longrightarrow & (A[t^{-1}],A) \\ \downarrow & & \downarrow & & & & \downarrow \\ (\mathcal{O}_{X_i}(U_i),\mathcal{O}^+_{X_i}(U_i)) & \longrightarrow & (\mathcal{O}_{X_j}(U_j),\mathcal{O}^+_{X_j}(U_j)) & \longrightarrow & \dots & \longrightarrow & (\mathcal{O}_X(U),\mathcal{O}^+_X(U)) \end{array}$$

So the conclusion follows as colimits commutes with colimits. □

Prop. (14.8.6.19) [Almost Acyclicity for Perfectoids]. Fix a perfectoid field K and a perfectoid affinoid K-algebra (R,R^+) with adic spectrum $X=\mathrm{Spa}(R,R^+)$, then

- (R,R^+) is sheafy, i.e. $\mathcal{O}_X$ and $\mathcal{O}_X^+$ are sheaves.
- $\mathcal{O}_X^+(X)=R^+$, and $H^i(X,\mathcal{O}_X^+)$ is almost zero for $i>0$.
- $\mathcal{O}_X(X)=R$, and $H^i(X,\mathcal{O}_X)=0$ all $i>0$.

Proof: As in the proof of(14.8.6.16), it suffices to prove $\mathcal{O}_X^0$ is almost exact w.r.t any covering $\mathfrak{U}$. For this, notice each term is π-adically complete and flat by(14.8.5.1), so it suffices to prove it is almost exact modulo π(4.7.3.2). Then by the tilting equivalence, it suffices to prove for $X^\flat$. So we may assume at first that K is of char$p$. Then we may replace K by $L=\mathbb{F}_p\widehat{[[t]]_{perf}}[t^{-1}]$.

But then Noetherian approximation(14.8.6.18) shows that the rational subrings are completion of filtered colimits of p-finite K-algebras((14.8.2.27) used), and then we reduced to the p-finite case, as in the proof of(14.8.6.16). □

7 Étale Site of Perfectoid Spaces

Def. (14.8.7.1) [Finite Étale Map of Adic Spaces]. A map of Huber pairs $(A,A^+)\to(B,B^+)$ is called **finite étale** if $A\to B$ is finite étale, and B^+ is the integral closure of A^+ in B.

A map $f:X\to Y$ of adic spaces is called **finite étale** if there is a cover of Y by affinoids $V\subset Y$ that $U=f^{-1}(V)$ are all affinoids, and the map $(\mathcal{O}_Y(V),\mathcal{O}_Y^+(V))\to(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ is finite étale. Write $Y_{f\acute{e}t}$ for the category of all such maps.

Def. (14.8.7.2) [Étale Maps]. A map $X=\mathrm{Spa}(A,A^+)\to Y=\mathrm{Spa}(B,B^+)$ of adic spaces is called **étale** iff for any $x\in X$, there exists an open $x\in U$ and open $f(U)\subset V$ together with an adic space W that $f:U\to V$ factors through an open immersion $U\to W$ and a finite étale map $W\to V$.

Cf.[**?**]P65.

Def. (14.8.7.3) [Strongly Finite Étale]. For convenience, in case of perfectoid affinoid K-algebras, we call a map of Huber pairs $(A,A^+)\to(B,B^+)$ **strongly finite étale** if it is finite étale and B^{+a} is almost finite étale over A^{+a}.

A map $f:X\to Y$ of adic spaces is called **strongly finite étale** if there is a cover of Y by affinoids $V\subset Y$ that $U=f^{-1}(V)$ are all affinoids, and the map $(\mathcal{O}_Y(V),\mathcal{O}_Y^+(V))\to(\mathcal{O}_X(U),\mathcal{O}_X^+(U))$ is strongly finite étale. Write $Y_{sf\acute{e}t}$ for the category of all such maps.

Finally we will prove that if (A,A^+) is perfectoid, then any finite étale map $(A,A^+)\to(B,B^+)$ is strongly finite étale.

Prop. (14.8.7.4) [Strongly Finite Étale Maps Form a Stack]. If $f : X \to Y$ is a strongly finite étale map that $Y = \mathrm{Spa}(A, A^+)$ is an affinoid perfectoid, then X is also affinoid perfectoid, and the structure map $(\mathcal{O}_X(X), \mathcal{O}_X^+(X)) \to (\mathcal{O}_Y(Y), \mathcal{O}_Y^+(Y))$ is strongly finite étale.

Proof: By(14.8.7.9), it suffices to prove in char$p$. Then we can replace K by $L = \widehat{\mathbb{F}_p[[t]]_{perf}}[t^{-1}]$. Then by Noetherian approximation(14.8.6.18), we can assume that Y is a limit of p-finite affinoids $\mathrm{Spa}(B_i, B_i^+)$. As both rational subsets and finite étale algebras pass through filtered colimit, and adic spectrum is quasi-compact(14.8.2.24), we can assume that a finite étale cover of Y arises through base change of some $\mathrm{Spa}(B_i, B_i^+)$. So it suffices to prove the proposition in case of Y p-finite. Then Y is a completion of perfection of some algebraically admissible ring over $\mathbb{F}_p[t]$. Then by the above argument again, we can assume that Y is algebraically admissible.

Now a classical theorem(Cf.[Étale cohomology of rigid analytic varieties and adic spaces, Huber 1.6.6(2)]) shows that the finite étale cover of Y is global finite étale $\mathrm{Spa}(S, S^+) \to \mathrm{Spa}(R, R^+)$ in this case. Notice the strongness is not needed because we are working in char p, where almost purity theorem is already proven. □

Cor. (14.8.7.5). For an affinoid perfectoid space $Y = \mathrm{Spa}(R, R^+)$, the functor $X \mapsto \mathcal{O}_X^+(X)$ defined an equivalence of categories $Y_{sf\acute{e}t} \cong R^{+a}_{af\acute{e}t}$, and the functor $X \mapsto \mathcal{O}_X(X)$ gives a fully faithful functor $Y_{sf\acute{e}t} \to R_{f\acute{e}t}$.

Def. (14.8.7.6) [Étale Site of Perfectoid Spaces]. Let X be a perfectoid space, then the étale site of X is the category $X_{\acute{e}t}$ of perfectoid spaces that is étale over X, and coverings are given by topological coverings. We also consider the following subcategories:

- $X_{\acute{e}t}^{aff}$, the category of affinoid perfectoid spaces étale over X.
- $X_{\acute{e}t,qcqs}$, the full subcategory of qcqs perfectoid spaces étale over X.
- $X_{\acute{e}t,qc,sep}$, the full subcategory of qc separated perfectoid spaces étale over X.

Prop. (14.8.7.7) [Gabber-Ramero]. If A is a finite K^0-algebra that is π-adically Henselian, then

$$A[\pi^{-1}]_{f\acute{e}t} \cong \widehat{A}[\pi^{-1}]_{f\acute{e}t}.$$

Proof: Cf.[Almost Ring Theory P5.4.53]. □

Cor. (14.8.7.8) [Finite Étale Covers and Direct Limits of Complete Uniform Rings]. Let (A_i, A_i^+) be a filtered system of complete uniform affinoid K-algebras, and (A, A^+) be their colimit in the category of complete uniform affinoid Tate rings, then

$$2 - \mathrm{colim}_i\, A_{i,f\acute{e}t} \cong A_{f\acute{e}t}$$

as categories.

Proof: By(14.8.2.27), A^+ is the π-adic completion of the algebraic colimit B^+ of A_i^+, and $A = A^+[\pi^{-1}]$. Each A_i is complete and π-torsion-free, thus the colimit is Henselian and π-torsion-free(4.3.10.3)(4.3.10.6). Then the proposition(14.8.7.7) shows that $B^+[\pi^{-1}]_{f\acute{e}t} \cong A_{f\acute{e}t}$. Now it remains to show that

$$2 - \mathrm{colim}_i\, A_{i,f\acute{e}t} \cong B^+[\frac{1}{\pi}]_{f\acute{e}t},$$

which is because étale sites commutes with taking filtered colimits □

Final Proof of Almost Purity Theorem

Prop. (14.8.7.9). We have an equivalence of categories $X_{sf\acute{e}t} \cong X^\flat_{sf\acute{e}t}$. For this, use(14.8.7.5),(14.8.5.10) and the proven part of(10.3.10.1) and notice that

$$A^{+a}_{af\acute{e}t} = A^{0a}_{af\acute{e}t} \cong A^{\flat 0a}_{af\acute{e}t} = A^{\flat +a}_{af\acute{e}t},$$

and the integral closure clearly corresponds.(It get around the problem that $R^{0a}_{f\acute{e}t} \to R_{f\acute{e}t}$ hasn't been proven essentially surjective).

Prop. (14.8.7.10)[Proof of Almost Purity Theorem]. Fix a perfectoid affinoid K-algebra (R, R^+), if $S \in R_{f\acute{e}t}$, then the integral closure of S^+ in R^+ lies in $R^{+a}_{af\acute{e}t}$, and this gives an inverse to the morphism d in(10.3.10.1), thus finishing the proof of almost purity theorem.

Proof: Continuing the proof of(10.3.10.1), it suffices to show that $d : R^{+a}_{af\acute{e}t} \to R_{f\acute{e}t}$ is essentially surjective, because $S^+ \to \overline{S} \subset R^+$ is the only possible inverse, by the almost purity theorem in char$p$ and tracing the tilting equivalence(10.3.9.6). Given(14.8.7.5), it suffices to prove that for $X = \mathrm{Spa}(R, R^+)$, the prestacks $X_{sf\acute{e}t} \cong X_{f\acute{e}t}$, where $X_{sf\acute{e}t}(U) = \mathcal{O}^{+a}_X(U)_{sf\acute{e}t}$, and $X_{f\acute{e}t}(U) = \mathcal{O}_X(U)_{f\acute{e}t}$.

We use(5.1.3.22), firstly $X_{sf\acute{e}t}$ is a stack, by(14.8.7.4), and for each U, $X_{sf\acute{e}t}(U) \to X_{f\acute{e}t}(U)$ is fully faithful by almost purity theorem(10.3.10.1). $X_{f\acute{e}t}$ is separated by(14.8.4.21), because the structure section of an element $S \in X_{f\acute{e}t}$ is determined its value on the stalk.

Its left to prove that their stalks are equal, for this, use the formula

$$\mathrm{colim}_{x\in U}(\mathcal{O}_X(U), \mathcal{O}^+_X(U)) = (\widehat{k(x)}, \widehat{k^+(x)})$$

in the category of complete uniform affinoid K-algebras(they are all perfectoids(14.8.5.1) thus uniform), by definition. So we get by(14.8.7.8):

$$\mathrm{colim}_{x\in U}\, \mathcal{O}_X(U)_{f\acute{e}t} \cong \widehat{k(x)}_{f\acute{e}t},$$

and by(14.8.7.8) together with the proven part of almost purity theorem(10.3.10.1):

$$\mathrm{colim}_{x\in U}\, \mathcal{O}^+_X(U)_{af\acute{e}t} \cong \mathrm{colim}_{x^\flat\in U^\flat}\, \mathcal{O}^{\flat+}_X(U^\flat)_{af\acute{e}t} \cong \kappa^+(x^\flat)_{af\acute{e}t} \cong \kappa^+(x)_{af\acute{e}t}.$$

Now we have already proved the almost purity over fields(10.3.10.1) which says $\kappa(x^\flat)_{af\acute{e}t} \cong \kappa^+(x)_{af\acute{e}t}$, so their stalks are the same. □

Cor. (14.8.7.11) [Invariance of Étale Site under Tilting]. There is a natural isomorphism of categories $X_{\acute{e}t} \cong X^\flat_{\acute{e}t}$, by almost purity theorem(10.3.10.1) and the localness of étale maps.

Prop. (14.8.7.12) [Almost Acyclicity]. For any perfectoid space X, the functor $U \mapsto \mathcal{O}_X(U)$ is a sheaf on $X_{\acute{e}t}$, and $H^i(X_{\acute{e}t}, \mathcal{O}^+_X)$ is almost zero if X is affinoid perfectoid.

14.9 Pro-Étale Sites on Perfectoids and Diamonds

Main references are [Sch17] and [Notes on Diamonds, David Hansen].

1 Properties of Perfectoid Spaces

Totally Disconnected Spaces

Def. (14.9.1.1) [Totally Disconnected Spaces]. A perfectoid space X is called **totally disconnected** if it is qcqs and any open covering $\{U_i \to X\}$ splits, i.e. $\coprod U_i \to X$ splits, or equivalently, there is a refinement covering $\{V_i \to X\}$ that $X \cong \coprod V_i$.

A perfectoid space X is called **strictly totally disconnected** if it is qcqs and every étale cover splits.

Prop. (14.9.1.2). Let X be a qcqs perfectoid spaces, then X is totally disconnected iff all its connected components are of the form $\mathrm{Spa}(K, K^+)$ where (K, K^+) are perfectoid affinoid fields. And it is strictly totally disconnected if moreover K are all alg.closed.

Proof: Cf.[Sch17].P29, P35. □

Prop. (14.9.1.3). if X is a totally disconnected perfectoid space, then X is affinoid.

Proof: Cf.[Sch17].P30. □

Injections

Def. (14.9.1.4) [Injections]. A map $f : X \to Y$ of perfectoid spaces is called an injection if for any perfectoid space Z, $f_* : \mathrm{Hom}(Z, X) \to \mathrm{Hom}(Z, Y)$ is an injection.

Prop. (14.9.1.5) [Residue Field Map is Injection]. Let X be a perfectoid space and $x \in X$, giving rise to a map of residue fields

$$i_x : \mathrm{Spa}(\kappa(x), \kappa(x)^+) \to X,$$

then i_x is an injection of perfectoid spaces.

Proof: To show this, firstly we can replace X with an affinoid nbhd of X. Then notice that $\mathrm{Spa}(\kappa(x), \kappa(x)^+)$ is the filtered limit over all rational nbhds U of x in X, and for each U, $U \to X$ is an injection by definition(14.8.3.1), so i_x is also an injection. □

Cor. (14.9.1.6). In particular, if X is qcqs and has a unique closed point $x \in X$, then $X = \mathrm{Spa}(\kappa(x), \kappa(x)^+)$, as in this case X is the only quasi-compact open subset containing x.

Prop. (14.9.1.7) [Characterizations of Injections]. Let $f : Y \to X$ be a map of perfectoid spaces, then the following conditions are equivalent:

- f is an injection.
- For any perfectoid adic field (K, K^+), the map of sets $f_* : Y(K, K^+) \to X(K, K^+)$ is an injection.
- The map $|f| : |Y| \to |X|$ is injective, and for all rank 1 point $y \in Y$ with image $f(y) = x \in X$, the map of completed residue fields $\kappa(x) \to \kappa(y)$ is an isomorphism.
- The map $|f| : |Y| \to |X|$ is injective, and f is final in the category of maps $Z \to X$ that $|Z| \to |X|$ factors through the map $|Y| \to |X|$.

In particular, by item4, an injection of perfectoid spaces is determined by its topological map.

Proof: Cf.[Sch17]P21. $4 \to 1 \to 2$ is trivial. □

Prop. (14.9.1.8) [Injection and Base Change].

- Let $f : Y \to X$ be an injection of perfectoid spaces, and $X' \to X$ any map of perfectoid spaces, then the pullback $f' : Y' = Y \times_X X' \to X'$ is also an injection, and the induced map

$$|Y'| \to |Y| \times_{|X|} |X'|$$

is a homeomorphism.

- A map of perfectoids spaces is an injection iff it is universally injective.

Proof: Cf.[Sch17]P24. □

Immersions

Def. (14.9.1.9) [Immersions]. A map of perfectoid spaces $f : Y \to X$ is called an immersion if f is an injection and $|f| : |Y| \to |X|$ is a locally closed immersion. If $|f|$ is moreover closed or open, then it is called closed/open immersion.

Def. (14.9.1.10) [Zariski Closed Immersion]. Let $f : Z \to X$ be a map of perfectoid spaces where $X = \mathrm{Spa}(R, R^+)$ is affinoid perfectoid, then

- the map f is called Zariski closed immersion if f is a closed immersion and $|Z| = V(I) \subset |X|$, where $I \subset R$ is an ideal.
- the map f is called strongly Zariski closed immersion if $Z = \mathrm{Spa}(S, S^+)$ is affinoid perfectoid, $R \to S$ is surjective, and S^+ is the closure of R^+ in S.

Prop. (14.9.1.11).

- If f is strongly Zariski closed, then f is Zariski closed, in particular a closed immersion.
- If f is Zariski closed, then Z is affinoid.
- If X is of characteristic p, and f is Zariski closed, then f is strongly Zariski closed.

Proof: Cf.[**?**] Section2.5. □

Prop. (14.9.1.12). For any map of perfectoid spaces $Y \to X$, the diagonal map $\Delta_f : Y \to Y \times_X Y$ is an immersion.

Proof: Clearly Δ_f is an injection, thus it suffices to show that $|\Delta_f|$ identifies Y with a locally closed subset of $|Y \times_X Y|$. This can be checked locally on the target, so we can assume $X = \mathrm{Spa}(R, R^+)$ and $Y = \mathrm{Spa}(S, S^+)$, then the diagonal map is strongly Zariski closed, as $S \widehat{\otimes}_R S \to S$ is surjective and maps the integral closure of $S^+ \widehat{\otimes}_{R^+} S^+ \to S^+$ onto S^+. Thus by(14.9.1.11), Δ_f is a closed immersion in this case. □

Def. (14.9.1.13) [Separated Map]. A map $f : Y \to X$ of perfectoid spaces is called separated if Δ_f is a closed immersion.

Prop. (14.9.1.14)[Valuation Criterion]. Let $f : Y \to X$ be a map of perfectoid spaces. The following are equivalent:

- f is separated.

- $|\Delta_f|:|Y|\to|Y\times_X Y|$ is a closed immersion.
- $|f|$ is quasi-separated, and for any perfectoid adic field (K,K^+) and any diagram

$$\begin{array}{ccc} \mathrm{Spa}(K,\mathcal{O}_K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow f \\ \mathrm{Spa}(K,K^+) & \longrightarrow & X \end{array},$$

there exists at most one dotted arrow making the diagram commutative.

Proof: The equivalence of 1 and 2 is by(14.9.1.12).

2 → 3: If $|\Delta_f|$ is a closed immersion, then it is in particular quasi-compact, thus f is quasi-separated. Now if there are two dotted-arrow making this diagram commutative, they define a point $z\in(Y\times_X Y)(K,K^+)$ s.t. $z|_{\mathrm{Spa}(K,\mathcal{O}_K)}\in\Delta_f(Y)(K,\mathcal{O}_K)$. But $|\Delta_f|(|Y|)$ is closed in $|Y\times_X Y|$, so z maps $\mathrm{Spa}(K,K^+)$ into $|\Delta_f|(|Y|)$ iff it maps $\mathrm{Spa}(K,\mathcal{O}_K)$ into $|\Delta_f|(|Y|)$, as $\mathrm{Spa}(K,\mathcal{O}_K)\subset\mathrm{Spa}(K,K^+)$ is dense**??**. Now Δ_f is an injection, so by(14.9.1.7), z factors through Δ_f thus the two maps are equal.

3 → 2: The condition implies that $|\Delta_f|:|Y|\to|Y\times_X Y|$ is a quasi-compact locally closed immersion of locally spectral spaces which is moreover specializing. But because $|\Delta_f|$ is quasi-compact, the image of $|\Delta_f|$ is pro-constructible, and it is also closed under specialization, thus it is closed, Cf.[Sch17]P25. □

2 Pro-Étale Site and v-Site

Prop. (14.9.2.1). if (R,R^+) is the completed filtered colimit of perfectoid Huber pairs (R_i,R_i^+), $X_i=\mathrm{Spa}(R_i,R_i^+)$, $X=\mathrm{Spa}(R,R^+)$, then base change induce equivalences of categories:

- $2-\lim_i X_{i,f\acute{e}t}\cong X_{f\acute{e}t}$.
- $2-\lim_i X_{i,\acute{e}t}^{aff}\cong X_{\acute{e}t}^{aff}$.
- $2-\lim_i X_{i,\acute{e}t,qcqs}\cong X_{\acute{e}t,qcqs}$.
- $2-\lim_i X_{i,\acute{e}t,qc,sep}\cong X_{\acute{e}t,qc,sep}$.

Proof: Cf.[Sch17]P27.

1 follows from almost purity theorem. □

Def. (14.9.2.2)[Pro-étale Morphism]. A map of perfectoid Huber pairs $(A,A^+)\to(B,B^+)$ is called **pro-étale** iff it is the completed filtered colimit of étale ring maps $(A,A^+)\to(A_i,A_i^+)$.

A morphism of perfectoid spaces is **pro-étale** if there is an affinoid covering $V_i=\mathrm{Spa}(R_i,R_i^+)$ of X that $f^{-1}(V_i)$ have coverings $U_{ij}=\mathrm{Spa}(R_{ij},R_{ij}^+)$ that $(R_i,R_i^+)\to(R_{ij},R_{ij}^+)$ are all pro-étale.

In fact, by(14.9.2.7), if this is true for one affinoid covering V_i of X, then this is true for any affinoid covering of X.

Prop. (14.9.2.3). If S is a profinite set and X is a perfectoid space, then we can define a new perfectoid space $X\times\underline{S}$ as the inverse limit of $X\times\underline{S_i}$, where $S=\varprojlim S_i$. Then $X\times\underline{S}$ is pro-étale over X.

Prop. (14.9.2.4) [Immersion are Pro-Étale]. If $f:Z\hookrightarrow X$ be a Zariski closed immersion with image $V(I)$, then f is affinoid pro-étale. Then $f(Z)$ can be written as the intersection of rational subsets

$$U_{f_1,\ldots,f_n}=\{|f_1|,\ldots,|f_n|\le|\varpi|\}$$

for various n and $f_1, \ldots, f_n \in I$. Then $Z = \varprojlim U_{f_1,\ldots,f_n} \to X$, as it is a closed immersion thus an injection(14.9.1.11), which shows $Z \to X$ is pro-étale.

In particular, an immersion is also pro-étale because pro-étale can be checked analytically locally.

Cor. (14.9.2.5) [Diagonal Map is Pro-Étale]. If $f : Y \to X$ is a map of perfectoid spaces, then $\Delta_f : Y \to Y \times_X Y$ is pro-étale, by(14.9.1.12).

Prop. (14.9.2.6). If X is an affinoid perfectoid space, then the functor

$$\mathrm{Pro}(X_{\acute{e}t}^{aff}) \to X_{pro\acute{e}t}^{aff} : \varprojlim_i (X_i) \mapsto \varprojlim_i X_i$$

is an equivalence of categories.

Proof: This map is essentially surjective by definition, To show it is fully faithful, it suffices to show that for $Y = \varprojlim_i \mathrm{Spa}(Y_i, Y_i^+), Z = \varprojlim_j \mathrm{Spa}(Z_j, Z_j^+)$,

$$\mathrm{Hom}_X(Y, Z) = \varprojlim_j \varinjlim_i \mathrm{Hom}(Y_i, Z_j).$$

We need to show for any $Z \to X$,

$$\mathrm{Hom}_X(Y, Z) = \varinjlim_i \mathrm{Hom}(Y_i, Z).$$

Because $2 - \lim_i X_{i,\acute{e}t,qcqs} \cong X_{\acute{e}t,qcqs}$(14.9.2.1), we have

$$\mathrm{Hom}_X(Y, Z) = \mathrm{Hom}_Y(Y, Y \times_X Z) = \varinjlim_i \mathrm{Hom}_{Y_i}(Y_i, Y_i \times_X Z) = \varinjlim_i \mathrm{Hom}_X(Y_i, Z).$$

□

Prop. (14.9.2.7) [Properties of Pro-Étale Morphisms].

- (Affinoid)Pro-Étale maps are stable under composition and pullbacks.
- Let $f : Y \to X, f' : Y' \to X$ be (affinoid)pro-étale, then any map $g : Y \to Y'$ over X is also (affinoid)pro-étale.
- For any affinoid perfectoid space X, the category $X_{pro-\acute{e}t}^{aff}$ has all finite limits.

Proof: 1: Composition is obvious. pro-étale maps are stable under pullbacks because étale maps do.

2: We can factor g as a section of the map $Y \times_X Y' \to Y$ and the projection map $Y \times_X Y' \to Y'$. Thus it suffices to show a section of a pro-étale map is pro-étale. But if $Y = \varprojlim_i Y_i \to X$ is pro-étale, then a section is given by compatible sections $s_i : X \to Y_i$. Then $X = \varprojlim_i (X \times_{Y_i} Y) \to X$ is pro-étale.

3: This is because $X_{\acute{e}t}^{aff}$ has finite limits, because it has a final object and fiber products(10.3.9.17).
□

Def. (14.9.2.8) [Big Pro-Étale Site]. Consider the following categories:

- Perfd, the category of perfectoid spaces.
- Perf, the category of perfectoid spaces of characteristic p.
- $X_{pro\acute{e}t}$, the category of perfectoid spaces pro-étale over X, where X is a perfectoid space.

- $X^{aff}_{proét}$, the category of affinoid perfectoid spaces pro-étale over X.

The **big pro-étale site** is the category Perfd endowed with the topology that a family of maps $\{f_i : Y_i \to X\}$ is a covering if all f_i are pro-étale and for any quasi-compact open subset $U \subset X$, there is a finite set $J \subset I$ and quasi-compact opens $V_j \subset Y_j$ that $U = \cup_{j\in J} f_j(V_j)$.

These truly form sites by(14.9.2.7).

Cor. (14.9.2.9). The presheaf $\mathcal{O} : X \mapsto \mathcal{O}_X(X), \mathcal{O}^+ : X \mapsto \mathcal{O}_X^+(X)$ on the big étale site are sheaves. If X is affinoid perfectoid, then $H^i(X_{proét}, \mathcal{O}) = 0$ for $i > 0$, and $H^i(X_{proét}, \mathcal{O}^+)$ is almost zero for $i > 0$. Moreover, the big pro-étale site is subcanonical.

Proof: Firstly we can assume X is affinoid because we already know $\mathcal{O}, \mathcal{O}^+$ are sheaves w.r.t. the analytic topology. Let $Y \to X$ be an affinoid pro-étale covering of X, where $Y = \mathrm{Spa}(R_\infty, R_\infty^+)$, $(R_\infty, R^+_\infty) = (\varinjlim_i (R_i, R_i^+))^\wedge$. Then fixing a pseudo-uniformizer ϖ of R, the complexes

$$0 \to R^+/\varpi \to R_j^+/\varpi \to \cdots$$

is almost exact, because $H^i(X_{ét}, \mathcal{O}_X^+/\varpi)$ is almost zero for $i > 0$. Now take a direct limit over i, then

$$0 \to R^+/\varpi \to R_\infty^+/\varpi \to \cdots$$

is almost exact. Now by induction on n, we can prove

$$0 \to R^+/\varpi^n \to R_\infty^+/\varpi^n \to \cdots$$

is almost exact. Then by passing to the direct limit ,

$$0 \to R^+ \to R_\infty^\infty \to \cdots$$

is almost exact. Then by inverting ϖ,

$$0 \to R \to R_\infty \to \cdots$$

is exact. These give us the desired results. Notice $\mathcal{O}^+$ is a sheaf because it is the elements of valuations≤ 1 everywhere by(14.8.3.7).

For the final assertion, if $\{Y_i \to Y\}$ is a pro-étale covering of Y, and $g_i : Y_i \to X$ are maps that agree on $Y_i \times_X Y_j$, then firstly we can glue these maps together topologically to a map $|Y| \to |X|$. So this problem can be considered locally on X, so we may assume $X = \mathrm{Spa}(R, R^+)$ is affinoid, and maps $(R, R^+) \to (\mathcal{O}(Y_i), \mathcal{O}^+(Y_i))$ that agree on the overlap(14.8.4.4), then they glue to a map $(R, R^+) \to (\mathcal{O}(Y), \mathcal{O}^+(Y))$, as $\mathcal{O}, \mathcal{O}^+$ are all sheaves, and this gives a morphism $Y \to X$. □

Prop. (14.9.2.10) [Strictly Totally Disconnected Pro-Étale Cover]. Let X be an affinoid perfectoid space, then there is an affinoid perfectoid space $\widetilde{X}$ with an affinoid pro-étale surjective and universally open map $\widetilde{X} \to X$ that $\widetilde{X}$ is strictly totally disconnected.

Proof: Cf.[Sch17]P35. □

Prop. (14.9.2.11). The presheaf $\mathcal{O}, \mathcal{O}^+$ are sheaves w.r.t. the v-topology. Moreover, the v-site is subcanonical.

Proof: Cf.[Sch17]P40. □

Prop. (14.9.2.12). Let X be an affinoid perfectoid space, then $H^i_v(X, \mathcal{O}) = 0$ for $i > 0$, and $H^i_v(X, \mathcal{O}^+)$ is almost zero for $i > 0$.

Proof: Cf.[Sch17]P41. □

Descent on Pro-Étale Site

Prop. (14.9.2.13) [Descent May Fail]. The question is whether the fibered category over Perfd:

$$X \mapsto \{\text{Perfectoid Spaces } Y \to X\}$$

is a stack for the pro-étale toplogy. This fails in general. An evidence is that the fibered category

$$X \mapsto \{\text{Affinoid Perfectoid Spaces } Y \to X\}$$

is not a stack on the category of affinoid Perfectoid spaces with the analytic topology, let along the pro-étale topology:

Let $X = \mathrm{Spa}\, K\langle x, y\rangle$, and $V \subset X$ be $\{(x,y)||x| = 1 \text{ or } |y| = 1\}$, then V is covered by two affinoids, but is not an affinoid itself: $H^1(V, \mathcal{O}_V) = \widehat{\bigoplus}_{m,n>0} K x^{-m} y^{-n} \neq 0$. But there is a standard rational covering $X = \cup_i X(\frac{f_1, f_2, f_3}{f_i})$, where $f_1 = \varpi$, $f_2 = x$, $f_3 = y$, and

$$U_0 \cap V = \varnothing, \quad U_1 \cap V = \{|x| = 1\} \subset U_1, \quad U_2 \cap V = \{|y| = 1\} \subset U_2$$

are all affinoid. There is a similar example in the perfectoid case, thus

$$X \mapsto \{\text{Affinoid Perfectoid Spaces } Y \to X\}$$

is not a stack.

Prop. (14.9.2.14) [Pro-étale is not Pro-étale Local]. There is an example of a non-pro-étale map that is pro-étale locally pro-étale.

Proof: Cf.[S-W20]P66. □

Prop. (14.9.2.15) [Characterization of Locally pro-étale Maps]. Let $f : X \to Y$ be a morphism of affinoid perfectoid spaces, then the following are equivalent:

- There exists an affinoid pro-étale cover $Y' \to Y$ s.t. the base change $X' = X \times_Y Y' \to Y'$ is pro-étale.
- For all geometric points $\mathrm{Spa}\, C \to Y$, $X \times_Y \mathrm{Spa}\, C = \mathrm{Spa}\, C \times \underline{S}$ for some profinite set S.

Proof: Cf.[S-W20]P66. □

Prop. (14.9.2.16) [Descent]. Descent data of the the fibered category

$$X \mapsto \{\text{Perfectoid Spaces } Y \to X\}$$

of a perfectoid space $Y' \to X'$ along a pro-étale cover $X' \to X$ is effective in the following cases:

- If X, X', Y' are affinoids and X is totally disconnected.
- if f is separated and pro-étale and X is strictly totally disconnected.
- If f is separated and étale. In particular, the fibered category

  $$X \mapsto \{\text{separated étale } X \to Y\}$$

  is a stack over the category of perfectoid spaces with the pro-étale topology.
- If f is finite étale. In particular, the fibered category

  $$X \mapsto \{\text{finite étale } X \to Y\}$$

  is a stack over the category of perfectoid spaces with the pro-étale topology.

Proof: Cf.[Sch17]P9.3, 9.6, 9.7. □

3 Morphisms of v-Stacks

Def. (14.9.3.1) [Étale Morphism of Stacks]. Let $f : Y' \to Y$ be a map of pro-étale stacks on the category Perfd,

- Assume f is locally separated(i.e. there is an open cover of Y' over which f becomes separated), then f is called **quasi-pro-étale** if for any strictly totally disconnected perfectoid space X and a map $X \to Y$, the pullback $Y' \times_Y X$ is representable and $Y' \times_Y X \to X$ is pro-étale.
- Assume f is locally separated, then f is called **étale** if for any perfectoid space X and a map $X \to Y$, the pullback $Y' \times_Y X$ is representable and $Y' \times_Y X \to X$ is étale.
- f is called **finite étale** if for any perfectoid space X and a map $X \to Y$, the pullback $Y' \times_Y X$ is representable and $Y' \times_Y X \to X$ is finite étale.

4 Diamonds

Remark (14.9.4.1) [Motivation of Diamonds]. The idea of diamonds is that there should be a functor

$$\diamond : \{\text{analytic adic spaces over } \mathbb{Z}_p\} \to \{\text{diamonds}\}$$

that forgets the structure morphism to $\mathbb{Z}_p$. For a perfectoid space X, $X \mapsto X^f lat$ has this property, so this functor should coincides on these objects. Now any analytic adic space X over $\mathbb{Z}_p$ is pro-étale locally perfectoid:

$$X = \operatorname{Coeq}(\widetilde{X} \times_X \widetilde{X} \rightrightarrows X),$$

where $\widetilde{X} \to X$ is a pro-étale perfectoid cover. The equivalence relations $R = \widetilde{X} \times_X \widetilde{X}$ is also perfectoid, so this functor should send X to $\operatorname{Coeq}(R^\flat \rightrightarrows \widetilde{X}^\flat)$.

For example, if $X = \operatorname{Spa}(\mathbb{Q}_p)$, then a pro-étale cover of X is $\operatorname{Spa}((\mathbb{Q}_p^{cycl})^\wedge)$, and then $R = \widetilde{X} \times_X \widetilde{X} = \widetilde{X} \times \underline{\mathbb{Z}_p^*}$ by Galois theory, and then $\mathbb{Q}_p^\diamond$ should be defined as the coequalizer of $\operatorname{Spa}((\mathbb{Q}_p^{cycl})^\flat)/\mathbb{Z}_p^*$, whose meaning is explained in(14.9.4.10).

Def. (14.9.4.2) [Diamonds]. A **diamond** is a pro-étale sheaf $\mathcal{D}$ on Perf that can be written as $\mathcal{D} = X/R$, where $X \in \text{Perf}$ and R is a pro-étale equivalence relation in $X \times X$(i.e. an equivalence relation that the maps $s, t : R \to X$ are pro-étale), and also R is representable.

Prop. (14.9.4.3). Let $X \in \text{Perf}$ and $R \subset X \times X$ a representable pro-étale equivalence relation, then

- The quotient sheaf $Y = X/R$ is a diamond.
- The natural map of sheaves $R \to X \times_Y X$ is an isomorphism.
- Let $\widetilde{X} \to X$ be a pro-étale cover by a perfectoid space $\widetilde{X}$, and $\widetilde{R} = R \times_{X \times X} (\widetilde{X} \times \widetilde{X})$ the induced equivalence relation, then $\widetilde{R}$ is a representable pro-étale equivalence relation of $\widetilde{X}$, and the natural map $\widetilde{Y} = \widetilde{X}/\widetilde{R} \to Y = X/R$ is an isomorphism.
- The map $X \to Y$ is quasi-pro-étale(14.9.3.1).

Proof: 1 is by definition.

For 2, firstly $R \to X \times_Y X$ is injective as subsheaves of $X \times X$. Next, if $Z \to X \times_Y X$ is any map from a perfectoid space Z, then we have two maps $a, b : Z \to X$ that their composition with $X \to Y$ agree. This means after passing to a pro-étale covering $\widetilde{Z} \to Z$, the composition map $\widetilde{Z} \to Z \to X \times X$ factors through R. Now this map $\widetilde{Z} \to R$ descends to a map $Z \to R$, because pro-étale site is subcanonical and the two projection maps $\widetilde{Z} \times_Z \widetilde{Z} \to R$ coincides because they do after compositing with $R \hookrightarrow X \times X$.

3: Firstly $\widetilde{R}$ is representable as fiber products of representable objects(14.8.5.9), and the two projections are pro-étale, as they are compositions of base changes of pro-étale morphisms. Also the mop $\widetilde{Y}\to Y$ of pro-étale sheaves is surjective, as the composition $\widetilde{X}\to X\to Y$ is.

To show $\widetilde{Y}\to Y$ is injective, let Z be a perfectoid space with two maps $Z\to\widetilde{Y}$ that coincide after compositing with $\widetilde{Y}\to Y$, we need to show $a=b$. Now because pro-étale site is subcanonical, it suffices to show this after replacing Z with a pro-étale cover $\widetilde{Z}$, such that a,b factors over $\widetilde{a},\widetilde{b}:Z\to\widetilde{X}$. The associated map $Z\to\widetilde{X}\times\widetilde{X}\to X\times X$ factors through R by item2, so we get a map $Z\to R\times_{X\times X}(\widetilde{X}\times\widetilde{X})=\widetilde{R}$, which means $\widetilde{a},\widetilde{b}$ induces the same map $Z\to\widetilde{Y}$. So we are done.

4: By 3, we can replace X by $\widetilde{X}=\coprod_i U_i\to X$, where U_i is an affinoid cover of $\widetilde{X}$, and R by the the induced equivalence relation in $\widetilde{X}\times\widetilde{X}$, and to pro-étale is analytically local. In this way, we may assume $R\subset X\times X$ and $X\times X\to X$ are separated.

Let X' be a strictly totally disconnected perfectoid space and $X'\to X$ be a map. Because $X\to Y$ is surjective as sheaves on Perf, there is a pro-étale cover $\widetilde{X'}\to X'$ and a map $\widetilde{X'}\to X$ lying over $X'\to Y$. We can assume $\widetilde{X'}$ is affinoid. Let $W=X'\times_Y X\to X'$ be the fiber product, then

$$\widetilde{X'}\times_{X'}W=\widetilde{X'}\times_X(X\times_Y X)=\widetilde{X'}\times_X R$$

is representable and pro-étale over $\widetilde{X'}$, and also separated. So by(14.9.2.16), W is also representable, pro-étale and separated over X. □

Cor. (14.9.4.4) [Equivalent Characterization of Diamonds]. Let Y be a pro-étale sheaf on Perf, then Y is a diamond iff there is a surjective quasi-pro-étale morphism $X\to Y$ from a perfectoid space X. If X is a disjoint union of strictly totally disconnected spaces, then $R\subset X\times_Y X\subset X\times X$ is a representable pro-étale equivalence relation with $Y=X/R$.

Proof: If Y is a diamond, then $X\to Y$ is quasi-pro-étale by(14.9.4.3). Conversely, if there is a quasi-pro-étale morphism $X\to Y$, by(14.9.2.10), we can assume that X is a disjoint union of strictly disconnected spaces. In this case, by the definition of auasi-pro-étale, R is representable and the projections $R=X\times_Y X\to X$ is pro-étale, and $X/R\cong Y$: it suffices to show this map is injective: if $a,b:Z\to X$ are two maps that coincide after composing with $X\to Y$, then after replacing to a pro-étale covering $\widetilde{Z}\to Z$, we can lift to maps $(\widetilde{a},\widetilde{b}):\widetilde{Z}\to R$. And this map descend to a map $Z\to R$, because the pullback to $\widetilde{Z}\times_Z\widetilde{Z}\to R$ coincides as they do after composing with $R\hookrightarrow X\times X$. So $X/R\to Y$ is injective. □

Cor. (14.9.4.5).

- Let Y be a pro-étale sheaf on Perf and there is a quasi-pro-étale map $Y'\to Y$, where Y' is a diamond, then Y is also a diamond.
- Let $f:Y'\to Y$ be a quasi-pro-étale map of pro-étale sheaves on Perf and Y is a diamond, then Y' is also a diamond.

Proof: 1: By(14.9.4.4), we can choose a quasi-pro-étale map $X\to Y'$ where X is a perfectoid space, then $X\to Y'\to Y$ is also quasi-pro-étale, so Y is a diamond by(14.9.4.4) again.

2: Choose a surjective quasi-pro-étale map $X\to Y$ where X is a perfectoid space, then $X'\times_X Y$ is representable and $X'\to Y'$ is quasi-pro-étale and surjective, thus Y' is a diamond by(14.9.4.4). □

Lemma (14.9.4.6). The absolute product of two perfectoid spaces of char p is also a perfectoid space.

Proof: Cf.[Sch17]P71. □

Prop. (14.9.4.7) [Absolute Product of Diamonds]. Let $\mathcal{D}, \mathcal{D}'$ be diamonds, then the product sheaf $\mathcal{D} \times \mathcal{D}'$ is also a diamond.

Proof: Let $\mathcal{D} = X/R$ and $\mathcal{D}' = X'/R'$, then $R \times R', X \times X'$ are also representable by(14.9.4.6), $R \times R' \to (X \times X') \times (X \times X')$ is also an injection, and the projections are pro-étale. Thus $\mathcal{D} \times D' = (X \times X')/(R \times R')$ is a diamond, by(14.9.4.3). □

Prop. (14.9.4.8) [Fiber Products]. Fiber products exist in the category of diamonds.

Proof: Let $Y_1 \to Y_2 \leftarrow Y_3$ be a diagram of diamonds. Choose representations $Y_i = X_i/R_i$, and after replacing X_1, X_2 with a pro-étale covering using(14.9.4.3), we can assume there are maps $X_i \to X_3$ lying over $Y_i \to Y_3$. Moreover, we can replace X_i by $X_i \times_{Y_3} X_3$ to assume that $X_i \to Y_1 \times_{Y_3} X_3$ is surjective in the pro-étale topology.

In this case, the map $X_1 \times_{X_3} X_2 \to Y_1 \times_{Y_3} Y_2$ is surjective in the pro-étale topology, and the equivalence relation $R_4 = X_4 \times_{Y_4} X_4$ can be calculated to be $R_4 = R_1 \times_{R_3} R_2$, which is representable. It remains to see that $R_4 \to X_4$ is pro-étale. But $R_1 \times R_2 \to X_1 \times X_2$ is pro-étale, so does its base change $R_1 \times_{X_3} R_2 \to X_1 \times_{X_3} X_2 = X_4$, and also $R_4 = R_1 \times_{R_3} R_2 \to R_1 \times_{X_3} R_2$ is pro-étale because it is the base change of $R_3 \to R_3 \times_{X_3} R_3$, which is pro-étale by(14.9.2.5). □

Prop. (14.9.4.9). Let Y be a diamond, then Y is a sheaf for the v-topology.

Proof: Cf.[Sch17]P54. □

<u>$\mathrm{Spd}(\mathbb{Q}_p)$</u>

Prop. (14.9.4.10). Let $\mathrm{Spd}(\mathbb{Q}_p)$ be defined as

$$\mathrm{Spa}((\mathbb{Q}_p^{cycl})^\flat)/\mathbb{Z}_p^* = \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty})))/\mathbb{Z}_p^*,$$

where $\mathbb{Z}_p^*$ acts on $\mathbb{F}_p((t^{1/p^\infty}))$ via $\gamma(t) = (1+t)^\gamma - 1$(10.3.8.17). To be precise, it is the coequalizer of

$$\underline{\mathbb{Z}_p}^* \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \rightrightarrows \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty})))$$

where one map is projection and the other map is the group action. To show this is diamond, we first need to verify this is an injection thus an equivalence relation, which is by(14.9.4.11).

Lemma (14.9.4.11). Consider the map

$$g : \underline{\mathbb{Z}_p}^* \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \rightrightarrows \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty})))$$

where the first map is group action and the second map is projection, then this is an injection map.

Proof: For any perfectoid affinoid field (K, K^+), $\mathbb{Z}_p^*$ acts freely on the topological nilpotent elements of K, thus the map is an injection, by(14.9.1.7). □

Prop. (14.9.4.12) [Torsor over Affinoid Perfectoid Space]. Let G be a profinite group and $f : \mathcal{F}' \to \mathcal{F}$ be a $\underline{G}$-torsor, with G profinite, then for any affinoid $X = \mathrm{Spa}(B, B^+)$ and any morphism $X \to \mathcal{F}$, the pullback $\mathcal{F}' \times_{\mathcal{F}} X$ is representable by a perfectoid affinoid $X' = \mathrm{Spa}(A, A^+)$, where (A, A^+) is the completed filtered colimit of (A_H, A_H^+), where for each open normal subgroup H of G, A_H/B is a finite étale G/H-torsor.

Proof: If H is an open normal subgroup of G, then $\mathcal{F}'/\underline{H} \to \mathcal{F}$ is a G/H-torsor, and $\mathcal{F}' = \varprojlim_H \mathcal{F}'/\underline{H}$, thus we reduce to the case G is finite. But for this case, we use the fact {perfectoid spaces finite étale over X} is a stack(14.9.2.16), and the definition of G-torsor. □

Prop. (14.9.4.13) [Description of $\mathrm{Spd}(\mathbb{Q}_p)$**].** If $X = \mathrm{Spa}(R, R^+)$ is an affinoid perfectoid space of characteristic p, then $(\mathrm{Spd}\,\mathbb{Q}_p)(X)$ is the set of isomorphism classes of data of the following shape.

- A $\mathbb{Z}_p^*$-torsor $R \to \widetilde{R}$, i.e. $\widetilde{R} = (\varinjlim_i R_i)^\wedge$, where R_n/R is finite étale with Galois group $(\mathbb{Z}/p^n\mathbb{Z})^*$.
- A topological nilpotent unit $t \in \widetilde{R}$ s.t. for all $\gamma \in \mathbb{Z}_p^*$, $\gamma(t) = (1+t)^\gamma - 1$.

Proof: Notice $\mathrm{Spa}(\mathbb{Q}_p^{cycl})^\flat \to \mathrm{Spd}(\mathbb{Q}_p)$ is a $\mathbb{Z}_p^*$-torsor by definition, so for any morphism $X \to \mathrm{Spd}(\mathbb{Q}_p)$, the pullback $\mathrm{Spa}(\mathbb{Q}_p^{cycl})^\flat \times_{\mathrm{Spd}(\mathbb{Q}_p)} X \to X$ is also a $\mathbb{Z}_p^*$-torsor, so it is isomorphic to a torsor $\mathrm{Spa}(\widetilde{R}, \widetilde{R}^+) \to \mathrm{Spa}(R, R^+)$ by(14.9.4.12), and the map $\mathrm{Spa}(\mathbb{Q}_p^{cycl})^\flat \times_{\mathrm{Spd}(\mathbb{Q}_p)} X \to X \to \mathrm{Spa}(\mathbb{Q}_p^{cycl})^\flat$ is an $\mathbb{Z}_p^*$-equivariant map, which is equivalent to a topologically nilpotent element $t \in \widetilde{R}$ that is equivariant, i.e. $\gamma(t) = (1+t)^\gamma - 1$.

Conversely, for any such a $\mathbb{Z}_p^*$-torsor $R \to \widetilde{R}$, an equivariant element $t \in \widetilde{R}$ descends to a map $X \to \mathrm{Spd}(\mathbb{Q}_p)$. □

Prop. (14.9.4.14). The category of perfectoid spaces over $\mathbb{Q}_p$ is equivalent to the category of perfectoid spaces X of characteristic p equipped with a structure morphism $X \to \mathrm{Spd}(\mathbb{Q}_p)$.

Proof: Consider the category of triples $(X^\sharp, X, \iota)$, where $X^\sharp$ is a perfectoid space over $\mathbb{Q}_p$, X is a perfectoid space of characteristic p, $\iota : X^{\sharp\flat} \cong X$ is an isomorphism. A map of triples is a tuple $(f^\sharp, f) : (X^\sharp, X, \iota) \to (Y^\sharp, Y, \iota')$ that $\iota' \circ f^{\sharp\flat} = f \circ \iota$.

This category is equivalent to the category of perfectoid spaces over $\mathbb{Q}_p$ by the forgetful functor, where the quasi-inverse is given by $X^\sharp \mapsto (X^\sharp, X^{\sharp\flat}, \mathrm{id}_{X^{\sharp\flat}})$. And this category is also fibered in equivalent relations over Perf. So it is equivalent to a presheaf $\mathrm{Untilt}_{\mathbb{Q}_p}$ which maps X to the isomorphism classes of untilts $(X^\sharp, \iota)$ over $\mathbb{Q}_p$, where $\iota : X^{\sharp\flat} \cong X$ is an isomorphism, by(3.1.8.31).

Similarly we can show define a functor Untilt which maps X to the isomorphism classes of untilts $(X^\sharp, \iota)$(of whatever characteristic), where $\iota : X^{\sharp\flat} \cong X$ is an isomorphism.

Let $X = \mathrm{Spa}(R, R^+)$ be an affinoid perfectoid space of characteristic p. If $X^\sharp = \mathrm{Spa}(R^\sharp, R^{\sharp+})$ is an untilt. Let $\widetilde{X}^\sharp = X^\sharp \widehat{\otimes}_{\mathbb{Q}_p} \mathbb{Q}_p^{cycl}$, then $\widetilde{X}^\sharp \to X^\sharp$ is a pro-étale $\underline{\mathbb{Z}_p^*}$-torsor, whose tilt $\widetilde{X} \to X$ is a pro-étale $\underline{\mathbb{Z}_p^*}$-torsor equipped with a $\underline{\mathbb{Z}_p^*}$-equivariant map $\widetilde{X} \to \mathrm{Spa}(\mathbb{Q}_p^{cycl})^\flat$ this is a morphism $X \to \mathrm{Spd}(\mathbb{Q}_p)$ by(14.9.4.13).

Conversely, let $\widetilde{X} \to X$ be a pro-étale $\underline{\mathbb{Z}_p^*}$-torsor and $\widetilde{X} \to \mathrm{Spa}(\mathbb{Q}_p^{cycl})^\flat$ a $\underline{\mathbb{Z}_p^*}$-equivariant map, then by tilting equivalence there exists a morphism $\widetilde{X}^\sharp \to \mathrm{Spa}(\mathbb{Q}_p^{cycl})$ which is also $\underline{\mathbb{Z}_p^*}$-equivariant. The equivariance means that it is a descent datum along $\widetilde{X} \to X$, so it descends to an untilt $X^\sharp$ of X over $\mathbb{Q}_p$.

Finally, for general affinoid perfectoid space X, as $\mathrm{Untilt}_{\mathbb{Q}_p}$ and $\mathrm{Spd}(\mathbb{Q}_p)$ are all sheaves on Perf, the above construction can be glued to give an isomorphism between them. □

Prop. (14.9.4.15)[Untilts is a Sheaf]. Untilt is a v-sheaf on the site Perf. So does $\mathrm{Untilt}_{\mathbb{Q}_p}$, because the invertibility of p can be verified locally as $\mathcal{O}$ is sheaf.

Proof: Firstly Untilt is clearly an analytic sheaf, so it suffices to show that if $X = \mathrm{Spa}(R, R^+)$ is a perfectoid space of characteristic p with a v-cover $Y = \mathrm{Spa}(S, S^+) \to X$ and $Y^\sharp = \mathrm{Spa}(S^\sharp, S^{\sharp+})$ is an untilt of Y that the corresponding two untilts of $Z = Y \times_X Y$ agree, then there is a unique untilt $X^\sharp = \mathrm{Spa}(R^\sharp, R^{\sharp+})$ whose pullback to Y is $Y^\sharp$.

Cf.[Sch17]P86. □

15 Representation Theory

15.1 Classical Representation Theory

In this section the representation theory over field $\mathbb{C}$ are studied(at least over a topological field of characteristic0). Modular representations are studied in Modular Representations.

For classical representations, the theory of semisimple algebras should be kept in mind.

1 Topological Representations

Def. (15.1.1.1) [Representations]. Let G be a topological group, R be a topological ring with a G-action, then an R-**representation** of G is a topological R-module V with an R-covariant action of G on M s.t. $G \times M \to M$ is continuous. The category of such representations is denoted by $\mathrm{Rep}_R(G)$.

An **irreducible representation** is a representation that has no non-trivial invariant closed subspaces. An **indecomposable representation** is a representation that is not a direct sum of two subrepresentations.

Def. (15.1.1.2) [Free Representations]. Situation as in(15.1.1.1), $V \in \mathrm{Rep}_R(G)$ is called a **free** R**-representation** if V is free over B. And it is trivial iff $V \cong B^n \in \mathrm{Rep}_B(G)$.

Def. (15.1.1.3) [Constructing Representations]. Dual representations, tensor product, and symmetric and exterior tensors.

Def. (15.1.1.4)[Projective Representations]. A **projective representation** of a topological group G on a TVS V is a continuous map $G \times P(V) \to P(V)$, where the topology on $P(V)$ is induced from $V\backslash\{0\} \subset V$.

Prop. (15.1.1.5)[F.D. Schur's Lemma]. Let $(\pi_1, V_1), (\pi_2, V_2)$ be an irreducible f.d. $\mathbb{C}$-representation of a topological group G, then $C(\pi_1, \pi_2) = \mathbb{C}$ if $\pi_1 \cong \pi_2$, and 0 otherwise.

Proof: This is because π_i are irreducible as representations with discrete topology of G: Any subspace of V_i is closed. So we reduce to(15.1.1.10). □

Def. (15.1.1.6) [Types of Representations]. Let V be an irreducible f.d. $\mathbb{C}$-representation of a topological group G, then there are three possibilities:

- $V \ncong V^*$, called a **representation of complex type**.
- There is an invariant symmetric form on V inducing an isomorphism $V \cong V^*$, called a **representation of real type**.
- There is an invariant alternating form on V inducing an isomorphism $V \cong V^*$, called a **representation of quaternion type**.

The category of representation of $\mathbb{K}$-type is denoted by $\mathrm{Rep}(G)_{\mathbb{K}}$.

Proof: By Schur's lemma(15.1.1.5), either $V \not\cong V^*$ or there is a unique isomorphism $V \cong V^*$ up to scalar, which is equivalent to an invariant form B on V. The two coordinate of this invariant form induces two isomorphisms $V \cong V^*$, which must be proportional, so $B(x,x) = cB(x,x)$, so $c = 0$ or $B(x,x) = 0$ for all x, which means B is symmetric or alternating. □

Def. (15.1.1.7)[Unitary Representations]. Usually we consider unitary representations on a Hilbert space. A **unitary representation** of a topological group G on a Hilbert space $\mathcal{H}$ is defined to be a homomorphism from G to the group $U(\mathcal{H})$ of unitary operators of $\mathcal{H}$ continuous in the strong operator topology(10.8.4.7). Notice by(10.8.4.8), this is equivalent to the unitary and continuous in the weak operator topology.

The category of unitary representations of G is denoted by $\mathrm{Rep\,uni}(G)$.

Def. (15.1.1.8) [Projective Unitary Representation]. A **projective unitary representation** of a topological group G on a Hilbert space $\mathcal{H}$ is defined to be a continuous homomorphism from G to the group $PU(\mathcal{H})$ of unitary operatoes of $\mathcal{H}$, where the topology of $PU(\mathcal{H})$ is induced from the strong operator topology of $U(\mathcal{H})$(10.8.4.7). Notice by(10.8.4.8), this is equivalent to the unitary and continuous in the weak operator topology.

Def. (15.1.1.9) [Character]. Let $\rho : G \to GL(n, V)$ be a linear representation of f.d of a group G. Then the **character** of χ_ρ is defined to be $\chi_\rho(g) = \mathrm{tr}(\rho(g))$.

Prop. (15.1.1.10) [Schur's lemma]. If (π, V) is an at most countable dimensional irreducible $\mathbb{C}$-representation of a topological $\mathbb{C}$-algebra, then $\mathrm{End}_A(V) \cong \mathbb{C}$. In particular this holds for $\dim A$ countable.

Proof: First the dimension of $\dim_{\mathbb{C}} \mathrm{End}(V)$ is at most countable, because V is acyclic by irreducibly, so $\dim_{\mathbb{C}} \mathrm{End}(V) \leq \dim_{\mathbb{C}} V$. And $\mathrm{End}(V)$ is a skew field, by irreducibility. So the result follows from(2.2.1.10). □

Cor. (15.1.1.11). Any irreducible representation of a commutative group has dimension 1.

Cor. (15.1.1.12)[Index 2 Subgroup]. Let G be a topological group and H an open (normal)subgroup of index 2, $G = H \rtimes \{\sigma\}$. Let (π, V) be an irreducible representation of H of at most countable dimensional, then

- $\mathrm{res}_H^G \mathrm{ind}_H^G \pi \cong \pi \oplus \pi^\sigma$.
- $\pi \cong \pi^\sigma$ iff π is the restriction of an irreducible representation of G, called **type I**. And there are exactly two such extensions to G.
- $\pi \not\cong \pi^\sigma$ iff $\mathrm{ind}_H^G \pi$ is an irreducible representation of G, called **type II**.

All these are true for unitarizable representations.

Proof: 1: This is clear.

2: If π is a restriction of an irreducible smooth representation of G, then σ intertwines π and π^σ. Conversely, if $\pi \cong \pi^\sigma$, then there is an operator A on V that intertwines π and π^σ, and then $A^2 = \mathrm{id}$ by Schur's lemma(15.1.1.10). Let σ acts by A, then this representation extends to G.

3: If π extends to G, then clearly π appear in $\mathrm{ind}_H^G \pi$ but not surjective, so $\mathrm{ind}_H^G \pi$ is not irreducible. Conversely, if $\mathrm{ind}_H^G \pi$ is not irreducible, notice $\mathrm{res}_H^G \mathrm{ind}_H^G \pi \cong \pi \oplus \pi^\sigma$, thus $\pi \cong \pi^\sigma$, otherwise any G-invariant subspace can only be π or π^σ, so π or π^σ extends to representations of G, contradicting 2. □

Prop. (15.1.1.13). For any topological G a topological ring B with a G-action, $d \in \mathbb{N}$, there is a bijection between the set of equivalence classes of trivial B-representations V of G of rank d and the category of $H^1(G, \mathrm{GL}(d, B))$. Moreover, V is trivial iff it is mapped to the distinguished point of $H^1(G, \mathrm{GL}(d, B))$.

Proof: This follows by taking the matrix of $g \in G$ w.r.t. a B-basis of V. □

Cor. (15.1.1.14). Let L/K be a Galois extension of fields, then any f.d. L-representation of $\mathrm{Gal}(L/K)$ is trivial.

Proof: This follows from Hilbert's theorem90(10.1.3.16). □

Admissible Representations

Def. (15.1.1.15) [Admissible Representations]. Let $G \in \mathcal{G}\mathrm{rp}^{\mathrm{top}}$ and E a topological field that G acts trivially and B a topological E-algebra s.t. $B \in \mathrm{Rep}_E(G)$. Then $V \in \mathrm{Rep}_E^{\mathrm{fd}}(G)$ is called a B**-admissible** representation if $B \otimes_E V \in \mathrm{Rep}_B(G)$ is trivial.

The category $\mathrm{Rep}_E^{B\text{-adm}}(G)$ is the full subcategory of $\mathrm{Rep}_E(G)$ consisting of f.d. B-admissible E-representations of G.

Prop. (15.1.1.16) [Inclusions and Admissibility]. Let $G \in \mathcal{G}\mathrm{rp}^{\mathrm{top}}$ and E a topological field that G acts trivially and B_1, B_2, B a topological E-algebra s.t. $B_1, B_2, B \in \mathrm{Rep}_E(G)$, and $B_1 \subset B, B_2 \subset B$, $B_1 \cap B_2 = B_0$, and $B^G \subset B_0$, then

$$\mathrm{Rep}_E^{B_1\text{-adm}}(G) \cap \mathrm{Rep}_E^{B_2\text{-adm}}(G) = \mathrm{Rep}_E^{B_0\text{-adm}}(G).$$

Proof: The RHS is contained in LHS trivially. For the converse inclusion, if $V \in \mathrm{Rep}_E^{B_1\text{-adm}}(G) \cap \mathrm{Rep}_E^{B_2\text{-adm}}(G)$, there exists elements $\{u_i\} \subset (B_1 \otimes_E V)^G$ and $\{v_i\} \subset (B_2 \otimes_E V)^G$ s.t.

$$B \otimes_E V = Bu_1 \oplus \dots Bu_n = Bv_1 \oplus \dots Bv_n.$$

Then the transformation matrix from $\{u_i\}$ to $\{v_i\}$ is an element in $GL(n; B)$ that is invariant under G, so contained in $GL(n; B^G)$. Thus it is clear that

$$\{v_i\} \subset (B_2 \otimes_E V)^G \cap (B_1 \otimes_E V)^G = (B_0 \otimes_E V)^G,$$

and then $B_0 \otimes_E V = B_0 v_1 \oplus \dots B_0 v_n$, and V is B_0-admissible. □

Gal_K-Regularity

Def. (15.1.1.17) [G-Regularity]. Situation as in(15.1.1.15), we want to establish a numerical criterion for recognizing B-admissible representations. B is called G**-regular** if it satisfies the following three conditions:

H1 : B is a domain.

H2 :$(\mathrm{Frac}(B))^G = B^G$, in particular, B^G is a field.

H3 : if $b \neq 0 \in B$ and Eb is stable under G-action, then $b \in B^*$.

Notice a field is clearly G-regular.

Cor. (15.1.1.18). Notice that (H3) implies $B^G \in \mathtt{Field}$, because for $b \in B^{\mathrm{Gal}_K}$, Eb is clearly stable under G-action, thus b is invertible.

Also the morphism
$$\alpha_B(W) : B \otimes_{B^G} W^G \to W$$
is injective for all finite free $W \in \mathrm{Rep}_B(G)$. In particular, this is true for $W = B \otimes_E V, V \in \mathrm{Rep}_E^{\mathrm{fd}}(G)$, and we get a functor
$$D_B : \mathcal{V}\mathrm{ect}_E \to \mathcal{V}\mathrm{ect}_{B^G}$$
such that
$$\dim_{B^G} D_B(V) \le \dim_E V.$$

Proof: To show α_W is injective, it suffices to show a linear basis $\{e_i\}$ of W^G over B^G is linearly independent over B: Suppose $\sum a_i e_i = 0$, where $a_i \in B$, with the number of nonzero coefficients minimal, and $a_1 \neq 0$, then dividing $a_1 \in \mathrm{Frac}(B)$, we assume $a_1 = 1$, and then acting by $g - \mathrm{id}$, we get
$$\sum (g(a_i) - a_i) e_i = 0$$
and this has smaller non-zero elements, unless a_i is fixed by g for any $g \in G$, so $a_i \in \mathrm{Frac}(B)^G = B^G$ by (H2), contradiction. □

Prop. (15.1.1.19)[B-Admissible Representations]. If B is G-regular(15.1.1.17), $V \in \mathrm{Rep}_E^{\mathrm{fd}}(G)$ and $W = B \otimes_E V$, then the following are equivalent:

- W is trivial, i.e. V is B-admissible.
- $\alpha_B(W)$(15.1.1.18) is an isomorphism.
- $\dim_{B^G} D_B(V) = \dim_E V$.

Proof: 1, 2 are equivalent by(15.1.1.18), as B^{Gal_K} is a field. Also $2 \to 3$ is clear.

$3 \to 2$: $\alpha_W : B \otimes_{B^G} W^G \to B \otimes_E V$ is a B-linear morphism of two finite free B-modules, then it suffices to show the determinant map is an isomorphism. Let $v_1, \ldots, v_d$ be a E-basis of V and $w_1, \ldots, w_d$ a B^G-basis of W^G. Let b be the unique element of B that
$$\alpha_W(v_1) \wedge \ldots \wedge \alpha_W(v_d) = b w_1 \wedge \ldots \wedge w_d$$
then $gb = \eta b$ for $g \in G$ where η is determined by the identity $\alpha_W(gv_1) \wedge \ldots \wedge \alpha_W(gv_d) = \eta \alpha_W(v_1) \wedge \ldots \wedge \alpha_W(v_d)$. Now the E-space of $v_1, \ldots, v_d$ is V, which is stable under G action, thus $\eta \in E$, and then by (H3) $b \in B^*$, so we are done. □

Cor. (15.1.1.20) [$\mathrm{Rep}_E^{B-\mathrm{adm}}(G)$]. If B is Gal_K-regular, then

- $\mathrm{Rep}_E^{B-\mathrm{adm}}(G) \subset \mathrm{Rep}_E(G)$ is stable under subobjects and quotients.
- $D_B : \mathrm{Rep}_E^B(G) \to \mathcal{V}\mathrm{ect}_{B^G}$ is exact and faithful.
- $\mathrm{Rep}_E^{B-\mathrm{adm}}(G) \subset \mathrm{Rep}_E(G)$ is stable under taking dual and tensor products. And if $V, V_1, V_2 \in \mathrm{Rep}_E^{B-\mathrm{adm}}(G)$, then there is a natural isomorphism
$$D_B(V_1) \otimes D_B(V_2) \cong D_B(V_1 \otimes V_2)$$
and
$$D_B(V) \otimes D_B(V^\vee) \cong D_B(V \otimes V^\vee) \to D_B(E) = B^G$$
is a perfect pairing between $D_B(V)$ and $D_B(V^\vee)$.

Proof: 1: Given an exact sequence $0 \to V_1 \to V \to V_2 \to 0 \in \mathrm{Rep}_E(G)$, tensoring B and taking G-fixed points, we get an exact sequence

$$0 \to D_B(V_1) \to D_B(V) \to D_B(V_2)$$

from which we derive the inequality $\dim_{B^G} D_B(V) \le \dim_{B^G} D_B(V_1) + \dim_{B^G} D_B(V_2)$. Now we have $\dim_{B^G} D_B(V_i) \le \dim_E V_i$ by(15.1.1.18), so

$$\dim_{B^G} D_B(V) \le \dim_{B^G} D_B(V_1) + \dim_{B^G} D_B(V_2) \le \dim_E V_1 + \dim_E V_2 = \dim_E V.$$

But this is an equality because V is B-admissible, thus V_1, V_2 are all B-admissible, and the exact sequence is in fact an isomorphism by dimension reason.

2: D_B is faithful because $B \otimes_{B^G} D_B(V) \cong B \otimes_E V$.

3: There is a natural map

$$D_B(V_1) \otimes_{B^G} D_B(V_2) = (B \otimes_E V_1)^G \otimes (B \otimes_E V_2)^G \to (B \otimes_E (V_1 \otimes_E V_2))^G = D_B(V_1 \otimes_E V_2),$$

and $\dim_{B^G} D_B(V_1 \otimes_E V_2) \le \dim_E(V_1) \cdot \dim_E(V_2)$, so it suffices to show that this map is injective. For this, notice that $D_B(V_1 \otimes_E V_2) \subset B \otimes_E (V_1 \otimes_E V_2)$, and after tensoring B,

$$D_B(V_1) \otimes_{B^G} D_B(V_2) \subset B \otimes_{B^G} (D_B(V_1) \otimes_{B^G} D_B(V_2)) \cong (B \otimes_E V_1) \otimes_B (B \otimes_E V_2) \to B \otimes_E (V_1 \otimes_E V_2)$$

is an isomorphism.

To show for the dual preserves B-admissibility, notice that $\mathrm{Rep}_E^{B-\mathrm{adm}}(G)$ is also stable under exterior products, as exterior products are quotient of tensor products. Notice there is an isomorphism

$$\wedge(V^\vee) \otimes \wedge^{\dim V - 1} V \cong V^\vee,$$

so it suffices to show for $\dim V = 1$. Let v_0 be an E-basis of V, $g(v_0) = \eta(g) v_0$, then $D_B(V) = B^G(b \otimes v_0)$ for some $b \neq 0 \in B$. Thus $b/g(b) = \eta(g)$. And it is easy to show that $D_B(V^\vee) = B^G(b^{-1} \otimes v_0)$, and the natural pairing is perfect. In general, the pairing is also perfect because perfectness of a pairing can be checked after passing to the determinant space. □

Unitary Representations of Locally Compact Groups

For unitary representations of locally compact groups, see10.11.

2 Smooth Representations

Prop. (15.1.2.1)[Smooth Representations]. A **smooth representation** of a locally compact group G on a complex vector space is a continuous representation w.r.t the discrete topology.

The category $\mathrm{Rep}^{\mathrm{alg}}(G)$ of smooth representations is a full Abelian subcategory of the category of continuous representations, and there is a right adjoint to the forgetful functor:

$$\mathrm{Rep}(G) \to \mathrm{Rep}^{\mathrm{alg}}(G) : V \mapsto V^\infty = \bigcup_{K \subset G \text{ compact open}} V^K$$

So it preserves injectives and $\mathcal{M}(G)$ has enough injectives.

Def. (15.1.2.2) [Equivariant Sheaves]. Let G be a locally compact group acting on a space X, let $p : G \otimes X \to X$ be the projection and $a : G \times X \to X$ be the action, then a **equivariant sheaf** on X is a pair $(\mathcal{F}, \rho)$, where $\mathcal{F}$ is a locally constant complex sheaf on X and ρ is an isomorphism of sheaves $p^*(\mathcal{F}) \cong a^*(\mathcal{F})$ that:

- ρ is identity on $e \otimes X$.
- $p_{23}^*\rho \circ (\mathrm{id}_G \times a)^*\rho = (m \times \mathrm{id}_X)^*\rho$ on $G \times G \times X$.

Prop. (15.1.2.3). If X is a pt with the trivial G-action, then a equivariant sheaf on X is equivalent to a representation of G.

Proof: For any equivariant sheaf on X, the pullback are just locally constant functions of G with value in V. Then ρ on each stalk g defines an action of g on V. Compatibility with the G-action shows that this is a group action. And consider the stalk at e, because ρ is id at e, for each v, there is an open nbhd U that $\rho(u)v = v$ on for $u \in U$, thus it is smooth. The converse is obvious. □

Def. (15.1.2.4) [Coinvariants]. The **Jacquet functor** $J_G : \mathrm{Rep}(G) \to \mathcal{V}\mathrm{ect}_{\mathbb{C}}$ is the functor mapping a representation V of G to $V/V(G)$, where $V(G)$ is spanned by $\pi(g)v - v$. It is equivalent to the functor $V \mapsto V \otimes_G \mathbb{C}$.

Let ψ be a character of G, then we can more generally define $J_{G,\psi} : \mathrm{Rep}(G) \to \mathcal{V}\mathrm{ect}_{\mathbb{C}}$ is the functor mapping a representation V of G to $V/V_{G,\psi}$, where $V_{G,\psi}$ is spanned by $\pi(g)v - \psi v$. It is equivalent to the functor $V \mapsto V \otimes_G \mathbb{C}_\psi$, or equivalently $J_{G,\psi} = J_G \circ (\psi^{-1}\otimes)$.

Prop. (15.1.2.5). If G is compact, then $e_G V = V^G = V/V(G)$.

And if G is a union of increasing family of compact groups, then J_G is exact, so is $J_{G,\psi}$.

Proof: J_G is clearly right exact. And if G is compact, $e_G V = V^G = V/V(G)$: if $\pi(G)v = v$, then $v = e_G v$, and if $e_G v = 0$, then because v is smooth, $\sum_{h_i \in G/K} h_i v = 0$, thus $v = \frac{1}{[G:K]}(v - h_i v)$ is in $V(G)$.

If G is a union of compact groups K_i, then $V/V(G) = \mathrm{colim}\, V/V(K_i)$ is exact. □

Prop. (15.1.2.6). If G is a union of increasing family of compact open subgroups $\{K_\alpha\}$, then $v \in V(G,\psi)$(ψ can be trivial) iff for some K_α, $\int_{K_\alpha} \psi^{-1}(h)\pi(h)v dh = 0$.

Proof: We can assume ψ is trivial. If $v = \pi(h)w - w$ and $h \in K_\alpha$, then $\int_{K_\alpha} \psi^{-1}(h)\pi(h)v dh = 0$. Conversely, by the proof of(15.1.2.5), $V(G) = \cup V(K_\alpha) = \cup \ker(e_{K_\alpha})$, which is equivalent to $\int_{K_\alpha} \pi(h)v dh = 0$. □

Def. (15.1.2.7) [Contragradient Representation]. For a smooth representation V of G, the **contragradient smooth representation** $V^\wedge = (V^*)^\infty$ is the smooth part of V^*.

Prop. (15.1.2.8). Let E be a smooth or f.d. representation of a topological group G, then

- E has an irreducible subquotient.
- If E is f.g., then it has an irreducible quotient.

Proof: 2: Use Zorn's lemma for the set of proper G-subspaces of U, the union of a chain of proper G-subspaces is proper, because it is f.g.. So it has a maximal proper G-space, thus the quotient is irreducible.

1 follows from 2 by choosing a f.g. submodule. □

Prop. (15.1.2.9) [Induced Representation]. The induced and compactly induced representations have the following equivalent forms:

$$\mathrm{Ind}_H^G(V) = \mathrm{Hom}_{\mathbb{Z}[H]}(\mathbb{Z}[G], V), \quad \mathrm{ind}_H^G(V) = \mathbb{Z}[G] \otimes_{\mathbb{Z}[H]} V.$$

I.e., if H acts on V by ρ, then $\mathrm{ind}_H^G(\rho)$ is the space $\oplus_{\gamma \in G/H} V_\gamma$ where $V_\gamma \cong V \in \mathcal{M}\mathrm{od}_H$, and that for $v_\gamma \in V_\gamma$, $(\mathrm{Ind}(\rho)g)v_\gamma = \rho(h)v_{\gamma'} \in V_{\gamma'}$ where $g\gamma = \gamma' h$ that $\gamma' \in G/H, h \in H$.

Proof: Choose a set of left coset representatives Γ of G/H, then Γ^{-1} is a set of right coset representatives for $H\backslash G$. Now $\mathbb{Z}[G]=\oplus_{\gamma\in\Gamma}\mathbb{Z}[H]\gamma^{-1}$, and we define the space $V_\gamma\cong V$ of maps from $\mathbb{Z}[G]$ to V determined by: $v_\gamma(g)=\rho(g\gamma)v\in V$ if $g\in H\gamma^{-1}$ and 0 otherwise.

Then $\mathrm{Ind}(\rho)(V)=\oplus_{\gamma\in\Gamma}V_\gamma$ that for $v_\gamma\in V_\gamma$, $(\mathrm{Ind}(\rho)g)v_\gamma$ is the map $\mathbb{Z}[G]$ to V determined by: $((\mathrm{Ind}(\rho)g)v_\gamma)(g')=\rho(g'\gamma'h)v\in V$ if $g'\in H(\gamma')^{-1}$, and 0 otherwise, where $g\gamma=\gamma'h$. Then $(\mathrm{Ind}(\rho)g)v_\gamma=\rho(h)v_{\gamma'}$, which is the same as the formula for $\mathrm{Ind}(\rho)$ as in(15.1.2.9). So the map $v_\gamma\to v_\gamma:\mathrm{Ind}(\rho)\to\mathrm{Ind}(\rho)$ is an isomorphism in $\mathbb{Z}[G]-\mathcal{M}\mathrm{od}$. □

Prop. (15.1.2.10) [Clifford's Theorem]. If $\rho:G\to GL(V)$ is a semisimple smooth or f.d. representation and H is a normal subgroup of G, then $\rho|_H$ is also semisimple.

In particular, a normal Abelian subgroup acts by scalars on any irreducible $\mathbb{C}$-representation of G, by(15.1.1.11).

Proof: Use definition(2.4.1.4), we reduce to the case ρ is simple. Now an H-subrepresentation is simple iff it has no proper H-subrepresentations, so clearly G maps a simple H-subrepresentation to another simple H-subrepresentation. So if W is the sum of all simple H-subrepresentations, then G preserves W, which shows $W=V$, and V is H-semisimple by(2.4.1.4). □

Prop. (15.1.2.11) [Restriction]. If G is a group and H is an open normal subgroup of G of finite index n. Let (π,V) be a smooth representation of G of f.d. over a field of characteristic $p\nmid n$, then

- If $\pi|_H$ is completely reducible, then π is also completely reducible.
- If (π,V) is irreducible, then $\pi|_H=\pi_1\oplus\ldots\oplus\pi_k$ where π are irreducible representations of H and $k\leq[G:H]$.
- If (π,V) is irreducible, the isotopy parts of H are all of the same dimension, and if there are more than 1 isotropy classes, then G is an induced representation.

Moreover, item2, 3 are also true for H open normal in G s.t. $HZ(G)$ is of finite index n.

Proof: Let $g_1,\ldots,g_n$ be a coset representation of G/H.

1: If V_1 is a G-submodule of V, then V_1 has a complementary H-submodule $V_1^\perp$. Let P_0 be the projection of V onto V_1 along $V_1^\perp$, then $P=\frac{1}{p}\sum\pi(g_i)P_0\pi(g_i)^{-1}$ is a projection of V onto V_1 that commutes with G-action. Therefore the kernel of P is a G-submodule of V that is complementary to V_1.

2: Let $v\in V$, then $\{\pi(g_i)v\}$ generates V as a H-representation, thus by(15.1.2.8) there is an H-submodule $V'\subset V$ that V/V' is irreducible. Let $V_i=\pi(g_i)V'$, then V/V_i are also irreducible representations of H. Consider the H-invariant map $V\mapsto\oplus V/V_i$, its kernel is G-invariant, thus trivial, thus V is a submodule of $\oplus V/V_i$, and the assertion follows.

3: The G-action permutes with isotopy classes. And if there are more than 1 classes, choose the stabilizer G_ρ of one V^ρ, then $V=\mathrm{Ind}_{G_\rho}^G V^\rho$ by(15.1.2.9). □

Prop. (15.1.2.12) [Kolchin]. Let G be a discrete group acting on a f.d. vector space V s.t. each $g\in G$ acts via a unipotent endomorphism, then there is a basis s.t. G is mapped into $U(n,T)$.

Proof: Cf.[Mil17]P279. □

3 Linear Representation of Finite Groups

Basic references are [Ser77], [A-B95]. [群表示论 notes 薛航].

Remark (15.1.3.1). The representations in this subsection is assumed to be of f.d. over a field of char0, in particular, over a subfield of $\mathbb{C}$. In particular, there is no need to consider topologies.

Because a finite group is compact, all results of compact groups apply to a finite group, see4.

Because a finite group is locally profinite, all results of locally profinite groups apply to finite groups2.

Prop. (15.1.3.2) [Orthogonality of Characters]. The characters χ_i of irreducible representations of G form a basis of $ZL^2(G)$ by(10.11.4.30). Also, for $s \in G$, let $c(s)$ be the number of elements in the conjugacy class of s, then:

- $\int_i |\chi_i(s)|^2 = g/c(s)$.
- If t is not conjugate to s, then $\sum_i \chi_i(s)^* \chi_i(t) = 0$.

Proof: The last assertion follows from the first one, if you consider a matrix with conjugacy classes as column and characters as rows, and place $\sqrt{c(s)/g}\chi_i(s)$ in the entries, then it is an orthogonal matrix. □

Cor. (15.1.3.3) [Representations Determined by Characters]. A representation of G over $\mathbb{C}$ is determined by its character, by(2.4.1.13).

Cor. (15.1.3.4) [Number of Representations]. If G is a finite group, then the cardinality of $\widehat{G}$ is equal to the number of conjugates of G, and $\sum_{\pi\in\widehat{G}} d_\pi^2 = |G|$.

Proof: Both $\{\chi_\pi\}$ and the characteristic functions of the conjugate classes of G are basis for $L^2(G)$. And the second assertion follows from the Peter-Weyl theorem(10.11.4.15) as $\sum_{\pi\in\widehat{G}} d_\pi^2$ is the dimension of $L^2(G)$. □

Cor. (15.1.3.5). G is Abelian iff every irreducible representation of G is of dimension 1.

Proof: This follows immediately from the equation $\sum_{\pi\in\widehat{G}} d_\pi^2 = |G|$(15.1.3.4), as G is Abelian iff it has $|G|$ conjugacy classes iff $|\widehat{G}| = |G|$ iff $d_\pi = 1$ for any π. □

Prop. (15.1.3.6). If G is a finite p-group and A is a nonzero p-torsion G-module, then $A^G \neq 0$.

Proof: We may consider A generated by a single element. Because A is p-torsion, $|A| = p^n$ for some n. Now consider the orbit, then if the orbit is not a single element, then its order is divisible by p, so $|A^G|$ is divisible by p. But 0 is fixed, so $A^G \neq 0$. □

<u>**Group Algebra $\mathbb{C}[G]$**</u>

Prop. (15.1.3.7) [Maschke's Theorem]. If F is a field of char p and G is a finite group of order prime to p, then for any representation U of $F[G]$ and a submodule V, there exists a complement of V in U.

Proof: Choose an arbitrary projection π of U to V, and let $\rho(v) = 1/|G|\sum g^{-1}\pi(g(v))$, then it can be checked ρ commutes with G-actions, thus its kernel is also a G-modules, and it is identity on V, so $U = V \oplus k\ker\rho$. □

Cor. (15.1.3.8) [Totally Decomposable]. Any such representation of G is a direct sum of irreducible representations.

Prop. (15.1.3.9) [Brauer-Nesbitt]. For a finite group G, if two finite dimensional semisimple representations over a field has the same char poly for every element g of G, then they are isomorphic.

Proof: Just use the irreducible representations are orthogonal and that they have the same and for char p, we can use divide by p and the char poly becomes p-th power and we can do this forever, contradiction. □

Prop. (15.1.3.10). Integral properties of characters.

Prop. (15.1.3.11) [Dimensions Divisor Order]. The dimension of the irreducible representations of G divides the order of G.

Proof: □

Cor. (15.1.3.12). The dimension of the irreducible representations of a p-group G is a p-power.

Prop. (15.1.3.13) [Burnside's Theorem]. Any group of order n that n has only two prime divisors are solvable.

Proof: □

Induced Representations and Mackey Theory

Remark (15.1.3.14). When G is a finite group, the induced representation Ind_H^G(15.1.2.9) is the same as the (compact)induction in(15.1.5.41). In particular, all the results there holds in the finite group case.

Prop. (15.1.3.15) [Character of Induced Representations]. Character of induced representations, Cf.[Serre, P30].

Rationality Problems

Def. (15.1.3.16) [Ring $R_K(G)$]. We want to consider the representations over a subfield K of $\mathbb{C}$.

Let $R_K(G)$ be the $\mathbb{Z}$-module generated by the characters of the representations of G over K, then it is a subring of $R(G) = R_{\mathbb{C}}(G)$. And define the $\mathbb{Z}$-module $\overline{R}_K(G)$ to be the elements of $R(G)$ with values in K. Clearly $R_K(G) \subset \overline{R}_K(G)$.

Prop. (15.1.3.17) [Induction and Restriction Morphism]. Let H be a subgroup of G, then the induction induces a Abelian group homomorphism $R(H) \to R(G)$, and restriction induces a ring homomorphism $R(G) \to R(H)$. The formula $\mathrm{Ind}(\varphi \cdot \mathrm{res}(\psi)) = \mathrm{Ind}(\varphi) \cdot \psi$ shows the image of Ind is an ideal of $R(G)$. Also by Frobenius reciprocity(15.1.5.44), Ind and Res are dual to each other:

$$(\varphi, \mathrm{res}\,\psi)_H = (\mathrm{Ind}\,\varphi, \psi)_G.$$

Prop. (15.1.3.18). Let ρ_i be the isomorphism classes of all irreducible linear representations of G over K and χ_i there characters. Then

- χ_i form a basis of $R_K(G)$.
- χ_i are mutually orthogonal.

Proof: □

Cor. (15.1.3.19). A representation of G over $\mathbb{C}$ is realizable over K iff its character belongs to $R_K(G)$.

Proof: One direction is trivial, for the other, if $\chi \in R_K(G)$, then $\chi = \sum n_i\chi_i$, and $(\chi, \chi_i) = n_i(\chi_i, \chi_i)$. As $(\chi, \chi_i) \geq 0$ as they are representations of G, we have $n_i \geq 0$, thus $\rho = \sum n_i\rho_i$ is realizable over K, by(15.1.3.3). □

Def. (15.1.3.20) [Schur Indices]. $K[G]$ is called **quasisplit** if the D_i are all commutative, or equivalently, all $m_i = 1$.

Prop. (15.1.3.21). If L/K is finite and $L[G]$ is quasisplit, then $[L : K]$ is divisible by each of the Schur indices m_i.

Proof: □

Prop. (15.1.3.22). The characters $\psi = \chi_i/m_i$ form a basis of $\overline{R}_K(G)$.

Proof:

□

Cor. (15.1.3.23). $R_K(G) = \overline{R}_K(G)$ iff $K[G]$ is quasisplit.

Cor. (15.1.3.24) [Brauer]. If m is the least common multiples of the orders of the elements of G and K contains the m-th roots of unity, then $R_K(G) = R(G)$.

Proof:

□

Cor. (15.1.3.25). If m is the least common multiples of the orders of the elements of G, then all the Schur indices of G over any field K divides the Euler function $\varphi(m)$.

Proof: This follows from(15.1.3.24) and(15.1.3.21) by considering the field $K[\mu_m]$ over K. □

Def. (15.1.3.26) [Galois-Action on G]. Let $L = K(\mu_m)$, where m divides the order of any element in G, then L/K is Galois and $G(L/K) = \Gamma_K$ is a subgroup of $(\mathbb{Z}/m\mathbb{Z})^*$. Then this group can act on G by $\sigma_t(x) = x^n$ as a set, and we call two elements $s, s' \in G$ Γ_K**-conjugate** iff they are in the same Γ_K orbits of G.

Prop. (15.1.3.27). A class function f on G with values in L belongs to $K \otimes_{\mathbb{Z}} R(G)$ iff

$$\sigma_t(f(s)) = f(s^t)$$

for $\sigma_t \in \Gamma_K$ and $s \in G$.

Proof: Cf.[Serre, P95]. □

Cor. (15.1.3.28). A class function f on G with values in K belongs to $K \otimes_{\mathbb{Z}} R_K(G)$ iff it is constant on the Γ_K-orbits of G.

Proof: Because the □

Prop. (15.1.3.29). For a finite group G, all representations of G has characters in $\mathbb{Q}$ iff it all representations have characters in G, iff every two element generating the same subgroup of G is conjugate.

Proof: Cf.[Serre P103]. □

Cor. (15.1.3.30). representations of S_n all has characteristic in $\mathbb{Z}$.

Artin's Theorem & Brauer's Theorem

Prop. (15.1.3.31) [Generalized Artin Theorem]. Let X be a family of subgroups of a finite group G. Let $\mathrm{Ind} : \oplus_{H\in X} R_K(H) \to R_K(G)$ be the ring homomorphism induced by induction, then the following properties are equivalent:

- G is the union of conjugates of the subgroups in X.
- the cokernel of Ind is finite.

Proof: $2 \to 1$: By the character of induced representations(15.1.3.15), any function in the image of Ind vanishes outside the union of conjugates of the subgroups in X, so if this is not G, then the cokernel cannot by finite.

$1 \to 2$: Notice the duality of Ind and Res(15.1.3.17), it suffices to show that Res is injective, but this is clear. □

Cor. (15.1.3.32) [Artin Theorem]. Choose X as the family of cyclic subgroups of G, then every character of G is a rational combination of characters induced from cyclic subgroups of G.

Proof:

□

Prop. (15.1.3.33) [Brauer's Theorem]. Let $G \in \mathcal{A}\mathrm{b}^{\mathrm{fin}}$, then $K_0(\mathrm{Rep}(G))$ is generated by $\mathrm{Ind}_{H_i}^G(\chi_i)$, where $H_i \leq G, \chi_i \in \widehat{H}_i$.

Proof: □

Prop. (15.1.3.34) [Generalized Brauer's Theorem].

Proof: □

Important representations

Prop. (15.1.3.35) [Q_8]. There is a 2-dimensional representation of the quadratic group $Q_8 = \{\pm 1, \pm i, \pm j, \pm k\}$:

$$i \mapsto \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad j \mapsto \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}, \quad k \mapsto \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

Prop. (15.1.3.36). There is a representation of S_n on the $n-1$-dimensional hypersurface $\sum x_i = 0$.

5 Locally Profinite Groups

Structure Sheaf and Distributions

Cf.[Representations of the Group GL(n,F) over Local Fields Bernstein/Zelevinsky] and [Bernstein, Representation of p-adic Groups, Bernstein].

Remark (15.1.5.1). For structure theory of locally profinite groups, Cf.1.

Def. (15.1.5.2)[Structure Sheaf and Distributions]. For a locally profinite space X, the structure sheaf $C^\infty(X)$ on X is defined to be the locally constant sheaf $\underline{\mathbb{C}}$ of X.

The space $C_c^\infty(X) = C_c(X)$ of **test functions** on X is the set of locally constant continuous functions with compact supports.

The space $\mathcal{S}^*$ of **distribution** on X consists of linear functionals on $C_c^\infty(X)$.

Prop. (15.1.5.3). If X is locally profinite space and $\mathcal{F}$ is a C^∞ sheaf, then for any open subset $U \subset X$, $Z = X \backslash U$, there is an exact sequence:

$$0 \to \Gamma_c(U, \mathcal{F}) \to \Gamma_c(X, \mathcal{F}) \to \Gamma_c(Z, \mathcal{F}) \to 0.$$

So if we define $\mathcal{D}(X, \mathcal{F})$ the space of **distributions on** $\mathcal{F}$ on X to be the space of linear functional on $\Gamma_c(X, \mathcal{F})$, then there is an exact sequence

$$0 \to \mathcal{D}(Z, \mathcal{F}) \to \mathcal{D}(X, \mathcal{F}) \to \mathcal{D}(U, \mathcal{F}) \to 0.$$

Proof: The left exactness is clear. To show the right surjectivity, let $f \in \Gamma_c(Z, \mathcal{F})$, then for each $x \in \mathrm{Supp}(f)$, there is a compact open nbhd U_x that f restricts to an element of $\Gamma(U_x, \mathcal{F})$. Then these U_x cover $\mathrm{Supp}(f)$, then by(3.3.4.7), there is a disjoint finite cover $\{U_i\}$ of $\mathrm{Supp}(f)$ that f are induced by $f_i \in \Gamma(U_i, \mathcal{F})$. Now we can replace U_i by $U_i \backslash \cup_{j<i} U_j$ to let U_i be disjoint, then f extends to an element of $\cup U_i$. □

Cor. (15.1.5.4). For X locally profinite and $U \in X$ open, $Z = X - U$, there is an exact sequence:

$$0 \to C_c^\infty(U) \to C_c^\infty(X) \to C_c^\infty(Z) \to 0,$$

Thus also an exact sequence

$$0 \to \mathcal{S}^*(Z) \to \mathcal{S}^*(X) \to \mathcal{S}^*(U) \to 0,$$

Proof: The first is the exact sequence(15.1.5.3) applied to the constant sheaf(structure sheaf of X). The second is the dual of the first. □

Prop. (15.1.5.5). If X, Y are both locally profinite, then

$$C_c^\infty(X \times Y) = C_c^\infty(X) \otimes_{\mathbb{C}} C_c^\infty(Y)$$

Proof: Because the subspaces of the form $U \times V$ for U, V open form a subbasis of $X \times Y$, so any compact open subset of $X \times Y$ is a disjoint union of sets of the form $U \times V$. □

Def. (15.1.5.6) [Cosmooth $C_c^\infty(X)$-Modules]. A **cosmooth $C_c^\infty(X)$-module** is a $C_c^\infty(X)$-module M that for any $m \in M$, there exists some compact open $U \subset X$ that $m = \chi_U m$.

Prop. (15.1.5.7) [Cosmooth $C_c^\infty(X)$-Module and $C^\infty(X)$-Sheaves]. Let $\mathcal{F}$ be a C^∞-sheaf on X, then the space $\Gamma_c(X, \mathcal{F})$ is a cosmooth $C_c^\infty(X)$-module(15.1.5.6), and this defines an equivalence of categories between the category of non-degenerate $C_c^\infty(X)$-modules and $C^\infty(X)$-sheaves.

Notice that in this case, a $C_c^\infty(X)$-module M being non-degenerate is equivalent to: for any $m \in M$, there is a compact open subset U that $\chi_U m = m$.

Proof: For any non-degenerate $C_c^\infty(X)$-module M, define a sheaf $\mathcal{F}_M$ of the compatible stalks in $\prod_{x\in X} M/M(x)$, where

$$M(x) = \{m \in M | \chi_U m = 0 \text{ for some } x \in U\}.$$

Then we show these two functors are inverse to each other: One direction is clear, as the sheaf $\mathcal{F}$ is just the sheaf of compatible stalks in $\prod_{x\in X} \mathcal{F}_x$, and it is easy to see $\mathcal{F}_x \cong M/M(x)$. For the other direction, any element in $\Gamma_c(X, \mathcal{F}_M)$ is induced from $f_i \in \Gamma(U_i, \mathcal{F}_M)$, where U_i are pairwise disjoint compact open subsets, by(3.3.4.7), and it is easy to see $\Gamma(U_i, \mathcal{F}_M) = \chi_U M$. Thus $\Gamma_c(X, \mathcal{F}_M) = C_c^\infty(X)M$, and the non-degeneracy of M shows $\Gamma_c(X, \mathcal{F}_M) \cong M$. □

Remark (15.1.5.8). Notice that $M(x)$ can be equivalently defined to be the space spanned by the elements

$$\{gm | g \in C_c^\infty(X), g(x) = 0, m \in M\}.$$

Prop. (15.1.5.9). If G is a locally profinite group, any $\varphi \in C_c^\infty(G)$ is K-bi-invariant under some compact open subgroup K.

Proof: φ must be of the form $\sum a_i \chi_{U_i}$, where each U_i is open compact. Then for each element $x \in U_i$, there is an open compact group U_x that $U_x x \cup x U_x \subset U_i$, by(10.11.1.50). Now because $\operatorname{Supp} f$ is compact, f.m. of the $U_x x \cap x U_x$ covers $\operatorname{Supp}\varphi$, thus we consider their intersection $\cap U_{x_i}$, which is a compact open subgroup K_0 that φ is K_0-bi-invariant. □

Lemma (15.1.5.10). Let G be locally profinite and H a closed subgroup, then G/H is locally profinite space by(10.11.1.51). Then the projection $P : C_c(G) \to C_c(G/H)$ defined in(10.11.1.36) restricts to a projection $P^\infty : C_c^\infty(G) \to C_c^\infty(G/H)$, and it is surjective.

Proof: Firstly P maps $C_c^\infty(G)$ into $C_c^\infty(G/H)$ because if φ is left invariant under K, then $P\varphi$ is also left invariant under K. For the surjectivity, let $\varphi \in C_c^\infty(G/H)$, then $V = \operatorname{Supp}\varphi$ is open compact, then by(10.11.1.52) there is an open compact subspace V that $p(V) = U$, Then we can define

$$\psi(x) = \chi_V(x)\varphi(p(x))/P(\chi_V)(p(x)),$$

then it is supported on V, and $P(\psi) = \varphi$. Also, it is locally constant, as is easily verified. □

Prop. (15.1.5.11) [Left Invariant Distribution]. Let G be a locally profinite group and T is a left invariant distribution on G, then it is the restriction of a unique Haar measure.

Proof: Any element $f \in C_c^\infty(G)$ is of the form $\sum a_i \lambda(h_i) e_K$ for some K, by(15.1.5.9), where $e_K = \mu(K)^{-1}\chi_K$. Because T is left-invariant, $T(f) = \sum a_i T(e_K)$, and $\int f d\mu = \sum a_i$. Thus to show T is a multiple of $d\mu$, it suffices to show $T(e_K)$ is independent of K.

If $K_1 \leq K_2$, then $K_2 = \coprod_{i=1}^n a_i K_1$, where $n = [K_2 : K_1]$, so $e_{K_2} = \mu(K_1)/\mu(K_2) \sum_{i=1}^n \lambda(a_i) e_{K_1}$. Also $\mu(K_2) = n\mu(K_1)$ by left invariance. Now it is clear $T(e_{K_1}) = T(e_{K_2})$ by left invariance of T. Then for any two K, K', we can find an open compact group K'' in their intersection, thus $T(e_K) = T(e_{K'})$. □

Cor. (15.1.5.12). If T is a distribution on G that satisfies $\lambda(g)T = \xi(g)^{-1}T$ for $g \in G$, then there is a unique Haar measure $d\mu$ that $T(f) = \int_G \xi(g) f(g) d\mu(g)$.

Proof: Consider the distribution $T'(f) = T(\xi^{-1} f)$, then it is left invariant. □

Cor. (15.1.5.13) [Invariant Quotient Distribution]. Let G be a locally profinite group and H a closed subgroup. then left H-invariant measures on G are identified with measures on G/H.

And if there exists a left G-invariant distribution D on G/H, then G/H admits a G-invariant measure(10.11.1.38), whose restriction to $C_c^\infty(G/H)$ is D.

Proof: Consider the distribution $D\circ P^\infty$, which is a left invariant linear functional on $C_c^\infty(G)$, (15.1.5.11) shows that it's the restriction of a Haar measure on G.

Then we can use the same method as in(10.11.1.38) to show $\Delta_G|_H=\Delta_H$, and the surjectivity of P^∞(15.1.5.10) shows D is a quotient measure on G/H. □

Prop. (15.1.5.14) [Gelfand Pairs]. Let G be a locally profinite group and H a closed subgroup s.t. $\Delta(G)|_H=\Delta_H$. Suppose ι is an involution on G that leaves H invariant and acts trivially on those distributions on G with are H-bi-invariant, then for any smooth irreducible representation V of G, $\dim(V^*)^H\cdot\dim((V^\vee)^*)^H\leq 1$.

Proof: Given two H-invariant maps $l:C\to\mathbb{C}, m:V^\vee\to\mathbb{C}$, by Frobenius reciprocity, we get two maps $l':C_c^\infty(H\backslash G)\to V, m':C_c^\infty(H\backslash G)\to V^\vee$ that are surjective, and give rise to $B:C_c^\infty(\mathcal{H}\times\mathcal{H}\backslash G\times G)\to V\times V^\vee\to\mathbb{C}$.

Then B satisfies $B(f,g)=B(i(g),i(f))$, where $i(f)(x)=f(\overline{x}^{-1})$: There is a commutative diagram

$$\begin{array}{ccc} G\times G & \xrightarrow{(x,y)\mapsto xy^{-1}} & G \\ \Big\downarrow{\scriptstyle (x,y)\mapsto(\iota(y)^{-1},\iota(x)^{-1})} & & \Big\downarrow{\scriptstyle\iota} \\ G\times G & \xrightarrow{(x,y)\mapsto xy^{-1}} & G \end{array}$$

and the horizontal arrows identify left H-invariant right G-invariant distributions on G with left $H\times H$-invariant distributions on $G\times G$.

By the surjectivity of l',m', $\ker(l'),\ker(m')$ are left and right radicals of B resp., and the above formula shows they determine each other, and l',m' are determined by their kernels, thus we are done. □

Prop. (15.1.5.15) [Bernstein-Zelevinsky?]. If $p:X\to Y$ is a continuous map of locally profinite groups, $\mathcal{F}$ be a cosmooth C^∞-sheaf on X**??**. Let G be a group acting on X and the sheaf $\mathcal{F}$ that $p(gx)=p(x)$, and χ a character of G. Then

- Let $\Gamma_c(X,\mathcal{F})(\chi)$ be the $C_c^\infty(X)$-submodule of $\Gamma_c(X,\mathcal{F})$ generated by $gf-\chi(g)^{-1}f, g\in G, f\in\Gamma_c(X,\mathcal{F})$. Then $\Gamma_c(X,\mathcal{F})/\Gamma_c(X,\mathcal{F})(\chi)$ is a non-degenerate $C_c^\infty(Y)$-module by composing p, so we can define $\mathcal{G}$ the sheaf on Y corresponding to this submodule by(15.1.5.7). Then if $y\in Y$ and $Z=p^{-1}(y)$, the stalk
$$\mathcal{G}_y\cong\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi).$$
- Assume there are no non-zero distributions $D\in\mathcal{D}(p^{-1}(y),\mathcal{F}|_{p^{-1}(y)})$ that satisfies $gD=\chi(g)D$ for any $y\in Y$, then no such D exists in $\mathcal{D}(X,\mathcal{F})$.

Proof: 1: Firstly $\Gamma_c(X,\mathcal{F})/\Gamma_c(X,\mathcal{F})(\chi)$ is a $C_c^\infty(Y)$-module because $\varphi\circ p$ fixes $\Gamma_c(X,\mathcal{F})(\chi)$:

$$(\varphi\circ p)(gf-\chi(g)^{-1}f)=g((\varphi\circ p)f)-\chi(g)^{-1}((\varphi\circ p)f),$$

which uses the condition $p(gx)=p(x)$. The non-degeneracy is also clear, by(15.1.5.7).

Secondly $\Gamma_c(Z,\mathcal{F})\cong\Gamma_c(X,\mathcal{F})/\Gamma_c(U,\mathcal{F})$ by(15.1.5.3), so $\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi)$ is isomorphic the quotient of $\Gamma_c(X,\mathcal{F})$ by $\Gamma_c(U,\mathcal{F})$ and $\Gamma_c(X,\mathcal{F})(\chi)$, because $\Gamma_c(U,\mathcal{F})$ is stable under action of $f\mapsto gf-\chi(g)^{-1}f$(this uses the condition $p(gx)=p(x)$).

We claim the space $\Gamma_c(U,\mathcal{F})$ is the space L generated by elements of the form $(\varphi\circ p)f$, where $\varphi\in C_c^\infty(Y),\varphi(y)=0,f\in\Gamma_c(X,\mathcal{F})$: L is clearly contained in $\Gamma_c(U,\mathcal{F})$, and if $f\in\Gamma_c(U,\mathcal{F})$, then $\operatorname{Supp} f$ is compact and disjoint from Z, so there is an open compact subset $U\subset Y$ containing $p(\operatorname{Supp} f)$ but not y. Let $\varphi=\chi_U$, then $f=(\chi_U\circ p)f\in L$.

Then by(15.1.5.7), the stalk $\mathcal{G}_y$ is isomorphic to $M/M(y)$, where $M=\Gamma_c(X,\mathcal{F})/\Gamma_c(X,\mathcal{F})(\chi)$. So $M(y)$ is just the image of the space L in M by(15.1.5.8), hence $\mathcal{G}_y$ is exactly $\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi)$.

2: this follows from 1, as $gD=\chi(g)D$ is just saying $D(g^{-1}f-\chi(g)f)=0$, or that D annihilates $\Gamma_c(Z,\mathcal{F})/\Gamma_c(Z,\mathcal{F})(\chi)=\mathcal{G}_y$ by item1. So this is equivalent to $\mathcal{G}_y$=0 for any y, which is equivalent to $\mathcal{G}=0$, as $\mathcal{G}$ is a sheaf. □

Cor. (15.1.5.16)[Invariant Distribution On Orbits]. Let γ be an action of a locally profinite group G on a locally profinite space X and a $C^\infty(X)$-sheaf. Assume the action is constructible(3.11.1.21) and there are no G-invariant distribution on any G-orbit in X, then there are no non-zero G-invariant distribution on X.

Proof: Firstly, by(3.11.1.22) and(3.3.4.6) any orbit is locally profinite. If there is a G-invariant distribution on X, we may change X to $\operatorname{Supp} T$, which is G-invariant, thus by(3.11.1.22) there is an open subset $U\subset X$ that G acts regularly, thus we reduce to the regular action case.

Then we can consider $X\to X/G$, X/G is locally profinite by(3.11.1.10), so Bernstein-Zelevinsky(15.1.5.15) can be used. □

Prop. (15.1.5.17)[Gelfand-Kazhdan]. If G is a locally profinite group, and γ is an action of G on a locally profinite space X, σ is a homeomorphism $X\cong X$, $\mathcal{F}$ is a C^∞-sheaf on X, and we assume:

- γ is constructible,
- for each $g\in G$, there is a $g^\sigma\in G$ that $\gamma(g)\sigma=\sigma\gamma(g^\sigma)$.
- For some $n\geq 0$ and $g_0\in G$, $\gamma^n=\gamma(g_0)$.
- If there is a non-zero G-invariant $\mathcal{F}$-distribution T on a G-orbit S, then $\sigma(S)=S$ and $\sigma(T)=T$.

Then any G-invariant distribution on X is invariant under σ.

Proof: Let T be a G-invariant $\mathcal{F}$-distribution that $\sigma T\neq T$, then $n>1$, and for any n-th root of unity ξ, consider $T_\xi=\sum\xi^{-i}\sigma^i(T)$. Then

$$\sigma T_\xi=\xi T_\xi,\quad \sum_\xi T_\xi=nT,\quad \sum\xi T_\xi=n\sigma(T).$$

so $\sum_\xi(\xi-1)T_\xi=n(\sigma(T)-T)\neq 0$, which shows there is a root $\xi\neq 1$ that $T_\xi\neq 0$. Notice T_ξ is G-invariant by condition2. Consider the action $\sigma_x i=\xi\cdot\sigma$, then T_ξ is invariant under σ_ξ.

Let G' be the semi-direct product of G with σ_ξ, under the action of $\sigma_\xi^{-1}g\sigma_\xi=g^\sigma$, then G' is locally profinite and acts on $X,\mathcal{F}$. Clearly this action is also constructible.

Now for any G'-orbit S', we prove there are no G'-invariant distribution on S', because it is in priori G-invariant, so some distribution exists on some G-orbit $S\subset S'$, but then condition4 shows σ fixes S, then $S=S'$ and $\sigma(T)=T$. But $\sigma_\xi(T)=T$, contradiction. Finally,(15.1.5.16) shows there are no G'-invariant distribution on X, contradicting T_ξ. □

Cor. (15.1.5.18)[Gelfand-Kazhdan]. If G is a locally profinite group that is σ-compact, and γ is an action of G on a locally profinite space X, $\sigma: X\cong X$ is a homeomorphism, and we assume:

- γ is constructible,
- for each $g\in G$, there is a $g^\sigma\in G$ that $\gamma(g)\sigma=\sigma\gamma(g^\sigma)$.
- For some $n\geq 0$ and $g_0\in G$, $\sigma^n=\gamma(g_0)$.
- For any x, x and $\sigma(x)$ are in the same G-orbit.

Then any G-invariant distribution on X is invariant under σ.

Proof: We use(15.1.5.18) and take $\mathcal{F}$ to be just $C^\infty(X)$. Then we need to check condition4: for any G-orbit S of X let $s\in S$ and $\mathrm{Stab}(s)=H$, $S\cong G/H$ by(3.11.1.22) and(10.11.1.53). Then(15.1.5.13) shows T is just the G-invariant measure on $G/H: T\varphi=\int_{G/H}\varphi(\gamma(g)s)$. Now condition4 and2 shows σT is also G-invariant, thus $\sigma T=cT$. Clearly $c\geq 0$, and condition3 shows $c^n=1$, thus $c=1$. □

Hecke Algebra

This is a continuation of Hecke Algebras.

Def. (15.1.5.19) [Hecke Algebras of Locally Profinite Groups]. The algebra $\mathcal{H}(G)$ of test functions(15.1.5.2) on a locally profinite group G under convolution is an algebra, called the **Hecke algebra** of G. And for a compact open subgroup K of G, $\mathcal{H}_K$ is the subspace of K-bi-invariant functions in $\mathcal{H}(G)$.

Notice $\mathcal{H}=\cup_K\mathcal{H}_K$ by(15.1.5.9). Also $\mathcal{H}_K$ has a unit $e_K=\mu(K)^{-1}\chi_K$. This is easily verified.

Then $\mathcal{H}_G$ is an idempotented algebra(2.4.4.2).

Proof: Define the set $\mathcal{E}$ of idempotents in $\mathcal{H}(G)$ as e_K, where K is compact open in G. The fact that $\mathcal{H}$ is an idempotented algebra follows from(15.1.5.20) and(15.1.5.22). □

Prop. (15.1.5.20) [Point Measure]. Consider the point measure δ_g for $g\in G$, it is not an element in $\mathcal{H}(G)$, but it can convolute on $\mathcal{H}(G)$: $(\delta_g*\varphi)(x)=\varphi(g^{-1}x),(\varphi*\delta_g)(x)=\varphi(xg)$. Then

- If $g\in K$, then $\delta_g*e_K=e_K*\delta_g=e_K$.
- $\delta_g*e_K*\delta_{g^{-1}}=e_{gKg^{-1}}$.
- If $K=K_1K_2$ is an open subgroup, then $e_{K_1}*e_{K_2}=e_K$. In particular, $e_K*e_K=e_K$.

Remark (15.1.5.21). In fact we should define the Hecke algebra as locally constant distributions on G, then there equations are more natural. This algebra is equivalent to Hecke algebra by $f\mapsto f\mu_G$.

Prop. (15.1.5.22). $\mathcal{H}_K=e_K*\mathcal{H}*e_K=\mathcal{H}[e_K]$.

Proof: Notice by(15.1.5.20), functions in $e_K*\mathcal{H}*e_K$ is clearly K-bi-invariant. For the other direction, notice if φ is left and right K-invariant, then $\varphi=e_K*\varphi=\varphi*e_K=e_K*\varphi*e_K$. □

Prop. (15.1.5.23) [Smooth Representations and $\mathcal{H}$-Modules]. For a smooth representation (π,V) of G, for any v, $g\mapsto\pi(g)v$ can be regarded as a locally constant function with value in V, thus for any $\varphi\in\mathcal{H}_G$, $g\mapsto\varphi(g)\pi(g)v$ is locally constant with compact support, thus we can define a representation of the Hecke algebra $\mathcal{H}_G$ by

$$\pi(\varphi)v=\int_G\varphi(g)\pi(g)vdg$$

which just has nothing to do with integration, and this is compatible with convolution by formal reason. Then this is a smooth $\mathcal{H}_G$-module, and this gives an equivalence between the category of smooth(admissible) representations of $\mathcal{H}(G)$(2.4.4.4) and the category of smooth(admissible) representations of G.

Proof: For any $v \in V$, there is an open compact subgroup K that $v \in V[e_K]$, thus $e_K v = v$, so V is smooth. For the equivalence of categories, for any $\mathcal{H}(G)$-module V, we can define a G-action by linearly extending the action $\pi(g)e_K v = (\delta_g * e_K)v$. Notice by associativity of representation and smoothness, this is well-defined on all of V, and is a representation of G. Also it is continuous because $v = e_K v$ for some K thus $\pi(g)v = (\delta_g * e_K)v = e_K v = v$ for any $g \in K$. Finally these two functors are inverse to each other is also easily checked. □

Cor. (15.1.5.24). $(-)^K, (-)^\infty$(15.1.2.1) are both exact, by(2.4.4.3).

Cor. (15.1.5.25). Let (π, V) be a non-zero smooth representation of a locally profinite group G, then the following are equivalent by(2.4.4.6) and(15.1.5.23):

- π is irreducible.
- V is simple as $\mathcal{H}$-module.
- V^{K_0} is either zero or simple as a $\mathcal{H}_{K_0}$-module for all open compact subgroups K_0 of G.

Prop. (15.1.5.26) [Fourier Transform]. If G is a locally profinite Abelian group, then the Fourier transform induces an isomorphism

$$\mathcal{H}(\widehat{G}) \cong C_c^\infty(G) : \varphi \mapsto \widehat{\varphi}(\xi) = \int_G \varphi(y)\overline{\langle \xi, y\rangle} dy.$$

Proof: By(10.11.3.8) this is an algebra homomorphism. It remains to show that the image are all locally compact, and this is clear from the fact $\widehat{G}$ is given the compact-open topology(10.11.3.6). □

Admissible Smooth Representations

Prop. (15.1.5.27).

- For any compact open subset K of G, $V^K = ((V^\wedge)^K)^*$.
- $\mathrm{Hom}_G(V, W^\wedge) = \mathrm{Hom}(W, V^\wedge)$.
- $V \hookrightarrow (V^\wedge)^\wedge$ is an injection.

Proof: 1: Using(15.1.5.23), because $(\widetilde{V})^K = V^{*K}$. There is a homomorphism $V^{*K} \to V^{K*}$, it is injective, because if $f(v) = 0$ for each $v \in V^K$, then $f(w) = f(e_K v) = 0$. It is also injective, because for each $f \in V^{K*}$, the inverse image is $g(w) = g(e_K w)$.

2: $\mathrm{Hom}(V, \widetilde{W}) = \mathrm{Hom}(V, W^*) = \mathrm{Hom}(V \otimes W, \mathbb{C})$.

3: by the proof of item1,

$$\widetilde{\widetilde{V}} = \cup_K((\cup_K V^{*K})^{*K}) = \cup_K((\cup_K V^{*K})^{K*}) = \cup_K(V^{*K*}) = \cup_K(V^{K**}).$$

So the filtered colimits of the injections $V^K \to (V^K)^{**}$ gives an injection $\cup_K(V^{K**})$. □

Cor. (15.1.5.28) [Contragradient Functor is Exact]. The contragradient functor $V \mapsto \widehat{V}$ is exact. Because $(-)^*$, $(-)^\infty$ are all exact(15.1.5.24).

Cor. (15.1.5.29). If P is projective in $\mathcal{M}(G)$, then $\widetilde{P}$ is injective in $M(G)$.

Proof: $\mathrm{Hom}(X, \widetilde{P}) = \mathrm{Hom}(P, \widetilde{X})$, and notice that the contragradient functor is exact(15.1.5.28). □

Def. (15.1.5.30) [Admissible Representations]. An **admissible smooth representation** of a locally profinite group G is a smooth representation that for any compact open subgroup K of G, V^K is of f.d.. The category of admissible smooth representation of G is denoted by $\mathrm{Rep}^{\mathrm{adm}}(G)$.

Then a smooth representation is admissible iff $V \cong (V^\wedge)^\wedge$. In particular, the contragradient of an admissible representation is admissible.

Proof: If V^K is of f.d. for each K, then by the proof of item3 of(15.1.5.27), $V \cong \widetilde{\widetilde{V}}$. Conversely, if $V \cong \widetilde{\widetilde{V}}$, then $V^K \cong V^{K**}$, thus V must be finite, by(2.3.3.9). □

Cor. (15.1.5.31). For an irreducible admissible representation, the contragradient is also irreducible admissible.

Extensions of admissible representations are admissible, by(15.1.5.24).

Prop. (15.1.5.32) [Decomposition of Admissible Representations]. Let K be a compact open subgroup of G, then any smooth representation of G decomposes as

$$V = \bigoplus_{\rho \in \mathrm{Rep}(K)} V^\rho,$$

and V is admissible iff each V^ρ are all of f.d. In particular, this shows the two notations of admissible(locally compact group and locally profinite groups) are compatible for smooth representations.

Remark (15.1.5.33). WARNING: The decomposition theorem of compact groups cannot be directly used, as representation may not be of f.d. so may not be unitarizable.

Proof: Firstly $V \subset \sum_{\rho \in \widehat{K}} V(\rho)$, because any $v \in V$ is fixed by some compact open subgroup K_0 of K, and we can choose K_0 to be normal in K by(3.11.1.6), so for $\Gamma = K/K_0$,

$$v \in V^{K_0} = \oplus_{\rho \in \widehat{\Gamma}} V(\rho) \subset \sum_{\rho \in \widehat{K}} V(\rho).$$

Also this sum is direct, because otherwise $\sum_{\rho \in S} c_\rho v_\rho = 0$, but let K_0 be the intersection of kernels of ρ, then this is an equation of elements in representations of $\Gamma = K/K_0$ finite, so contradicting(15.1.3.8).

If π is admissible, then $V(\rho) \subset V^{\ker \rho}$ is of f.d.. Conversely, if V is not admissible, then V^{K_0} is of infinite dimensional for some K_0 compact compact normal, so V^{K_0} decomposes as direct sums of $V(\rho)$ for $\rho \in \widehat{K/K_0}$, thus one of these space must be of infinite dimensional. □

Def. (15.1.5.34) [Character of Admissible Representations]. Let (π, V) be an admissible representation of G, then for any $\varphi \in \mathcal{H}$, $\varphi \in \mathcal{H}_K$ for some compact open subset of G, by(15.1.5.19), so $\mathrm{Im}(\pi(\varphi)) \subset V^K$, which is of f.d., so we can define the trace of φ as $\mathrm{tr}(\pi(\varphi)|V^K)$. Notice this is independent of K chosen by linear algebra reasons. And this defines a distribution on $\mathcal{H} : \varphi \mapsto \mathrm{tr}(\varphi)$, called the **character** of V.

Cor. (15.1.5.35). $\mathcal{M}(G)$ has enough injectives.

Proof: As $\mathcal{M}(G)$ has enough projectives(2.4.4.9)(15.1.5.23), there is a surjection $P \to \widetilde{X}$, thus an injection $\widetilde{\widetilde{X}} \hookrightarrow \widetilde{P}$(15.1.5.28). Now $X \hookrightarrow \widetilde{\widetilde{X}}$ by(15.1.5.27). □

Irreducible Admissible Representations

Prop. (15.1.5.36) [Separation Lemma]. If G is a σ-compact locally profinite group, then for any $0 \neq h \in \mathcal{H}(G)$, there is an irreducible representation ρ that $\rho(h) \neq 0$.

Proof: Cf.[Bernstein, P20], [Bernstein-Zelevinsky, P19].**?** □

Prop. (15.1.5.37) [Shur's Lemma].

- If G is a σ-compact locally profinite group, then any irreducible smooth representation V is of at most countable dimension, thus $\mathrm{End}_G(V) = \mathbb{C}$ by(2.2.1.10).
- If G is a locally profinite group, then any irreducible admissible representation V of G satisfies $\mathrm{End}_G(V) = \mathbb{C}$.

Proof: 1: If it is of at most finite dimension because if ξ generate V, then notice its stablizer is compact open, and G is σ-compact, so V is at mots countable.

2: Let K_0 be a small open compact subgroup that $V^{K_0} \neq 0$, then V^{K_0} is of f.d. and preserved under $T \in \mathrm{End}_G(V)$, thus T has an eigenvalue c, thus $T = cI$ on V. □

Prop. (15.1.5.38). Let $(\pi_1, V_1), (\pi_2, V_2)$ are two irreducible representations of a locally profinite group G. If $V_1^K \cong V_2^K \neq 0$ as $\mathcal{H}_K$-module for some compact open subgroup K of G, then $\pi_1 \cong \pi_2$. This follows immediately from(2.4.4.7).

Prop. (15.1.5.39) [Characters Determine Irreducible Admissible Representations]. Let $\pi_1, \ldots, \pi_n$ be inequivalent irreducible admissible representations of a locally profinite group G, then their characters $\mathrm{tr}(\pi_i)$ are linearly independent. In particular, an irreducible admissible representation is determined by its character.

Proof: Choose K that $V_i^K \neq 0$ for any i, the hypothesis together with(15.1.5.38) shows $V_i^K \ncong V_j^K$. Then we finish by(10.11.4.22). □

Prop. (15.1.5.40) [Representations of Product Group]. If G_1, G_2 are all locally profinite groups and (π_i, M_i) are irreducible admissible representations of G_i, then $M_1 \otimes M_2$ is an irreducible admissible representation of $G_1 \times G_2$, and any irreducible admissible representations of $G_1 \times G_2$ comes like this.

Proof: By(15.1.5.23) and(2.4.4.15), this follows if we have $\mathcal{H}_{G_1 \otimes G_2} \cong \mathcal{H}_{G_1} \otimes \mathcal{H}_{G_2}$. And this fact is easily deduced from(15.1.5.5). □

Induced Representations and Mackey Theory

Def. (15.1.5.41) [Smooth Induced Representations]. Let G be a locally profinite group and H is a closed subgroup, (π, V) be a smooth representation of H, we can define the **smooth induced representation** $\mathrm{Ind}_H^G \pi$ as the space of locally constant f on G with values in V

$$f(hg) = \sqrt{\frac{\Delta_G(h)}{\Delta_H(h)}}\pi(h)f(g).$$

with the natural right G-representation. Notice this is similar to that of unitary representations of locally compact groups, in(10.11.5.3).

the induced representation $\mathrm{Ind}_H^G \pi$ has a subrepresentation ind_H^G consisting of functions that is compactly supported in $H \backslash G$, called the **compactly induced representation**.

Remark (15.1.5.42). The normalized factor here is used to make the induction of a unitarizable representation unitarizable(15.1.5.52).

Prop. (15.1.5.43) [Description of the Induced Representations]. Situation as in(15.1.5.41). Let $K \subset G$ be an open compact subgroup, and $\Omega \subset G$ be a system of coset representations of $H\backslash G/K$. For each $g \in G$, denote $N_g = H \cap gKg^{-1}$ the compact open subgroup of H, then the restriction of functions from G to Ω induces an isomorphism of $(\mathrm{Ind}_H^G(V))^K$ with the $\prod_{g\in\Omega} V^{N_g}$. And in this way, $(\mathrm{ind}_H^G(V))^K$ is mapped to $\bigoplus_{g\in\Omega} V^{N_g}$.

Prop. (15.1.5.44). Let G be a locally profinite group, H a closed subgroup of G, and B a closed subgroup of H, then

- Ind_H^G and ind_H^G are both exact functors $\mathrm{Rep}^{\mathrm{alg}}(H) \to \mathrm{Rep}^{\mathrm{alg}}(G)$.
- $\mathrm{Ind}_H^G \circ \mathrm{Ind}_B^H = \mathrm{Ind}_B^G$ and $\mathrm{ind}_H^G \circ \mathrm{ind}_B^H = \mathrm{ind}_B^G$.
- $\mathrm{Ind}_H^G(\sigma)^\vee = \mathrm{ind}_H^G(\sigma^\vee)$.
- (Smooth Frobenius Reciprocity)If $(\pi, W) \in \mathrm{Rep}^{\mathrm{alg}}(G)$, $(\rho, V) \in \mathrm{Rep}^{\mathrm{alg}}(H)$, then there are functorial isomorphisms

$$\mathrm{Hom}_G(\pi, \mathrm{Ind}_H^G(\rho)) = \mathrm{Hom}_H(\pi|_H, \rho\otimes\sqrt{\frac{\Delta_G}{\Delta_H}}), \quad \mathrm{Hom}_G(\mathrm{ind}_H^G(\sigma), \pi) = \mathrm{Hom}_H(\rho\otimes\sqrt{\frac{\Delta_H}{\Delta_G}}, (\pi^\vee|_H)^\vee)$$

Proof: 1: This follows from the description in(2.4.4.3) and(2.4.4.3) by taking colimits.

2: For simplicity we prove for G, H, B unimodular. An element in $\mathrm{Ind}_H^G \circ \mathrm{Ind}_B^H(V)$ is an element $\varphi : G \mapsto \mathrm{Hom}(H, V)$ that satisfies $\varphi(hg)(h') = (\pi(h)\varphi(g))(h') = \varphi(g)(hh')$, thus $\varphi(g)(h) = \varphi(hg)(1)$. Let $\Phi(g) = \varphi(g)(1)$, then Φ satisfies $\Phi(bg) = \pi(b)\Phi(g)$. So $\varphi \mapsto \Phi$ is an isomorphism. ind case follows from item3.

3: For $f : G \to V \in \mathrm{Ind}_H^G(\sigma), f' \in G \to V^\vee \in \mathrm{ind}_H^G(\sigma^\vee)$, $\langle f, f'\rangle$ is compactly supported in $H\backslash G$, and $\langle \pi(h)f, \pi(h)f'\rangle = \frac{\Delta_G(h)}{\Delta_H(h)}\langle f, f'\rangle$, thus we can define a G-invariant pairing

$$\langle f, f'\rangle = \int_{H\backslash G} \langle f(g), f'(g)\rangle d\mu_{H\backslash G}(g)(10.11.1.44).$$

This map is a perfect pairing on the K-fixed part for any compact open K using description in(15.1.5.43), thus we are done.

4: Given a $\Phi : W \to \mathrm{Ind}_H^G V$, we have a map $\varphi : W \to V : \varphi(w) = \Phi(w)(1)$, then it is verified that $\varphi \in C(\pi|_H, \rho \otimes \sqrt{\frac{\Delta_G}{\Delta_H}})$. Conversely, if $(\varphi : W \to V) \in C(\pi|_H, \rho \otimes \sqrt{\frac{\Delta_G}{\Delta_H}})$ is given, we can define $\Phi; W \to \mathrm{Ind}_H^G V : \Phi(w)(g) = \varphi(\pi(g)w)$, then $\Phi(w) \in \mathrm{Ind}_H^G V$ and this is linear in w(remember to check smoothness). Finally, it is easily verified these maps are inverse to each other. The second assertion follows from item3 and(15.1.5.27). □

Cor. (15.1.5.45). If $H\backslash G$ is compact, then $\mathrm{Ind}_H^G = \mathrm{ind}_H^G$, and they map admissible representations to admissible representations, by the description in(2.4.4.3), as $H\backslash G/K$ is both compact and discrete thus finite.

Prop. (15.1.5.46). If H is normal in G and for any $\rho \in \mathrm{Rep}(H)$, let ρ^g be ρ twisted by conjugation of $g \in G$, then $\mathrm{Ind}_H^G(\rho) \cong \mathrm{Ind}_H^G(\rho^g)$, and $\mathrm{ind}_H^G(\rho) \cong \mathrm{ind}_H^G(\rho^g)$

Proof: □

Prop. (15.1.5.47). Let $H \leq G, K \trianglelefteq G, \rho \in \mathrm{Rep}(H)$, then

$$(\mathrm{Ind}_H^G(\rho))^K \cong \mathrm{Ind}_{H/H\cap K}^{G/K}(\rho^{H\cap K}) \in \mathrm{Rep}^{\mathrm{alg}}(G/K)$$

Proof: □

Prop. (15.1.5.48). Let G be a locally profinite group and H is a closed subgroup, (π, V) be a smooth representation of H, then there is a G-invariant map $P_\pi : C_c^\infty(G) \otimes V \to \mathrm{ind}_H^G(\pi)$:

$$P_\pi(\varphi, v)(g) = \int_H \varphi(b^{-1}g)\sqrt{\frac{\Delta_G(b)}{\Delta_H(b)}}\pi(b)v db.$$

And if $\dim \pi < \infty$ and there is an open compact subgroup K of G that $G = HK$, then this map is surjective.

Moreover,

$$P(\lambda(b)^{-1}\varphi, v) = \sqrt{\Delta_G(b)\Delta_H(b)}P(\varphi, \pi(b)v), \quad b \in H$$

Proof: It can be verified that $P_\pi(\varphi, v)(bg) = \sqrt{\frac{\Delta_G(b)}{\Delta_H(b)}}\pi(b)P_\pi(\varphi, v)$.

If $H\backslash G$ is compact, by(10.11.1.52), there is a compact open subset K of G that $G = HK$, then for any $f \in \mathrm{Ind}_H^G(\pi) = \sum v_i \otimes f_i$, consider $\varphi_i = \chi_{K^{-1}} f_i$, then $\sum P(\varphi_i, v_i) = \sum V(H \cap K) f_i v_i = V(H \cap K)f$. □

Prop. (15.1.5.49) [Mackey's Decomposition]. Let H, K be closed subgroups of a locally profinite group G, ρ is a smooth representation of H. If $s \in G$, then we can define a new representation of $H_s = K \cap sHs^{-1}$ as $\rho^s(g) \mapsto \rho(s^{-1}gs)$. Then if we use unnormalized induction,

- If either H or K is open in G, then

$$\mathrm{res}_K^G \mathrm{ind}_H^G \rho \cong \bigoplus_{s \in H\backslash G/K} \mathrm{ind}_{H_s}^K \rho^s$$

- If K is open in G, then

$$\mathrm{res}_K^G \mathrm{Ind}_H^G \tau \cong (\prod_{s \in H\backslash G/K} \mathrm{Ind}_{H_s}^K \tau^s)^\infty$$

Proof: Cf.[Yam22]. □

Cor. (15.1.5.50) [Mackey's Intertwining Theorem]. Let H be a closed subgroup of a locally profinite group G, K an open subgroup of G, σ(resp. τ) be a smooth representation of K(resp. H), define τ^s as in(15.1.5.49), then if we use unnormalized induction,

-
$$\mathrm{Hom}_G(\mathrm{ind}_K^G \sigma, \mathrm{Ind}_H^G \tau) \cong \prod_{s \in H\backslash G/K} \mathrm{Hom}_{H_s}(\sigma, \tau^s).$$

- If moreover $H\backslash HgK \cong H_s\backslash K$ is compact for any $g \in G$(e.g. K is compact) and σ is f.g. over K, then

$$\mathrm{Hom}_G(\mathrm{ind}_K^G \sigma, \mathrm{ind}_H^G \tau) \cong \bigoplus_{s \in H\backslash G/K} \mathrm{Hom}_{H_s}(\sigma, \tau^s).$$

Proof: 1: This is a direct consequence of Mackey's decomposition(15.1.5.49) and Frobenius reciprocity(15.1.5.44):

$$\begin{aligned}\mathrm{Hom}_G(\mathrm{ind}_K^G\sigma, \mathrm{Ind}_H^G\tau) &\cong \mathrm{Hom}_K(\sigma, \mathrm{res}_K^G \mathrm{Ind}_H^G\tau) \cong \mathrm{Hom}_K(\sigma, (\prod_{s\in H\backslash G/K} \mathrm{Ind}_{H_s}^K \tau^s)^\infty) \\ &\cong \mathrm{Hom}_K(\sigma, \prod_{s\in H\backslash G/K} \mathrm{Ind}_{H_s}^K \tau^s) \cong \prod_{s\in H\backslash G/K} \mathrm{Hom}_K(\sigma, \mathrm{Ind}_{H_s}^K \tau^s) \\ &\cong \prod_{s\in H\backslash G/K} \mathrm{Hom}_{H_s}(\sigma, \tau^s).\end{aligned}$$

2 is similar. □

Cor. (15.1.5.51) [Compact Induction Admissible]. If H is a subgroup of G that $H\backslash G$ is compact, then Ind_H^G takes admissible representations to admissible representations.

Proof: For any compact open subgroup $K\subset G$, $H\backslash G/K$ is finite, as $H\backslash G$ is compact and K is open, then by Mackey's decomposition(15.1.5.49), $(\mathrm{Ind}_H^G \rho)^K = \oplus_{s\in H\backslash G/K}\rho^{s^{-1}Ks\cap H}$ is of f.d. if ρ is admissible. □

Unitarizable Admissible Representations

Prop. (15.1.5.52). The induction of a unitarizable representation is unitarizable, by(10.11.5.3).

Prop. (15.1.5.53)[Converse of Schur's Lemma]. If (π, V) is a unitarizable admissible representation of a locally profinite group G that $\mathrm{Hom}_G(V,V)=\mathbb{C}$, then π is irreducible.

Proof: Cf.[Bump, P523].? □

Compact Representations

Def. (15.1.5.54) [Compact Representations]. For a locally profinite group G, a **compact representation** is a smooth representation of G s.t. for every $\xi\in V$ and every compact open subgroup $K\subset G$, the function $D_{\xi,K}: G\to V: g\mapsto \pi(e_K)\pi(g^{-1})\xi$ has compact support.

Prop. (15.1.5.55). $V\in \mathrm{Rep}^{\mathrm{alg}}(G)$ is compact iff every matrix coefficient of V is compactly supported. And every f.g. compact representation is admissible.

Proof: If V is compact, for any $\xi\in V, \xi^\wedge\in V^\wedge$, $\xi^\wedge\in (V^\wedge)^K$, then $\mathrm{Supp}\,\varphi_{\xi,\xi^\wedge}\in \mathrm{Supp}\, D_{\xi,K}$ is compact.

For the converse, Cf.[Bernstein Zelevinsky, P26]. □

15.2 Modular Representations

Main references are [Ser77] and [Bon11].

1 Block Theory

See [Bon11].

2 Unequal Characteristic

3 Equal Characteristic

Prop. (15.2.3.1). The only irreducible representation of a p-group over a a field of char p is the trivial representation.

Proof: For any $v \in V$, consider the additive subgroup generated by $g(s)v$, then it is a finite group of prime power order. Then(2.1.7.4) shows it has a element other than 0 fixed by all G, thus it is not irreducible unless trivial representation. □

15.3 Galois Representations(Basics)

Main references are [Theories of p-adic Galois Representations, Fontaine/Yi Ouyan], [Local Langlands for GL(n), Zijian Yao]. [Con06], [R. Taylor, Galois representations, long version of the talk given at the iCM 2002].

Notation (15.3.0.1).

- Use notations defined in Classical Representation Theory.
- Use notations defined in Cohomology of Arithmetic Fields.

Remark (15.3.0.2). For $K \in \texttt{Field}$, $E \in \texttt{Field}^{\mathrm{top}}$, the theory of Galois representations study the category $\mathrm{Rep}_E(\mathrm{Gal}_K)$.

1 Basics

Def. (15.3.1.1) [Galois Representations]. For any $K \in \texttt{Field}, p \in \mathbf{P}$,

- an **Artin representation** of K is a f.d. smooth $\mathbb{C}$-representation of Gal_K.
- a **p-adic Galois representation** of K is a f.d. continuous $\mathbb{Q}_p$-representation of Gal_K. If $K \in p\text{-}\texttt{LField}$, this is called a **$p$-adic local Galois representation**(of K).
- a **p-adic integral Galois representation** of K is a f.d. continuous $\mathbb{Q}_p$-representation of Gal_K. If $K \in p\text{-}\texttt{LField}$, this is called a **$p$-adic local integral Galois representation**(of K).
- if $K \in p\text{-}\texttt{LField}, \ell \in \mathbf{P}\backslash\{p\}$, then an **$\ell$-adic Galois representation** of K is a f.d. continuous $\mathbb{Q}_\ell$-representation of Gal_K.

Cor. (15.3.1.2) [Artin Representations as ℓ-adic(or p-adic) Representations]. A choice of isomorphism(12.2.1.27) $\overline{\mathbb{Q}}_p \cong \overline{\mathbb{Q}}_\ell \cong \mathbb{C}$ induces a bijection between Artin representations and ℓ-adic(or p-adic) representations with open kernels.

Prop. (15.3.1.3) [Compact Groups Stabilize a Lattice]. Let Γ be a compact group and let $\rho : \Gamma \to GL(n, \overline{\mathbb{Q}}_p)$ be a continuous homomorphism, then there exists a finite extension $L/\mathbb{Q}_p$ that $\rho(\Gamma) \subset GL(n, L)$, and up to conjugation, $\rho(\Gamma) \subset GL(n, \mathcal{O}_L)$, or equivalently, Γ fixes a $\mathcal{O}_L$-lattice.

Proof: Notice $\rho(\Gamma)$ is compact and Hausdorff, so by Baire category theorem, now that $GL(n, L)$ is closed in $GL(n, \overline{\mathbb{Q}}_p)$ for all $L/\mathbb{Q}_p$ finite, and all this extensions are countable by primitive element theorem, so there is an L that $\rho(\Gamma) \cap GL(n, L)$ contains an open subset of $\rho(\Gamma)$, so it is an open subgroup, thus of finite index, hence by adding all the coset representations into L, we get an L' finite.

For the second assertion, notice $\rho(\Gamma)$ is compact in $GL(n, L)$, thus by(13.3.1.5), it is conjugate to $GL(n, \mathcal{O}_L)$. □

Prop. (15.3.1.4) [Brauer-Nesbitt]. If two n-dimensional representations have the same char polynomial and char $k = 0$, or char $k > n$ and they have the same character, then their semisimplification are the same.

Proof: The proof is not hard, use the Artin-Wedderburn theorem, and the fact the representation may not by semisimple. □

Def. (15.3.1.5) [Restricted Galois Representations]. By(12.4.2.17), if $F \in \texttt{GField}$, for any $v \in \Sigma_F$, a Galois representation ρ of F can be restricted to a Galois representations ρ_v of Gal_{F_v}, called the **restricted Galois representation**.

Def. (15.3.1.6) [Cyclotomic Characters and Tate Twists]. For $K \in \texttt{Field}, p \in \mathbf{P}$, the p-adic **cyclotomic character** χ_p of Gal_K is the character corresponding to the 1-dimensional p-adic Tate module of $\mathbb{G}_{a,K}$.

For any $(\rho, V) \in \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_K)$ or $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ and $n \in \mathbb{Z}$, we can define the **Tate twist** $\rho(n)$ as the representation twisted by n-th power of the cyclotomic character χ_p^n.

Def. (15.3.1.7) [Tate Duals]. For a p-adic representation V of the Galois group of a field K, the **Tate dual** V^D of V is defined to be $V^D = V^\vee(1)$. Similarly for p-adic integral representations.

Def. (15.3.1.8) [Properties of Galois Representations]. Let ρ be a representation of $\mathrm{Gal}_\mathbb{Q}$ on some topological ring A, then

- ρ is called an **odd representation** if $\rho(\mathfrak{c}) = -1$, and an **even representation** otherwise.
- For $p \in \mathbf{P}$, ρ is said to be **unramified at** p if $I_p \subset \ker(\rho|_{\mathrm{Gal}_{\mathbb{Q}_p}})$.
- For $p \in \mathbf{P}$, ρ is said to be **flat at** p if for any Artinian quotient A/I of A, the quotient representation $\overline{\rho}|_{\mathrm{Gal}_{\mathbb{Q}_p}}$ is isomorphic to the representation of $\mathrm{Gal}_{\mathbb{Q}_p}$ on the geometric points of a finite flat group scheme over $\mathbb{Z}_p$.

2 ℓ-adic (Local)Galois Representations

Def. (15.3.2.1) [Notations].

- Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, $K \in p\text{-}\texttt{NField}$ with residue field $\mathbb{F}_q$.
- Let $\ell \in \mathbf{P} \setminus \{p\}$.
- $t_\ell : I_K/R_K \to \mathbb{Z}_\ell$ be the ℓ-adic tame character(12.2.3.18).
- Let σ be a fixed lift of $\mathrm{Frob} \in \mathrm{Gal}_{\mathbb{F}_q}$.
- Let $\chi = \chi_\ell$ be the unramified cyclotomic character(15.3.1.6) $\widehat{\mathbb{Z}} \cong \mathrm{Gal}_K / I_K \to \mathbb{Z}_\ell : \sigma \mapsto q$.

Prop. (15.3.2.2). If $\rho : \Gamma \to GL(n,k) = GL(V)$ is a representation, then it has a filtration $0 = V_0 \subset V_1 \subset \ldots \subset V_n = V$ where V_{i+1}/V_i is irreducible, then there is a semisimplification of ρ, which is $\rho^{ss} = \oplus V_{i+1}/V_i$.

Def. (15.3.2.3) [Residential Representation]. If $L/\mathbb{Q}_p$ finite, we may take a Γ-stable $\mathcal{O}_L$-lattice Γ, then the **residual representation** $\overline{\rho}_L$ is defined by $\Gamma \to GL(\Lambda/\pi\Lambda)$. Then the semisimplification of $\overline{\rho}_L$ is independent of Λ chosen.**?**

Prop. (15.3.2.4) [Induced Galois Representations]. Let F be a local field with residue characteristic p. Let $(n, q) = 1$, then any irreducible representation (ρ, V) of Gal_F of dimension n is induced from a character χ of K^* for a field extension K/F of degree n.

Proof: Suppose χ factors through a normal subgroup $G(L/F)$. It suffices to show ρ is an induced representation from a subgroup, then use induction. Suppose it is not, then consider the filtration of Galois groups $R_v \subset I_v \subset G_F$. R_v is a pro-p-group, thus all irreducible f.d. representations are p-powers, by(15.1.3.12), thus it is 1-dimensional. Now R_v is a normal subgroup, by(15.1.2.10), R_v acts by scalars on V. Now the exact sequence $1 \to R_v \to I_v \to I_v/R_v \to 0$ is a split exact sequence(12.2.2.17), and I_v/R_v is cyclic, thus $\rho|_{I_v}$ also contains a character, and the same argument as above shows I_v acts by characters. Then a twist of ρ factors through G/I_v, which is a cyclic group, contradiction. $\square$

Thm. (15.3.2.5). Let K be a p-adic field with residue field k and $k=\overline{k}$, then any $\rho\in\mathrm{Rep}^{\mathrm{pot.\,st}}_{\mathbb{Q}_\ell}(\mathrm{Gal}_K)$ comes from geometry.

Proof: Cf.[Fontaine, Galois Rep]P12.? □

Weil Representations

References are [Yao17].

Prop. (15.3.2.6)[Primitive Weil Representation]. $\pi\in\mathrm{Rep}^{\mathrm{alg}}(W_K)$ is called primitive if it is not induced from a representation of a proper subgroup. Then for any primitive representation of W_F, it factors through $C_{E/F}$ for some finite extension E/F by continuity, and by Clifford's theorem(15.1.2.10), the normal subgroup C_E acts by scalars, so the image of $W_{E/F}$ in $GL(V)$ is a finite group.

Def. (15.3.2.7) [Twisting Character of W_K]. For $s\in\mathbb{C}$, define the quasi-character $\omega_s:W_F\to\mathbb{C}^\times: x\mapsto||x||^s$.

Prop. (15.3.2.8) [Twisting of Weil Representation]. For any $\rho\in\mathrm{Irr}^{\mathrm{alg}}(W_F)$, there exists some $s\in\mathbb{C}$ that $\omega_s\otimes\rho$ factors through $W_F\to G_F$. And for this s, $(\omega_s\otimes\rho)(W_F)$ is a finite subgroup of $GL(V)$.

Proof: $\ker(\rho|_{I_F})$ is an open subgroup of I_F. Conjugation by σ induces a permutation on the finite subgroup $\rho(I_F)$, so there is some n that $\rho^n=\mathrm{id}$ on $\rho(I_F)$, which means $\rho(\sigma^n)$ commutes with each elements of W_F, thus it is a scalar by Schur's lemma. Thus we can chose s that $(\omega_s\otimes\rho)(\sigma^n)=0$, then $\omega_s\otimes\rho$ is trivial on $U=\langle\sigma^n,\ker(\rho|_{I_F})\rangle$, which is a subgroup of W_F of finite index. Thus the image is finite.

Also the closed subgroup $\overline{U}=\overline{\langle\sigma^n,\ker(\rho|_{I_F})\rangle}\subset\mathrm{Gal}_K$ if of finite index, and $\overline{U}\cap W_F=U$, thus $W_F/U\cong\mathrm{Gal}_F/\overline{U}$, and this representation extends to Gal_K. □

Cor. (15.3.2.9) [Galois-Type Representations]. As W_K is dense in Gal_K, $\mathrm{Rep}^{\mathrm{alg}}(\mathrm{Gal}_K)\subset\mathrm{Rep}^{\mathrm{alg}}(W_K)$ is a subcategory. The representations in this subcategory are called **representations of Galois-type**.

(15.3.2.8) shows Rep$^{\mathrm{alg}}(\mathrm{Gal}_K)$ are almost the same as Rep$^{\mathrm{alg}}(W_K)$. $\rho\in\mathrm{Rep}^{\mathrm{alg}}(W_K)$ is of Galois-type iff it has a finite image.

Prop. (15.3.2.10). Let ρ be a representation of W_K that $\rho(I_K)$ is finite, the following are equivalent:

- $\rho(\sigma)$ is semisimple for any $\sigma\in W_K$.
- $\rho(\varphi)$ is semisimple.
- ρ is a semisimple representation.

Proof: Cf.[Yao17]P4. □

Def. (15.3.2.11)[ℓ-Integral Representations]. For $\rho\in\mathrm{Rep}_{\overline{\mathbb{Q}}_\ell}(W_K)$, by(15.3.2.8), the eigenvalues of r are ℓ-adic units iff the eigenvalues of $\rho(\sigma)\in\mathcal{O}^*_{\overline{\mathbb{Q}}_\ell}$, iff the characteristic polynomial of $\rho(\sigma)$ are in $\mathcal{O}_{\overline{\mathbb{Q}}_\ell}[T]$ and $|\det(\rho(\sigma))|=1$. Such a representation is called an **ℓ-integral representation**.

Def. (15.3.2.12)[Types of 2-Dimensional Representations]. By(15.3.2.6), any 2-dimensional representation of W_F has finite image in $PGL(2,\mathbb{C})\cong SO(3,\mathbb{C})$(11.7.4.13). Thus by conjugacy into $SO(3,\mathbb{R})$, the image is isomorphic to a cyclic, dihedral, tetrahedral, octahedral or icosahedral group by(11.7.4.23), called the **type of this Weil representation**.

Def. (15.3.2.13)[Dihedral Representation]. A **dihedral Weil representation** is a representation $W_F \to GL(2,\mathbb{C})$ that is induced from a quasi-character of W_E for some quadratic extension E/F. (What's the relation with(15.3.2.12)**?**)

Prop. (15.3.2.14) [Induced Weil Representations]. If $(p,n) = 1$ and $K \in p\text{-}\texttt{NField}$, then any irreducible representation $W_K \to GL(n,\mathbb{C})$ is induced from a quasi-character of W_E(equivalently $E^\times$) where E is a n-dimensional field extension E/F.

Proof: By(10.11.5.4), the class of such induced extensions are stable under twisting by ω_s, thus using(15.3.2.8), we can assume that the representation factors through $G(\overline{F}/F)$, thus through $G(K/F)$ for some finite extension K/F, thus the assertion follows from(15.3.2.4). □

Def. (15.3.2.15)[Artin Conductor]. For $(\rho,V) \in \mathrm{Rep}^{\mathrm{alg}}(W_K)$, define the **Artin conductor**

$$f(\rho) = f(\chi_\rho) = \sum_{i>0} \frac{1}{[G_0 : G_i]} \dim(V/V^{G_i})$$

where G_i are the higher ramification groups of G.

Def. (15.3.2.16) [Artin Conductors]. Let L/F be a Galois extension of global fields and $(\rho,V) \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, for $v \in \Sigma_F^{\mathrm{fin}}$, let $G_v = G_{v,0} \supset G_{v,1} \supset \ldots \supset G_{v,m} = 0$ be higher ramification groups at v, then the **Artin conductor** of ρ is defined to be the ideal in $\mathcal{O}_F$:

$$\mathfrak{f}(\rho) = \prod_{v\in\Sigma_F^{\mathrm{fin}}} \mathfrak{p}_v^{a_v}, \quad a_v = \sum_{i\geq 0} \dim(V/V^{G_{v,i}})\frac{\#G_{v,i}}{\#G_{v,0}}.$$

And we also define the **Swan conductor**

$$\mathfrak{b}(\rho) = \prod_{v\in\Sigma_F^{\mathrm{fin}}} \mathfrak{p}_v^{b_v}, \quad b_v = \sum_{i\geq 1} \dim(V/V^{G_{v,i}})\frac{\#G_{v,i}}{\#G_{v,0}}.$$

Prop. (15.3.2.17) [Conductor-Discriminant-Formula]. For any Galois extension of global fields L/F,

$$\mathfrak{d}_{L/F} = \prod_{\rho\in\mathrm{Irr}(\mathrm{Gal}(L/F))} \mathfrak{f}(F,\rho)^{\chi_\rho(1)}$$

Proof: Cf.[Neu99]P534. □

Deligne-Weil Representations

Def. (15.3.2.18)[Weil-Deligne Groups]. The **Weil-Deligne group** WD_K is the group scheme $W_K \ltimes \mathbb{G}_a \in \mathcal{G}\mathrm{rp}/\mathbb{Q}$ given by the action

$$wxw^{-1} = |w|x.$$

Def. (15.3.2.19) [Deligne-Weil Representations]. For $L \in \texttt{Field}^0$, the category $\mathfrak{wd}_L(W_K)$ of **Deligne-Weil representations** of W_K over L consists of triples (ρ,V,N), where $(\rho,V) \in \mathrm{Rep}_L^{\mathrm{alg}}(W_K)$ and $N \in \mathrm{End}(V)$ s.t.

$$\rho(x)N\rho(x)^{-1} = |x|\cdot N, \quad x \in W_K.$$

Equivalently, a Deligne-Weil representation is a smooth representation (ρ,V) of W_K together with a W_K-map $V \mapsto V(1)$(15.3.1.6).

Equivalenly, a Deligne-Weil representation is a representation of the group scheme WD_K(15.3.2.18) over L, by**??**.

N is necessarily nilpotent, and for an irreducible Deligne-Weil representation, $N = 0$.

$\mathfrak{wd}_{\mathbb{C}}(W_K)$ is also denoted by $\mathfrak{wd}(W_K)$.

Proof: Because $\sigma N \sigma^{-1} = q^{-1} \cdot N$, N has no non-zero eigenvalues, so N is nilpotent. □

Remark (15.3.2.20). Deligne-Weil representations are exactly the continuous representations of W_K, as will be illustrated in(15.3.2.26).

Def. (15.3.2.21). Define tensor product and inner Homs: $(\rho_1, V_1, N_1) \otimes (\rho_2, V_2, N_2) = (\rho_3, V_3, N_3)$ where

$$V_3 = V_1 \otimes V_2, \quad \rho_3(x)(v_1 \otimes v_2) = \rho_1(x)v_1 \otimes \rho_2(x)v_2, \quad N_3(v_1 \otimes v_2) = N_1(v_1) \otimes v_2 + v_1 \otimes N_2(v_2).$$

and also $\mathrm{Hom}((\rho_1, V_1, N_1), (\rho_2, V_2, N_2)) = (\rho_3, V_3, N_3)$ where

$$V_3 = \mathrm{Hom}(V_1, V_2), \quad (\rho_3(x)\varphi)(v_1) = \rho_2(x)(\varphi(\rho_1(x)^{-1}(v_1))), \quad (N_3\varphi)(v_1) = N_2(\varphi(v_1)) - \varphi(N_1(v_1)).$$

And also the dual $\rho^\vee = \mathrm{Hom}(\rho, \mathbb{1})$.

Def. (15.3.2.22) [F-Semisimple Representations]. $\rho = (\rho_0, V, N) \in \mathfrak{wd}_L(W_K)$ is called **F-semisimple** if (ρ_0, V) is semisimple.

Prop. (15.3.2.23)[$\mathrm{Sp}_m(\rho)$]**.** If $(\rho, V) \in \mathrm{Rep}^{\mathrm{alg}}(W_K)$ and $m \geq 0$, we can define $\mathrm{Sp}_m(\rho) \in \mathfrak{wd}(W_K)$ given by $\mathrm{Sp}_m(\rho) = V \oplus V(1) \ldots \oplus V(m-1)$ and N maps $V(i)$ isomorphically to $V(i+1)$ for $i < m-1$, and trivial on $V(m-1)$.

Then any representation that

Thm. (15.3.2.24) [Grothendieck's ℓ-adic Monodromy Theorem]. For $\ell \in \mathbf{P} \setminus \{p\}$ and $\rho \in \mathrm{Rep}_{\mathbb{Q}_\ell}(W_K)$,

- There exists an open subgroup $I'_K \subset I_K$ and a uniquely determined nilpotent operator $N \subset \mathrm{End}(V)$ s.t. for all $\sigma \in I'_K$, $\rho(\sigma) = \exp(t_\ell(\sigma)N)$.
- For any element $x \in W_K$,

$$\rho(x)N\rho(x^{-1}) = |\cdot N.$$

Proof: Cf.[Fontaine, P12].**?** □

Cor. (15.3.2.25) [Potentially Unramified]. If ρ is a semisimple ℓ-adic continuous representation of W_K, then $\#\rho(I_K) < \infty$.

Proof: Choose a finite extension K'/K s.t. $I_{K'} \subset I'_K$, then $\rho|_{I_{K'}}$ is both unipotent and semisimple(15.1.2.10). □

Thm. (15.3.2.26) [ℓ-adic Deligne-Weil Representations, Deligne]. There is an equivalence of categories

$$\mathrm{WD} = \mathrm{WD}_p : \mathrm{Rep}^{\mathrm{fd}}(W_K) \cong \mathfrak{wd}(W_K)$$

$$(\rho, V) \mapsto (\rho_\sigma, V, N), \quad \rho_\sigma(\sigma^n x) = \rho(\sigma^n x)\exp(-t_\ell(x)N),$$

where N is given in(15.3.2.24).

Moreover, by(15.3.2.9) and (15.3.2.11), this map identifies

$$\mathrm{WD} : \mathrm{Rep}^{\mathrm{fd}}(\mathrm{Gal}_K) \cong \mathfrak{wd}^{\ell\text{-int}}(W_K),$$

and ρ is unramified iff $\mathrm{WD}(\rho)$ is unramified.

Proof: ? This is a Weil-Deligne representation by(15.3.2.24). WD is a functor and is an equivalence by the uniqueness of N(15.3.2.24). □

Cor. (15.3.2.27). In the above situation, for $\rho \in \mathrm{Rep}_L(\mathrm{Gal}_K)$, the following are equivalent:

- ρ is semisimple.
- ρ is F-semisimple and $\rho(I_K)$ is finite.
- ρ' is F-semisimple and $N = 0$.

3 Mod ℓ Local Galois Representations

Notation (15.3.3.1). Use notation as in(15.3.2.1).

Def. (15.3.3.2) [Decomposed Generically]. Let $K \in p-\texttt{LField}$ with residue field $\mathbb{F}_q$ and $\ell \in \mathbf{P}\backslash p$, an unramified representation

$$\overline{\rho} : \mathrm{Gal}_K \to \mathrm{GL}(n, \overline{\mathbb{F}_\ell})$$

is called **decomposed generically** if the eigenvalues $\{\lambda_1, \ldots, \lambda_n\}$ of $\overline{\rho}(\varphi)$ satisfies $\lambda_i/\lambda_j \notin \{1, q\}$ for any $1 \le i \ne j \le n$.

4 Representations from Geometry

Prop. (15.3.4.1). Let $k \in \texttt{Field}$ and $E \in \mathcal{E}\mathrm{ll}/k$, then for any $N \in \mathbb{Z} \cap k^\times$, there is an action of Gal_k on $E[N] \cong (\mathbb{Z}/(N))^2$, giving a representation

$$\rho_{E,N} : \mathrm{Gal}_k \mapsto GL(2, \mathbb{Z}/(N)).$$

Let $\overline{\rho}_{E,N}$ denote the representation $\mathrm{Gal}_k \mapsto GL(2, \mathbb{Z}/(N))/\{\pm 1\}$. Then $\rho_{E,N}$ is surjective iff $\overline{\rho}_{E,N}$ is surjective.

Proof: Notice if $\overline{\rho}_{E,N}$ is surjective, then either $\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}$ or $\begin{bmatrix} & 1 \\ -1 & \end{bmatrix}$ is in the image, thus -1 is in the image. □

Def. (15.3.4.2) [Tate modules]. For $\ell \in \mathbf{P}$, the action of Gal_k on the Tate module $T_\ell(E)$(13.5.6.15) is denoted by ρ_{E,ℓ^∞}.

Prop. (15.3.4.3) [Determinant of Tate Modules]. If (K, k) be a CDVR and $E \in \mathcal{E}\mathrm{ll}/K$, then $\det(\rho_{E,\ell^\infty})$ is the ℓ-cyclotomic character χ_{ℓ^∞}(15.3.1.6), by Weil pairing(13.5.7.6).

Prop. (15.3.4.4) [Serre]. Assume $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is non-CM, then there exists $N_0 \in \mathbb{Z}_+$ s.t. $\rho_{E,N}$ is surjective for any $N \ge N_0$.

Proof: □

Conj. (15.3.4.5) [Serre's Uniformity Problem]. There exists a number $N_0 \in \mathbb{Z}_+$ s.t. for any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ non-CM, $\rho_{E,N}$ is surjective for any $N \ge N_0$.

Proof: □

Deformation of Galois Representations(Mazur)

15.4 p-adic Local Galois Representations

Main references are [Berger, Galois representations and (φ,Γ)-modules], [Car19]. and [notes on p-adic Hodge, Conrad], [notes on p-adic Hodge, Serin Hong].

Notation (15.4.0.1).

- This is a continuation of the section Galois Representations(Basics).
- Use notations defined in Classical Representation Theory.
- Use notations defined in Fargues-Fontaine Curve.
- Let K be a p-adic field with (perfect) residue field k,
- $K_0 = W(k)[\frac{1}{p}]$ its maximal unramified subextension.
- The Frobenius action on K_0 is denoted by σ.
- $K_\infty = K(\mu_{p^\infty})$, $\Gamma = \mathrm{Gal}(K_\infty/K)$.

1 $\mathbb{C}_K$-Admissibility

$\mathbb{C}_K$-Admissibility

Prop. (15.4.1.1) [Variant of Hilbert's Theorem90]. Any $V \in \mathrm{Rep}^{\mathrm{fd}}_{\widehat{K^{\mathrm{ur}}}}(\mathrm{Gal}(K^{\mathrm{ur}}/K))$ is trivial. In particular, any unramified f.d. representation of Gal_K is $\widehat{K^{\mathrm{ur}}}$-admissible thus $\mathbb{C}_p$-admissible, which is a special case of(15.4.1.2).

Proof: Denote by $\mathcal{O}$ the ring of integers of $\widehat{K^{\mathrm{ur}}}$ and $\mathfrak{m}$ the maximal ideal, Let W be a f.d. $\widehat{K^{\mathrm{ur}}}$-semi-linear representation, $(v_{1,0},\ldots,v_{d,0})$ a basis of W over $\widehat{K^{\mathrm{ur}}}$ and $\mathcal{O}_W$ the $\mathcal{O}$-span of $(v_{1,0},\ldots,v_{d,0})$, then we are going to construct a sequence of tuples $(v_{1,n},\ldots,v_{d,n})$ that $v_{i,n+1}\equiv v_{i,n} \mod \mathfrak{m}^n$ and $\mathrm{Frob}_q(v_{i,n})\equiv v_{i,n} \mod \mathfrak{m}^n$ for all i and n.

Use induction on n: the case $n=1$ follows from the fact $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ is trivial as a $\overline{k}$-semi-linear representation of Gal_k. To prove this, notice there is a finite extension l of k and an l-semi-linear representation W_L of $G_{l/k}$ that $\overline{k}\otimes_l W_l \cong \mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$, then the assertion follows from Hilbert's theorem90(10.1.3.16).

For general n, we are looking for vectors $w_1,\ldots,w_d\in\mathcal{O}_W$ that $\mathrm{Frob}_q(v_{i,n}+\pi^n w_i)\equiv v_{i,n}+\pi^n w_i \mod \mathfrak{m}^{n+1}$, which is equivalent to $\mathrm{Frob}_q\overline{w_i}-\overline{w_i}=\frac{\mathrm{Frob}_q v_{i,n}-v_{i,n}}{\pi^n}$ in $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$. To prove this, notice $\mathrm{Frob}_q-\mathrm{id}$ is surjective on $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$, which follows from the fact $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ is trivial as proved above and $\mathrm{Frob}_q-\mathrm{id}$ is surjective on $\overline{k}$.

Now $v_{i,n}$ are Cauchy sequences and they converges to a tuple v_i that $G_{K^{ur}/K}$ acts trivially and it is an $\mathcal{O}$-basis of $\mathcal{O}_W$, as its reduction modulo $\mathfrak{m}$ is a basis of $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$, so it is a $\widehat{K^{\mathrm{ur}}}$-basis of W. □

Prop. (15.4.1.2) [$\mathbb{C}_p$-Admissibility]. For $(\rho,V)\in\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, the following are equivalent:

- V is $\mathbb{C}_p$-admissible.
- $\#\rho(I_K)<\infty$.
- V is $L\widehat{K^{\mathrm{ur}}}$-admissible for some finite extension L/K.

Proof: Cf.[p-adic Period Rings Intro, P18].?

$2\to 3$: This follows from(15.4.1.1). □

Cor. (15.4.1.3) [$H^0_{\text{cont}}(\text{Gal}_K, \mathbb{C}_p(\psi))$, Sen-Tate]. $H^0_{\text{cont}}(\text{Gal}_K, \mathbb{C}_p(\psi)) = \begin{cases} K & , \#\psi(I_K) < \infty \\ 0 & , \#\psi(I_K) = \infty \end{cases}$. In particular,

$$H^0_{\text{cont}}(\text{Gal}_K, \mathbb{C}_p(m)) = \begin{cases} K & , m = 0 \\ 0 & , m \neq 0 \end{cases}.$$

Proof: This follows from(15.1.1.19) and(15.4.1.2). For the last assertion, the cyclotomic extension of K thus also the cyclotomic character of G_K is infinitely unramified, thus χ^s_{cycl} factors through a finite quotient iff $s = 0$. And $H^0(\text{Gal}_K, \mathbb{C}_p) = K$ by Ax-Sen-Tate(12.2.5.7). □

Cor. (15.4.1.4) [Potentially Unramified]. If $\eta : \text{Gal}_K \to \mathbb{Z}_p^*$ is a character and there is $y \in \mathbb{C}_K^\times$ that $\eta(g) = g(y)/y$, then there exists a finite Abelian extension L of K that $\eta|_{G_L}$ is unramified, i.e. η is **potentially unramified**.

Cor. (15.4.1.5). For any $n, m \in \mathbb{Z}$,

$$\text{Hom}_{\text{Rep}_{\mathbb{C}_K}(\text{Gal}_K)}(\mathbb{C}_K(n), \mathbb{C}_K(m))$$

is of one-dimensional over K if $n = m$, and vanishes otherwise.

Proof: Let $W = \text{Hom}_{\mathbb{C}_p}(\mathbb{C}_K(n), \mathbb{C}_K(m)) = \mathbb{C}_K(m-n)$, then the desired space is W^{Gal_K}, and the assertion follows from(15.4.1.3). □

<u>H^1_{cont} **of** Gal_K**-Actions on** $\mathbb{C}_p(\psi)$</u>

Def. (15.4.1.6) [Notations]. Let $K \in p\text{-}\mathtt{NField}$, K_∞ is an Abelian extension of K that the Galois group Γ has a subgroup Γ_0 of finite index that $\Gamma_0 \cong \mathbb{Z}_p$, and $H_K = \text{Gal}_{K_\infty}$. The natural examples is $K_\infty = K(p^{\frac{1}{p^\infty}})$.

Let $\Gamma_m = \Gamma_0^m$ and K_m the fixed field of Γ_m.

Decompose $\Gamma = \Sigma \times \Gamma_0$ and let γ be a topological generator of Γ_0, then every element of Γ_0 can be written as γ^t for some $t \in \mathbb{Z}_p$. Denote $\gamma_s = \gamma^{p^s}$.

$\psi : G_K \to \Gamma \to \mathbb{Z}_p^*$ be a character factoring through Γ, then we can form a representation $\mathbb{C}_p(\psi)$ of G_K on $\mathbb{C}_p$ that $\rho(\sigma)(x) = \psi(\sigma)\sigma(x)$. This is an action because G_K acts trivial on $\mathbb{Z}_p^*$.

Lemma (15.4.1.7). Giving an $\sigma \in \text{Gal}(K/\mathbb{Q}_p)$, if $x, y \in \mathfrak{m}_{\mathbb{C}_p}$ that $x \equiv y \mod \pi_K^n$, then $[\pi_K]^\sigma(x) \equiv [\pi_K]^\sigma(y) \mod \pi_K^{n+1}$, where f^σ is given by action of σ on the coefficients.

Proof: This is because the coefficients of $[\pi_K]^\sigma$ are divisible by π_K except for degree q, where it is $x^q - y^q = (x-y)(x^{q-1} + x^{q-2}y + \ldots + y^{q-1})$ which is divisible by π_K^{n+1} because the residue field of K is of order q. □

Prop. (15.4.1.8). If we let the action of $\sigma \in \text{Gal}(K/\mathbb{Q}_p)$ on the residue field giving by $\overline{\sigma} : k_K \to \overline{\mathbb{F}}_p : x \mapsto x^{q_\sigma}$, where $q_\sigma = p^{n_\sigma}$ is a p-power, given an element $\eta = (\eta_0, \eta_1, \ldots) \in TG$, we have $\eta^{q_\sigma} \equiv [\pi_K]^\sigma(\eta_{n+1}^{q_\sigma}) \mod \pi_K$, hence the above lemma(15.4.1.7) shows that $[\pi_K^n]^\sigma \eta_n^{q_\sigma} \equiv [\pi_K^{n+1}]^\sigma(\eta_{n+1}^{q_\sigma}) \mod \pi_K^{n+1}$, so $[\pi_K^n]^\sigma(\eta_n^{q_\sigma})$ is a Cauchy sequence, converging to an element μ_σ(don't care about η).

If $g \in G_K$, then $g(\eta_n) = [\chi_K(g)](\eta_n)$, hence take q_σ-th power, $g(\eta_n^\sigma) \equiv [\chi_K(g)]^\sigma(\eta_n^{q_\sigma}) \mod \pi_K$, then

$$[\chi_K(g)]^\sigma [\pi_K^n]^\sigma(\eta_n^{q_\sigma}) \equiv [\pi_K^n]^\sigma g(\eta_n^{q_\sigma}) = g([\pi_K^n]^\sigma \eta_n^{q_\sigma}) \mod \pi_K.$$

hence by limiting, $g(\mu_\sigma) = [\chi_K(g)]^\sigma(\mu_\sigma)$.

Lemma (15.4.1.9).

$$v_p(\mu_\sigma)=\begin{cases}\frac{q_\sigma}{e_K(q-1)}+\frac{1}{e_K} & n(\sigma)\neq 0\\ \frac{1}{e_K(q-1)}+v_p(\sigma(\pi_K)-\pi_K) & n(\sigma)=0\end{cases}$$

Proof: By(8.5.3.28), we know the Newton polygon of $[\pi_K^n]^\sigma$. When $n(\sigma)\neq 0$, $v(\eta_1^{q_\sigma})=\frac{q_\sigma}{e_K(q-1)}>\frac{1}{e_K(q-1)}$, so the valuation of $[\pi_K]^\sigma(\eta_1^{q_\sigma})$ equals the valuation of its degree 1 term, which is $v(\pi_K\eta_1^{q_\sigma})=\frac{q_\sigma}{e_K(q-1)}+\frac{1}{e_K}$. Now we have by(15.4.1.8), we have $[\pi_K]^\sigma\eta^{q_\sigma}\equiv[\pi_K^2]^\sigma(\eta_2^{q_\sigma}) \mod \pi_K^2$, and $\frac{q_\sigma}{e_K(q-1)}+\frac{1}{e_K}<2/e_K$, so valuation already stable at degree 1, and $v(\mu_\sigma)=v([\pi_K]^\sigma(\eta_1^{q_\sigma}))$.

If $q_\sigma=1$, it's more delicate, because degree 1 and degree q term has the same minimal valuation, so they may jump to higher valuations. Notice $[\pi_K^n](\eta_n)=0$, so $[\pi_K^n]^\sigma(\eta_n)=([\pi_K^n]^\sigma-[\pi_K^n])(\eta_n)$. And we have by(12.2.2.21), for $x\in\mathcal{O}_K$, $v(\sigma(x)-x)\geq v(x)+v(\frac{\sigma(\pi_K)}{\pi_K}-1)+\delta_{v(x),0}v(\pi_K)$, with equality when $v_p(x)=q/e_K$. So by the Newton polygon, the minimum valuation of the coefficient of $[\pi_K^n]^\sigma-[\pi_K^n]$ appear at degree p^{n-1} and possibly p^n. The valuation of η_n is too small($\frac{1}{e_Kp^{n-1}(p-1)}$) that we don't need to consider other degrees but can assure that degree p^{n-1} is of minimum valuation, which is $v(\eta_n^{p^{n-1}})+v(\sigma(\pi_L)-\pi_L)=\frac{1}{e_K(q-1)}+v_p(\sigma(\pi_K)-\pi_K)$. □

Prop. (15.4.1.10). For any $\sigma\in\mathrm{Gal}(K/\mathbb{Q}_p)\backslash\{\mathrm{id}\}$, there is an element $\alpha_\sigma\in\mathbb{C}_p^*$ that $\sigma\circ\chi_K(g)=g(\alpha_\sigma)/\alpha_\sigma$ for all $g\in\mathrm{Gal}_K$, where χ_K is the Lubin-Tate character.

Proof: We let $\alpha_\sigma=\log^\sigma_{\mathcal{F}_\pi}(\mu_\sigma)$, by(15.4.1.9), $1/e_K<\mu_\sigma<\infty$, so by the Newton polygon analysis of $\log_{F_\pi}$(8.5.3.29), α_σ has the same valuation of μ_σ, in particular, $\alpha_\sigma\neq 0$. Then

$$g(\alpha_\sigma)=\log^\sigma_{\mathcal{F}_\pi}(g(\mu_\sigma))=(\log_{\mathcal{F}}\circ[\chi_K(g)])^\sigma(\mu_\sigma)=(\chi_K(g)\cdot\log_{\mathcal{F}_\pi})^\sigma(\mu_\sigma)=\sigma(\chi_K(g))\cdot\alpha_\sigma.$$

□

Cor. (15.4.1.11). $\log_p(\sigma(\chi_K(g)))=g(\log(\alpha_\sigma))-\log_p(\alpha_\sigma)$.

Prop. (15.4.1.12) [$H^1_{\mathrm{cont}}(\mathrm{Gal}_K,\mathbb{C}_p(\psi))$, Sen-Tate]. There is an inf-res exact sequence

$$0\to H^1_{\mathrm{cont}}(\Gamma_K,\widehat{K}_\infty(\psi))\to H^1_{\mathrm{cont}}(\mathrm{Gal}_K,\mathbb{C}_p(\psi))\to H^1_{\mathrm{cont}}(H_K,\mathbb{C}_p(\psi)),$$

and

$$H^1_{\mathrm{cont}}(H_K,\mathbb{C}_p(\psi))=0,\quad H^1_{\mathrm{cont}}(\mathrm{Gal}_K,\mathbb{C}_p(\psi))=\begin{cases}0 & ,\#\psi(I_K)=\infty\\ \text{a } K\text{-vector space of dimension 1} & ,\#\psi(I_K)<\infty\end{cases}.$$

Proof: For the first assertion, ψ is trivial on H_K, so $\mathbb{C}_p(\psi)\cong\mathbb{C}_p$ as H_K-representation, so it suffice to show for $\psi=\mathrm{id}$. Let f be a cocycle, as H_K is compact, $f(H_K)\in p^{-k}\mathcal{O}_{\mathbb{C}_p}$ for some integer k. So the lemma below(15.4.1.13) shows that we can move f cohomologouly to higher valuation, i.e. $f(g)=\sum x_i-g(\sum x_i)$, so f is a coboundary.

For the second assertion, we assume $\Gamma_K\neq\mathbb{Z}_p^*$, for this case, see remark(15.4.1.14) below.

let γ be a topological generator of $\Gamma_K=1+p^k\mathbb{Z}_2^*$, $k\geq 0$, because $\mathbb{Z}_p^*$ are all topological cyclic groups except for $\mathbb{Z}_2^*\cong\mathbb{Z}/2\mathbb{Z}\oplus\mathbb{Z}_2$, and γ_n be a topological generator of Γ_{F_n} which is also a power of γ. By(10.1.4.4) we know $H^1(\Gamma_K,\widehat{K}_\infty(\psi))=\widehat{K}_\infty(\psi)/1-\gamma$.

For n large, we have a decomposition $\widehat{K_\infty}(\psi)=K_n(\psi)\oplus X_n(\psi)$ by(12.2.3.31), and $1-\gamma_n$ is invertible on $X_n(\psi)$. Now $1-\gamma_n=(1-\gamma)(1+\gamma+\ldots+\gamma^{k-1})$, so $1-\gamma$ is also invertible in $X_n(\psi)$. And on $K_n(\psi)$, if ψ is of infinite order, then $1-\gamma$ is injective, otherwise $x=\psi(\gamma)^N\gamma^N(x)=\psi(\gamma)^Nx$. So it is also surjective because it is a K-linear mapping of K_n. So $\widehat{K_\infty}(\psi)/1-\gamma=0$. If ψ is of finite order then $K_n(\psi)\cong K_n$ as Γ_K-module when n is large enough that γ factors through Γ_{K_n}, by(10.1.3.1). So $K_n/1-\gamma=K_n/\ker(\mathrm{tr}_{K_n/K})=K$. □

Lemma (15.4.1.13). If $f : H_K \to p^n\mathcal{O}_{\mathbb{C}_p}$ is a continuous cocycle, then there exists a $x \in p^{n-1}\mathcal{O}_{\mathbb{C}_p}$ that the cohomologous cocycle $g \mapsto f(g) - (x - g(x))$ has values in $p^{n+1}\mathcal{O}_{\mathbb{C}_p}$.

Proof: $p^{n+2}\mathcal{O}_{\mathbb{C}_p}$ is open in $p^n\mathcal{O}_{\mathbb{C}_p}$, so there is a finite extension L/K that $f(H_L) \in p^{n+2}\mathcal{O}_{\mathbb{C}_p}$. By(12.2.3.25), there is a z that $\mathrm{tr}_{L_\infty/K_\infty}(z) = p$, so there is a $y \in p^{-1}\mathcal{O}_{L_\infty}$ that $\mathrm{tr}_{L_\infty/K_\infty}(y) = 1$.

Now for a set of representatives Q of H_K/H_L, denote $x_Q = \sum_{h\in Q} h(y)f(h)$, then for $g \in H_K$, $g(Q)$ is also a set of representative, and $g(x_Q) = \sum_{h\in Q} gh(y)gf(h) = \sum_{h\in Q} gh(y)(f(gh) - f(g)) = x_{g(Q)} - f(g)$, as $\mathrm{tr}(y) = 1$. So $f(g) - (x_Q - g(x_Q)) = x_{g(Q)} - x_Q$. The RHS is in $p^{n+1}\mathcal{O}_{\mathbb{C}_p}$, because: if we let $gh_i = h_{g(i)}a_i$, where $a_i \in H_L$, then $x_{g(Q)} - x_Q = \sum h_{g(i)}(y)f(h_{g(i)}a_i) - \sum h_{g(i)}(y)f(h_{g(i)}) = \sum h_{g(i)}(y)h_{g(i)}(f(a_i))$, which is in p^{n+1} because $h_{g(i)}(y) \in p^{-1}\mathcal{O}_{\mathbb{C}_p}$ and $f(a_i) \in p^{n+2}\mathcal{O}_{\mathbb{C}_p}$ by the choice of L. □

Remark (15.4.1.14). In case $\Gamma_K = \mathbb{Z}_2^*$,

$$0 \to H^1_{\mathrm{cont}}(\{\pm 1\}, K(\psi)) \to H^1_{\mathrm{cont}}(\mathbb{Z}_2^*, \widehat{K}_\infty(\psi)) \to H^1_{\mathrm{cont}}(1 + 2\mathbb{Z}_2^*, \mathbb{C}_p(\psi))$$

$H^1(\{\pm 1\}, K(\psi)) = 0$ whether $\psi(-1) = 1$ or -1. And by the same proof as above, possibly replace X_n with X_{n+1}, to remedy the singularity of $p = 2$, $H^1(1 + 2\mathbb{Z}_2^*, \mathbb{C}_p(\psi)) = K$, with generator $[g \mapsto \frac{\chi(g)-1}{\gamma-1}(a)]$ for some a. This cocycle extends to a cocycle of $\mathbb{Z}_2^*$, so the map is surjective.

Prop. (15.4.1.15). The 1-dimensional K-vector space $H^1_{\mathrm{cont}}(\mathrm{Gal}_K, \mathbb{C}_p)$ is generated by the cocycle $[g \mapsto \log_p \chi(g)]$.

Proof: By the proof of(15.4.1.12), we know that $H^1(\Gamma_K, K_n) \xrightarrow{f} H^1(G_K, \mathbb{C}_p)$ is an isomorphism. for $\alpha \in K$, if $\chi(g) = \gamma^k$, then $f(\alpha)(g) = (1 + \gamma + \ldots + \gamma^{k-1})(\alpha) = k\alpha = \alpha \cdot \log_p(\chi(g))/\log_p(\gamma)$. So by continuity, f is a multiple of $[g \mapsto \log_p(\chi(g))]$. □

Lemma (15.4.1.16). And $f \in \mathrm{Hom}(I_K^{\mathrm{ab}}, \mathbb{Q}_p)$ is of the form $f(g) = \mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g))$ for some $\beta_f \in K$.

Proof: By(12.6.2.25), χ_K is a canonical isomorphism $I_K^{ab} \cong \mathcal{O}_K^*$. Any $f \in \mathrm{Hom}(\mathcal{O}_K^*, \mathbb{Q}_p)$ is of the form $f(y) = \mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p(y))$ for some $\beta_f \in K$, because: by(12.2.3.9), when n is large, $\log_p$ is a bijection between U_K^n and $\pi_K^n\mathcal{O}_K$.

$\pi_K^n\mathcal{O}_K \to \mathbb{Q}_p$ can be extended to a map $K \to \mathbb{Q}_p$ as $\mathbb{Q}_p$ is divisible. Now trace is a invertible bilinear form on K, so the assertion is true on U_K^n for some n, and because U_K^n is of finite index in $\mathcal{O}_K^*$ and $\mathbb{Q}_p$ is of char 0, this is true for all $\mathcal{O}_K^*$. □

Prop. (15.4.1.17). The map $H^1(\mathrm{Gal}_K, \mathbb{Q}_p) \to H^1(\mathrm{Gal}_K, \mathbb{C}_p)$ is given as follows: as $f \in H^1(\mathrm{Gal}_K, \mathbb{Q}_p)$ must factor through $\mathrm{Gal}_K^{\mathrm{ab}}$, if the restriction of f to I_K^{ab} corresponds to β_f, then f maps to $\beta_f[g \mapsto \log_p \chi(g)]$.

Proof: $f(g) = \mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g))$ on I_K, but this map extends to map on G_K. So $f(g) = \mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g)) + c(g)$ for a unramified map c on G_K.

Now by(10.1.4.3), $H^1(G, \widehat{\mathbb{Q}}_p^{ur}/\mathbb{Q}_p)$ vanish because $H^1(G, \overline{\mathbb{F}}_p)$ vanish(10.1.3.1), so there is a $z \in \widehat{\mathbb{Q}}_p^{ur}$ that $c(g) = g(z) - z$. And

$$\mathrm{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g)) = \sum_\sigma \sigma(\beta_f \log_p \chi_K(g)) = \beta_f \,\mathrm{tr}_{K/\mathbb{Q}_p}(\log_p \chi_K(g)) + \sum_\sigma (\sigma(\beta_f) - \beta_f)\sigma(\log_p \chi_K(g)).$$

Notice(15.4.1.10) gives a β_σ that $\sigma(\log_p \chi_K(g)) = g(\beta_\sigma) - \beta_\sigma$, and $\mathrm{tr}_{K/\mathbb{Q}_p}(\log_p \chi_K(g)) = \log_p \chi(g)$ because $(N_{K/\mathbb{Q}_p}\chi_K(g))^{-1} = (\chi(g))^{-1}$, as they both correspond via local CFT to the element in G_K^{ab} which acts by g on L_π and id on K^{ur}. Thus the result. □

2 Hodge-Tate Representations

References are [Sen80] and [Car19].

Hodge-Tate Representations

Def. (15.4.2.1) [$B_{\text{H-T}}$]. Let $B_{\text{H-T}} = \mathbb{C}_K[t,t^{-1}], B'_{\text{H-T}} = \mathbb{C}_K((t))$, and let G_K acts on it by $g(at^i) = g(a)\chi_{\text{cycl}}(g)^i t^i$. In addition, there is a filtration on $B'_{\text{H-T}}$ given by $\text{Fil}^m B'_{\text{H-T}} = t^m\mathbb{C}_p[[t]]$, then the graded ring of $B'_{\text{H-T}}$ is isomorphic to $B_{\text{H-T}}$. (15.4.1.3) shows that $B_{\text{H-T}}^{\text{Gal}_K} = (B'_{\text{H-T}})^{\text{Gal}_K} = K$.

$B_{\text{H-T}}$ and $B'_{\text{H-T}}$ are Gal_K-regular(15.1.1.17).

Proof: $B'_{\text{H-T}}$ is Gal_K-regular because it is a field. For $B_{\text{H-T}}$, $B_{\text{H-T}} \subset \text{Frac}(B_{\text{H-T}}) \subset B'_{\text{H-T}}$, taking Gal_K-fixed points shows (H2). For (H3), if $\mathbb{Q}_p x$ is stable under Gal_K and x is not of the form at^i, then we can get a non-trivial Gal_K-fixed point of $\mathbb{C}_K(j-i)$, which is impossible by(15.4.1.3). □

Cor. (15.4.2.2) [Hodge-Tate Representations]. Let $W \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_K)$. For $k \in \mathbb{Z}$, let

$$W\{k\} = \{x \in W | g(x) = \chi_{\text{cycl}}^k(g)x\} \subset W(-k)$$

then

$$\bigoplus_{k\in\mathbb{Z}}(\mathbb{C}_K(k)\otimes_K W\{k\}) \to W$$

is injective. W is called a **Hodge-Tate representation** if this is an isomorphism.

Proof: Notice $B_{\text{H-T}} \cong \bigoplus_{m\in\mathbb{Z}} \mathbb{C}_K(m) \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_K)$, so

$$B_{\text{H-T}} \otimes_K (B_{\text{H-T}} \otimes_{\mathbb{C}_K} W)^{\text{Gal}_K} \cong B_{\text{H-T}} \otimes_K \bigoplus_{m\in\mathbb{Z}} (\mathbb{C}_K(m)\otimes_K W\{m\}) \hookrightarrow B_{\text{H-T}} \otimes_{\mathbb{C}_K} W.$$

is injective by(15.1.1.18). □

Cor. (15.4.2.3) [Hodge-Tate Representations]. Let K be a p-adic field, then $V \in \text{Rep}^{\text{fd}}_{\mathbb{Q}_p}(\text{Gal}_K)$ is called a **Hodge-Tate representation** if it is $B_{\text{H-T}}$-admissible. The category of Hodge-Tate representations are denoted by $\text{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\text{Gal}_K)$.

Then $V \in \text{Rep}^{\text{fd}}_{\mathbb{Q}_p}(\text{Gal}_K)$ is Hodge-Tate iff it is $B'_{\text{H-T}}$-admissible iff $\mathbb{C}_K \otimes_{\mathbb{Q}_p} V$ is Hodge-Tate thus decomposes as

$$\mathbb{C}_K \otimes_{\mathbb{Q}_p} V \cong \mathbb{C}_K(n_1) \oplus \ldots \oplus \mathbb{C}_K(n_d) \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_K).$$

Proof: If $\mathbb{C}_K \otimes_{\mathbb{Q}_p} V$ is Hodge-Tate, then clearly $\dim_K(B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_K} = \dim_{\mathbb{Q}_p} V$, thus V is $B_{\text{H-T}}$-admissible(15.1.1.19). Conversely, $\dim_K(B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_K} = \dim_{\mathbb{Q}_p} V = d$ implies V is Hodge-Tate by(15.4.2.2). The equivalence with $B'_{\text{H-T}}$-admissibility is similar. □

Def. (15.4.2.4)[Hodge-Tate Weights]. For $V \in \text{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\text{Gal}_K)$, V is said to have Hodge-Tate weights i with multiplicity d_i if $\dim_K W\{i\} = d_i$.

In particular, $\mathbb{Q}_p(n)$ has a single Hodge-Tate weight n.

Prop. (15.4.2.5). If $K' \in \texttt{Field}$, $K' \subset \overline{K}$, then for $W \in \text{Rep}^{\text{fd}}_{\mathbb{C}_K}(\text{Gal}_K)$, the natural maps

$$K' \otimes_K D_K(W) \to D_{K'}(W), \quad \widehat{K^{\text{ur}}} \otimes_K D_K(W) \to D_{\widehat{K^{\text{ur}}}}(W)$$

are isomorphisms. In particular,

$$\text{Rep}^{\text{fd}}_{\mathbb{Q}_p}(\text{Gal}_K) \cap \text{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\text{Gal}_{K'}) = \text{Rep}^{\text{fd}}_{\mathbb{Q}_p}(\text{Gal}_K) \cap \text{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(I_K) = \text{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\text{Gal}_K)$$

Proof: For $K' \subset \overline{K}$, $D_K(W) = D_{K'}(W)^{\text{Gal}(K'/K)}$, thus the isomorphism follows from Galois descent(15.1.1.14). For $\widehat{K^{\text{ur}}}$, Cf.[Conrad, P20]**?** □

3 Sen-Tate Theory

Colmez-Sen-Tate Conditions

Sen's Theory

Remark (15.4.3.1). Sen's theory goes further than $\mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ and to study $\mathrm{Rep}^{\text{fd}}_{\mathbb{C}_K}(\mathrm{Gal}_K)$.

Prop. (15.4.3.2) [Hilbert's Theorem90 for Gal_{K_∞}]. Any $W \in \mathrm{Rep}^{\text{fd}}_{\mathbb{C}_p}(\mathrm{Gal}_K)$ is trivial as a $\mathbb{C}_p$-semi-linear representation of Gal_{K_∞}. In particular, there is an isomorphism

$$\mathbb{C}_K \otimes_{\widehat{K_\infty}} W^{\mathrm{Gal}_{K_\infty}} \cong W \in \mathrm{Rep}_{\mathbb{C}_K}(\mathrm{Gal}_{K_\infty}).$$

Proof: The proof is similar to that of(15.4.1.1).

Let $\mathcal{O}_W$ be any $\mathcal{O}_{\mathbb{C}_p}$-lattice in W. Firstly we construct a $\mathbb{C}_p$-basis $w_1, \ldots, w_d$ of W that $w_i \in \mathcal{O}_W$ and $gw_i \equiv w_i \mod p^2\mathcal{O}_W$ for all $g \in \mathrm{Gal}_{K_\infty}$ and $p\mathcal{O}_W \subset \mathcal{O}_{\mathbb{C}_p}w_1 \oplus \ldots \oplus \mathcal{O}_{\mathbb{C}_p}w_d$.

By continuity there is a finite Galois extension L/K that **?** Cf.[p-adic Hodge Intro, P23]. □

Prop. (15.4.3.3). By(15.4.3.2), the next step of Sen's theory is to study $W \in \mathrm{Rep}_{\widehat{K_\infty}}(\Gamma_K)$. To this attempt, Sen considers the subspace of Γ_K-finite vectors in W, they form a vector space $W_0 \subset W$ over K_∞. Then there exists an integer r and a basis $(v_1, \ldots, v_d)$ of W that the K_r-span of v_i are stable under Γ_K-actions.

Obviously, these v_i are G_K-finite, thus in particular

$$\widehat{K_\infty} \otimes_{K_\infty} W_0 \cong W.$$

Proof: Cf.[p-adic Hodge Intro, P25].**?** □

Cor. (15.4.3.4) [Sen's Operator]. Combining the previous two propositions, let $W \in \mathrm{Rep}^{\text{fd}}_{\mathbb{C}_p}(\mathrm{Gal}_K)$, denote $\widehat{W}_\infty = W^{G_{\overline{K}/K_\infty}}$ and W_∞ the set of Γ_K-finite vectors of $\widehat{W}_\infty$, then

$$\mathbb{C}_p \otimes_{K_\infty} W_\infty \cong W.$$

Let $v_1, \ldots, v_d$ be given by(15.4.3.3), $W_r = \oplus K_r v_i$. For $g \in G_K$, let $\rho_W(g)$ be the endomorphism of W_r given by action of g, then $\rho_W(\gamma_s)$ is linear when $s \geq r$, and because γ_s converges to id, $\log \rho_W(\gamma_s)$ is defined for s large. Then **Sen's operator** Φ_W is defined to be $\Phi_W = \frac{\log \rho(\gamma_s)}{p^s}$, or equivalently $\Phi_W(v) = \lim_{t\to 0} \frac{\gamma^t(v)-v}{t}$.

Sen's operator is defined over K, as it commutes with Γ_K seen from the limit form, and its kernel is the $\mathbb{C}_p$-subspace of W generated by elements invariant under Γ_K.

Proof: It is evident that fixed points of Γ_K are killed by Φ_W. Conversely, the kernel of Φ_W on W_∞ is stable under action of G_K, thus is a sub-representation of Γ_K in W_∞, and because W_∞ consists of finite vectors, the G_K-action is continuous w.r.t the discrete topology, and Hilbert's theorem90(10.1.3.16) shows this subspace is generated by elements invariant under G_K. □

Prop. (15.4.3.5) [Sen's Category]. Let $\mathrm{Sen}(K, K_\infty)$ be the category of f.d. K_∞-vector spaces equipped with an endomorphism defined over K, then the construction sending W to (W_∞, Φ_W) induces a functor

$$\mathrm{Sen} : \mathrm{Rep}^{\text{fd}}_{\mathbb{C}_p}(\mathrm{Gal}_K) \to \mathrm{Sen}(K, K_\infty).$$

This functor commutes with direct sums, and also under tensor products, with the Sen's operator given by

$$\Phi_{W\otimes W'} = \Phi_W \otimes \mathrm{id}_{W'} + \mathrm{id}_W \otimes \Phi_{W'}.$$

This functor is faithful, but in general not full. However, it reflects isomorphisms.

Proof: This functor is faithful because W_∞ generates W as a $\mathbb{C}_p$-vector space. To show it reflects isomorphism, Let $f : W_\infty \to W'_\infty$ be an isomorphism commuting with Sen's operator, then it extends by linearity to an isomorphism of $\mathbb{C}_p$-vector spaces $W \to W'$, and f is Γ_s-equivariant for some s by the definition of Sen's operator. Then considering the space of Γ_s-equivariant $\mathbb{C}_p$-linear morphisms from W to W', Hilbert's theorem90 shows there is a basis f_i consisting of G_K-equivariant morphisms. Then it remains to show there exists a linear K-combination of f_i that is invertible. This is possible because it is true for K_s, as f is invertible, and K is an infinite field. □

Cor. (15.4.3.6). $W \in \mathrm{Rep}^f_{\mathbb{C}_p}(\mathrm{Gal}_K)$ is trivial iff $\Phi_W = 0$.

Proof: As $\mathcal{S}$ reflects isomorphisms, compare with the trivial representation $\mathbb{C}_p^d$. □

Prop. (15.4.3.7) [Hodge-Tate Representations and Sen's Operators]. A representation $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(G_K)$ is Hodge-Tate iff the Sen's operator $\Phi_{\mathbb{C}_p\otimes_{\mathbb{Q}_p}V}$ is semisimple with eigenvalues in $\mathbb{Z}$. For a general V, the eigenvalues of $\Phi_{\mathbb{C}_p\otimes_{\mathbb{Q}_p}V}$ is called the **generalized Hodge-Tate weights** of V.

Proof: If V is a Hodge-Tate representation, then clearly $\Phi_W(v) = \lim_{t\to 0}\frac{\gamma^t(v)-v}{t}$ acts by k on $\mathbb{C}_p(k)$, thus it is semisimple with eigenvalues in $\mathbb{Z}$. Conversely, on the i-eigenspace of Φ, tensoring χ_{cycl}^{-i}, Φ acts trivially, then because the kernel of Φ are the fixed points of Γ_K(15.4.3.4), thus this eigenspace is isomorphic to $\mathbb{C}_p(i)^d$, so V is Hodge-Tate. □

4 Fontaine's Rings

Notation (15.4.4.1). In this subsection, we denote $B_{\mathrm{dR}}, B_{\mathrm{crys}}$ etc. to denote Fontaine's ring w.r.t. the perfectoid field $\mathbb{C}_K$ defined in1.

Lemma (15.4.4.2). Let $\varepsilon = (\ldots, \varepsilon_1, \varepsilon_0) \in \mathcal{O}^\flat_{\mathbb{C}_K}$ s.t. $\varepsilon_0 = 1$ and $\varepsilon_1 \neq 1$, then $|\varepsilon - 1| = \frac{p}{p-1}$.

Proof:

$$|\varepsilon-1| = |(\varepsilon-1)^\sharp|_{\mathbb{C}_K} = |\lim_{n\to\infty}(\varepsilon_n-1)^{p^n}|_{\mathbb{C}_K} = \lim_{n\to\infty} p^n|\varepsilon_n - 1| = \lim_{n\to\infty}\frac{p^n}{p^{n-1}(p-1)} = \frac{p}{p-1}$$

□

Prop. (15.4.4.3) [$\mathbb{Q}_p$-Line in B_{dR}]. $\theta([\varepsilon]-1) = \varepsilon_0 - 1 = 0$, so $[\varepsilon]-1 \in \ker\theta$, and we can define

$$t_\varepsilon = \log([\varepsilon]) = \sum_{n\geq 1}(-1)^{n-1}\frac{([\varepsilon]-1)^n}{n} \in B^+_{\mathrm{dR}}.$$

Then this is a uniformizer in the CDVR B^+_{dR}. Moreover, any other choice of ε is of the form $\varepsilon' = \varepsilon^a$ for $a \in \mathbb{Z}_p$, then $t_{\varepsilon'} = at_\varepsilon$, and $\gamma(t_\varepsilon) = \chi_{\mathrm{cycl}}(\gamma)t$ for any $\gamma \in \mathrm{Gal}_K$.

Proof: t_ε is a uniformizer because $[\varepsilon]-1$ is: $[\varepsilon^{1/p}]-1$ is a unit in B_{dR}, and

$$\eta=\frac{[\varepsilon]-1}{[\varepsilon^{1/p}]-1}=1+[\varepsilon^{1/p}]+\ldots+[\varepsilon^{(p-1)/p}]$$

is distinguished, because if $\eta=\sum[c_n]p^n$, consider reducing to the residue field: $W(\mathcal{O}_{\mathbb{C}_K^\flat})\to W(\mathcal{O}_{\mathbb{C}_K^\flat}/t)$, then $\overline{\varepsilon}=1$ by(15.4.4.2), and $\overline{\eta}=p$, thus $|c_0|<1,|c_1-1|<1$, so it is distinguished(4.5.4.20), thus a uniformizer by(14.2.1.2).

For the last assertion, by the formal property of log, it suffices to show that if $a_i\to a\in\mathbb{Z}_p$, then $[\varepsilon^{a_i}]\to[\varepsilon^a]\in B_{\text{dR}}$. Then it suffices to show that for $a\in\mathbb{Z}_p,|a|$ small,

$$|[\varepsilon^a]-1|\to 0.$$

And this can be done with the topology given in(14.2.1.20)**?** □

Cor. (15.4.4.4). $\operatorname{gr}(B_{\text{dR}})\cong B_{\text{H-T}}$.

Cor. (15.4.4.5). B_{dR} is Gal_K-regular, but B_{dR}^+ is not Gal_K-regular.

Proof: B_{dR} is Gal_K-regular because it is a field. B_{dR}^+ is not Gal_K-regular because $\mathbb{Q}_p t_\varepsilon$ is stable under Gal_K-action but t_ε is not invertible in B_{dR}^+. □

Prop. (15.4.4.6) [Galois Actions]. Gal_K acts on $\mathcal{O}_{\mathbb{C}_K}/(p)$ thus acts on $\mathcal{O}_{\mathbb{C}_K^\flat}$ and on A_{inf}. Then Fontaine's functor $\theta:A_{\text{inf}}\to\mathcal{O}_{\mathbb{C}_K}$ is Gal_K-equivariant, thus $\ker\theta$ is Gal_K-stable, so Gal_K-acts on B_{dR}^+ and B_{dR}, and $B_{\text{dR}}\to\mathbb{C}_K$ is Gal_K-equivariant.

Prop. (15.4.4.7). There is a canonical lifting of $\overline{K}\to\mathbb{C}_K$ along $B_{\text{dR}}^+\to\mathbb{C}_K$, and it is Gal_K-equivariant.

However, this embedding is not continuous, thus there is no embedding $\mathbb{C}_K\subset B_{\text{dR}}^+$.

Proof: $K_0=W(k)[\frac{1}{p}]\subset W(\mathcal{O}_{\mathbb{C}_K}^\flat)[\frac{1}{p}]=B_{\text{inf}}\subset B_{\text{dR}}$, and it follows from Hensel's lemma that any element in $\overline{K}$ lifts uniquely to an element of B_{dR}^+, so $\overline{K}\subset B_{\text{dR}}^+$, and is Gal_K-invariant, by uniqueness and the fact $B_{\text{dR}}\to\mathbb{C}_K$ is Gal_K-equivariant(15.4.4.6).

For the last assertion, if the embedding is continuous, the $B_{\text{dR}}^+\to\mathbb{C}_K$ has a section, and the filtration splits so $B_{\text{dR}}\cong B_{\text{H-T}}$. □

Prop. (15.4.4.8).

- $K=(B_{\text{dR}}^+)^{\text{Gal}_K}=B_{\text{dR}}^{\text{Gal}_K}$
- $K_0=B_{\text{crys}}^{\text{Gal}_K}$, and the canonical morphism $K\otimes_{K_0}B_{\text{crys}}\to B_{\text{dR}}$ is injective.
- $\mathbb{Q}_p=B_e^{\text{Gal}_K}$.
- $\mathbb{Q}_p=(\operatorname{Fil}^0 B_\mu)^{\text{Gal}_K}$ for $\mu=\text{crys}$ or $\mu\geq 1$.

Proof: 1: Firstly $K\subset B_{\text{dR}}$ and is invariant under Gal_K by(15.4.4.7). On the other hand, the exact sequence

$$0\to\operatorname{Fil}^{m+1}B_{\text{dR}}\to\operatorname{Fil}^m B_{\text{dR}}\to\mathbb{C}_p(m)\to 0\text{(15.4.4.13)}.$$

induces an injection

$$B_{\text{dR}}^{\text{Gal}_K}\cap\operatorname{Fil}^m B_{\text{dR}}/B_{\text{dR}}^{\text{Gal}_K}\cap\operatorname{Fil}^{m+1}B_{\text{dR}}\hookrightarrow\mathbb{C}_p(m)^{\text{Gal}_K}.$$

Thus $B_{\text{dR}}^{\text{Gal}_K}=B_{\text{dR}}^{\text{Gal}_K}=K$.

2: The injectivity of $K\otimes_{K_0}B_{\text{crys}}\to B_{\text{dR}}$ Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.2.8].

3: From 2 and notice $B_e=B_{\text{crys}}^{\varphi=\text{id}}$.

4: Cf.[Period Rings, P45].**?** □

Lemma (15.4.4.9). Let $W \in \mathcal{V}\mathrm{ect}_K^{\mathrm{fd}}$, then the map:

$$\{\text{Filtrations on } W\} \to \{\mathrm{Gal}_K\text{-stable } B_{\mathrm{dR}}^+\text{-lattice in } W \otimes_K B_{\mathrm{dR}}\} : \mathrm{Fil} \mapsto \mathrm{Fil}^0(W \otimes_K B_{\mathrm{dR}})$$

is bijective and the inverse is given by $\Gamma \mapsto \{(t^n\Gamma)^{\mathrm{Gal}_K} \subset (B_{\mathrm{dR}} \otimes_{B_{\mathrm{dR}}^+} \Gamma)^{\mathrm{Gal}_K} = W\}_{n\in\mathbb{Z}}$.

Proof: Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.4.3].**?** □

deRham and Crystalline Representations

Def. (15.4.4.10) [deRham, Crystalline and Semistable Representations]. Situation as in(15.4.4.8), for $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$,

- V is called a **deRham representation** iff V is B_{dR}-admissible**??**, or equivalently
$$\dim_K(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V)^{\mathrm{Gal}_K} = \dim_{\mathbb{Q}_p} V.$$
The category of deRham representations of Gal_K are denoted by $\mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$.
- V is called a **crystalline representations** iff V is B_{crys}-admissible, or equivalently
$$\dim_{K_0}(B_{\mathrm{crys}} \otimes_{\mathbb{Q}_p} V)^{\mathrm{Gal}_K} = \dim_{\mathbb{Q}_p} V.$$
The category of crystalline representations of Gal_K are denoted by $\mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{crys}}(\mathrm{Gal}_K)$.

Def. (15.4.4.11) [$\mathrm{Rep}'_{B_e}(\mathrm{Gal}_K)$]. Denote by $\mathrm{Rep}'_{B_e}(\mathrm{Gal}_K)$ the category of finite locally free B_e-modules M with a semi-linear Gal_K-action that there exists a Gal_K-invariant B_{dR}^+-lattice $\Gamma \in M \otimes_{B_e} B_{\mathrm{dR}}$ that G_K acts continuously.

Summary

Prop. (15.4.4.12) [Diagram of Inclusions].

$$\begin{array}{ccccccccccc}
B_{\mathrm{inf}}^+ & \longrightarrow & B_\mu^+ & \hookrightarrow & B_{\mathrm{crys}}^+ & \hookrightarrow & B_\mu^+ & \hookrightarrow & B_{\mathrm{max}}^+ & \hookrightarrow & B_{\mathrm{dR}}^+ \\
 & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 & & \underset{(\mu>p-1)}{B_\mu} & \hookrightarrow & B_{\mathrm{crys}} & \hookrightarrow & \underset{(1\le\mu\le p-1)}{B_\mu} & \hookrightarrow & \underset{=B_1^+}{B_{\mathrm{max}}} & \hookrightarrow & B_{\mathrm{dR}}
\end{array}$$

Prop. (15.4.4.13) [Properties of B_{dR}].

- B_{dR} is a discretely valued field with residue field $\mathbb{C}_K$ and valuation ring B_{dR}^+.
- B_{dR} is an algebra over $\overline{\widehat{K^{\mathrm{ur}}}} = \overline{K}\widehat{K^{\mathrm{ur}}}$ but not over $\mathbb{C}_K$.
- B_{dR} has a special uniformizer t_ε s.t. $\mathbb{Q}_p t_\varepsilon \cong \mathbb{Q}_p(1) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$.
- B_{dR} has a filtration $\{\mathrm{Fil}^m B_{\mathrm{dR}} = t_\varepsilon^m B_{\mathrm{dR}}^+\}$, and $B_{\mathrm{dR}}^{\mathrm{gr}} \cong B_{\text{H-T}}$ as graded rings.
- $B_{\mathrm{dR}}^{\mathrm{Gal}_K} = K$.

Proof: 1 follows from(14.2.1.18), 2 follows from(15.4.4.7). 3 follows from(15.4.4.3). 4 follows from(15.4.4.4). 5 follows from(15.4.4.8). □

Prop. (15.4.4.14) [Properties of B_{crys}].

- B_{crys} is an algebra over $\widehat{K^{\text{ur}}}$.
- B_{crys} has a Frobenius endomorphism φ.
- There is a canonical embedding $B_{\text{crys}} \otimes_{K_0} K \hookrightarrow B_{\text{dR}}$, and $t_\varepsilon \in B_{\text{crys}}$.
- $B_{\text{crys}}^{\text{Gal}_K} = K_0$.
- $(B_{\text{crys}} \cap B_{\text{dR}}^+)^{\varphi=1} = \mathbb{Q}_p$.

Proof: ? □

5 deRham Representations

Lemma (15.4.5.1). Let V be a finite $\mathbb{Q}_p$-vector space with an action of Gal_K, then the action is continuous iff the induced action on $V \otimes_{\mathbb{Q}_p} B_{\text{dR}}^+$ is continuous.

Proof: This is because the action of Gal_K on B_{dR}^+ is continuous, and V has the induced topology in $V \otimes_{\mathbb{Q}_p} B_{\text{dR}}^+$. □

Prop. (15.4.5.2) [$\mathbb{C}_K$-admissible Representations are deRham]. $\text{Rep}_{\mathbb{Q}_p}^{\mathbb{C}_K\text{-adm}}(\text{Gal}_K) \subset \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$.

Proof: For $V \in \text{Rep}_{\mathbb{Q}_p}^{\mathbb{C}_K}$, by(15.4.1.2), there exists a finite extension L/K s.t. V is $L\widehat{K^{\text{ur}}}$-admissible. Thus V is deRham as $L\widehat{K^{\text{ur}}} \subset B_{\text{dR}}$(15.4.4.13). □

Prop. (15.4.5.3) [Potentially deRham are deRham]. Let $K' \subset \mathbb{C}_K$ be another p-adic field, then

$$\text{Rep}_{\mathbb{Q}_p}(\text{Gal}_K) \cap \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_{K'}) = \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K).$$

In particular, being deRham is not sensible to ramifications, which is a bad feature compared to being crystalline or semistable.

Proof: Because $\widehat{K^{\text{ur}}} \subset \widehat{(K')^{\text{ur}}}$ is of finite degree, it suffices to prove for two cases: K'/K is finite or $K' = \widehat{K^{\text{ur}}}$. But the finite case follows from Galois descent the same as**??**. The second case follows from [Conrad, P80]? □

Prop. (15.4.5.4) [Filtered D_{dR}]. For $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$, there is a finite filtration Fil on $D_{\text{dR}}(V)$ s.t.

$$\text{Fil}^m D_{\text{dR}}(V) = (t^m B_{\text{dR}} \otimes_E V)^{\text{Gal}_K} \subset D_{\text{dR}}(V).$$

Prop. (15.4.5.5) [deRham Representations are Hodge-Tate]. For $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$,

- there is an injection of graded vector spaces

$$\text{gr}(D_{\text{dR}}(V)) \hookrightarrow D_{\text{H-T}}(V),$$

- If $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$, the map in item1 is an isomorphism, and V is Hodge-Tate.
- If $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$,

$$B_{\text{dR}} \otimes_K D_{\text{dR}}(V) \cong B_{\text{dR}} \otimes_{\mathbb{Q}_p} V$$

  identifies filtrations.

Proof: 1: Consider the exact sequences

$$0 \to \mathrm{Fil}^{m+1} B_{\mathrm{dR}} \to \mathrm{Fil}^m B_{\mathrm{dR}} \to \mathbb{C}_p(m) \to 0 (15.4.4.13).$$

Tensoring V and taking Gal_K-invariants give injections

$$h : \mathrm{gr}^m(D_{\mathrm{dR}}(V)) \hookrightarrow V(m)^{\mathrm{Gal}_K},$$

giving the injection $\mathrm{gr}(D_{\mathrm{dR}}(V)) \hookrightarrow D_{\text{H-T}}(V)$.

2: If $V \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, this is an isomorphism by dimension reason, and V is Hodge-Tate by dimension reason.

3: Firstly notice $\mathrm{Fil}^m(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \subset \mathrm{Fil}^m(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V)$ is trivial, thus it suffices to show that the induced map

$$f : \mathrm{gr}(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \to \mathrm{gr}(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V) = B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V$$

is an isomorphism. But notice

$$B_{\text{H-T}} \otimes \mathrm{gr}(D_{\mathrm{dR}}(V)) \xrightarrow{g} \mathrm{gr}(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \xrightarrow{f} B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V$$

equals $B_{\text{H-T}} \otimes h$, so g is an isomorphism because it is surjective, and thus f is also an isomorphism. □

Cor. (15.4.5.6). 1-dimensional Hodge-Tate representations are deRham.

Proof: This is because if $V \cong \mathbb{Q}_p(\psi)$ where ψ is a character of Gal_K, and $\mathbb{C}_p \otimes_E V \cong \mathbb{C}_p(m)$, then by Sen-Tate(15.4.1.3), $\psi(-m)$ is potentially unramified, thus $\mathbb{C}_p$-admissible by(15.4.1.2), and thus deRham(15.4.5.2). □

Remark (15.4.5.7) [D_{dR} Insensitive to Ramifications]. D_{dR} is far from fully faithful. In fact, any unramified representation V is deRham by(15.4.5.3), and $D_{\mathrm{dR}}(V)$ is a simple filtration with graded ring $K^d[0]$, but V can be different from trivial representation.

Prop. (15.4.5.8). The functor $D_{\mathrm{dR}} : \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \to \mathrm{Fil}\,\mathcal{V}\mathrm{ect}_K$ is faithful and exact, and commutes with taking tensor products and duals. Moreover, the perfect pairing in(15.1.1.20) is a perfect pairing of filtered vector spaces.

Proof: Let $0 \to V_1 \to V \to V_2 \to V \in \mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ be an exact sequence, then V_i are also Hodge-Tate by(15.4.5.5), so there is an exact sequence

$$0 \to \mathrm{gr}(D_{\mathrm{dR}}(V_1)) \to \mathrm{gr}(D_{\mathrm{dR}}(V)) \to \mathrm{gr}(D_{\mathrm{dR}}(V_2)) \to 0,$$

showing that

$$0 \to D_{\mathrm{dR}}(V_1) \to D_{\mathrm{dR}}(V) \to D_{\mathrm{dR}}(V_2) \to 0$$

is an exact sequence of filtered vector spaces.

For tensor product, it suffices to show that

$$\mathrm{gr}(D_{\mathrm{dR}}(V_1) \otimes D_{\mathrm{dR}}(V_2)) \to \mathrm{gr}(D_{\mathrm{dR}}(V_1 \otimes V_2))$$

is an isomorphism, which reduces to

$$D_{\text{H-T}}(V_1) \otimes D_{\text{H-T}}(V_2) \cong D_{\text{H-T}}(V_1 \otimes V_2) (15.1.1.20).$$

For perfect pairing, it suffices to show that the map

$$D_{\mathrm{dR}}(V^\vee) \to D_{\mathrm{dR}}(V)^\vee$$

is an isomorphism of filtered vector spaces. But then it reduces to the isomorphism

$$D_{\text{H-T}}(V^\vee) \cong D_{\text{H-T}}(V)^\vee (15.1.1.20).$$

□

Prop. (15.4.5.9) [Extensions of deRham Representations]. If $0 \to V_1 \to V \to V_2 \to 0$ is an exact sequence in $\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ s.t. V_1, V_2 are deRham, and the Hodge-Tate weights of V_1 are strictly larger than that of V_2, then V is deRham.

In particular, any upper-triangular representation with diagonal $(\mathbb{Q}_p(a_1), \mathbb{Q}_p(a_2), \ldots, \mathbb{Q}_p(a_n))$ with $a_1 > a_2 \ldots > a_n$ is deRham.

Proof: By twisting, we may assume that all Hodge-Tate weights of V_1 are positive and Hodge-Tate weights of V_2 are non-positive. There is an exact sequence

$$0 \to D_{\mathrm{dR}}(V_1) \to D_{\mathrm{dR}}(V) \to D_{\mathrm{dR}}(V_2) = \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2)$$

so it suffices to show that $\mathrm{Fil}^0 D_{\mathrm{dR}}(V) \to \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2)$ is surjective. But it follows from(10.1.3.15) that there is an exact sequence

$$\mathrm{Fil}^0 D_{\mathrm{dR}}(V) \to \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2) \to H^1_{\mathrm{cont}}(\mathrm{Gal}_K, B^+_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1).$$

So it suffices to show that $H^1(\mathrm{Gal}_K, B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) = 0$. The exact sequence

$$0 \to t_\varepsilon^{m+1} B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1 \to t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1 \to \mathbb{C}_p(m) \otimes_{\mathbb{Q}_p} V_1 \to 0$$

induces a surjection $H^1_{\mathrm{cont}}(\mathrm{Gal}_K, t_\varepsilon^{m+1} B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) \twoheadrightarrow H^1_{\mathrm{cont}}(\mathrm{Gal}_K, t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1)$ by hypothesis. Notice B^+_{dR} is t_ε-complete, so we can use approximation technique similar to(10.1.4.3) to show that $H^1_{\mathrm{cont}}(\mathrm{Gal}_K, t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) = 0$. □

Remark (15.4.5.10). For an example of $V \in \mathrm{Rep}^{\text{H-T}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ that is not deRham, Cf.[Conrad, P78].

B_{dR}-Representations

Fontaine in [Arithmétique des représentations galoisiennes p-adiques, 2004] studied $\mathrm{Rep}_{B_{\mathrm{dR}}}(\mathrm{Gal}_K)$ in similar spirit of Sen's theory. He firstly showed that any B_{dR}-representations descends to a $K_\infty((t))$-representation W, and similar to Sen's operator, Fontaine defined a K_∞-linear derivative $\nabla_W : W \to W$.

6 (φ, Γ)-Modules

Main References are [Fontaine90: Représentations p-adiques des corps locaux],[Fontaine94a: Le corps des périodes p-adiques] and [Fonatine94b: Repésentations p-adiques semi-stables]. [Foundations of Theory of (φ, Γ)-modules over the Robba Ring] is used and I'm mostly following [Berger, Galois representations and (φ, Γ)-modules].

Def. (15.4.6.1) [φ-module]. Let M be a A-module and $\sigma : A \to A$ is a ring map. Then an additive map $\varphi : M \to M$ is called **σ-semi-linear** iff $\varphi(am) = \sigma(a)\varphi(m)$ for $a \in A$. A **φ-module** over (A, σ) is an A-module M with a σ-semi-linear φ. The category of φ-modules over A is denoted by $\varphi\text{-}\mathcal{M}\mathrm{od}_A$.

Giving a A-module M and a $\varphi : M \to M$, there is a map $\Phi : A \otimes_{\sigma,A} M = \sigma_* M \to M : \lambda \otimes m \to \lambda\varphi(m)$, which is a A-module map iff φ is σ-semi-linear.

If we define a ring $A_\sigma[\varphi]$ as the free group $A[X]$ modulo the relation $Xa = \sigma(a)X$ and ring relations in A, then it is a ring. Then a φ-module over (A, σ) is equivalent to a left $A_\sigma[\varphi]$-module.

Thus $\varphi\text{-}\mathcal{M}\mathrm{od}_A$ is a Grothendieck Abelian category with tensor products, and moreover, the kernel as $A_\sigma[\varphi]$-module is the same as the kernel as a A-module.

Def. (15.4.6.2). If there is a map $\alpha : (A_1, \sigma_1) \to (A_2, \sigma_2)$ that commutes with σ_i, then we have a **pullback** from $\Phi\mathcal{M}_1$ to $\Phi\mathcal{M}_2$: $\alpha^*(M) = (A_2)_{\sigma_2}[\varphi] \otimes_{(A_1)_{\sigma_1}[\varphi]} M$(15.4.6.1).

Def. (15.4.6.3) [Étale φ-Modules]. If A is Noetherian, then a φ-module M is called **étale** iff it is f.g and the corresponding $\Phi : \sigma_* M \to M$ in(15.4.6.1) is a bijection. The subcategory of étale φ-modules is denoted by $\varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}})(A)$.

In case when σ is a bijection, Φ is a bijection iff φ is a bijection.

Proof: Note that in this case $\sigma_* M \to M$ is a bijection by $\lambda \otimes m \to \sigma^{-1}(\lambda)m$, so the rest is easy. □

Prop. (15.4.6.4). If A is Noetherian and A_σ is flat, then $\varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(A)$ is a Tannakian category.

Proof: 0 is the zero object, the canonical sum&product are clearly étale . And we need to check the kernel and cokernel are étale . But we have an exact sequence $0 \to \ker \to M \to N \to \mathrm{Coker} \to 0$ so we tensor with A_σ to get a morphism of sequences that $\sigma_* M \to M, \sigma_* N \to N$ are both bijective, so by 5-lemma, it is bijection at kernel and cokernel, so they are étale . □

Def. (15.4.6.5) [Dual Étale φ-Modules]. For $E \in \mathtt{Field}, M \in \varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(E)$, the isomorphism $\Phi : M_\varphi \cong M$ induces an isomorphism

$$\Phi^t : M^\vee \cong (M_\varphi)^\vee = M_\varphi^\vee.$$

Thus the dual $\Phi^{-t} : M_\varphi^\vee \cong M^\vee$ shows $M^\vee$ is also an étale φ-module.

Prop. (15.4.6.6) [$\mathbb{F}_p$-Representations and Étale φ-Modules]. Let $E \in \mathtt{Field}^p$, then

- For any $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{F}_p}(\mathrm{Gal}_E)$, V is E^{sep}-admissible, and

$$D_{E^{\mathrm{sep}}}(V) = (E^{\mathrm{sep}} \otimes V)^{\mathrm{Gal}_E}$$

  has a φ-action, and it is an étale φ-module.

- For any $M \in \varphi\text{-}\mathcal{M}\mathrm{od}(E)$,

$$\mathbb{V}(M) = (E^{\mathrm{sep}} \otimes_E M)^{\varphi=\mathrm{id}}$$

  is a $\mathbb{F}_p$-representation of Gal_E, and there is an injection

$$\alpha_M : E^s \otimes_{\mathbb{F}_p} \mathbb{V}(M) \hookrightarrow E^s \otimes_E M.$$

- These two functors define an equivalence of Tannakian categories(3.1.6.13)

$$D_{E^{\mathrm{sep}}} : \mathrm{Rep}_{\mathbb{F}_p}(\mathrm{Gal}_E) \cong \varphi\text{-}\mathcal{M}\mathrm{od}^{\text{ét}}(E) : \mathbb{V}.$$

Proof: 1: V is E^{sep}-admissible by(15.1.1.14). To show it is étale , it suffices to show that $\varphi : D_{E^{\mathrm{sep}}}(V) \to D_{E^{\mathrm{sep}}}(V)$ is bijective. Let $e_1, \ldots, e_n$ be a basis of $D_{E^{\mathrm{sep}}}(V)$, and $v_1, \ldots, v_n$ be a basis of V, then $\underline{e} = \underline{v}B$ for some matrix $B \in \mathrm{GL}(n; E^{\mathrm{sep}})$. Then if $[\varphi]\underline{e} = A\overline{e}$ for $A \in \mathrm{Mat}(n; E)$, then $A = B^{-1}\varphi(B)$, and $\det(A) = \det(B)^{p-1} \neq 0$, so φ is bijective.

2: It suffices to show that if $v_1, \ldots, v_h \in \mathbb{V}(M)$ are linearly dependent over E^{sep}, then they are dependent over $\mathbb{F}_p$. For this, we use induction on h: Suppose $\sum \lambda_i v_i = 0$, we may assume that $v_h = -1$, so $v_h = \sum_{i=1}^{h-1} \lambda_i v_i$, and by an action of φ, then $\sum_{i=1}^{h-1}(\lambda_i^p - \lambda_i)v_i = 0$, so by induction hypothesis, $\lambda_i \in \mathbb{F}_p$.

3: For $V \in \mathrm{Rep}_{\mathbb{F}_p}(\mathrm{Gal}_E)$, because E is E^{sep}-admissible,

$$\mathbb{V}(D_{E^{\mathrm{sep}}}(V)) = (E^{\mathrm{sep}} \otimes_E D_{E^{\mathrm{sep}}}(V))^{\mathrm{Gal}_E} \cong (E^{\mathrm{sep}} \otimes_{\mathbb{F}_p} V)^{\mathrm{Gal}_E} = V.$$

Conversely, there is a

To show these are isomorphisms of Tannakian categories, one can easily show that both $D_{E^{\mathrm{sep}}}$ and $\mathbb{V}$ preserve tensor products and they identify identity elements $\mathbb{F}_p$ and E. □

Cor. (15.4.6.7). Isomorphism classes of d-dimensional p-adic representations of Gal_E are in bijection with the isomorphism classes of matrixes in $\mathrm{GL}(d; E)$ where

$$A \sim B \iff \exists P \in \mathrm{GL}(d; E), B = P^{-1}A\varphi(P).$$

Galois Representations and Étale φ-Modules

Notation (15.4.6.8). Let $E \in \mathtt{Field}^p$, denoted $\mathcal{O}_{\mathcal{E}} = \mathrm{Coh}(E)$(4.5.3.27), and $\mathcal{E} = \mathrm{Frac}(\mathcal{O}_{\mathcal{E}}) = \mathcal{O}_{\mathcal{E}}[\frac{1}{p}]$. $\mathcal{E}$ has a natural Frobenius.

Prop. (15.4.6.9). By the functoriality of Cohen rings**?**, if $\mathcal{O}_{\mathcal{E}^{\mathrm{ur}}} = \mathrm{Coh}(\overline{E})\mathcal{E}^{\mathrm{ur}} = \mathcal{O}_{\mathcal{E}^{\mathrm{ur}}}[\frac{1}{p}]$, then there is a bijection $\mathrm{Gal}(\mathcal{E}^{\mathrm{ur}}/\mathcal{E}) \cong \mathrm{Gal}_E$. Thus there are Gal_K-action and φ-action on $\mathcal{O}_{E^{\mathrm{ur}}}, \mathcal{E}_{\mathrm{ur}}$ and by continuity extends to actions on $\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}}, \widehat{\mathcal{E}_{\mathrm{ur}}}$, and

$$(\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}})^{\mathrm{Gal}_E} = \mathcal{E}, \quad (\mathcal{E}^{\mathrm{ur}})^{\mathrm{Gal}_E} = \mathcal{O}_E, (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}})^{\varphi=\mathrm{id}} = \mathbb{Q}_p, \quad (\mathcal{E}^{\mathrm{ur}})^{\varphi=\mathrm{id}} = \mathbb{Z}_p.$$

Proof: **?** □

Prop. (15.4.6.10). For $M \in \varphi\text{-}\mathfrak{Mod}^{\mathrm{ft}}(\mathcal{O}_{\mathcal{E}})$, M is étale over $\mathcal{O}_E$ iff $M/(p)$ is étale over E.

Proof: This is because étale is equivalent to the matrix of φ is a bijection, which is equivalent to its reduction modulo p is a bijection. □

Def. (15.4.6.11) [Effective φ-Modules]. An **effective φ-module** over $\mathcal{E}$ is a φ-module $(D, \varphi) \in \varphi\text{-}\mathfrak{Mod}_{\mathcal{E}}$ s.t. there is a complete $\mathcal{O}_E$-lattice M of D that $\varphi(M) \subset M$.

Def. (15.4.6.12) [Stably-Étale φ-Modules]. A **stably-étale φ-module** over $\mathcal{E}$ is a φ-module over $\mathcal{E}$ s.t. there exists a φ-stable $\mathcal{O}_{\mathcal{E}}$-lattice in $\mathcal{E}$ that is an étale φ-module over $\mathcal{O}_E$. Then the category of stably-étale φ-modules is a Tannakian category, denoted by $\varphi\text{-}\mathfrak{Mod}^{\mathrm{st}\cdot\mathrm{\acute{e}t}}(\mathcal{O}_{\mathcal{E}})$.

Proof: For $\mathcal{O}_{\mathcal{E}}$ this follows from(15.4.6.4), and for $\mathcal{E}$, notice if $D = M[\frac{1}{p}], D' = M'[\frac{1}{p}]$, then

$$\mathrm{Hom}_{\varphi\,\mathfrak{Mod}^{\mathrm{\acute{e}t}}(\mathcal{E})}(D, D') = \mathrm{Hom}_{\varphi\,\mathfrak{Mod}^{\mathrm{\acute{e}t}}(\mathcal{O}_{\mathcal{E}})}(L, L')[\frac{1}{p}]$$

and $p : D' \to D'$ is an isomorphism, so it follows that $\varphi\,\mathfrak{Mod}^{\mathrm{\acute{e}t}}(\mathcal{O}_{\mathcal{E}})$ is also Abelian. □

Prop. (15.4.6.13). Any $V \in \mathrm{Rep}_{\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}}}(\mathrm{Gal}_E)$ is trivial.

Proof: Cf.[Fontaine-Ouyang]P34.**?** □

Thm. (15.4.6.14) [Classification of $\mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_E)$]. For $V \in \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_E)$,

$$\mathbb{M}(V) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V)^{\mathrm{Gal}_E}$$

is an étale φ-module over $\mathcal{O}_{\mathcal{E}}$, and for any $M \in \varphi\text{-}\mathfrak{Mod}^{\text{ét}}(\mathcal{O}_{\mathcal{E}})$,

$$\mathbb{V}(M) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M)^{\varphi=\mathrm{id}}$$

is a $\mathbb{Z}_p$-representation of Gal_E. And these two functors define an equivalence of categories:

$$\mathbb{M} : \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_E) \cong \varphi\text{-}\mathfrak{Mod}^{\text{ét}}(\mathcal{O}_{\mathcal{E}}) : \mathbb{V}.$$

Proof: To show $\mathbb{M}(V)$ is étale , Cf.[Fontaine]P35.
By(15.4.6.15), we have an isomorphism

$$\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} \mathbb{V}(M) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M,$$

and by(15.4.6.13),

$$\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{M}(V) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V.$$

Thus

$$\mathbb{V}(\mathbb{M}(V)) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{M}(V))^{\varphi=\mathrm{id}} \cong (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V)^{\varphi=\mathrm{id}} = V(15.4.6.9),$$

$$\mathbb{M}(\mathbb{V}(M)) = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} \mathbb{V}(M))^{\mathrm{Gal}_E} \cong (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M)^{\mathrm{Gal}_E} = M(15.4.6.9).$$

□

Lemma (15.4.6.15). Situation as in(15.4.6.14),

$$\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} V(M) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M.$$

Proof: Cf.[Fontaine-Ouyang]P36.**?** □

Thm. (15.4.6.16) [Classification of $\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_E)$].

- For $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_E)$,

$$\mathbb{D}(V) = (\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} V)^{\mathrm{Gal}_E}$$

  is an stably-étale φ-module over $\mathcal{E}$, and there is a natural isomorphism

$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathcal{E}} \mathbb{D}(V) \cong \widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} V.$$

- for any $D \in \varphi\text{-}\mathfrak{Mod}^{sst.\,\text{ét}}(\mathcal{E})$,

$$\mathbb{V}(D) = (\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathcal{E}} D)^{\varphi=\mathrm{id}}$$

  is a $\mathbb{Q}_p$-representation of Gal_E, and there is a natural isomorphism

$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} \mathbb{V}(D) \cong \mathcal{E}^{\mathrm{ur}} \otimes_{\mathcal{E}} D,$$

- These two functors define an equivalence of Abelian Tannakian categories(3.1.6.13):

$$\mathbb{M} : \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_E) \cong \varphi\text{-}\mathcal{M}\mathrm{od}^{sst.\,\text{ét}}(\mathcal{E}) : \mathbb{D}.$$

Proof: For any $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_E)$, by(15.3.1.3), there exists a stable $\mathbb{Z}_p$-lattice, thus

$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathbb{Q}_p} V = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathbb{Z}_p} T)[\frac{1}{p}], \quad \mathbb{D}(V) = \mathbb{D}(T)[\frac{1}{p}] = \mathcal{E} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{D}(T).$$

and for any $D \in \varphi\text{-}\mathcal{M}\mathrm{od}^{\mathrm{st}\,.\,\text{ét}}(\mathcal{E})$, there exists an $\mathcal{O}_{\mathcal{E}}$-lattice stable under φ, which is an étale φ-module over $\mathcal{O}_E$. Thus

$$\widehat{\mathcal{E}^{\mathrm{ur}}} \otimes_{\mathcal{E}} D = (\mathcal{O}_{\widehat{\mathcal{E}^{\mathrm{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M)[\frac{1}{p}], \quad \mathbb{V}(D) = V(M)[\frac{1}{p}] = \mathbb{Q}_p \otimes_{\mathbb{Z}_p} \mathbb{V}(M).$$

Thus it is clear that the assertion follows from that of(15.4.6.14). □

Cor. (15.4.6.17). Étale modules over E of rank d are of the form $M_A = \oplus_{i=1}^d E e_i$ with

$$\varphi : M \to M : \varphi(\lambda e_j) = \lambda^p \sum_{i=1}^d a_{ij} e_i.$$

Isomorphism classes of d-dimensional $\mathbb{Q}_p$-representations of Gal_E are in bijection with the isomorphism classes of matrixes in $\mathrm{GL}(d; \mathcal{O}_{\mathcal{E}})$ where

$$A \sim B \iff \exists P \in \mathrm{GL}(d; \mathcal{E}), B = P^{-1} A \varphi(P).$$

(φ, Γ)-Modules

Def. (15.4.6.18) [(φ,Γ)-modules]. If A is a topological ring with a Frobenius φ, and A has an action of a topological group Γ that commutes with σ, then a (φ,Γ)**-module** M is a φ-module M over A with a semi-linear action of Γ that commutes with φ.

If A is complete and φ is flat, then an **étale** (φ,Γ)**-module** M is a (φ,Γ)-module that the φ-module structure is étale (15.4.6.3).

Similar to φ-modules, (φ,Γ)-modules forms a Tannakian category.?

Thm. (15.4.6.19) [Classification of $\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$].

Overconvergent (φ, Γ)-Modules

Filtered (φ, N)-Modules

Def. (15.4.6.20) [$(\varphi, N, \mathrm{Gal}(L/K))$-Modules]. Let L/K be a Galois extension with residue field k_L and $L_0 = L \cap K_0$.

Then the category $(\varphi,N)\text{-}\mathcal{M}\mathrm{od}_{L/K}$ of $(\varphi, N, \mathrm{Gal}(L/K))$-modules consists of f.d. L_0-spaces V_0 with

- a σ-semi-linear endomorphism,
- a L_0-linear endomorphism N,
- a semi-linear continuous action of $\mathrm{Gal}(L/K)$ (w.r.t the discrete topology).

That satisfies:

- $N\varphi = p\varphi N$,
- N, φ commutes with $\mathrm{Gal}(L/K)$-actions.

Notice that the condition implies N maps the subspace of φ-slope l to the subspace of φ-slope $l-1$, in particular, N is nilpotent.

Prop. (15.4.6.21). Situation as in(15.4.6.20), (φ, N)-$\mathcal{M}\mathrm{od}_{L/K}$ is an Abelian Tannakian category, where the actions on the tensor is defined to as follows:

$$\varphi(v\otimes w) = \varphi(v)\otimes\varphi(w), \quad N(v\otimes w) = N(v)\otimes w + v\otimes N(w), \quad g(v\otimes w) = g(v)\otimes g(w).$$

Def. (15.4.6.22) [Filtered $(\varphi, N, \mathrm{Gal}(L/K))$-Modules]. The category (φ, N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ of **filtered $(\varphi, N, \mathrm{Gal}(L/K))$-module** consists of tuples

$$(V, \varphi, N, \mathrm{Gal}(L/K), \mathrm{Fil}^\bullet)$$

where

- $(V, \varphi, N, \mathrm{Gal}(L/K)) \in (\varphi, N)$-$\mathcal{M}\mathrm{od}_{L/K}$(15.4.6.20),
- $(V\otimes_{L_0} L, \mathrm{Fil}^\bullet) \in \mathrm{Fil}_L$.

The category φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ of **filtered φ-modules(isocrystals)** over K is the Abelian subcategory of $(\varphi, N, \mathrm{Gal}(L/K))$-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ with $N = 0$. φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{K/K}$ is also denoted by φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_K$.

Prop. (15.4.6.23) [HN-Formalism for Filtered φ-Modules]. The category φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$(15.4.6.22) is a HN-formalism where $\mathcal{A}$ is the Abelian category φ-$\mathcal{M}\mathrm{od}(L_0)$(15.4.6.20), the rank is defined as usual and

$$\deg((V, \varphi, \mathrm{Fil}^\bullet)) = t_{\text{H-T}}(V_L, \mathrm{Fil}^\bullet) - t_N(V, \varphi)$$

where $t_{\text{H-T}}$ is the Hodge-Tate degree(3.2.4.27) and $t_N = v_p(\det(\varphi; V))$. This is a HN-formalism.

Proof: The proof is clear, the same as that of(3.2.4.27). □

Def. (15.4.6.24) [Weakly Admissible φ-Modules]. The cateogory φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}^{\text{weak. adm}}$ of **weakly admissible φ-modules** is the subcategory of φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ consisting of objects that are semistable of slope 0 w.r.t the HN-formalism(15.4.6.23). It is an Abelian category by(3.2.4.33).

Prop. (15.4.6.25) [Faltings]. The subcategory (φ, N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}^{\text{weak. adm}} \subset (\varphi, N)$-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ is stable under tensor products. In particular, (φ, N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}^{\text{weak. adm}}$ is an Tannakian category.

Proof: [Tensor Products in p-adic Hodge, Totaro, P9,12]. □

Cor. (15.4.6.26). The subcategory φ-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_K^{\text{weak. adm}} \subset \varphi$-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_K$ is stable under tensor products and duals.

Cor. (15.4.6.27). Tensor product of semistable filtered isocrystals in (φ, N)-$\mathrm{Fil}\,\mathcal{M}\mathrm{od}_{L/K}$ is also semistable.

Proof: This is because shifting the filtration of a semistable filtered isocrystal of slope c down by c gives a weakly admissible filtered isocrystal. □

7 Crystalline Representations

References are [Crystalline Representations and F-crystals, Kisin].

Thm. (15.4.7.1). The Tannakian category of crystalline representations of Gal_K is equivalent to the Tannakian categories of weakly admmisible filtered isocrystals.

Proof: □

Prop. (15.4.7.2). Let L/K be a finite field extension, then

$$\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)\cap\mathrm{Rep}^{\mathrm{crys}}_{\mathbb{Q}_p}(\mathrm{Gal}_L)=\mathrm{Rep}^{\mathrm{crys}}_{\mathbb{Q}_p}(\mathrm{Gal}_K).$$

Proof: Cf.[Period Rings, P52].**?** □

Prop. (15.4.7.3) [Unramified Representations are crystalline].

$$\mathrm{Rep}^{\mathrm{fd,ur}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)\subset\mathrm{Rep}^{\mathbb{C}_p\text{-adm}\,+\,\mathrm{crys}}_{\mathbb{Q}_p}(\mathrm{Gal}_K).$$

Proof: By(15.4.1.1), any unramified $V\in\mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ is $\widehat{K^{\mathrm{ur}}}$-admissible, thus B_{crys}-admissible as $\widehat{K^{\mathrm{ur}}}\subset B_{\mathrm{crys}}$(15.4.4.14). And V is also $\mathbb{C}_p$-admissible by(15.4.1.1).

To show the converse inclusion, use(15.4.1.2)(15.1.1.16) and the fact $L\widehat{K^{\mathrm{ur}}}\cap B_{\mathrm{crys}}=\widehat{K_0^{\mathrm{ur}}}$**?**. □

Remark (15.4.7.4). For examples of $V\in\mathrm{Rep}^{\mathrm{dR}}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ that is not crystalline, Cf.[Period Rings, P52].**?**

Prop. (15.4.7.5) [Crystalline Representation]. The functor

$$\mathcal{D}:\mathrm{Rep}_{B_e}(G_K)'\to\varphi\text{-}\mathcal{M}\mathrm{od}_{K_0}:W\mapsto(W\otimes_{B_e}B_{\mathrm{crys}})^{\mathrm{Gal}_K}$$

are left adjoint to the functor

$$\mathcal{V}:\varphi\text{-}\mathcal{M}\mathrm{od}_{K_0}\to\mathrm{Rep}_{B_e}G_K':(D,\varphi_D)\mapsto(D\otimes_{K_0}B_{\mathrm{crys}})^{\varphi_D\otimes\varphi=\mathrm{id}}$$

Moreover, $\mathcal{V}$ is fully faithful, $\mathrm{id}\cong\mathcal{D}\circ\mathcal{V}$, $\mathcal{V}\circ\mathcal{D}\hookrightarrow\mathrm{id}$, and $M\in\mathrm{Rep}_{B_e}(\mathrm{Gal}_K)$ is in the image of $\mathcal{V}$ iff $\mathcal{V}(\mathcal{D}(M))\cong M$.

Proof: Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.2.12]. □

Cor. (15.4.7.6). In particular, a B_e-representation is crystalline iff it is in the image of $\mathcal{V}$. Now we define a Vector bundle $\mathcal{E}$ on X to be crystalline iff the $H^0(X\backslash\{\infty\},\mathcal{E})$ is crystalline.

8 Semistable Representations

Thm. (15.4.8.1) [deRham $\iff$ potentially Semistable(Fontaine's Potentially Semistable Theorem), Colmez/André-Kedlaya-Mebkhout]. $V\in\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ is deRham iff it is potentially semistable.

Proof: □

Cor. (15.4.8.2). For $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$, we have the following implications:

$$\begin{array}{ccccc}
\text{unramified} = \mathbb{C}_p\text{-adm} + \text{crystalline} & \Longrightarrow & \text{crystalline} & \Longrightarrow & \text{semistable} \\
\Downarrow & & \Downarrow & & \Downarrow \\
\mathbb{C}_p\text{-adm} = \text{pot.unramified} = \text{Hodge-Tate with weights } 0 & \Longrightarrow & \text{pot.crys} & \Longrightarrow & \text{de Rham} = \text{pot.semistable} \\
 & & & & \Downarrow \\
 & & & & \text{Hodge-Tate}
\end{array}$$

Prop. (15.4.8.3). A potentially semistable representation defines an isomorphism class of Weil-Deligne representations $WD_q \to \mathrm{GL}(d, \overline{\mathbb{Q}}_\ell)$.

15.5 Representations of Algebraic Groups

References are[Mil17].

1 Basics

Throughout this subsection, G is an affine algebraic group over a field k if not said.

Def. (15.5.1.1) [Linear Representations of Algebraic Groups]. Let R be a ring and V a free R-module, let $\mathrm{GL}(V)$ be the group functor

$$\mathcal{CA}\mathrm{lg}_R \to \mathcal{G}\mathrm{rp} : R' \mapsto \mathrm{Aut}(V \otimes_R R').$$

Then a **linear representation** (r, V) of an algebraic group G over R is a homomorphism of group functors $r : G \to \mathrm{GL}(V)$. It is called **faithful representation** if r is a monomorphism as natural transformation of functors.

If V is of f.d., this is equivalent to a homomorphism $G \to \mathrm{GL}(V)$. And by(8.1.5.6), it is faithful iff $G \to GL(V)$ is a closed embedding.

For a linear representation (r, V), let $\mathrm{End}(V) = \mathrm{Aut}(r)$.

Prop. (15.5.1.2) [Representations and Co-modules]. A representation of G on V is equivalent to a right $\Gamma(G)$-comodule structure on V(2.9.1.10).

Proof: Let $A = \Gamma(G)$. For any representation $r : G \to GL(V)$, it induces a map $G(A) \to GL_A(V \otimes A)$, which maps id_A to a map $\rho : V \to V \otimes A$. Now if $\rho(e_j) = \sum e_i \otimes a_{ij}$, then by funtoriality, the map $G(R') \to GL_R(V \otimes R')$ is given by $g \mapsto (e_j \mapsto e_i \otimes a_{ij}(g))$.

And it can be verified that this is a group homomorphism iff the comodule condition is satisfied. □

Def. (15.5.1.3) [Stabilizers]. Let (r, V) be a representation of an affine group scheme G over R, W a subspace of V, consider the functor

$$\mathrm{Stab}_G(W) : R' \mapsto \{g \in G(R') | g(W_{R'}) = W_{R'}\},$$

then if V is of f.d., $\mathrm{Stab}_G(W)$ is representable by a closed subgroup of G, called the **stabilizer group scheme** of W in V.

Proof: Let $\rho : \Gamma(G) \to V \otimes \Gamma(G)$ be the comodule action corresponding to r, let $\{e_i\}_{i\in I}$ be a basis for W, and extends it to a basis $\{e_i\}_{J \coprod I}$ of V, and

$$\rho(e_j) = \sum e_i \otimes a_{ij}, \quad a_{ij} \in \Gamma(G).$$

Let $g \in \mathrm{Hom}(\Gamma(G), R')$, then $ge_j = \sum e_i \otimes g(a_{ij})$, and then clearly G_W is represented by the quotient of $\Gamma(G)$ by the ideal generated by $\{a_{ij} | i \in I, j \in J\}$. □

Cor. (15.5.1.4). If S is a scheme and G is an affine group scheme over S, $\mathcal{V}$ a locally free sheaf on S and $\mathcal{W}$ a locally free subsheaf of $\mathcal{V}$, then similarly $\mathrm{Stab}_G(\mathcal{W})$ is representable by a closed subgroup of G over S, by considering affine-locally.

Cor. (15.5.1.5). Let (ρ, V) be a f.d. representation of G and $S \subset G(k)$ be a subset schematically dense in G, then a subspace $W \subset V$ is stable under G iff it is stable under S.

Prop. (15.5.1.6)[Fixed Subspace]. Let (r, V) be a linear representation of an algebraic group, define the **fixed subspace** by G:

$$V^G = \{v \in V | gv_R = v_R, \forall R \in \mathcal{CAlg}_k, g \in G(R)\}.$$

Then for any $R \in \mathcal{CAlg}_k$, $V^G \otimes R$ is the submodule of $V \otimes R$ that is fixed by elements of $G(R')$ for any $R' \in \mathcal{CAlg}_R$.

Proof: Cf.[Mil17]P96. □

Cor. (15.5.1.7). The fixed subspace is compatible with base change of fields.

Def. (15.5.1.8) [Subrepresentations]. A subspace W of a linear representation V of an algebraic group G is called a **subrepresentation** of V if $\widetilde{G} = \mathrm{Stab}_G(W)$.

A linear representation is called **simple** if has no non-trivial subrepresentations.

Prop. (15.5.1.9). Let U be a normal subgroup of an algebraic group G, then for any representation V of G, V^U is a subrepresentation of V.

Prop. (15.5.1.10)[Union of F.D. Subrepresentations]. Let (r, V) be a linear representation of G, then V is a filtered union of its f.d. subrepresentations.

Proof: It suffices to consider comodules and prove any vector $v \in V$ is contained in a f.d. subcomodule. Let $\{e_i\}$ be a basis of $\Gamma(G)$, let

$$\Delta(e_i) = \sum_{i,k} r_{ijk} e_j \otimes e_k, \quad \rho(v) = \sum_i v_i \otimes e_i, \quad v_i \in V.$$

Because $(\mathrm{id}_V \otimes \Delta) \circ \rho = (\rho \otimes \mathrm{id}_{\Gamma(G)}) \circ \rho$(2.9.1.10), thus

$$\sum_{i,j,k} r_{ijk} v_i \otimes e_j \otimes e_k = \sum_k \rho(v_k) e_k$$

which means

$$\rho(v_k) = \sum_{j,k} r_{ijk} v_i \otimes e_j.$$

Thus $\mathrm{span}\{e_i\}$ is a f.d. comodule of V containing v. □

Cor. (15.5.1.11). Any simple representations of an algebraic group is of f.d.

Prop. (15.5.1.12) [Schur's Lemma]. Let (V, r) be a simple representation of an algebraic group G, then $\mathrm{End}(V)$ is a f.d. division algebra D over k. In particular, if $k = \overline{k}$, then $\mathrm{End}(V) = k$.

Prop. (15.5.1.13)[Simple Representations of Product Groups]. Let G_1, G_2 be algebraic groups and V_1, V_2 are simple representations of G_1, G_2 resp., then $V_1 \otimes V_2$ is a simple representation of $G_1 \times G_2$.

Conversely, if $\mathrm{End}(V) = k$ for any simple representation (V, r) of G_1, then any simple representation of $G_1 \times G_2$ is of this form.

Proof: Cf.[Mil17]P91. □

Def. (15.5.1.14)[Semisimple Representations]. A linear representation (r, V) of an algebraic group is called **semisimple** if it is a direct sum of simple representations. Equivalently, it is a sum of simple subrepresentation.(The proof is the same).

Or equivalently, every submodule has a complement.

Prop. (15.5.1.15)[Base Change]. Let (V, r) be a f.d. linear representation of an algebraic group over a field k, k'/k a field extension, then $(V', r') = (V, r) \otimes_k k'$ is a representation of $G_{k'}$, and

- If (V', r') is simple, and (V, r) is simple.
- If (V, r) is simple and $\mathrm{End}(V) = k$, then (V', r') is simple.
- If (V, r) is semisimple and k'/k is separable or $\mathrm{End}(V)$ is a separable algebra over k, then (V', r') is semisimple.

Proof: Cf.[Mil17]P90. □

Prop. (15.5.1.16)[Constructing All F.D. Representations]. Let V be a faithful f.d. representation of G, then every f.d. representation of G is a subquotient of $V^m \otimes (V^\vee)^n$.

Proof: Cf.[Mil17]P88. □

Def. (15.5.1.17)[Diagonalizable Representation]. A representation of an algebraic group is called **diagonalizable** if it is a direct sum of 1-dimensional representations.

Let G be an algebraic group over a field k and $r : G \to GL(V)$ be a representation. If V is a sum of 1-dimensional representations, then r is diagonalizable(15.5.1.17).

Proof: Let $V = \sum_{\chi \in X(G)} V_\chi$. If the sum is not direct, then there is are some relation $v_1 + v_2 + \ldots + v_m = 0$ for $v_i \in V_{\chi_i}$. Applying ρ shows

$$0 = v_1 \otimes a(\chi_1) + \ldots + v_m a(\chi_m)$$

so any coordinate of v_i is 0 by(8.1.1.13). □

Prop. (15.5.1.18) [Chevalley]. Let G be an algebraic group, then every algebraic subgroup $H \subset G$ arises as the stabilizer of a 1-dimensional subspace in a f.d. representation of G.

Proof: Cf.[Mil17]P94. □

Cor. (15.5.1.19). Let G be an algebraic group over a field of characteristic0, then an algebraic subgroup H of G is normal in G iff for any linear representation V of G and a character $\chi \in X(H)$, the eigenspace V_χ is stable under G.

Proof: □

Prop. (15.5.1.20). Let G be an algebraic group over a field k s.t. the order of $\pi_0(G)$ is prime char k, then any representation V of G is semisimple iff it's semisimple when restricted to G^0.

Linear Algebraic Group

Def. (15.5.1.21)[Linear Algebraic Groups]. Let k be a field, then a **linear algebraic group** over k is a closed subgroup scheme of GL_n for some n.

Notice a linear algebraic group over a field of characteristic 0 is automatically smooth, by Cartier theorem(8.1.4.2).

Prop. (15.5.1.22) [Affine Algebraic Group is Linear]. If G is an affine group scheme, then the regular representation(8.2.1.2) contains a faithful f.d. subrepresentation. In particular, the regular representation is itself faithful.

Proof: Let e_i be a generator of $\Gamma(G)$ as a k-algebra, let V be a f.d. subrepresentation of the regular representation containing e_i(15.5.1.10), let v_i be a basis for V, and suppose $\Delta(e_j) = \sum e_i \otimes a_{ij}$, then the image of $\Gamma(GL(V)) \to \Gamma(G)$ contains a_{ij}. Now because $\varepsilon : A \to k$ is the counit,

$$e_j = (\varepsilon \otimes \mathrm{id})\Delta(e_j) = \sum \varepsilon(e_i) a_{ij},$$

so the image contains V, so it contains $\Gamma(G)$, so this is a closed immersion, thus a faithful representation, by(15.5.1.1). □

2 Tannakian Duality

In this subsection, let G be an affine group scheme, and k is a field.

Lemma (15.5.2.1). Let G be an affine group scheme over ring R corresponding to a Hopf algebra A. If u is an R-endomorphism of A that the following diagram commutes:

$$\begin{array}{ccc} A & \xrightarrow{\Delta} & A \otimes A \\ \downarrow{\scriptstyle u} & & \downarrow{\scriptstyle 1\otimes u} \\ A & \xrightarrow{\Delta} & A \otimes A \end{array},$$

then there exists a $g \in G(R)$ that $u = r_A(g)$, where r_A is the regular action of G on A.

Proof: Let $\varphi : G \to G$ be the morphism corresponding to u, then the commutative diagram shows $\varphi_S(xy) = x\varphi_S(y)$ for $x, y \in G(S)$. Then $\varphi_S(x) = xg_S$ where $g_S = \varphi_S(e)$.

Then for $f \in A, x \in G(R)$, $x(uf) = \varphi_R(x)(f) = (xg)(f) = x(r_A(f))$, thus $u = r_A(g)$. □

Prop. (15.5.2.2). Let G be an algebraic group over k and R is a k-algebra. Suppose that for any f.d. representation (V, r_V) of G, we are given an R-linear map $\lambda_R : V_R \to V_R$ that satisfies:

- $\lambda_{V\otimes W} = \lambda_V \otimes \lambda_W$.
- $\lambda_1 = \mathrm{id}$.
- For G-invariant maps $u : V \to W$, $\lambda_W \circ u_R = u_R \circ \lambda_V$.

then there exists a unique $g \in G(R)$ that $\lambda_V = r_V(g)$ for any V.

Proof: Cf.[Milne, P164].? □

Cor. (15.5.2.3) [Reconstruction Theorem]. Let $\omega : \mathrm{Rep}_k(G) \to Vect_k$ be the forgetful functor, and for any k-algebra R, let $\omega_R = R \otimes \omega$, then this proposition says the canonical morphism $G(R) \to \mathrm{End}^{\otimes}(\omega_R)$ is an isomorphism. Now if $\underline{\mathrm{Aut}}^{\otimes}(\omega)$ is the functor $R \mapsto \mathrm{End}^{\otimes}(\omega_R)$, then $G \cong \underline{\mathrm{Aut}}^{\otimes}(\omega)$.

Cor. (15.5.2.4). Let G, G' be affine algebraic groups over k and let $F : \mathrm{Rep}_k(G') \to \mathrm{Rep}_k(G)$ be a tensor functor that $\omega^G \circ F = \omega^{G'}$, then there exists a unique homomorphism $f : G \to G'$ that $F = \omega^f$.

Proof: Such a tensor functor defines a homomorphism

$$F^* : \underline{\mathrm{Aut}}^{\otimes}(\omega^G)(R) \to \underline{\mathrm{Aut}}^{\otimes}(\omega^{G'})(R)$$

functorial in R, thus defines a homomorphism $f : G \to G'$ by Yoneda lemma and(15.5.2.4). □

Lemma (15.5.2.5). Let μ be a cocharacter $\mathbb{G}_m \to G$ over $\overline{\mathbb{Q}_p}$, then the conjugacy class $\{\mu\}$ of μ is defined over a finite extension $E/\mathbb{Q}_p$.

Proof: By Tannakian duality, two cocharacters are conjugate over a field K iff the filtrations they defined on $V \otimes \overline{\mathbb{Q}_p}$ for some faithful $V \in \mathrm{Rep}_{\mathbb{Q}_p}(G)$ are isomorphic by an action of $G(K)$. Now this action of $G(\overline{\mathbb{Q}_p})$ on $V_{\overline{\mathbb{Q}_p}}$ is defined over a f.d. field extension $E/\mathbb{Q}_p$, so the filtrations are isomorphic by an action of $G(E)$. □

Prop. (15.5.2.6) [Abstract Jordan Decompositions]. Let G be an algebraic group over a perfect field k and $g \in G(k)$, then there exists unique elements $g_s, g_u \in G(k)$ that for any representation (V, r_V) of G, $r_V(g_s) = r_V(g)_s$ and $r_V(g_u) = r_V(g)_u$. Furthermore,

$$g = g_s g_u = g_u g_s.$$

The elements g_s, g_u are called the semisimple and unipotent parts of g, and this decomposition is called the abstract Jordan decomposition of g. $g \in G(k)$ is called a **semisimple or unipotent element** if $g = g_s$ or $g = g_u$.

Proof: This follows from the functoriality of Jordan decompositions(2.3.6.7) and the reconstruction theorem(15.5.2.2). □

Cor. (15.5.2.7). To check a decomposition is Jordan decomposition, it suffices to check for a single faithful representation of G.

Remark (15.5.2.8). Let G be a group variety over an alg.closed field k. In general, the set $G(k)_s$ of semisimple elements in $G(k)$ is not closed for the Zariski topology, but the set $G(k)_u$ of unipotent elements are closed for the Zariski topology. To see this, embed G into GL_n for some n, then the set of unipotent elements are the matrices with characteristic polynomial $(T-1)^n$, and this is a polynomial condition.

Tannakian Reconstruction

Prop. (15.5.2.9) [Tannakian Reconstruction]. Let $(\mathcal{C}, \otimes)$ be a rigid Abelian tensor category that $k = \mathrm{End}(1)$ and $\omega : \mathcal{C} \to \mathcal{V}\mathrm{ect}_k$ an exact faithful k-linear tensor functor, then the functor $\underline{\mathrm{Aut}}^{\otimes}(\omega)$ is representable by an affine groups scheme G, and $\mathcal{C} \cong \mathrm{Rep}_k(G)$.

Proof: Cf.[Milne, Tannakian category, P21].**?** □

Cor. (15.5.2.10) [Tannakian Reconstruction]. Let $\mathcal{C}$ be a k-linear Abelian category where k is a field, and $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ a k-bilinear functor. Suppose there are given a faithful exact k-linear functor $\mathcal{C} \to \mathcal{V}\mathrm{ect}_k$ and functorial isomorphisms $\varphi_{X,Y,Z} : X \otimes (Y \otimes Z) \to (X \otimes Y) \otimes Z$ and $\psi_{X,Y} : X \otimes Y \to Y \otimes X$ that

- F commutes with $\otimes$, and maps φ and ψ to the natural associativity and commutativity isomorphism in $Vect_k$.
- There exists an identity object $1 \in \mathcal{C}$ that $k \to \mathrm{End}(1)$ is an isomorphism and $F(1)$ has dimension 1.
- Any object $L \in \mathcal{C}$ that $F(L)$ has dimension 1 is an invertible object.

Then $\mathcal{C}$ is equivalent to $\mathrm{Rep}_k(G)$ for some affine group scheme G over k. In fact, $G \cong \underline{\mathrm{Aut}}^{\otimes}(\omega)$ as in(15.5.2.3)

Proof: The proof of(15.5.2.9) shows F defines an equivalence of categories $\mathcal{C} \to \mathrm{Rep}_k(G)$ where G is an affine monoid scheme representing $\mathrm{End}_k^{\otimes}(\omega)$. Thus we may assume $\mathcal{C} = \mathrm{Rep}_k(G)$. For the rest, Cf.[Tannakian Categories, Milne, P24]. □

Cor. (15.5.2.11) [Real Algebraic Envelope]. Let K be a topological group, then the category $\mathrm{Rep}_{\mathbb{R}}(K)$ of f.d. continuous real representations, together with the forgetful functor satisfies the hypothesis of(15.5.2.10), thus there is an algebraic group $\widetilde{K}$ over $\mathbb{R}$, called the **real algebraic envelope** of K, and an equivalence of categories

$$\mathrm{Rep}_{\mathbb{R}}(\widetilde{K}) \to \mathrm{Rep}_{\mathbb{R}}(K)$$

induced by a homomorphism $K \to \widetilde{K}(R)$, which is an isomorphism when K is compact**?**.

Cor. (15.5.2.12) [Hochschild-Mostow Group]. Similar as(15.5.2.11), if G is a complex Lie group or a f.g. abstract group, and $\mathcal{C}$ the category of f.d. complex representations, then it satisfies the hypothesis of(15.5.2.10), thus it is the category of representations of an affine group scheme $A(G)$ over $\mathbb{C}$, together with a homomorphism $P : G \to A(G)$, called the **Hochschild-Mostow group** of G.

Prop. (15.5.2.13). Let $\mathscr{C}$ be a small k-linear Abelian category, and let $\omega : \mathscr{C} \to \mathscr{V}\mathrm{ect}_k$ be an exact faithful k-linear functor, then there exists a coalgebra C s.t. $\mathscr{C}$ is equivalent to the category of C-comodules of f.d.

Proof: Cf.[Mil17] P175. □

Properties of G and $\mathrm{Rep}_k(G)$

Prop. (15.5.2.14). Let G be an affine group scheme over k, then

- G is finite iff there exists an object $X \in \mathrm{Rep}_k(G)$ that every object of $\mathrm{Rep}_k(G)$ is isomorphic to a subquotient of X^n for some $n > 0$.
- G is algebraic iff there exists an object $X \in \mathrm{Rep}_k(G)$ that every object of $\mathrm{Rep}_k(G)$ is isomorphic to a subquotient of $X^n \otimes (X^\vee)^m$ for some $m, n \geq 0$.

Proof: Cf.[Milne, Tannakian categories, P25]. □

Prop. (15.5.2.15). Let $f : G \to G'$ be a homomorphism of affine group schemes over k, and let ω^f be the corresponding functor $\mathrm{Rep}_k(G') \to \mathrm{Rep}_k(G)$. Then

- f is faithfully flat iff ω^f is fully faithful and each ω^f induces an equivalence of subobjects of X' and $\omega^f(X')$.
- f is a closed immersion iff every object of $\mathrm{Rep}_k(G)$ is isomorphic to a subquotient of an object $\omega^f(X')$.

Proof: Cf.[Milne, Tannakian categories, P25]. □

Cor. (15.5.2.16). Let k has characteristic 0, then G is connected iff for any non-trivial representation X of G, $\langle X \rangle$ is not stable under $\otimes$.

Proof: Cf.[Milne, Tannakian categories, P25]. □

3 Unipotent Groups

Def. (15.5.3.1)[Unipotent Groups]. A **unipotent algebraic group** is an algebraic group G s.t. for any non-zero linear representation V of G, $V^G\neq 0$. Equivalently, every such representation sends G into $\mathrm{Unip}(n)$ in some coordinates.

Prop. (15.5.3.2). Let G be an algebraic group over k and k'/k a field extension, then G is unipotent iff $G_{k'}$ is unipotent.

Proof: This follows from the fact that for any representation V of G, $(V\otimes k')^{G_{k'}}=V^G\otimes k'$(15.5.1.7). □

Prop. (15.5.3.3). For an affine algebraic group G over a field k, the following are equivalent:

- G is unipotent.
- G is isomorphic to a subgroup of $\mathrm{Unip}(n)$ for some n.
- The Hopf algebra $\Gamma(G)$ is coconnected.

Proof: Cf.[Mil17]P281. □

Prop. (15.5.3.4). If U is a normal unipotent subgroup of an algebraic group G, then for any semisimple representation V of G, U acts trivially.

Proof: Consider a simple subrepresentation W of V, then $W^U\neq 0$ is a subrepresentation of G by(15.5.1.9), thus U acts trivially on W. As V is a sum of simple representations(15.5.1.14), U acts trivially on V. □

Prop. (15.5.3.5). Representations of $\mathbb{G}_a$ over a field of characteristic 0 corresponds to locally nilpotent endomorphisms.

Proof: `https://qchu.wordpress.com/2017/11/26/the-representation-theory-of-the-additive-group-s` □

4 Reductive Groups

Prop. (15.5.4.1). A group variety G is reductive if it has a faithful representation that is semisimple over $\overline{k}$, by(15.5.3.4).

Prop. (15.5.4.2). Let $k\in\mathtt{Field}^0, G\in\mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/k$ is connected, then the following are equivalent:

- G is a reductive group.
- Every f.d. representation of G is semisimple(15.5.1.14).
- Some faithful representation of G is semisimple(15.5.1.14).

Proof: □

15.6 Complex Representations of Finite Groups of Lie Type

Main references are [Bon11], [Introduction to Deligne-Lustig Theory, David Schwein], [Representations of finite groups of Lie type, Dign/Michel, 1991].

Notation (15.6.0.1).

- Use notations defined in Étale Cohomology Theory.
- Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}Z_+}, k \in \texttt{Field}, \#k = q, G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/k$.
- Let $\ell \in \mathbf{P}\backslash p$, K an ℓ-adic local field with ring of integers $\mathcal{O}_K$ and residue field k.

1 Finite Groups of Lie Type

Def. (15.6.1.1) [Finite Groups of Lie Type]. For a reductive group $G/\overline{k}$, if $F \in \mathrm{End}(G)$ satisfies the fixed point of $F(\overline{k})$ is finite, then its fixed points G^F is called a **finite group of Lie type**.

If G is defined over some finite subfield k, i.e. $G = G_0 \times_k \overline{k}$, and $F = \mathrm{Fr}_{G_0}$, then $G^F = G_0(k)$ is called a **Chevalley group**. If moreover $G_0 \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/k$ is reductive and simply-connected, then $G_0(k)$ is called a **universal finite group**(of Lie type).

If G is a a finite group of Lie type that is not a Chevalley group, then it is called a **twist group**(of Lie type).

Prop. (15.6.1.2) [Steinberg]. If $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/\overline{k}$ is simple reductive group, and $F \in \mathrm{End}(G)$ satisfies the fixed point of $F(\overline{k})$ is finite, then there are exactly two cases:

- (Chevalley Groups)F is a standard Frobenius: $A_n, B_n, C_n, D_n, G_2, F_4, E_6, E_7, E_8$.
- (**Steinberg Groups**)$^2A_n, {}^2D_n, {}^3D_4, {}^2_6$.
- (**Suzuki Groups**)$^2B_2, p = 2$.
- (**Ree Groups**)$^2G_2, p = 3$.
- (**Ree Groups**)$^2F_4, p = 2$.

Proof: □

Examples

Prop. (15.6.1.3) [SL(n)]. $PSL(n, \mathbb{F}_q)$ is simple except for $n = 2$ and $q = 2$ or 3.

$\mathrm{SU}(n)_{\mathbb{F}_q}$ is a twist of $\mathrm{SL}(n)_{\mathbb{F}_q}$, denoted by ${}^2A_{n-1}(\mathbb{F}_{q^2})$.

Proof: □

Prop. (15.6.1.4).

2 Conjugacy Classes

3 Deligne-Lustig Varieties

Def. (15.6.3.1) [Deligne-Lustig Varieties].

Affineness of Deligne-Lustig Varieties

4 Deligne-Lustig Theory

Main references are [Finite Groups of Lie Type, Carter], [P. Deligne and G. Lusztig, Representations of reductive groups over finite fields, Ann. of Math. (2) 103 (1976), no.1, 103–161.], [D-L76], https://www.dpmms.cam.ac.uk/~dbms2/deligne_lusztig/.

Deligne and Lustig used the ℓ-adic étale cohomology theory to construct all cuspidal representations of $G(\mathbb{F}_q)$.

Remark (15.6.4.1). Because $G(\mathbb{F}_q)$ is finite and $\mathbb{C}\cong\overline{\mathbb{Q}_\ell}$, we can consider representations $\mathrm{Rep}(G(\mathbb{F}_q))=\{\theta:G(\mathbb{F}_q)\to\mathrm{GL}(\overline{\mathbb{Q}}_\ell)$.

Def. (15.6.4.2) [Induction Pairs]. A **induction pair for** $G(\mathbb{F}_q)$ is a pair (T,θ), where $T\subset G$ is a maximal torus and θ is an ℓ-adic character $T(\mathbb{F}_q)\to\overline{\mathbb{Q}}_\ell^\times$.

Deligne-Lustig Inductions

Def. (15.6.4.3) [Deligne-Lustig Inductions]. Let (T,θ) be an induction pair(15.6.4.2), the action of $G(\mathbb{F}_q)$ and $T(\mathbb{F}_q)$ on $\widetilde{X}_S$ commutes, so for any $\theta\in\mathrm{Irr}(T(\mathbb{F}_q))$, the θ-isotopic part of $H^i_{\text{ét},c}(\widetilde{X}_T,\overline{\mathbb{Q}}_\ell)$ is $G(\mathbb{F}_q)$-invariant, thus we can define a **Deligne-Lustig Induction map** that on $\mathrm{Irr}(G(\mathbb{F}_q))$ is defined by

$$R^G_T:\mathrm{Irr}(T(\mathbb{F}_q))\to K_0(\mathrm{Rep}(G(\mathbb{F}_q))):\theta\mapsto\sum_i(-1)^iH^i_{\text{ét},c}(X_T,\overline{\mathbb{Q}}_\ell)^\theta.$$

Prop. (15.6.4.4). Let (T,θ) be an induction pair, if $\theta^\omega\neq\theta$ for any $w\in W$, then $R^G_T(\theta)\in\mathrm{Irr}(G(\mathbb{F}_q))$.

Proof: □

Prop. (15.6.4.5). If $(T,\theta),(T',\theta')$ are two induction pairs that are note $G(\mathbb{F}_q)$-conjugate, then $(R^G_T(\theta),R^G_{T'}(\theta'))=0$.

Proof: □

Def. (15.6.4.6) [Geometrically Conjugate Pairs]. If $(T,\theta),(T',\theta')$ are two induction pairs, they are called **geometrically conjugate** if $(T_{k'},\theta\circ\mathrm{Nm}_{k'/k}),(T'_{k'},\theta'\circ\mathrm{Nm}_{k'/k})$ are $G(k')$-conjugate for some finite extension $k'/\mathbb{F}_q$.

Prop. (15.6.4.7). If $(T,\theta),(T',\theta')$ are two induction pairs that are not geometrically conjugate, then $R^G_T(\theta),R^G_{T'}(\theta')$ are disjoint.

Proof: Cf.[D-L76]Cor6.3. □

Def. (15.6.4.8) [Dual Groups].

Prop. (15.6.4.9). The geometric conjugacy classes of induction pairs of G corresponds to the geometric conjugacy classes of semisimple elements of G^*(15.6.4.8).

Proof: □

Def. (15.6.4.10) [Lustig Series]. Let S be a semisimple conjugacy class of G^*, the **Lustig series** $\mathcal{E}(G,S)$ is the set of irreducible representations of G occurring in $R_T^G(\theta)$ for any (T,θ) in the geometric conjugacy class corresponding to S via(15.6.4.9). By(15.6.4.7),

$$\mathrm{Irr}(G(\mathbb{F}_q)) = \coprod_{S\in G^*_{\text{ss-conj}}} \mathcal{E}(G,S).$$

$\mathcal{E}(G,(1))$ is called the set of **unipotent representations**, which are all the irreducible representations appearing in $R_T^G(\mathbb{1})$ for various T.

5 Howlett-Lehler Theory

This theory decomposes Deligne-Lustig inductions into irreducible components.

6 Character Sheaves(Lustig)

References are [Introduction to character sheaves, Lustig], [Algebraic And Geometric Methods In Representation Theory, Lustig, 2014].

Remark (15.6.6.1). Let (S,θ) be an induction pair(15.6.4.2), there is in fact an isomorphism

$$H^i_{\text{ét},c}(\widetilde{X}_S,\overline{\mathbb{Q}}_\ell) \cong H^i_{\text{ét},c}(X_S,\mathcal{F}_\theta) \in \mathrm{Rep}(G(\mathbb{F}_q))$$

where $\mathcal{F}_\theta$ is the ℓ-adic local system on X_S corresponding to the $S(\mathbb{F}_q)$-torsor and θ. Thus much of the Deligne-Lustig theory can be interpreted in the language of sheaves, called **character sheaves**.

7 Gelfand-Graev representations

8 Alvis-Curtis Duality

Cf.[Duality for representations of a reductive group over a finite field, I, II, Deligne-Lustig].

9 Deligne-Lustig Varieties

Prop. (15.6.9.1). Let

10 GL(n)

Notation (15.6.10.1). The notation is the same as in(15.11.0.1).

Principal Series Representations

Prop. (15.6.10.2). Let $(\pi,V)\in \mathrm{Rep}^{\mathrm{fd}}(GL(2,k))$, then

- if the representation (π_1,V) is defined by $\pi_1(g)=\pi(g^{-t})$, then $\pi_1\cong\widehat{\pi}$.
- if $n=2$ and (π,V) is irreducible, let ω be the central character of π. If (π_2,V) is defined by $\pi_2(g)=\omega(\deg g)^{-1}\pi(g)$, then $\pi_2\cong\widehat{\pi}$.

Proof: The proof of(15.11.1.15) applies to this case, noticing a finite group is profinite hence locally profinite. □

Lemma (15.6.10.3). Let $\chi_1, \chi_2, \mu_1, \mu_2$ be characters of F^*, consider the principal representations $\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)$ of $GL(2,k)$ defined in(15.11.4.6), then

$$\dim \mathrm{Hom}_{GL(2,k)}(\mathcal{B}(\chi_1,\chi_2), \mathcal{B}(\mu_1,\mu_2)) = \delta_{\chi_1,\mu_1}\delta_{\chi_2,\mu_2} + \delta_{\chi_1,\mu_2}\delta_{\chi_2,\mu_1}.$$

Proof: Let χ, μ be characters of $B(k)$ defined as in(15.11.4.6), then by**??**, the dimension is just the dimension of space of functions $\Delta : GL(2,k) \to \mathbb{C}$ that

$$\Delta(b_2 g b_1) = \mu(b_1)\Delta(g)\chi(b_1), \quad b_1, b_2 \in B(k).$$

Then by the Bruhat decomposition(11.7.6.5), Δ is determined by its values on 1 and w_0. Notice that if $\chi_1 \neq \mu_1$ or $\chi_2 \neq \mu_2$, we can use this condition to show $\Delta(1) = 0$, and if $\chi_1 \neq \mu_2$ or $\chi_2 \neq \mu_1$, we can use this condition to show $\Delta(w_0) = 0$, and also the construction of Δ is clear in other cases. □

Prop. (15.6.10.4) [Principal Series Representations]. Let $\chi_1, \chi_2, \mu_1, \mu_2$ be characters of F^*, then $\mathcal{B}(\chi_1, \chi_2)$ is an irreducible representation of degree $q = |F| + 1$ unless $\chi_1 = \chi_2$, in which case it is the direct sum of two irreducible representations having degree 1 and q. And $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\mu_1, \mu_2)$ iff $\{\chi_1, \chi_2\} = \{\mu_1, \mu_2\}$.

Proof: Use(15.6.10.3), then

$$\dim \mathrm{End}_{GL(2,k)}(\mathcal{B}(\chi_1,\chi_2)) = 1 + \delta_{\chi_1,\chi_2}.$$

Now by Peter-Weyl, if a representation V is isomorphic to $\sum d_i\pi_i$, where π_1 are irreducible, then $\dim_G(V) = \sum d_i^2$(10.11.4.5). Then we now $\mathcal{B}(\chi_1, \chi_2)$ decomposes into two representations if $\chi_1 = \chi_2$ and is irreducible if $\chi_1 \neq \chi_2$.

In case $\chi_1 = \chi_2$, there is an invariant subspace of dimension 1, generated by the function $f(g) = \chi(\deg g)$. so the rest representation is of dimension q, because $G(2,k)/B(k) = q + 1$. □

Def. (15.6.10.5) [Steinberg Representation]. We call the q-dimensional subrepresentation of $\mathcal{B}(1,1)$ the **Steinberg representation**. It is verified that the q dimensional subrepresentation of $\mathcal{B}(\chi,\chi)$ is the twist of the Steinberg representation.

Weil Representations

Prop. (15.6.10.6) [Weil Representation for $SL(2,k)$]. In situation(16.5.4.5), let $W = L^2(E)$, define the modified Fourier transform w.r.t. ψ as in(10.11.3.33):

$$\widehat{\Phi}(x) = q^{-1}\sum_{y\in E}\Phi(y)\psi(\mathrm{tr}(\overline{x}y)).$$

Then there is a **Weil representation** $\omega : SL(2,k) \to \mathrm{End}(W)$:

$$(\omega(t(a))\Phi)(x) = \Phi(ax), \quad w(n(z)\Phi)(x) = \psi(zN(x))\Phi(x), \quad (\omega(w_1)\Phi)(x) = \varepsilon\widehat{\Phi}(x).$$

where we are using the presentation as in6, and $\varepsilon = 1$ is E/F is split, and -1 if it is anisotropic.

Remark (15.6.10.7). When F has characteristic$\neq 2$, this is just the Weil representation in(16.5.4.3).

Proof: This follows from direct verification, Cf.[Bump, P407]. □

Prop. (15.6.10.8) [Dihedral Weil Representations for $GL(2,k)$]. Situation as in(16.5.4.5), Define

$$W(\chi)=\{\Phi\in W|\Phi(yx)=\chi(y)^{-1}\Phi(x),y\in E_1^*\},$$

then by considering the order of E_1^*, $\dim W(\chi)=q+\varepsilon$. Also it is verified that $W(\chi)$ is stable under the Weil representation of $SL(2,k)$(15.6.10.6).

Now we want to extend this representation to $GL(2,k)$ by defining

$$(\omega(\begin{bmatrix}a&\\&1\end{bmatrix})\Phi)(x)=\chi(b)\Phi(bx)$$

where b is arbitrary that $N(b)=a$.

Remark (15.6.10.9). This is related to(16.5.4.7) and Howe duality.

Proof: It must be shown that this is truly a representation of $GL(2,k)$, it suffices to show that

$$\omega(\begin{bmatrix}a&\\&1\end{bmatrix})\omega(g)\omega(\begin{bmatrix}a^{-1}&\\&1\end{bmatrix})=\omega(\begin{bmatrix}a&\\&1\end{bmatrix}g\begin{bmatrix}a^{-1}&\\&1\end{bmatrix}),$$

where g is a generator of $SL(2,k)$. This is clear for $g=t(a)$, and also clear for $g=n(z)$. For $g=w_1$, it suffices to check

$$\omega(\begin{bmatrix}a&\\&1\end{bmatrix})\circ\wedge\circ\omega(\begin{bmatrix}a^{-1}&\\&1\end{bmatrix})\Phi(x)=\widehat{\Phi}(ax)$$

which is subtle but also clear. □

Prop. (15.6.10.10) [Split Weil Representation]. In the split case, the character χ of E^* is of the form $\chi((x,y))=\chi_1(x)\chi_2(y)$, and then condition in(16.5.4.5) just says $\chi_1\neq\chi_2$. Then:

$$(\pi(\chi),W(\chi))\cong\mathcal{B}(\chi_2,\chi_1)$$

Proof: The intertwining operator is given by

$$L:W(\chi)\to\mathcal{B}(\chi_2,\chi_1):(L\Phi)(g)=(\omega(g)\Phi)((1,0)).$$

Firstly $L\Phi\in\mathcal{B}(\chi_2,\chi_1)$ by direct verification for $t(a),T_1(k)$ and $n(z)$. Then it is an intertwining operator is clear.

Then this is an isomorphism because both are of dimension $q+1$(15.6.10.8) and $\mathcal{B}(\chi_2,\chi_1)$ is irreducible(15.6.10.4). □

Def. (15.6.10.11) [Cuspidal Representation]. $(\pi,V)\in\mathrm{Rep}^{\mathrm{fd}}(GL(2,k))$ is called a **cuspidal representation** if the Jacquet module $J(V)=0$. Notice in this finite case, this is equivalent to V has no $N(k)$-fixed vector, because the contragradient is well-known as $\mathrm{Rep}(G)$ is semisimple, and the trivial isotropic parts correspond, unlike the p-adic case.

Lemma (15.6.10.12). If (π,V) is a cuspidal representation of $GL(2,k)$, then the dimension of V is a multiple of $q-1$.

Proof: Because $N(k) \cong F$, any character of $N(k)$ is of the form $\psi_a(n(x)) = \psi(ax)$. Now decompose the contragradient representation V^* of G into isotypic parts of $N(k)$:$V^* = \oplus_{a\in F} V^*(a)$, then the hypothesis implies $V^*(0) = 0$.

Notice that the group $T_1(k)$ acts transitively on the spaces $V^*(a), a \neq 0$ by $\widehat{\pi}(\begin{bmatrix} t & \\ & 1\end{bmatrix})l$, because

$$\begin{bmatrix} t & \\ & 1\end{bmatrix}\begin{bmatrix} 1 & x/t \\ & 1\end{bmatrix} = \begin{bmatrix} 1 & x \\ & 1\end{bmatrix}\begin{bmatrix} t & \\ & 1\end{bmatrix}.$$

So the dimension of V is a multiple of $q-1$. □

Prop. (15.6.10.13) [Anisotropic Representation]. In the anisotropic case, the Weil representation $(\pi(\chi), W(\chi))$ is cuspidal and irreducible.

Proof: Suppose it is not cuspidal, then it contains a non-zero $N(k)$-fixed vector Φ_0(15.6.10.11), which means $\Phi_0(x) = w(n(z)\Phi_0)(x) = \psi(zN(x))\Phi(x)$. Now $\Phi_0(0) = 0$ because χ is nontrivial on E_1^*, and if $x \neq 0$, then there is a z that $\psi(zN(x)) \neq 1$ because ψ is non-trivial, so $\Phi_0(x) = 0$ also, so $\Phi_0 = 0$, contradiction.

Finally, subrepresentation of cuspidal representation is cuspidal by(15.6.10.11), then $(\pi(\chi), W(\chi))$ is irreducible, by the fact it is of dimension $q-1$(15.6.10.8) and lemma(15.6.10.12). □

Prop. (15.6.10.14)[Classification of Representations of $GL(2,k)$]. There is a list of all irreducible representations of $GL(2,k)$:

- $q-1$ 1-dimensional representations $\chi(\deg g)$, where χ is a character of $k^\times$.
- $\frac{(q-1)(q-2)}{2}$ principal series representations of dimension $q+1$.
- $q-1$ Steinberg representations(with twists) of dimension q.
- $\frac{q(q-1)}{2}$ cuspidal Weil representations of dimension $q-1$.

Proof: All these are irreducible representations by(15.6.10.4)(15.6.10.5) and(15.6.10.13). It suffices to show they are not isomorphic. Notice different kind of representation have different dimensions, thus it suffices to compare the same representations.

For principal series representations $\mathcal{B}(\chi_1,\chi_2), \chi_1 \neq \chi_2$, their isomorphisms are known by(15.6.10.4). For Steinberg representations, twisting are clearly different. For cuspidal Weil representations, there are $q^q - q$ way of choosing χ(16.5.4.5) and **?** Cf.[Local Langlands For GL(2)].

Finally, they are all the irreducible representations by the fact $\sum d_\sigma^2 = |G| = (q-1)^2 q(q+1)$(15.1.3.4). □

Whittaker Models

Def. (15.6.10.15) [Whittaker Functionals & Whittaker Models]. Let (π, V) be an irreducible representation of $GL(2,k)$, then the notion of **Whittaker functional** and **Whittaker model** is defined as in(15.11.3.1).

Prop. (15.6.10.16) [Existence and Uniqueness of Whittaker Models]. Let $\mathcal{G}$ be the representation of $GL(2,k)$ induced from the character $\psi_N(n(z)) = \psi(z)$ on $N(k)$, then it is multiplicity-free, and every irreducible representation of dimension> 1 occurs in it. Notice that this is just the existence and uniqueness of Whittaker models.

Proof: To show multiplicity free, it suffices to show $\mathrm{End}_{GL(2,k)}(\mathcal{G})$ is commutative, by Shur's lemma(10.11.2.4). Then we use**??**, which says this ring is isomorphic to the ring of functions Δ on G that

$$\Delta(n_2 g n_1) = \psi_N(n_2)\Delta(g)\psi_N(n_1).$$

where the multiplication is convolution**??**.

Notice it follows from the the Bruhat Decomposition(11.7.6.5) that the double coset $N(k)\backslash GL(2,k)/N(k)$ is uniquely represented by matrices with exactly two non-zero entries. Then it is clear a diagonal coset can support a function Δ iff it is a scalar multiple of I. In other words, the representatives are

$$\begin{bmatrix} a & \\ & a \end{bmatrix}, \quad \begin{bmatrix} & b \\ c & \end{bmatrix}.$$

Consider the involution of G given by

$$\iota(g) = w_1 g^t w_1^{-1},$$

then it is an anti-involution of G and it induces isomorphism on $N(k)$, so it induces an anti-involution of order two on the ring of functions Δ by $\iota(\Delta)(g) = \Delta(\iota(g))$. Notice this is an anti-involution because of(10.11.1.27) and the fact a finite group is unimodular. But this anti-involution fixes the representatives as above, so it is in fact identity on these Δ, which proves the convolution is commutative.

For the last assertion, just notice the dimension of $\mathcal{G}$ is $(q-1)(q^2-1)$, and the sum dimensions of irreducible representations of dimension>1 is just $(q-1)(q^2-1)$ by(15.6.10.14). □

Cor. (15.6.10.17). Frobenius reciprocity(10.11.5.5) implies that the space of Whittaker functionals is of dimension 1 for any irreducible representation of dimension>1.

11 SL(n)

Def. (15.6.11.1) [Drinfeld Curves]. The **Drinfeld curve** is defined to be the affine plane curve $\mathrm{Dri}/\mathbb{A}^2_q$

$$\mathrm{Dri}: x^q y - x y^q = 1$$

with completion $\overline{\mathrm{Dri}} = \mathrm{Dri} \cup \{\infty\} \subset \mathbb{P}^2_q$.

Prop. (15.6.11.2). There is a natural $\mu_{q+1} \times SL(2,\mathbb{F}_q)$-action on Dri, which induces a map on $H^*_{\text{ét},c}(\mathrm{Dri},\mathbb{Q}_\ell)$. Then we get the Deligne-Lustig induction

$$R^G_{T'}: \mu^*_{q+1} \to K_0(\mathrm{Rep}^{\mathrm{fd}}(SL(2,\mathbb{F}_q))).$$

Proof: □

Def. (15.7.2.1)[Bruhat-Tits Buildings]. For a Chevalley group $G = G(F)$, the **Bruhat-Tits building** $\mathcal{B}(G)$ is a building that

- vertices of $\mathcal{B}(G)$ corresponds to the set of compact open subgroups of G.
- $\mathcal{B}(G)$ is a union of subcomplexes called **apartments**, corresponding to the set of split maximal tori T of G.
-

Prop. (15.7.2.2)[$\mathcal{B}(SL(2,\mathbb{Q}_p))$]. The Bruhat-Tits building $\mathcal{B}(SL(2,\mathbb{Q}_p))$ is a $(p+1)$-regular tree where

- vertices of $\mathcal{B}(SL(2,\mathbb{Q}_p))$ corresponds to homothety classes of lattices $[\Lambda]$ in $\mathbb{Q}_p^2$.
- edges of $\mathcal{B}(SL(2,\mathbb{Q}_p))$ corresponds to adjacent pairs of lattices in $\mathbb{Q}_p^2$.

15.8 Representations of Semisimple Lie Algebras and Category $\mathcal{O}$

Main references are[Eti21] and[Car05].

This section studies representations of split semisimple Lie algebras. For a split semisimple Lie algebra $(\mathfrak{g}, \mathfrak{h})$, we use notations as in(2.5.3.30).

1 Semisimple Representations

Lemma (15.8.1.1). If $\mathfrak{g}$ is a semisimple Lie algebra over k, then every 1-dimensional representation of $\mathfrak{g}$ is trivial.

Proof: Such a representation vanishes at $[\mathfrak{g}, \mathfrak{g}]$, which equals $\mathfrak{g}$ by(2.5.2.4). □

Prop. (15.8.1.2) [Weyl]. For a Lie algebra $\mathfrak{g}$ over a field k,

- If the adjoint representation $\mathfrak{g} \to \mathfrak{gl}_{\mathfrak{g}}$ is semisimple, then $\mathfrak{g}$ is semisimple.
- If $\mathfrak{g}$ is semisimple and k has characteristic 0, then $\mathrm{Rep}(\mathfrak{g})$ is semisimple.

Proof: If the adjoint representation of $\mathfrak{g}$ is semisimple, then every ideal of $\mathfrak{g}$ has a complement, thus if $\mathfrak{g}$ is not semisimple, it has a dimension 1 quotient. But notice the Lie algebra k of dimension 1 has non-semisimple representations, for example $c \mapsto \begin{bmatrix} 0 & 0 \\ c & 0 \end{bmatrix}$, contradiction.

Semisimplicity of a Lie algebra is invariant under base change, also does simplicity of the category of representations(15.8.1.4), so we can assume that k is alg.closed. Now we need to show that any proper submodule W of a $\mathfrak{g}$-module V has a complement.

Assume first that $\dim V/W = 1$ and W is a simple $\mathfrak{g}$-module. This implies $\mathfrak{g}$ acts trivially on V/W by(15.8.1.1). Let c_V be the Casimir element of V(2.5.9.11), then c_V is also trivial on V/W. And c_V acts as a nonzero scalar on W as W is simple, by(2.5.9.11). Then the kernel of c_V is of 1-dimensional, and is a $\mathfrak{g}$-complement of W in V.

Next if $\dim V/W = 1$ but W is not simple $\mathfrak{g}$-module, then there is a submodule $W' \subset W$. By induction, the $\mathfrak{g}$-submodule W/W' has a complement V'/W' in V/W'. Then V'/W' has dimension 1, thus by induction, $V' = W' \oplus L$ for some 1-dimensional $\mathfrak{g}$-module. Then L is complementary to W in V.

Finally for the general case, let $\mathfrak{g}$ acts on $\mathrm{Hom}_k(V, W)$, consider the subspaces V_1, W_1 of $\mathrm{Hom}_k(V, W)$, where V_1 is the subspace of maps that restriction to W is a constant multiple of identity, and W_1 is the subspaces of W consisting of maps vanishing on W. They are both $\mathfrak{g}$-modules and $\dim V_1/W_1 = 1$. Then the above case shows $V_1 = W_1 \oplus L$ for some 1-dimensional $\mathfrak{g}$-module L. Because $\mathfrak{g}$ acts trivially on L(15.8.1.1), this means $L = \mathbb{F}f$ consists of $\mathfrak{g}$-homomorphisms. But $f|_W$ is non-zero constant, so the kernel of f is a complement of W in V. □

Cor. (15.8.1.3). Let (V, ρ) be a representation of a semisimple Lie algebra $\mathfrak{g}$ and $f : \mathfrak{g} \to V$ a linear map that

$$f([x, y]) = \rho(x)f(y) - \rho(y)f(x),$$

then there exists a $v_0 \in V$ that $f(x) = \rho(x)v_0$.

Proof: The condition on f is equivalent to $(f, \rho) : \mathfrak{g} \to \mathfrak{af}(V)$(2.5.1.11) is a homomorphism of Lie algebras. And this induces a representation ρ' of $\mathfrak{g}$ on $V' = V \oplus k$ that $\rho'(x)(V') \subset V$ for all $x \in \mathfrak{g}$. Because $\mathfrak{g}$ is semisimple, there is a line $L \subset V'$ that $V' = V \oplus L$ and $\mathfrak{g}$ acts trivially on L(15.8.1.1).

In other words, there is a vector $(-v_0, 1)$ that $\rho'(x)(-v_0, 1) = 0$ for all $x \in \mathfrak{g}$. So $f(x) = \rho(x)(v_0)$ for all x. So we are done. □

Prop. (15.8.1.4) [Semisimplicity and Extension]. Let $\mathfrak{g}$ be a Lie algebra over a field k. If $\mathrm{Rep}(\mathfrak{g}_K)$ is semisimple for some extension field K/k, then also is $\mathrm{Rep}(\mathfrak{g})$.

Proof: This is because for any representation (V,ρ) of $\mathfrak{g}$, $K\otimes_k \mathrm{End}(\rho)\cong \mathrm{End}(\rho_K)$, because this is true for $\mathrm{End}(V)$, and being $\mathfrak{g}$-equivariant is a linear condition. Then we can use(2.4.1.25) and(2.4.1.26). □

Prop. (15.8.1.5) [Semisimple Representations]. The following conditions on a representation $\mathfrak{g}\to\mathfrak{gl}_V$ are equivalent:

- ρ is semisimple.
- $\rho(\mathfrak{g})$ is reductive and its center consists of semisimple endomorphisms.
- $\rho(\mathfrak{r})$ consists of semisimple endomorphisms.
- The restriction of ρ to $\mathfrak{r}$ is semisimple.

Proof: $1\to 2$: If ρ is semisimple, then $\rho(\mathfrak{g})$ is reductive by(2.5.4.4). Its center consists of semisimple endomorphisms by [Mil13]P60**?**.

$2\to 3$: This is because if $\rho(\mathfrak{g})$ is reductive, then its center equals its radical and contains $\rho(\mathfrak{r})$, so $\rho(\mathfrak{r})$ consists of semisimple endomorphisms.

$3\to 4$: [Mil13]P60**?**.

$4\to 1$: [Mil13]P60**?**. □

Cor. (15.8.1.6). Let ρ and ρ' be representations of $\mathfrak{g}$. If ρ and ρ' are semisimple, then so are $\rho\otimes\rho'$ and $\rho^\vee$.

In particular, the category $\mathrm{Rep}^{ss}(\mathfrak{g})$ of semisimple representations of a Lie algebra $\mathfrak{g}$ form a Tannakian category, thus there is an algebraic group G that $\mathrm{Rep}^{ss}(\mathfrak{g})=\mathrm{Rep}(G)$.

Proof: Use the third criterion, for any $x\in\mathfrak{r}$, as $\rho(x),\rho'(x)$ are semisimple, so is $\rho(x)\otimes\rho'(x)$, so $\rho\otimes\rho'$ is also semisimple by(15.8.1.5). □

representations of $\mathfrak{sl}_2(\mathbb{C})$

Def. (15.8.1.7) [Primitive Element]. Let V be a $\mathfrak{sl}_2$-module, an element $v\in V$ is called **primitive of weight** λ if it is non-zero and $Xe=0, He=\lambda e$.

Prop. (15.8.1.8). Every non-zero f.d. $\mathfrak{sl}_2$-module contains a primitive element.

Proof: en element e is primitive iff the line generated by e is stable under the action of $\{X,H\}$: if $Xe=\lambda e$ and $He=\mu e$, then using the $[H,X]=2X$, we see that $2\lambda 0$, thus $\lambda=0$, and e is primitive. So each f.d. $\mathfrak{sl}_2$-module contains a primitive element, by Lie's theorem(2.5.1.24). □

Prop. (15.8.1.9) [Submodule Generated by Primitive Element]. Let V be a $\mathfrak{sl}_2$-module and $e\in V$ a primitive element of weight λ. Let $e_n=Y^ne/n!$, and $e_{-1}=0$, then we have

$$He_n=(\lambda-2n)e_n,\quad Ye_n=(n+1)e_{n+1},\quad Xe_n=(\lambda-n+1)e_{n-1}.$$

Proof: By induction on n,

$$HY^ne=([H,Y]+YH)Y^{n-1}e=(\lambda-2(n-1)-2)Y^ne=(\lambda-2n)e.$$

$Ye_n=(n+1)e_{n+1}$ is obvious.

And

$$\begin{aligned} nXe_n = XYe_{n-1} &= [X,Y]e_{n-1} + YXe_{n-1} \\ &= He_{n-1} + (\lambda - n + 2)Ye_{n-2} \\ &= (\lambda - 2n + 2 + (\lambda - n + 2)(n-1))e_{n-1} \\ &= n(\lambda - n + 1)e_{n-1} \end{aligned}$$

□

Cor. (15.8.1.10). Only two cases arise: either

- The elements $\{e_n\}$ are linearly independent.
- The elements $e_0, e_1, \ldots, e_m$ are linearly independent, and $e_{m+1} = e_{m+2} = \ldots = 0$, and weight λ of e equals m.

And if V is f.d., then case 1 cannot happen, and the subspace W generated by $e_0, \ldots, e_m$ is a $\mathfrak{g}$-module and it is irreducible.

Proof: Because each e_i has different eigenvalue under action of H, thus if they are all nonzero, then they are linearly independent. If $e_0, e_1, \ldots, e_m$ are linearly independent, and $e_{m+1} = e_{m+2} = \ldots = 0$, then by the proposition,

$$Xe_{m+1} = (\lambda - m)e_m$$

and $e_{m+1} = 0$ with $e_m \neq 0$, thus $\lambda = m$. Now the formulas in(15.8.1.9) shows that W is a $\mathfrak{g}$-module. And if $W' \subset W$ is a subspace invariant under $\mathfrak{g}$, then it contains some eigenvalues e_k of H, and then the formulas in(15.8.1.9) shows it contains all $e_0, e_1, \ldots, e_m$, thus $W' = W$. Thus W is irreducible. □

Prop. (15.8.1.11) [Irreducible Representations of $\mathfrak{sl}_2(\mathbb{C})$]. Let $W_m = \{e_0, \ldots, e_m\}$ be a $m+1$-dimensional vector space and $\mathfrak{sl}_2$ acts on W_m by

$$He_n = (m - 2n)e_n, \quad Ye_n = (n+1)e_{n+1}, \quad Xe_n = (m - n + 1)e_{n-1}.$$

Then W_n is a f.d. irreducible representation of $\mathfrak{sl}_2$, and any f.d representation of $\mathfrak{sl}_2$ of dimension $m+1$ is isomorphic to one of W_m.

Proof: The first assertion follows from(15.8.1.10) and the fact e_0 is a primitive element. For the second assertion, notice any f.d. representation W of $\mathfrak{g}$ contains a primitive element(15.8.1.8) thus by(15.8.1.10) generates an irreducible $\mathfrak{sl}_2$-submodule W_n, thus this submodule equals W, and $n + 1 = m + 1$, thus $n = m$. □

Remark (15.8.1.12). Notice this is special case of(15.8.2.15).

Cor. (15.8.1.13). W_0 is the just trivial action of $\mathfrak{sl}_2$, W_1 is isomorphic to the natural action of $\mathfrak{sl}_2$ on $\mathbb{C}^2$, and W_2 is isomorphic to the adjoint action of $\mathfrak{sl}_2$ on itself.

Proof: In fact, W_1 can be identified with the vector space $\mathbb{C}\{x, y\}$ where

$$Hx = x, Hy = -y, Yx = y, Yy = 0, Xy = x, Xx = 0.$$

Then the m-th symmetric tensor of W_1 is isomorphic to the vector space of polynomials in x, y of degree m, and by(2.5.9.2),

$$H(C_m^k y^k x^{m-k}) = (m - 2k)(C_m^k y^k x^{m-k}),$$

$$Y(C_m^k y^k x^{m-k}) = (k+1)(C_m^{k+1} y^{k+1} x^{m-k-1}),$$

$$X(C_m^k y^k x^{m-k}) = (m-k+1)(C_m^{k-1} y^{k-1} x^{m-k+1}).$$

So it is isomorphic to W_{m+1}. □

Cor. (15.8.1.14) [Representations of $\mathfrak{sl}_2(\mathbb{K})$]. Let $\mathbb{K} = \mathbb{R}$ or $\mathbb{C}$,

- Any f.d. representation V of $\mathfrak{sl}_2(\mathbb{K})$ is isomorphic to a direct sum of W_ms, and Thus
- The endomorphism on V induced by H is diagonalizable and with integral eigenvalues. if $\pm n$ are eigenvalues of H, then so are $n-2, n-4, \ldots, 4-n, 2-n$.
- For any $n \geq 0$, the linear maps

  $$Y^n : V^n \to V^{-n}, X^n : V^{-n} \to V^n$$

  are isomorphisms. In particular, V^{-n} and V^n have the same dimensions.

Proof: by Weyl's theorem(15.8.1.2), any representation of $\mathfrak{sl}_2(\mathbb{K})$ is isomorphic to a direct sum of irreducible representations, and the irreducible representations of $\mathfrak{sl}_2(\mathbb{C})$ clearly comes from real representations of $\mathfrak{sl}_2(\mathbb{R})$, thus irreducible representations of $\mathfrak{sl}_2(\mathbb{R})$ must be of the same form(otherwise tensor with $\mathbb{C}$ and decompose, and use conjugation).

Because we can assume V is one of W_m, so the other assertions are clear. □

2 Verma Modules

Def. (15.8.2.1) [Weights]. Let $(\mathfrak{g}, \mathfrak{h})$ be a semisimple Lie algebra with root system R and V is a $\mathfrak{g}$-module. If $\lambda \in \mathfrak{h}^*$, a vector $v \in V$ is said to have weight λ iff $hv = \lambda(h)v$ for any $h \in \mathfrak{h}$. The space of vectors in V of weight λ is denoted by $V[\lambda]$. An **integral weight** is a weight λ of the form $\lambda = \sum n_i \alpha_i^\vee$, where $\alpha_i \in R$, equivalently its values on h_i are all integers.

V is said to have a **weight decomposition** if $V = \oplus_{\lambda \in \mathfrak{h}^*} V[\lambda]$.

Prop. (15.8.2.2). Any f.d. $\mathfrak{g}$-module V has a weight decomposition, and the weights are all integral.

Proof: For any i, V is a $\mathfrak{s}_i = \{e_i, h_i, f_i\}$-module(2.5.3.20), so by the representation theory of $\mathfrak{sl}_2$, h_i acts semisimply on V, and the eigenvalues are integers. Thus $\mathfrak{h}$ acts semisimply on V, thus there is a weight decomposition, and the weights are all integral. □

Def. (15.8.2.3) [Highest Weight Representations]. A vector $v \in V$ is called a **highest weight vector** if it is a weight vector and $\mathfrak{n}_+ v = 0$, or equivalently $e_i v = 0$ for any e_i. A **highest weight representation** with highest weight λ is a representation that is generated by a highest weight vector of weight λ.

Prop. (15.8.2.4). Any f.d. $\mathfrak{g}$-module contains a highest weight vector, thus any irreducible f.d $\mathfrak{g}$-representation is a highest weight representation.

Proof: Let $P = \sum_i \alpha_i^\vee$, and choose a weight λ that (λ, P) is maximal, then $e_i v$ has weight $\lambda + \alpha_i$, thus $e_i v = 0$ for any i. □

Verma Modules

Def. (15.8.2.5) [Verma Modules]. Let $\lambda \in \mathfrak{h}^*$, $I_\lambda \subset U(\mathfrak{g})$ be the left ideal generated by the elements $h - \lambda(h)$ and e_i, then the **Verma module** $M_\lambda = U(\mathfrak{g})/I_\lambda$. has a weight decomposition, and it is a highest weight representation with highest vector $v_\lambda = \overline{1}$ with weight λ.

Prop. (15.8.2.6) [M_λ is Noetherian]. M_λ satisfies ascending chain condition on f.d. submodules.

Proof: This is because $U(\mathfrak{g})$ is left Noetherian(2.5.8.16) and $M_\lambda = U(\mathfrak{g})/I_\lambda$. □

Prop. (15.8.2.7). The map $\varphi : U(\mathfrak{n}_-) \to W_\lambda : \varphi(x) = xv_\lambda$ is an isomorphism of left $U(\mathfrak{n}_-)$-modules.

Proof: This follows from PBW theorem. □

Cor. (15.8.2.8). M_λ has a weight decomposition with $P(M_\lambda) = \lambda - Q^+$, and weight spaces of M_λ are all of f.d..

Prop. (15.8.2.9). If V is a $\mathfrak{g}$-module and $v \in V$ is a highest weight vector, then there is a unique homomorphism $M_\lambda \to V$ of $\mathfrak{g}$-modules that maps v_λ to v.

Cor. (15.8.2.10). Every highest weight representation has a decomposition into f.d. weight spaces. And they have a unique highest weight vector up to a scalar.

Prop. (15.8.2.11) [Quotient of Verma Modules]. M_λ has a unique irreducible quotient L_λ. In particular, L_λ is a quotient of every highest weight representation of $\mathfrak{g}$ with weight λ, by(15.8.2.9).

Proof: As M_λ has a weight decomposition, any submodule Y of M_λ has a weight decomposition, and cannot has weight λ, otherwise it generates M_λ by(15.8.2.10). Then the sum J_λ of all proper submodules of M_λ also cannot have weight λ, thus also proper. Then $L_\lambda = M_\lambda/J_\lambda$ is the unique irreducible quotient of M_λ. □

Cor. (15.8.2.12) [Classification of Irreducible Highest Weight Representations]. Any irreducible highest weight representation of $\mathfrak{g}$ is of the form L_λ where $\lambda \in \mathfrak{h}^*$.

Prop. (15.8.2.13) [Composition Factors of Verma Modules]. The Verma module M_λ has a finite composition series $M_\lambda = N_0 \supset N_1 \supset \ldots \supset N_r = 0$ that each N_i/N_{i+1} is irreducible and isomorphic to $L_{\omega(\lambda+\rho)-\rho}$ for some $\omega \in W$.

Proof: We can find a(not necessarily finite) series of submodules of M_λ that the subquotients are irreducible as M_λ satisfies ascending chain condition on submodules(15.8.2.6). □

Lemma (15.8.2.14). Let V be a $\mathfrak{g}$-module with weight decomposition into f.d. weight spaces. If V is a sum of f.d. $\mathfrak{s}_i$-modules for each i, then for each $\lambda \in P$ and $w \in W$, $\dim V[\lambda] = \dim V[w\lambda]$.

Proof: As W is generated by s_i, it suffices to prove for $w = s_i$, $\dim V[\lambda] = \dim V[w\lambda]$.

If $(\lambda, \alpha_i^\vee) = m \geq 0$ for some i, consider the operator $f_i^m : V[\lambda] \to V[s_i\lambda]$ is an isomorphism by hypothesis and the representation theory of $\mathfrak{sl}_2$. Similarly, if $(\lambda, \alpha_i^\vee) = -m \leq 0$, then $e_i^m : V[\lambda] \to V[s_i\lambda]$ is an isomorphism. □

Prop. (15.8.2.15) [Classification of F.D. Irreducible Representations]. F.d. irreducible representations of $\mathfrak{g}$ are classified by their highest dominant integral weights $\lambda \in P^+$ via the bijection $\lambda \mapsto L_\lambda$. Moreover, for any $\mu \in P$ and $w \in W$, $\dim L_\lambda[\mu] = \dim L_\lambda[w\mu]$.

Proof: Firstly if V is a f.d. $\mathfrak{g}$-module, then $\lambda \in P^+$ by(15.8.2.2). Now if $\lambda \in P^+$, then in L_λ, $f_i^{\lambda(h_i)+1} v_\lambda = 0$ for any i, because by(15.8.1.9), $e_i f_i^{\lambda(h_i)+1} v_\lambda = 0$, and $e_j f_i^{\lambda(h_i)+1} v_\lambda = 0$ for $j \neq i$ as v_λ is a highest weight vector. So $f_i^{\lambda(h_i)+1} v_\lambda$ generates a proper submodule of L_λ, which must be 0 as it cannot contain v_λ, and L_λ is irreducible.

Thus v_λ generate the $\mathfrak{s}_i$-module of highest weight $\lambda(h_i)$, and any element of $\mathfrak{g}$ generate a f.d. $\mathfrak{s}_i$-module, so V is a sum of f.d. $\mathfrak{s}_i$-modules for each i, thus by lemma(15.8.2.14), $\dim L_\lambda[\mu] = \dim L_\lambda[w\mu]$. To show L_λ is of f.d., first notice $P(L_\lambda) \cap P^+$ is finite, and $WP^+ = P$(2.7.2.16), and the fact $P(L_\lambda)$ is W-invariant. □

Prop. (15.8.2.16). $L_\lambda^* = L_{-w_0\lambda}$.

Proof: It suffices to show the lowest weight of L_λ is $w_0\lambda$: $w_0\lambda$ is a weight by(15.8.2.15), and if $\lambda' < w_0\lambda$, then $w_0\lambda' > \lambda$. □

Lemma (15.8.2.17). The representation L_n of $\mathfrak{sl}_2$ is of real type if n is even and of quaternion type if n is odd.

Proof: $L_n = \mathrm{Sym}^n L_1$, thus we can take the bilinear form $\mathrm{Sym}^n B$, where B is the alternating form on $L_1 \cong \mathbb{C}^2$, which is symmetric if n is even and alternating if n is odd. □

Prop. (15.8.2.18) [Type of Irreducible Representations]. Let $\lambda \in P^+$ that $\lambda = -w_0\lambda$, so L_λ is self-dual by(15.8.2.16), and it is of real type if $n = (2\rho^\vee, \lambda)$ is even and of quaternion type if $(2\rho^\vee, \lambda)$ is odd.

Proof: The number n is the eigenvalue of h on v_λ, where $\{h, e, f\}$ is the principal $\mathfrak{sl}_2$-subalgebra, and the other eigenvalues are all smaller. Then $L_\lambda \cong L_n \oplus \bigoplus_{-i<n} L_{m_i}$, so the invariant form on L_λ restricts to a non-zero invariant form on L_n, so the assertion follows from(15.8.2.17). □

Fundamental Representations

Prop. (15.8.2.19) [Fundamental Representations]. The following are equivalent for a dominant integral weight ω of a split semisimple Lie algebra $\mathfrak{g}$:

- ω is minuscule(2.7.3.15).
- All weights of the representation L_ω belongs to the orbit $W\omega$.
- The restriction of L_ω to $\mathfrak{s}_i$ is a direct sum of 1-dimensional and 2-dimensional subrepresentations.

Such a representation L_ω is called a **fundamental representation** of $\mathfrak{g}$.

Proof: $1 \to 2$: By(15.8.2.15), for any weight μ of L_ω, there is a $w \in W$ that $w\mu$ is dominant and $\omega - w\mu \in Q^+$. Thus $w\mu = \omega$ by(2.7.3.17), and $\mu \in W\omega$.

$2 \to 1$: If ω is not minuscule, then there is some positive α that $(\omega, \alpha^\vee) > 1$, so $2(\omega, \alpha) < (\alpha, \alpha)$, and $\omega - \alpha$ is a weight of L_ω(the weight of $f_\alpha v_\omega$, and it is not conjugate to ω, as $(\omega - \alpha, \omega - \alpha) = (\omega, \omega) - 2(\alpha, \omega) + (\alpha, \alpha) < (\omega, \omega)$.

$2 \iff 3$: If ω is minuscule and $v \in L_\omega$ be a highest weight vector for $\mathfrak{s}_i$, then $h_{\alpha_i} v = \omega(h_\alpha) = (\omega, \alpha^\vee) = 0$ or v(2.5.3.21). Thus we get 4 by the representation theory of $\mathfrak{sl}_2$. The reverse argument is also true. □

Cor. (15.8.2.20). The character for a fundamental representation L_ω is

$$\chi_\omega = \sum_{w \in W} e^{w\omega}.$$

Prop. (15.8.2.21). Let ω be a minuscule weight, then for any dominant integral weight λ,

$$L_\omega \otimes L_\lambda \cong \oplus_{w\in W, \lambda+w\omega\in P^+} L_{\lambda+w\omega}.$$

Proof: By Weyl's character formula and(15.8.2.20),

$$\chi_{L_\omega\otimes L_\lambda} = \frac{\sum_{\mu\in W\omega}\sum_{w\in W}\varepsilon(w)e^{w(\lambda+\rho)+\mu}}{\Delta} = \frac{\sum_{\gamma\in W\omega}\sum_{w\in W}\varepsilon(w)e^{w(\lambda+\rho+\gamma)}}{\Delta}$$

If $\lambda+\gamma\notin P^+$, then $(\lambda+\gamma,\alpha_i^\vee)<0$ for some i. But $(\gamma,\alpha_i^\vee)\geq -1$ as ω is minuscule, so $(\lambda+\gamma,\alpha_i^\vee)=-1$, and $(\lambda+\gamma+\rho,\alpha_i^\vee)=0$. Then for such γ, in the summand the w term cancels with ws_i term. Thus the summand equals the character for $\sum_{w\in W}e^{w\omega}$. Then we finish by(15.8.3.3). □

Prop. (15.8.2.22) [Fundamental Representations for Simple Lie Algebras]. By(2.7.3.20),

- for B_n, the fundamental representation corresponding to the minuscule weights ω_n is called the **Spin representation**, denoted by S.
- for C_n, the fundamental representation corresponding to the minuscule weights ω_1 is the standard representation of $\mathfrak{sp}_{2n}$.
- for D_n, the fundamental representation corresponding to the minuscule weights $\omega_1,\omega_{n-1},\omega_n$ are the standard representation and two Spin representations S^+,S^-.
- for E_7, the unique fundamental representation has dimension 56**?**.
- for E_6, the two fundamental representations are dual, and have dimensions 27**?**.

Prop. (15.8.2.23) [Bott Periodicity for Spin Representations]. Let $\mathfrak{g}=\mathfrak{so}_m$, then the behavior of the spin representation of $\mathfrak{g}$ is

- S is of real type if $m\equiv 1,7 \mod 8$.
- S is of quaternionic type if $m\equiv 3,5 \mod 8$.
- S_+,S_- are of real type if $m\equiv 0 \mod 8$.
- $S_+^*\cong S_-$ are of complex type if $m\equiv 2,6 \mod 8$.
- S_+,S_- are of quaternionic type if $m\equiv 4 \mod 8$.

Proof: We use(15.8.2.18). If $\mathfrak{g}=\mathfrak{so}_{2n}$, then $\rho^\vee=\rho=sum\omega_i=(n-1,n-2,\ldots,1,0)$, so $(2\rho^\vee,\omega_{n-1})=(2\rho^\vee,\omega_n)=\frac{n(n-1)}{2}$.

If $\mathfrak{g}=\mathfrak{so}_{2n+1}$, then it can be verified that $\rho^\vee=(n,n-1,\ldots,0)$, so $(2\rho^\vee,\omega_n)=\frac{n(n+1)}{2}$.

Also we need to consider w_0, so $\mathfrak{so}_{4n+2}$ are of complex type. □

3 Weyl Character Formula

Def. (15.8.3.1) [Central Characters of a Representation]. Let $V=\oplus_{\mu\in P}V[\mu]$ be a f.d. representation of a split semisimple Lie algebra $\mathfrak{g}$, the **central character** is an analytic function on $\mathfrak{h}$ that

$$\chi_V(h)=\sum_{\mu\in P}\dim V[\mu]e^{\mu(h)}.$$

In fact χ is an element in $\mathbb{Z}[e^{\alpha_1},\ldots,e^{\alpha_r},e^{-\alpha_1},\ldots,e^{-\alpha_r}]$.

Thm. (15.8.3.2) [Weyl Characteristic Formula, Weyl1925]. Let $\lambda \in P^+$, then the character $\chi_\lambda = \chi_{L_\lambda}$ of the f.d. irreducible representation L_λ of $\mathfrak{g}$(15.8.2.15) is given by

$$\chi_\lambda = \frac{\sum_{w\in W} \varepsilon(w) e^{w(\lambda+\rho)}}{\Delta}.$$

where Δ is the Weyl denominator(15.8.4.3).

Proof: We already know that $\Delta\chi_\lambda \sum_{\mu\in P} c_\mu e^\mu$ is W-anti-invariant, $c_{\lambda+\rho} = 1$, and $c_\mu = 0$ unless $\mu \in \lambda + \rho - Q^+$, so it suffices to show $c_\mu = 0$ if $\mu \in P^+ \cap (\lambda + \rho - Q^+)$ and $\mu \neq \lambda + \rho$.**?** □

Cor. (15.8.3.3) [Characters Determine Representations]. F.d. representations of a semisimple Lie algebra is determined by its characters, as the maximal exponent of χ_λ are different for different λ.

Cor. (15.8.3.4). For $\mathfrak{sl}_2(\mathbb{C})$, $\chi_{W_n}(z) = e^{nz} + e^{(n-2)z} + \ldots + e^{-nz} = \frac{e^{(n+1)z} - e^{-(n+1)z}}{e^z - e^{-z}}$. Notice these functions are linearly independent, so by(15.8.1.14), representations of $\mathfrak{sl}_2(\mathbb{C})$ are determined by their characters.

Cor. (15.8.3.5) [Weyl Denominator Formula].

$$\Delta = \sum_{w\in W} \varepsilon(w) e^{w\rho}.$$

Proof: This follows from the Weyl character formula by setting $\lambda = 0$. □

Prop. (15.8.3.6) [Kostant's Multiplicity Theorem]. Let $\mathfrak{g}$ be a split semisimple Lie algebra and $\lambda \in P^+$, then

$$\dim L_\lambda[\gamma] = \sum_{w\in W} \varepsilon(w)\mathfrak{P}(w(\lambda+\rho) - \rho - \gamma).$$

where $\mathfrak{P}$ is the Kostant's partition function(2.7.2.19).

Proof: This follows from the formula

$$\Delta^{-1} = e^{-\rho}\frac{1}{\prod_{\alpha\in R^+}(1-e^{-\alpha})} = e^{-\rho}\sum_{\alpha\in Q(R)} \mathfrak{P}(\alpha)e^{-\alpha}.$$

applied to Weyl's character formula(15.8.3.2). □

Prop. (15.8.3.7) [Steinberg's Multiplicity Formula]. Let $\lambda, \mu \in P^+$, then

$$L_\lambda \otimes L_\mu \cong \sum_{\nu\in P^+} c_{\lambda\mu\nu} L_\nu,$$

where

$$c_{\lambda\mu\nu} = \sum_{w,w'\in W} \varepsilon(w)\varepsilon(w')\mathfrak{P}(w(\lambda+\rho) + w'(\mu+\rho) - (\nu+2\rho)).$$

where $\mathfrak{P}$ is the Kostant's partition function(2.7.2.19).

Proof: Cf.[Cartar, P265]. □

Cor. (15.8.3.8) [Clebsch-Gordan Rule]. The tensor products of representations of $\mathfrak{sl}_2(\mathbb{C})$ satisfy

$$W_m \otimes W_n \cong \bigoplus_{i=0}^{\min(m,n)} W_{|m-n|+2i}.$$

Proof: This follows from(15.8.3.7) or from(15.8.3.4). □

Prop. (15.8.3.9) [Weyl Dimension Formula]. Let $\mathfrak{g}$ be a split semisimple Lie algebra and $\lambda \in P^+$, then

$$\dim L_\lambda = \frac{\prod_{\alpha\in R^+}(\alpha, \lambda+\rho)}{\prod_{\alpha\in R^+}(\alpha,\rho)}$$

Proof: Choose an element $h_\rho \in \mathfrak{h}$ that corresponds to $\rho \in \mathfrak{h}^*$ via the Killing form, then

$$\chi_\lambda(2th_\rho) = \frac{\sum_{w\in W}\varepsilon(w)e^{2t(w(\lambda+\rho),\rho)}}{\prod_{\alpha\in R^+}(e^{t(\alpha,\rho)} - e^{-t(\alpha,\rho)})}.$$

The crucial fact is that we can use Weyl's denominator formula(15.8.3.5) on the nominator, to get

$$\chi_\lambda(2th_\rho) = \frac{\prod_{\alpha\in R^+}(e^{t(\alpha,\lambda+\rho)} - e^{-t(\alpha,\lambda+\rho)})}{\prod_{\alpha\in R^+}(e^{t(\alpha,\rho)} - e^{-t(\alpha,\rho)})}.$$

Now taking limit $t \to 0$, we get the desired formula. □

Remark (15.8.3.10). The Weyl dimension formula can be used to determine a representation V is irreducible or not: First calculate the maximal weight, then used the Weyl dimension formula to calculate the dimension to see if it is equal to the dimension of V.

4 Category $\mathcal{O}$

Def. (15.8.4.1) [$\mathcal{O}_{int}$]. Let $(\mathfrak{g}, \mathfrak{h})$ be a split semisimple Lie algebras, the category $\mathcal{O}_{int}$ is the category of representations V of $\mathfrak{g}$ that with weight decomposition into f.d. weight spaces that the weights $P(V)$ is contained in the union of sets $\lambda^i - Q^+$ for f.m. weights $\lambda^1, \ldots, \lambda^N \in P^\vee(R)$.

Def. (15.8.4.2) [Characters]. The character for a f.d. representation can be extended to category $\mathcal{O}_{int}$ as a formal Laurent series

$$\chi \in \mathbb{Z}[[e^{-\alpha_1^\vee}, \ldots, e^{-\alpha_r^\vee}]][e^{\alpha_1^\vee}, \ldots, e^{\alpha_r^\vee}] : \chi_V(h) = \sum \dim V[\mu]e^{\mu(h)}.$$

Prop. (15.8.4.3). The character of M_λ is given by

$$\chi_{M_\lambda} = \frac{e^\lambda}{\prod_{\alpha\in R^+}(1-e^{-\alpha})} = \frac{e^{\lambda+\rho}}{\Delta}, \quad \Delta = \prod_{\alpha\in R^+}(e^{\alpha/2} - e^{-\alpha/2}).$$

where Δ is called the **Weyl denominator** of $\mathfrak{g}$.

15.9 Representations of (Non-Compact)Lie Groups

Remark (15.9.0.1) [Non-compact Lie Groups]. The feature of representations of non-compact Lie groups is most intersecting representations are ∞-dimensional and involves topologies. The vector space V is assumed to be Hausdorff, second countable and complete, locally convex, and separable.

1 Basics

Prop. (15.9.1.1) [Left Invariant Differential Operators]. For a connected Lie group G, consider its left and right regular action λ, ρ on $C^\infty(G)$(10.11.1.1). We will write dX for $X \in \mathfrak{g}$ as the representation of Lie algebra of G via ρ, then it commutes with λ. So it induces a map of $U(\mathfrak{g})$ to the ring of left G-invariant differential operators on G.(2.5.8.1).

Prop. (15.9.1.2) [Center element Bi-invariant]. If G is a connected Lie group with Lie algebra $\mathfrak{g}$ and $D \in Z(U(\mathfrak{g}))$, then the differential operator D defined in(15.9.1.1) is invariant under both left and right regular representations of G.

Proof: The left invariance is general from(15.9.1.1), for the right invariance, Because G is connected, it suffices to prove invariance for a nbhd of identity of G, thus suffices to prove

$$\rho(g_t)D = D\rho(g_t), \quad g_t = \exp(tX).$$

For this, let $\varphi(g,t) = (\rho(g_t)D - D\rho(g_t))(g)$ and take derivative w.r.t t, then it reads:

$$\partial/\partial t\varphi(g,t) = (DdX\rho(g_t)f - dX\rho(g_t)Df)(g) = dX\varphi(g,t)$$

because dX commutes with D. And also $\varphi(g,0) = 0$, so by lemma(15.9.1.3), $\varphi(g,t) = 0$ for any t, g. □

Lemma (15.9.1.3). If G is a connected Lie group with Lie algebra $\mathfrak{g}$, and $\varphi \in C^\infty(G \times \mathbb{R})$ satisfies

$$\frac{\partial}{\partial t}\varphi(g,t) = dX\varphi(g,t)$$

for some $X \in \mathfrak{g}$ and $\varphi(g,0) = 0$, then $\varphi = 0$.

Proof: Let $\varphi_g(u,v) = \varphi(g\exp(uX), v)$, then the condition says

$$\frac{\partial}{\partial u}\varphi_g(u,v) = \frac{\partial}{\partial v}\varphi_g(u,v),$$

which means $\varphi_g(u,v) = F(u+v)$, and the fact $\varphi_g(u,0) = 0$ shows $F = 0$. □

Cor. (15.9.1.4). If $G = GL(2,\mathbb{R})^+$, then $\mathfrak{g} = \mathfrak{gl}_2(\mathbb{R})$, and the Casimir element(2.5.8.20) $\Delta = -1/2(1/2h^2 + ef + fe)$ corresponds to a bi-invariant differential operator on $C^\infty(G)$, and it is called the **Laplace-Beltrami operator**.

Differential Vectors

Def. (15.9.1.5) [Smooth Vectors]. Let V be a continuous representation of G on a locally convex TVS. we define the space V^∞ of **smooth vectors** of V as $V^\infty = \cap_n V^n$ where

$$V^0 = \{v \in V^{n-1}, \frac{d}{dt}\exp(t\xi)v \text{ exists,}\} \quad V^n = \{v \in V^{n-1}, T_\xi(v) \in V^{n-1}, \forall \xi \in \mathfrak{g}\}.$$

And V^∞ is given the inverse limit topology.

Prop. (15.9.1.6) [Action of Distribution on Smooth Vectors]. There is a continuous action of $Distr_c(G)$ on V^∞: $T \mapsto \pi(T)$ compatible with the convolution structure on $Distr_c(G)$.

Proof: For $v \in V^\infty$, define $F^v(g) = g(v)$. For $T \in Distr_c(G)$, define

$$\pi(T)v = (T, F^v)$$

. For example,

- $\pi(\delta_x) = \pi(x)$.
- $\pi(u) = u$ for $u \in U(\mathfrak{g})$.
- $\pi(fdg)v = \int_G f(g)\pi(g)vdg$ for $f \in C_c(G)$.
- $\pi(f * g) = \pi(f)\pi(g)$.

□

Cor. (15.9.1.7). If $f \in C_c^\infty(G)$, then for any $v \in V$, the vector $T_{f\mu_{Haar}}(v) \in V^\infty$.

Proof: Notice $X\pi(f)v = \pi(X * f)v$, and we calculate $X * f$:

$$(X * f, v) = \int \frac{d}{dt}\pi(e^{tX}y)vf(y)dy = \frac{d}{dt}\int f(y)\pi(e^{tX}y)vdy = \frac{d}{dt}\int f(e^{-tX}y)\pi(y)vdy = \pi(f_X)v$$

where $f_X(g) = \frac{d}{dt}(e^{-tX}g)|_{t=0}$ is smooth. Iterating, we can show $\pi(f)v \in V^\infty$. □

Cor. (15.9.1.8) [Smooth Vectors Dense]. V^∞ is dense in V.

Proof: Choose a Dirac sequence $\{f_n\}$, then $T_{f_n\mu_{Haar}}v \in V^\infty$ converges to v, by(15.9.1.6). □

Cor. (15.9.1.9). If V is a f.d. vector space, then $V^\infty = V$.

Prop. (15.9.1.10) [Smooth Vectors in S^1]. Let $K = S^1$ and ρ be the regular representation on the Hilbert space $L^2(K) = L^2[0, 2\pi]$, then the smooth vectors in ρ are just precisely the elements of $C^\infty(K)$.

Proof: Take a Fourier expansion $f(x) = \sum a_n e^{2\pi inx}$. Suppose f is a C^1 vector, then there is a $g(x) = \sum b_n e^{2\pi inx}$ that $\lim \frac{1}{t}(f_t - f) = g$, so

$$\lim \sum_n |\frac{1}{t}(e^{2\pi int} - 1)a_n - b_n|^2 = 0.$$

which means $b_n = 2\pi ina_n$.

So if f is a C^∞ vector, then $|a_n|$ decay rapidly, and f and all its derivatives converge absolutely so f is smooth. Conversely, integration shows the Fourier coefficients of any smooth function f decay rapidly. □

Examples

Prop. (15.9.1.11)[Store-Newmann]. The Heisenberg representation of H acting on $L^2(\mathbb{R})$ is unitary and irreducible, where $\pi(p_a) = e^{iax}\cdot$, and $\pi(r_b) = T_b$.

Prop. (15.9.1.12)[$\widetilde{SL_2(\mathbb{R})}$]. Let $\widetilde{SL_2(\mathbb{R})}$ be the universal covering of $SL_2(\mathbb{R})$. Then $\mathrm{Rep}_f(\widetilde{SL_2(\mathbb{R})}) = \mathrm{Rep}_f(SL_2(\mathbb{R}))$. In particular, $\widetilde{SL_2(\mathbb{R})}$ admits no f.d. faithful representations, and the only quotient groups of it that admit f.d. faithful representations are $SL_2(\mathbb{R})$ and $PSL_2(\mathbb{R})$.

Proof: Let $\rho : \widetilde{SL_2(\mathbb{R})} \to GL(n,\mathbb{R})$ be a representation inducing a real Lie algebra representation ρ_*. Consider its complexification $\rho\otimes\mathbb{C} : \widetilde{SL_2(\mathbb{R})} \to GL(n,\mathbb{C})$. Because $SL(2,\mathbb{C})$ is simply connected(11.7.4.22), $\rho_*\otimes\mathbb{C}$ corresponds to a complex representation $\rho' : SL(2,\mathbb{C}) \to GL(n,\mathbb{C})$ by(11.7.3.13). Now because $\widetilde{SL_2(\mathbb{R})}$ is simply connected, so there is a real Lie group homomorphism $\gamma : \widetilde{SL_2(\mathbb{R})} \to SL(2,\mathbb{C})$ that $\rho'\circ\gamma = \rho$. But because ρ,ρ' both commutes with conjugation, so does γ. Thus the image of γ is in $GL(2,\mathbb{R})$, and ρ factors through $SL(2,\mathbb{R})$.

There is a quotient map $\pi : \widetilde{SL_2(\mathbb{R})} \to PSL_2(\mathbb{R})$, and $PSL_2(\mathbb{R})$ has trivial center, so the center of $\widetilde{SL_2(\mathbb{R})}$ is contained in $\ker(\pi)$, which is isomorphic to $\pi_1(PSL_2(\mathbb{R})) = \mathbb{Z}$, and is central in $\widetilde{SL_2(\mathbb{R})}$ by(11.7.1.6). so the center of $\widetilde{SL_2(\mathbb{R})}$ is just $\mathbb{Z}$. By what has been proved, for any representation of other covering space of $PSL_2(\mathbb{R})$, the induced representation on $\widetilde{SL_2(\mathbb{R})}$ factors through $SL_2(\mathbb{R})$, thus trivial on the subgroup $2\mathbb{Z}\subset\mathbb{Z}$, and the original representation factors through $SL_2(\mathbb{R})$ or $PSL_2(\mathbb{R})$. So the only possibility of faithful representation is $SL_2(\mathbb{R})$ or $PSL_2(\mathbb{R})$. For $PSL_2(\mathbb{R})$, take the □

Prop. (15.9.1.13)[F.D. Representations of $SL_2(\mathbb{K})$]. Let $\mathbb{K} = \mathbb{C}$ or $\mathbb{R}$, then the representations of $SL(2,\mathbb{K})$ are isomorphic to direct representations (ρ_n, V_n), where V_n =homogeneous polynomials of degree n in indeterminants x, y, and

$$\rho_n(\begin{bmatrix} a & b \\ c & d \end{bmatrix})(x^k y^{n-k}) = (ax+by)^k(cx+dy)^{n-k}.$$

Proof: We can check these representations truly induce irreducible representations of their Lie algebras $\mathfrak{sl}_2(\mathbb{K})$. Notice $SL(2,\mathbb{C})$ is simply connected(11.7.4.22), so(15.9.1.12) and(11.7.3.13) gives the result. □

2 Finite-Dimensional Representations

Prop. (15.9.2.1). Finite dimensional representations of a semisimple Lie group is completely reducible.

Proof: This is because its Lie algebra representation is completely reducible(15.8.1.2), and each subrepresentation corresponds to a Lie group subrepresentation. □

3 $(\mathfrak{g}, K)$-Modules

$(\mathfrak{g}, K)$-Modules

Def. (15.9.3.1) [$(\mathfrak{g}, K)$-Modules]. If G is a Lie group that may not be connected, and $K\subset G$ be a maximal compact Lie subgroup(8.3.6.11), then K acts on $\mathfrak{g}$. Then a $(\mathfrak{g}, K)$**-module** is a $\mathbb{C}$-vector space that has a K-finite action and a $\mathfrak{g}$ action that satisfies:

- for $k\in K,\eta\in\mathfrak{g}$, $T_kT_\eta T_{k^{-1}}=T_{Ad_k(\eta)}$.
- The action of $\mathfrak{k}$ on V induced by K agrees with the restriction of the action of $\mathfrak{g}$.

A $(\mathfrak{g},K)$-module is called **admissible** iff every V^ρ is of f.d..

Def. (15.9.3.2) [Contragradient $(\mathfrak{g},K)$-Module]. If M is an admissible $(\mathfrak{g},K)$-module, then we can define its **contragradient $(\mathfrak{g},K)$-module** as

$$M^\vee=(M^*)^\infty=\oplus_\rho(M^\rho)^*,$$

which is the K-finite part of the usual dual of M, and $\mathfrak{g}$ clearly acts on it.

$(\mathfrak{g},K)$-Modules and $\mathfrak{g}$-Modules

Def. (15.9.3.3). Let K_0 be the unital component of K, then there are forgetful functors

$$\mathcal{M}\mathrm{od}_{(\mathfrak{g},K)}\to\mathcal{M}\mathrm{od}_{(\mathfrak{g},K_0)}\to\mathcal{M}\mathrm{od}_{\mathfrak{g}}.$$

Prop. (15.9.3.4). The functor $(\mathfrak{g},K_0)-mod\to\mathfrak{g}-mod$ is fully faithful, and its essential image is stable under taking submodules.

Proof: Cf.[Gaitsgory P39]. □

Cor. (15.9.3.5). If $M\in(\mathfrak{g},K)-mod$ is irreducible as a $\mathfrak{g}$-module, then it is irreducible.

Prop. (15.9.3.6). The functor $\mathcal{M}\mathrm{od}_{(\mathfrak{g},K)}\to\mathcal{M}\mathrm{od}_{\mathfrak{g}}$ sends f.g. objects to f.g. objects.

Proof: By(15.9.3.4), it suffices to consider the functor $(\mathfrak{g},K)-mod\to(\mathfrak{g},K_0)-mod$. Let M be f.g. $(\mathfrak{g},K)$-module, and $\cup M_i=M$ be a chain of $(\mathfrak{g},K_0)$-submodules. Pick $k\in K$ for each element of $\pi_0(K)$(f.m.), then each $M_i'=\sum_k k(M_i)$ is a $(\mathfrak{g},K)$-submodule, thus $M_i'=M$ for some i. Now we can choose j large that $k(M_i)\in M_j$ for any k, then $M_j=M$(because we may choose M_i be f.g. $(\mathfrak{g},K_0)$-modules)**?**. □

Cor. (15.9.3.7). The category $\mathcal{M}\mathrm{od}_{(\mathfrak{g},K)}$ is Noetherian.

Proof: If $M\in(\mathfrak{g},K)-mod$ is f.g. and $M_1\subset M$, then M is f.g. as $\mathfrak{g}$-module, then M_1 is f.g. as $\mathfrak{g}$-module by(2.5.8.16). So clearly it is also f.g. as a $(\mathfrak{g},K)$-module. □

Prop. (15.9.3.8). For an irreducible $(\mathfrak{g},K)$-module M, the underlying $\mathfrak{g}$-module is a direct sum of f.m. irreducibles.

Proof: By(15.9.3.4), it suffices to prove M is a direct sum of f.m. irreducible $(\mathfrak{g},K_0)$-modules. M is f.g. as a $(\mathfrak{g},K_0)$-modules by the proof of(15.9.3.6), so it has a maximal submodule M' that $N=M/M'$ is irreducible. Pick $k\in K$ for each component of K, consider

$$M''=\cap_k k(M')$$

which is a proper $(\mathfrak{g},K)$-submodule of M, so it is 0, Hence the map

$$M\to\oplus(N)^k$$

is injective, where N^k is N twisted by conjugate action of k, so it is a submodule of a semisimple-module, thus semisimple. □

Properties of $(\mathfrak{g}, K)$-Modules

Cor. (15.9.3.9) [Schur's Lemma]. Schur's lemma holds for irreducible $(\mathfrak{g}, K)$-modules.

Proof: It suffice to show any endomorphism S of an irreducible $(\mathfrak{g}, K)$-module M has an eigenvalue. But S preserves M^ρ for any ρ, and M^ρ is of f.d, thus it has an eigenvalue over $\mathbb{C}$. □

Cor. (15.9.3.10) [Irreducible Unitary Representation Determined by Finite Part]. If V_1, V_2 are two irreducible unitary representations of G that are infinitesimal equivalent, then they are isomorphic.

Proof: Firstly they are admissible by(15.9.4.7), so we can talk about their corresponding $(\mathfrak{g}, K)$-modules M_i, then V_i are the Hilbert space completion of M_i by(15.9.3.24).

Now M_i has Hermitian forms, so $M_i \cong (M^*)^{alg}$, and if $S : M_1 \cong M_2$, then S^*S is an automorphism of M_1, thus by(15.9.3.25)(15.9.3.9) it is a scalar map, so after a scalar change, we may assume S preserves Hermitian structure thus induces an isomorphism of vector spaces $V_1 \cong V_2$, so by(15.9.3.24) it is an isomorphism of G-representations. □

Prop. (15.9.3.11). Any irreducible $(\mathfrak{g}, K)$-module has a Banach space structure.

Proof: □

Action of $Z(U(\mathfrak{g}))$

Prop. (15.9.3.12). Let M be an admissible $(\mathfrak{g}, K)$-module, then

$$M \cong \oplus_{\chi \in \mathrm{Spec}(Z(\mathfrak{g}))} M_\chi$$

s.t. $Z(\mathfrak{g})$ acts on each M_χ with a generalized character χ.

Now let $(\mathfrak{g}, K) - \mathcal{M}\mathrm{od}_\chi$ be the full subcategory of $(\mathfrak{g}, K)$-modules on which $Z(\mathfrak{g})$ acts with a generalized character χ.? Cf.[Gaitsgory P42].

Proof: $Z(\mathfrak{g})$ commutes with G thus K action, so it preserves each M^ρ, which are of f.d.. □

Prop. (15.9.3.13). The category $(\mathfrak{g}, K) - \mathcal{M}\mathrm{od}_\chi$ has only f.m. isomorphism classes of irreducible objects.

Proof: Cf.[Gaitsgory]. □

Prop. (15.9.3.14). If M is a f.g. $(\mathfrak{g}, K)$-module, then for any ρ of K, M^ρ is f.g. over $Z(\mathfrak{g})$.

Proof: Cf.[Gaitsgory P43]. □

Prop. (15.9.3.15). For $M \in (\mathfrak{g}, K) - mod_\chi$, the following are equivalent:

- M is f.g..
- M is of finite length.
- M is admissible.

Proof: $2 \to 1$ is trivial, $1 \to 3$ is by(15.9.3.14).

For $3 \to 2$: Use(15.9.3.13), there are only f.m. irreducible classes ρ_α, let $\rho = \oplus_\alpha \rho_\alpha$, then if there is a chain of length n, then there are at least n linearly independent morphisms in $\mathrm{Hom}_K(\rho, M)$. Thus n is bounded, because $\dim_K \mathrm{Hom}_K(\rho, M)$ is finite because M is admissible. □

Cor. (15.9.3.16). The category $(\mathfrak{g}, K) - mod_\chi$ is Artinian(3.7.3.19).

Cor. (15.9.3.17). Every irreducible $(\mathfrak{g}, K)$-module is admissible.

Proof: Firstly irreducible module are in $(\mathfrak{g}, K) - mod_\chi$ for some χ, and then use the proposition and(15.9.3.8). □

Cor. (15.9.3.18) [Harish-Chandra Modules]. For a $(\mathfrak{g}, K)$-module, the following conditions are equivalent:

- M is f.g. and admissible.
- M is f.g. and its support over $\mathrm{Spec}(Z(\mathfrak{g}))$ is finite.
- M is admissible and its support over $\mathrm{Spec}(Z(\mathfrak{g}))$ is finite.
- M is of finite length.

Then such modules are called a **Harish-Chandra module**.

Proof: ? □

Real Reductive Groups

Def. (15.9.3.19) [Admissible Representation]. Let G be a connected real reductive group(which is relevant, thus the complex representations of G and $G(\mathbb{R})$ are the same(8.3.6.8)), Let $K \subset G(\mathbb{R})$ be a maximal compact subgroup. Define $V^\infty, V^\rho, V^{K-fin}$ as in(10.11.4.7)(15.9.1.5).

An **admissible representation** of G is a representation V that for any f.d. irreducible representation ρ of K, V^ρ is of f.d.

Prop. (15.9.3.20). For any ρ, $V^\infty \cap V^\rho$ is dense in V^ρ.

Proof: ? □

Cor. (15.9.3.21). If V is admissible, then $V^{K-fin} \subset V^\infty$ by(15.9.1.9).

Prop. (15.9.3.22). If V is admissible, then V^{K-fin} is a $(\mathfrak{g}, K)$-module(15.9.3.1), and the map $V \mapsto V^{K-fin}$ induces a functor

$$Rep(G)_{adm} \to (\mathfrak{g}, K) - mod_{adm}.$$

And we call two admissible representations V_1, V_2 of G **infinitesimal equivalent** iff they are isomorphic after this functor.

Proof: By(15.9.3.21), $\mathfrak{g}$ can act on V^{K-fin}, and $U(\mathfrak{g})$ fixes V^{K-fin}: if $f \in V^{K-fin}$, let R be a f.d. K-subspace of V containing f, then $\mathfrak{k}f \in R$. Let R_1 be the f.d. vector space spanned by $\mathfrak{g}R$, then R_1 is invariant under $\mathfrak{k}$: for $X \in \mathfrak{k}, Y \in \mathfrak{g}, \varphi \in R$

$$X(Y\varphi) = [X, Y]\varphi + Y(X\varphi) \in R_1$$

so $R_1 \subset V^{K-fin}$, so $\mathfrak{g}$ fixes V^{K-fin}.

Also we check

$$T_k T_\eta T_{k^{-1}} = T_{Ad_k \eta}$$

which is by definition, and the second condition in(15.9.1.9) is also obvious. □

Lemma (15.9.3.23). Let V be an admissible representation of G, and $v \in V^{K-fin}$, then for any $\eta \in V^*$, the function $g \mapsto \eta(g(v))$ is real analytic.

Proof: Cf.[Gaitsgory P37]. □

Prop. (15.9.3.24) [$\mathrm{Rep}^{\mathrm{adm}}(G)$ **and** $(\mathfrak{g}, K)$**-Modules].**

- If V_1, V_2 be two admissible representations of G, if $S : V_1 \to V_2$ is a continuous map of TVS. Assume $S(V_1^{K-fin}) \subset V_2^{K-fin}$ and induces a $(\mathfrak{g}, K)$-module map, then the initial S is a map of G-representations.
- If $V \in Rep(G)_{adm}, M = V^{K-fin}$, then the functors

$$(V_1 \subset V) \mapsto (V_1)^{K-fin} \subset M; \quad (M_1 \subset M) \mapsto \overline{M}_1 \subset V$$

induces mutually inverse bijections between closed G-subrepresentations of V and $(\mathfrak{g}, K)$-submodules of M.

Proof: 1: It suffices to show for $v_1 \in V^{K-fin}$, $T_g S(v_1) S T_g(v_1)$. So by Hahn-Banach it suffices to show for any $\eta \in V_2^*$,

$$\eta(T_g S(v_1)) = \eta(S T_g(v_1)).$$

Both sides are analytic in g by(15.9.3.23), so it suffices to show all their derivatives at 1 are equal, and use the fact $\pi_0(K) \to \pi_0(G)$ is surjective(8.3.6.11). And the derivatives equal because S commutes with $\mathfrak{g}$-action.

2: Firstly $\overline{M}_1$ is a G-representation: because $\overline{M}_1 = ((M_1)^\perp)^\perp$ by Hahn-Banach. so it suffices to show for $v_1 \in M_1, \eta(g(v_1)) = 0$ for any $\eta \in (M_1)^\perp$. Then this uses analyticity(15.9.3.23) as above and the fact M_1 is a $(\mathfrak{g}, K)$-subrepresentation.

For the bijection, notice V_1^{K-fin} is dense in V_1 by(10.11.4.17). Conversely, for a submodule M_1, it suffices to show the image of $T_{\xi_\rho \mu_{Haar}}(\overline{M}_1) \subset M_1^\rho$ by(10.11.4.13). However $T_{\xi_\rho \mu_{Haar}}(M_1) \in M_1^\rho$ by(10.11.4.13), so this is true by continuity. □

Cor. (15.9.3.25)[Irreducibility of $(\mathfrak{g}, K)$**-Modules].** An admissible G-representation V is irreducible iff V^{K-fin} is irreducible as $(\mathfrak{g}, K)$-modules.

<u>**Irreducible Admissible** $(\mathfrak{g}, K)$**-Modules of** $GL(2, \mathbb{R})$</u>

Prop. (15.9.3.26) [Lie Theory]. Let V be an irreducible admissible $(\mathfrak{g}, K)$-module for $GL(2, \mathbb{R})^+$, then

- V^k is the space of all vectors $x \in V$ that $Hx = kx$.
- If $x \in V^k$, then $Rx \in V^{k+2}, Lx \in V^{k-2}$.
- If $0 \neq x \in V^k$, then $\mathbb{C}x = V^k, \mathbb{C}R^n x = V^{k+2n}, \mathbb{C}L^n V^{k-2n}$ and

$$V = \mathbb{C}x \oplus \bigoplus_{n>0} \mathbb{C}R^n x \oplus \bigoplus_{n>0} \mathbb{C}L^n x.$$

- Suppose $\Delta = \lambda$ on V, then if $x \in V^k$, then

$$LRx = (-\lambda - \frac{k}{2}(1 + \frac{k}{2}))x, \quad RLx = (-\lambda + \frac{k}{2}(1 - \frac{k}{2}))x.$$

Proof: 1: Let $W = iH$. If $x \in V^k$, then

$$Wx = \frac{d}{dt}\pi(e^{tW})x = \frac{d}{dt}\pi(k_t)x = \frac{d}{dt}e^{ikt}x = ikx$$

thus $Hx = kx$. And we know V decomposes as direct sums of representations of K(10.11.4.4), thus the result follows.

2: clear from(2.5.2.11).

3: Because the RHS is a $\mathfrak{g}$-submodule, by representation of $\mathfrak{sl}_z(\mathbb{C})$(15.8.1.11). And it is also a K-subrepresentation, by item1.

4: By(15.8.1.11). □

Cor. (15.9.3.27) [Non-Discrete Case]. For any $\lambda, \mu \in \mathbb{C}$ that $\lambda \neq \frac{k}{2}(1+\frac{k}{2})$ for k even/odd, there exists at most one isomorphism class of irreducible admissible even/odd $(\mathfrak{g}, K)$-module V on which Δ, I acts by λ, μ respectively, and the K-type is one vector f_k for each $k \in \mathbb{Z}$.

Proof: This follows from the classification of representation of $\mathfrak{sl}_2(\mathbb{C})$(15.8.1.11). Notice the action of K is controlled by(15.9.3.26) item1. □

Cor. (15.9.3.28)[Discrete Case]. Let $k \geq 1$ be an integer and $\lambda = \frac{k}{2}(1+\frac{k}{2})$. Let V be an irreducible admissible $(\mathfrak{g}, K)$-module with parity equals k, Let Σ be the K-types of V, then Σ is one of the following sets:

- $\Sigma^+(k) = \{l \in \mathbb{Z} | l \equiv k \mod 2, l \geq k\}$
- $\Sigma^-(k) = \{l \in \mathbb{Z} | l \equiv k \mod 2, l \leq -k\}$
- $\Sigma^0(k) = \{l \in \mathbb{Z} | l \equiv k \mod 2, -k < l < k\}$

And there are at most one isomorphism class with each Σ.

Proof: This follows from the classification of representation of $\mathfrak{sl}_2(\mathbb{C})$(15.8.1.11). Notice the action of K is controlled by(15.9.3.26) item1. □

Def. (15.9.3.29)[$H(s_1, s_2, \varepsilon)$]. If $\lambda \geq 1/4$, let $s - 1/2$ be the square root of $1/4 - \lambda$ which is imaginary, and let s_1, s_2 be determined that $\mu = s_1 + s_2, s = \frac{1}{2}(s_1 - s_2 + 1)$.

Consider the 1-dimensional representation σ of $B(\mathbb{R})^+$ that

$$\sigma(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix}) = \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_1} |y_2|^{s_2},$$

If s_1, s_2 are purely imaginary(i.e. μ is purely imaginary), then this representation is unitary, and we can consider the induced representation on $GL(2,\mathbb{R})^+$(10.11.5.3), then it is a unitary representation of $GL(2,\mathbb{R})^+$. For $f \in \operatorname{ind}_{B(\mathbb{R})^+}^G$,

$$f(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix} g) = \operatorname{sgn}(y_1)|y_1|^{s_1+1/2}|y_2|^{s_2-1/2} f(g)$$

and

$$(f_1, f_2) = \frac{1}{2\pi}\int_0^{2\pi} f_1(k_\theta)\overline{f_2(k_\theta)} d\theta.$$

so $H(s_1, s_2, \varepsilon)$ is identical to $L^2[-\pi/2, \pi/2]$ by Iwasawa decomposition(11.7.4.3). Then its K-finite vectors can be determined, which are sums of

$$f_l(g) = u^{s_1+s_2} y^s e^{il\theta}, l \equiv \varepsilon \mod 2.$$

so $H(s_1, s_2, \varepsilon)$ is admissible.

Even if μ is not purely imaginary, we can still define $H(s_1, s_2, \varepsilon)$ as above, and we consider its smooth vectors $H^\infty(s_1, s_2, \varepsilon)$, which are just the smooth functions in $H(s_1, s_2, \varepsilon)$, by(15.9.1.10).

Prop. (15.9.3.30). We can define the regular action of G on $H(s_1,s_2,\varepsilon)$(but may not be unitary), and the subspace $H^\infty(s_1,s_2,\varepsilon)$ is the space of smooth vectors for this representation.

Proof: It suffices to define the regular action of G on $H^\infty(s_1,s_2,\varepsilon)$ and show it is a bounded operator, so that it can be extended to $H(s_1,s_2,\varepsilon)$ by continuity.

By Cartan decomposition(11.7.6.1), G is generated by K and diagonal matrices of positive entries. $\rho(K)$ clearly preserves the inner product, so it suffices to consider these matrices.

By(16.1.1.20) and the calculation $d\theta' = y_1y_2D(\theta)^{-2}d\theta$, we have

$$\int_0^{2\pi}|\pi(\mathrm{diag}(y_1,y_2))f(k_\theta)|^2d\theta = (y_1y_2)^{s_1-1/2}\int_0^{2\pi}D(\theta)^{-s_1+s_2+1}|f(k_{\theta'})|^2d\theta'.$$

where

$$\theta' = \arctan(\frac{y_1}{y_2}\tan\theta),\quad D(\theta)=\sqrt{y_1^2\sin^2\theta+y_2^2\cos^2\theta}.$$

$D(\theta)$ is bounded above and below, thus $\pi(\mathrm{diag}(y_1,y_2))$ is a bounded operator. Also to show this representation is continuous, it suffices to show for $|f|_2$ small and y_1,y_2 small, $|\pi(\mathrm{diag}(y_1,y_2))f|_2$ is small. And this is also a consequence of the above formula. □

Lemma (15.9.3.31). For $f_l\in H(s_1,s_2,\varepsilon)$ as in(15.9.3.29), we have

$$Hf_l = lf_l,\quad ,Rf_l=(s+\frac{l}{2})f_{l+2}, Lf_l=(s-\frac{l}{2})f_{l-2},\Delta f_l=\lambda f_l,\quad If_l=\mu f_l$$

Proof: Clear from(16.1.1.1) and definition of f_l(15.9.3.29). □

Prop. (15.9.3.32) [Existence of $(\mathfrak{g},K)$-Modules]. Let $s=\frac{1}{2}(s_1-s_2+1),\lambda=s(1-s),\mu=(s_1+s_2)$, then (subquotients) of the $(\mathfrak{g},K)$-module $\mathfrak{H}$ of $H(s_1,s_2,\varepsilon)$ afford classes in(15.9.3.27) and(15.9.3.28). More precisely, Δ and I acts by scalars λ,μ respectively, and

- If s is not of the form $k/2, k\equiv\varepsilon \mod 2$, then $\mathfrak{H}$ is irreducible.
- If $s\ge 1/2$ and $s=\frac{k}{2}$ where $k\ge 1$ is an integer that $k\equiv\varepsilon\mod 2$, then $\mathfrak{H}$ has two irreducible invariant subspaces $\mathfrak{H}_+,\mathfrak{H}_-$ with K-types $\Sigma+,\Sigma_-$ respectively, and the quotient $\mathfrak{H}/\mathfrak{H}_+\oplus\mathfrak{H}_-$ is irreducible and has K-type $\Sigma^0(k)$.
- If $s\le 1/2$ and $s=1-\frac{k}{2}$ where $k\ge 1$ is an integer that $k\equiv\varepsilon\mod 2$. Then $\mathfrak{H}$ has an invariant subspace $\mathfrak{H}^0$ with K-types $\Sigma^0(k)$ and the quotient $\mathfrak{H}/\mathfrak{H}^0$ decomposes into two irreducible invariant subspaces $\mathfrak{H}^+,\mathfrak{H}^-$ with K-types $\Sigma+,\Sigma_-$ respectively.

Proof: The action of H,R,L,Δ,I is all clear from(15.9.3.31), and the decomposition and irreducibility is all clear from the representation theory of $\mathfrak{sl}_2$ and(15.9.3.27)(15.9.3.28). □

Prop. (15.9.3.33) [List of Irreducible Admissible $(\mathfrak{g},K)$-Modules for $GL(2,\mathbb{R})^+$]. Every irreducible admissible $(\mathfrak{g},K)$-module may be realized as the space of K-finite vectors in an admissible representation of G on a Hilbert space. Let $\lambda,\mu\in\mathbb{C}$, and $\varepsilon=0,1$.

- If λ is not of the form $\frac{k}{2}(1-\frac{k}{2})$, where $k\equiv\varepsilon\mod 2$, then there exists a unique irreducible admissible $(\mathfrak{g},K)$-module of parity ε on which Δ,I acts by scalars λ,μ, denoted by $P_\mu(\lambda,\varepsilon)$. These are called the **principal series**.
- If $\lambda=\frac{k}{2}(1-\frac{k}{2})$ for some $1\le k\equiv\varepsilon\mod 2$, then there exists three(two for $k=1$) irreducible admissible $(\mathfrak{g},K)$-module of parity ε on which Δ,I acts by scalars λ,μ. Their K-types are $\Sigma^\pm$, Σ^0 respectively. The irreducible admissible $(\mathfrak{g},K)$-modules of K-types $\Sigma^\pm$ are denoted by $D_\mu^\pm(k)$. If $k>1$, $D_\mu^\pm(k)$ are called **discrete series** and for $k=1$ they are called **limits of discrete series**.

Proof: This is a consequence of(15.9.3.27)(15.9.3.28) and(15.9.3.32). □

Prop. (15.9.3.34)[List of Irreducible Admissible $(\mathfrak{g}, K)$-Modules for $GL(2,\mathbb{R})$]. Let $\mu \in \mathbb{C}$, and $\varepsilon = 0, 1$.

- The f.d. representations are obtained by tensoring the symmetric powers of the standard representation of G with the 1-dimensional representation of the form $\chi \circ \det$.
- If χ_1, χ_2 are quasi-characters of $\mathbb{R}^*$ that $\chi_1\chi_2^{-1}$ is not of the form $y \mapsto \mathrm{sgn}(y)^\varepsilon |y|^{k-1}$, where $k \equiv \varepsilon \mod 2$, then there is a irreducible $(\mathfrak{g}, O(2,\mathbb{R}))$-module $\pi(\chi_1, \chi_2)$.
- If $\mu \in \mathbb{R}$ and $k \geq 1$ is an integer, then there are representations $D_\mu(k) = (D_\mu^+(k) \oplus D_\mu^-(k))$, called **discrete series** if $k \geq 2$ and **limits of discrete series** if $k = 1$.

Proof: Use(15.1.1.12) on $SO(2,\mathbb{R}) \subset O(2,\mathbb{R})$. It turns out $P_\mu(\lambda, \varepsilon)$ can be extended in two ways to a representation of $O(2,\mathbb{R})$: $H(s_1, \varepsilon_1, s_2, \varepsilon_2)$, corresponding to item2. It is unitarizable as $H(s_1, s_2, \varepsilon)$ is unitarizable.

The (limits of) discrete series are conjugate in pairs and combined to give a representation of $O(2,\mathbb{R})$, which is item3. It is unitarizable as it is just $H(s_1, s_2, \varepsilon)/\mathfrak{H}^0$.

The case $D_\mu^0(k)$ are also of type I and can be extended, and this irreducible representation are exactly the smooth parts of the symmetric representation of $GL(2,\mathbb{R})$ twisted by $\chi \circ \det$. □

Cor. (15.9.3.35) [Contragradient]. Let $G = GL(2,\mathbb{R}), K = O(2,\mathbb{R})$, (π, V) be an irreducible admissible $(\mathfrak{g}, K)$-module, then the contragradient $\widehat{\pi}$ is isomorphic to the $(\mathfrak{g}, K)$-module $T_k' = T_{k^{-t}}$ and $T_X' = T_{X^{-t}}$.

And it is also isomorphic to $\pi \otimes (\omega \circ \det)$.

Proof: This is a consequence of the classification of irreducible $(\mathfrak{g}, K)$-modules(15.9.3.33), where the K-type are unchanged, eigenvalues of Δ are unchanged, and eigenvalue of I is changed to $-\mu$, so they are isomorphic. □

4 Unitary Representations

The theory of abstract harmonic analysis applies in this case10.11.

Lemma (15.9.4.1)[Auxiliary Compact Supported Function Approximation]. Let G be a locally compact Lie group and K a compact subgroup. If $\mathcal{H}$ is a unitary representation of G on a Hilbert space, and let $f \neq 0 \in \mathcal{H}$, then for any $\varepsilon > 0$, there is a $\varphi \in C_c^\infty(G)$ s.t. $\pi(\varphi)$ is self-adjoint and $|\varphi(\rho)f - f| < \varepsilon$.

Moreover, if $f \in \mathcal{H}^\xi$ which is the decomposition part for K, we can assume $\varphi(kg) = \varphi(gk) = \xi(k)^{-1}\varphi(g)$. In particular if $\mathcal{H}^\xi$ is f.d., we find a φ that $\pi(\varphi)f = f$.

Proof: By continuity, there is a nbhd H of 1 that $|\pi(g)f - f| < \varepsilon$, then we can choose a φ positive real valued with support in U with integral 1, then $|\pi(\varphi)f - f| < \varepsilon$ by(10.9.3.22). We can also choose $\varphi(g) = \varphi(g^{-1})$, then $\pi(\varphi)$ is self-adjoint.

For the second case, notice first there is a nbhd V of 1 that $kVk^{-1} \in U$ for any $k \in K$(3.11.1.6), so let φ_1 be a positive real valued function supported in V, and let

$$\varphi_0(g) = \int_K \varphi_1(kgk^{-1})dk$$

then φ_0 is supported in U and $\varphi(kgk^{-1}) = \varphi_0(g)$ for any $k \in K$. Assume now that $\pi(k_\theta) = e^{ik\theta} f$, then we can use(10.11.1.39) for $P = G$ to see that

$$\pi(\varphi_0)f = \int_G \varphi_0(h)\pi(h)f dh = \int_G \int_K \varphi_0(hk)\pi(hk)f dk dh = \int_G \int_K \xi(k)\varphi_0(hk)dk\pi(h)f dh = \pi(\varphi)f$$

where

$$\varphi(g) = \int_K \xi(k)\varphi_0(gk)dk = \int_K \xi(k)\varphi_0(kg)dk$$

so $\varphi(k) = \varphi(gk) = \xi^{-1}(k)\varphi(g)$ as required. □

Unitary Irreducible Representation is Admissible

G appearing in this subsubsection are assumed to be a Lie group.

Prop. (15.9.4.2). If V is an irreducible unitary representation of G, then the image of the induced action of $Meas_c(G)$ is dense in $\mathrm{End}(V)$ in the strong topology(10.8.3.4).

Proof: This follows immediately from the von Neumann theorem(10.10.3.14) and Schur's lemma(10.11.2.4): if we denote the algebra generated by $Meas_c(G)$ by A, then

$$\overline{A} = (A^c)^c = (\mathbb{C})^c = \mathrm{End}(V).$$

□

Prop. (15.9.4.3). If V Is a representation of G that the image of the induced action of $Meas_c(G)$ is dense in $\mathrm{End}(V)$ in the strong topology, then

$$\dim(V^\rho) \le \dim(\rho)^2.$$

Proof: Follows directly from the following two lemmas(15.9.4.5)(15.9.4.6). □

Cor. (15.9.4.4)[Irreducible Unitary Representation is Admissible]. For any irreducible unitary representation of G, the K-finite part is an irreducible admissible $(\mathfrak{g}, K)$-module, and $\dim(V^\rho) \le \dim(\rho)^2$.

Proof: Follows directly from(15.9.3.25),(15.9.4.2) and(15.9.4.3). □

Lemma (15.9.4.5). For any $\rho \in \mathrm{Irrep}(K)$, let $A_\rho = \xi_\rho \cdot Meas_c(G) \cdot \xi_\rho$, this is an algebra that acts on V^ρ by(10.11.4.13). Then there exists a family of f.d. representations π of A_ρ that:

- Each π is of dimension$\le n = \dim(\rho)^2$.
- For every element $a \in A_\rho$, there exists a π that $\pi(a)$ is non-trivial.

Proof: Consider the set of all irreducible f.d. representations of G, and π^ρ their ρ-isotopic parts. Then these are representations of A_ρ, and for any $\varphi \in Meas_c(G)$, there is a π that $T_\varphi \ne \mathrm{Id}$**?**, and each π^ρ has dimension$\le \dim(\rho)^2$**?**. Cf.[Gaitsgory P46]. □

Lemma (15.9.4.6). If A is an associative algebra equipped with a family of f.d. modules satisfying conditions in(15.9.4.5), then if V is a representation of A that the image of A is dense in $\mathrm{End}(V)$ in the strong topology, then $\dim V \le n$.

Proof: For an associated algebra A, consider the minimal integer r that the property $P(r)$:

$$\sum_{\sigma\in\Sigma_r}\operatorname{sgn}(\sigma)a_{\sigma(1)}\cdots a_{\sigma(r)}=0$$

for any $a_1,\dots,a_r$, then Amitsur-Levitski showed that for $A=GL(n,\mathbb{C})$, $r=2n$(2.5.11.7).

Now the condition of A in(15.9.4.5) shows that P_{2n} is true for A. If $\dim V\geq n+1$, then the image of A satisfies $P(2n)$, so also $\operatorname{End}(V)$ satisfies $P(2n)$ because A is dense in $\operatorname{End}(V)$. But V contains a subgroup $GL(n+1,\mathbb{C})$, so it cannot satisfy $P(2n)$ by(2.5.11.7), contradiction. □

Cor. (15.9.4.7). Let V be an irreducible unitary representation of G, then for any $\rho\in Irrep(K)$,

$$\dim(V^\rho)\leq\dim(\rho)^2.$$

In particular, every unitary irreducible representation of G is admissible.

Proof: Directly from Lemmas(15.9.4.2) and(15.9.4.3) above, as the action of A_ρ on V^ρ is also have dense image in the strong topology. □

Prop. (15.9.4.8). If M is an irreducible $(\mathfrak{g},K)$-module equipped with an invariant inner product $((km_1,km_2)=(m_1,m_2),(\xi m_1,m_2)+(m_1,\xi m_2)=0)$, then the Hilbert space completion of M carries a unique unitary G-representation s.t. $V^{K-fin}=M$ as $(\mathfrak{g},K)$-modules.

Proof: By(15.9.4.9), the Hermitian form can be extended continuously to the Banach space completion of M, It suffices to prove the extended Hermitian form is continuous, because them we can choose its completion w.r.t. $(-,-)$.

For the invariance, consider $f(g)=(gm_1,m_2)-(m_1,g^{-1}m_2)$, then notice $(a,-)$ are continuous functional on V, thus by(15.9.3.23) and similar analytic method as in(15.9.3.24) using the invariance of inner product. □

Lemma (15.9.4.9). Situation as in(15.9.4.8), M has a Banach norm that $(m,m)\leq||m||^2$.

Proof: (15.9.3.11) shows M does have a Banach norm. Then let $M\cong V^{K-fin}$ and $M^{*alg}\cong(V^*)^{K-fin}$. However the Hermitian form induces $M\cong M^{*alg}$, thus we can form

$$M\xrightarrow{\Delta}M\oplus M\to V\oplus V^*$$

let V' be the closure of the image of M, then it is a G-representation by(15.9.3.24), and then

$$(m,m)\leq||i_1(m)||||i_2(m)||\leq(||i_1(m)||+||i_2(m)||)^2.$$

□

Cor. (15.9.4.10). The above proposition(15.9.4.8) is true for M admissible.

Hecke Algebras

Prop. (15.9.4.11) [Hecke Algebras of Lie Groups].

- If K is a compact Lie group, then the **Hecke algebra** $\mathcal{H}_K$ is defined to be the ring of smooth functions on K that is K-finite under both left and right translations, where the algebra is given by convolution. By Peter-Weyl theorem, these functions are dense in $C(K)$ and $L^2(K)$, and it is an idempotented algebra over $\mathbb{C}$**?** Cf.[Bump, P309].

- If G is a real reductive group and K is a maximal compact subgroup, then the **Hecke algebra** $\mathcal{H}_G$ is defined to be $\mathcal{H}_G = \mathcal{H}_K \otimes_{U(\mathfrak{k}_\mathbb{C})} U(\mathfrak{g}_\mathbb{C})$, where the right action of $U(\mathfrak{k}_\mathbb{C})$ on $\mathcal{H}_K$ is given by

$$f * D = \rho(D)f,$$

? Cf.[Bump, P312].

Proof: □

Prop. (15.9.4.12) [Equivalence of Representations Lie Group Case].

- For a compact Lie group K, the category $\mathcal{M}(K)$ of smooth representations of $\mathcal{H}_K$ is equivalent to the category of unitary representations of K.
- For a real reductive group G and a maximal compact subgroup K, the category of (admissible)$(\mathfrak{g}, K)$-modules is equivalent to the category of smooth(admissible) modules of $\mathcal{H}_G$.

Proof: Cf.[Cohomological Induction and Unitary Representations, P75]. □

Irreducible Unitary Representations of $GL(2,\mathbb{R})^+$

Lemma (15.9.4.13) [Finite Dimensional Case]. The only irreducible f.d. unitary representations of the group $GL(n,\mathbb{R})^+$ are the 1-dimensional characters $g \mapsto \det(g)^r$ where r is purely imaginary.

Proof: Such a representation defines a continuous map of $GL(n,\mathbb{R})^+$ into the compact unitary group $U(n)$. Now it induces a Lie algebra map $\mathfrak{sl}_n(\mathbb{R}) \to \mathfrak{u}_m$. This map must be trivial because otherwise this is an embedding because $\mathfrak{sl}_n(\mathbb{R})$ is simple. But this is impossible because the adjoint action of $\mathfrak{sl}_n(\mathbb{R})$ has real eigenvalues but the adjoint action of $\mathfrak{u}_m$ are all purely imaginary by(2.5.5.4). So the action is trivial on $SL(n,\mathbb{R})^+$, so induces an irreducible representation of $\det(g)$, which is clearly 1-dimensional. □

Lemma (15.9.4.14). Because for a unitary representation $\mathcal{H}$ of G, for $X \in \mathfrak{g}$, we have

$$(Xu, v) = -(u, Xv),$$

so $(Xv, w) = -(v, \overline{X}w)$ when complexified. So

$$(Rv, w) = -(v, Lw)$$

for any $v, w \in \mathcal{H}$, by(16.1.0.1).

Lemma (15.9.4.15) [Principal Series]. For the principal series $P_\mu(\lambda,\varepsilon)$ of $GL(2,\mathbb{R})^+$, there exists an irreducible unitary representation in this class if μ is purely imaginary and $\lambda \geq 1/4$ real.

Proof: Consider the unitary representation $H(s_1, s_2, \varepsilon)$ defined in(15.9.3.29), then it is irreducible and its class is $P_\mu(\lambda,\varepsilon)$ by(15.9.3.32) and(15.9.3.25). □

Lemma (15.9.4.16) [Possibilities of Unitary Representations]. Let $\mathcal{H}$ be a unitary representation of $GL(2,\mathbb{R})^+$. Assume Δ, I acts by scalars λ, μ respectively, then

- μ is purely imaginary and λ is real.
- If the $(\mathfrak{g}, K)$-module type of $\mathcal{H}$ is a principal series $P_\mu(\lambda,\varepsilon)$, then $\lambda > 0$, and if $\varepsilon = 1$, $\lambda > 1/4$.

Proof: 1: This follows from(15.9.4.14), as action of I is skew-symmetric and action of Δ is symmetric.

2: By(15.9.3.27), $V^k\neq 0$ for $k\equiv\varepsilon \mod 2$, let $f_k\in V^k$. Because $-4\Delta-H^2+2H=4RL$(16.1.0.1), take $k=\varepsilon$, then

$$(-4\lambda-\varepsilon^2+2\varepsilon)f_\varepsilon=4RLf_\varepsilon.$$

But by(15.9.4.14),

$$(4RLf_\varepsilon,f_\varepsilon)=-4(Lf_\varepsilon,Lf_\varepsilon)<0$$

thus $4\lambda>2\varepsilon-\varepsilon^2$. □

Cor. (15.9.4.17) [Reduction of μ]. The infinitesimal equivalence class of representations $P_\mu(\lambda,\varepsilon)$ or $D^\pm_\mu(k)$ contains an irreducible unitary representation iff μ is purely imaginary and the corresponding class $P(\lambda,\varepsilon)$ or $D^\pm(k)$ contains an irreducible unitary representation.

Proof: μ must be purely imaginary by the proposition. And we may tensoring a unitary representation by a $\deg(g)^r$, it is also unitary iff r is purely imaginary, and this increases the value of action of I by $2r$ and doesn't affect μ and ε because Δ has nothing to do with u(16.1.1.1). □

Prop. (15.9.4.18) [Intertwining Integral]. Let $s=\frac{1}{2}(s_1-s_2+1)$, define for $f\in V$,

$$M(s):H^\infty(s_1,s_2,\varepsilon)\to H^\infty(s_2,s_1,\varepsilon):(M(s)f)(g)=\int_{N(F)}f(w_0ug)du.$$

Then if $\mathrm{Re}(s_1-s_2)>0$, the integral is absolutely convergent, and commutes with the action of G.

Proof: Replacing f with $\rho(h)f$, we see that the convergence of $M(s)(f)(h)$ is equivalent to the convergence of $M(s)(\rho(h)f)$, so we assume $h=1$.

We use the identity

$$\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}=\begin{bmatrix}\Delta_x^{-1} & -x\Delta_x^{-1}\\ & \Delta_x\end{bmatrix}k_{\theta_x}$$

similar to(16.1.1.20) where

$$\Delta_x=\sqrt{1+x^2},\quad \theta(x)=\arctan(-1/x).$$

Then

$$(M(s)f)(1)=\int_{-\infty}^{\infty}(1+x^2)^{-s}f(k_{\theta(x)})dx$$

which convergences for $s>1/2$, that is $\mathrm{Re}(s_1-s_2)>0$.

To show $M(s)f\in H(s_2,s_1,\varepsilon)$, we check

$$(M(s)f)(\begin{bmatrix}1 & \xi\\ & 1\end{bmatrix}g)=(M(s)f)(g),\quad (M(s)f)(\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g)=\mathrm{sgn}(y_1)^\varepsilon|y_1|^{s_2+\frac{1}{2}}|y_2|^{s_1-\frac{1}{2}}(M(s)f)(g).$$

The first one is an easy consequence of change of variable, for the second,

$$\begin{aligned}(M(s)f)(\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g)&=\int f(\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g)dx\\ &=\int f(\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}\begin{bmatrix}1 & y_1^{-1}y_2x\\ & 1\end{bmatrix}g)dx\end{aligned}$$

$$
\begin{aligned}
&= \frac{y_1}{y_2} \int f(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} \begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g) dx \\
&= \frac{y_1}{y_2} \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_2-\frac{1}{2}} |y_2|^{s_1+\frac{1}{2}} \int f(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g) dx \\
&= \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_2+\frac{1}{2}} |y_2|^{s_1-\frac{1}{2}} (M(s)f)(g)
\end{aligned}
$$

To check $M(s)f$ is smooth, notice that the restriction of $M(s)f$ to K equals

$$
(M(s)f)(k_t) = \int_{-\infty}^{\infty} (1+x^2)^{-s} f(k_{\theta(x)+t}) dx.
$$

The convergence is uniform in t, thus is smooth in t.

The commutativity of $M(s)$ with G-action is immediate, because left and right action commutes. □

Prop. (15.9.4.19). Let $f_{k,s}$ be the function f_k in $H(s_1, s_2, \varepsilon)$(15.9.3.29) where $\mathrm{Re}(s_1 - s_2) > 0$ and $s = \frac{1}{2}(s_1 - s_2 + 1)$, then

$$
M(s) f_{k,s} = (-i)^k \sqrt{\pi} \frac{\Gamma(s)\Gamma(s-\frac{1}{2})}{\Gamma(s+\frac{k}{2})\Gamma(s-\frac{k}{2})} f_{k,1-s}
$$

Proof: Because $M(s)$ commutes with G-action, $M(s)f_{k,s}$ is a multiple of $f_{k,1-s}$, thus it suffices to calculate $(M(s)f_{k,s})(1)$, which is

$$
(M(s)f)(1) = \int_{-\infty}^{\infty} (1+x^2)^{-s} e^{ik\theta(x)} dx, \quad \theta(x) = \arctan(-1/x)
$$

by(15.9.4.18).

This integral then is calculated to be the expression above, by(10.4.10.1). □

Lemma (15.9.4.20) [Complementary Series]. For μ purely imaginary and $0 < \lambda < 1/4$ and $\varepsilon = 0$, there exists an irreducible unitary representation in this class of the $(\mathfrak{g}, K)$-module $P_\mu(\lambda, 0)$.

Proof: Let s_1, s_2 be complex numbers, we construct first a Hermitian pairing

$$
H(s_1, s_2, \varepsilon)_{fin} \times H(-\overline{s_1}, -\overline{s_2}, \varepsilon)_{fin} \to \mathbb{C} : (f, g') \mapsto \int_K f(k)\overline{g'(k)} dk
$$

which is invariant under action of G by(10.11.1.45). Now let $s_2 = -\overline{s_1}$, then $s = \frac{1}{2}(s_1 - s_2 + 1)$ is real and $\mu = s_1 + s_2$ is purely imaginary. Then composing this pairing with $i^\varepsilon M(s) : H(s_1, s_2, \varepsilon)_{fin} \to H(s_2, s_1, \varepsilon)_{fin} = H(-\overline{s_1}, -\overline{s_2}, \varepsilon)_{fin}$, then

$$
(f, \overline{f}') = \int_K f(k) \overline{i^\varepsilon M(s) f'(k)} dk.
$$

is G-invariant. We will show that it is positive definite if $\varepsilon = 0$ and $1/2 < s < 1$.

It can be seen from(15.9.4.19) that an orthogonal basis for $H(s_1, s_2, 0)_{fin}$ under this pairing is $f_{k,s}$ for k even. And by(15.9.4.19),

$$
(f_{k,s}, f_{k,s}) = (-1)^{k/2} \sqrt{\pi} \frac{\Gamma(s)\Gamma(s-\frac{1}{2})}{\Gamma(s+\frac{k}{2})\gamma(s-\frac{k}{2})}
$$

which is positive for $1/2 < s < 1$. Now we obtain a unitary representation of G on the Hilbert completion of this space(10.11.2.8).

Now we have constructed a unitary representation in the infinitesimal equivalence class $P_\mu(\lambda, 0)$ with $\lambda = s(1-s)$, $s = \frac{1}{2}(s_1 - \overline{s_1} + 1)$, so any $0 < \lambda < 1/4$ is possible. □

Lemma (15.9.4.21). For any integer k, there is a bijection between holomorphic functions φ on $\mathcal{H}$ and smooth functions Φ on $GL(2, \mathbb{R})^+$ that is invariant under $Z(R)^+$ and

$$\Phi(gk_\theta) = e^{ik\theta}\Phi(g), \quad L\Phi = 0.$$

Proof: The bijection is given by

$$\varphi(z) = y^{-k/2}\Phi(\begin{bmatrix} y & x \\ & 1 \end{bmatrix}), \quad \Phi(g) = ((y^{k/2}\varphi)[g]_k)i.$$

and the proof is a combination of formal calculation in(16.1.2.9) and(16.1.1.19) forgetting Γ:

$$L_k(y^{k/2}f(z)) = -(z-\overline{z})\frac{\partial}{\partial \overline{z}} - \frac{k}{2}(y^{k/2}f(z)) = -2iy^{(k+2)/2}\frac{\partial}{\partial \overline{z}}f(z).$$

□

Lemma (15.9.4.22) [Discrete Series]. if $k > 1$, then there exists a unitary representation in the infinitesimal equivalence class $D^{\pm}(k)$, more precisely,

- Let $L^2(\mathcal{H}, \mu_k)$ be the L^2-space of holomorphic functions f on the upper plane $\mathcal{H}$ w.r.t the measure $\mu_k = y^k\frac{dxdy}{y^2}$(10.6.3.3). Then the left action

$$\pi_k(g)f = f[g^{-1}]_k.$$

  of G is unitary and this representation π_k is in the infinitesimal equivalence class $D^-(k)$.
- Consider the automorphic of $GL(2, \mathbb{R})^+$:

$$\iota(\begin{bmatrix} a & b \\ c & d \end{bmatrix}) = \begin{bmatrix} a & -b \\ -c & d \end{bmatrix}$$

  then the representation $\pi_k \circ \iota$ is in the infinitesimal equivalence class $D^+(k)$

Proof: The second one follows from the first one, as ι interchanges the action of K thus the K-types.

For the first one, firstly it is a unitary representation: for $z' = g(z) = x' + iy'$, we have

$$y' = \frac{ad-bc}{|cz+d|^2}y$$

and $\mu_z = \mu_{z'}$, thus

$$||\pi(g^{-1})f||^2 = \int_{\mathcal{H}} |f(z')|^2\frac{(ad-bc)^k}{|cz+d|^{2k}}y^k\mu_z = \int_{\mathcal{H}} |f(z')|^2(y')^k\mu_{z'} = ||f||^2.$$

For the infinitesimal equivalence class, we consider the orthogonal basis $\varphi_n = (\frac{z-i}{z+i})^n\frac{(2i)^k}{(z+i)^k}$ and prove

$$\pi(k_\theta^{-1})\varphi_n = e^{2\pi i(k+2n)\theta}\varphi_n.$$

Then this will determine the K-type of π_k. This can be proven by direct calculation, Cf.[Ngo, P39]. □

Cor. (15.9.4.23). By(15.9.4.21) and the measure μ_k we choose, it is clear that there is an isometry between $L^2(\mathcal{H}, \mu_k)$ and a subspace of $L^2(G/Z)$ that is compatible with the left G action on $L^2(G)$, but the left and right action on $L^2(G/Z)$ is isomorphic, as $f(t) \mapsto f(t^{-1})$ intertwine them, because G/Z is unimodular. So this representation is **square integrable**, i.e. it can be embedded in $L^2(G/Z)$.

Lemma (15.9.4.24) [Limits of Discrete Series]. There exists a unitary representation in the infinitesimal equivalence class $D^{\pm}(1)$.

Proof: These two classes already appear in the unitary representation $H(0,0,1)$, by(15.9.3.32). □

Prop. (15.9.4.25) [List of Irreducible Unitary Representations of $GL(2,\mathbb{R})^+$]. Let μ be purely imaginary,

- The 1-dimensional representation $g \mapsto |\deg(g)|^{\mu}$.
- The unitary principal series $P_\mu(\lambda, \varepsilon)$, where $\varepsilon = 0, 1$ and $\lambda \geq 1/4$.
- The complementary series representations $P_\mu(\lambda, 0)$ where $0 < \lambda < 1/4$.
- The holomorphic discrete series $D^0_\mu(k)(k \geq 2)$ and limits of discrete series $(k = 1)$ $D^{\pm}_\mu(k)$.

Notice each of these infinitesimal equivalence classes of irreducible representations has a unique representative that is a unitary representation by(15.9.3.10).

Proof: By(15.9.3.25) and(15.9.3.10), the conclusion follows from the classification of $(\mathfrak{g}, K)$-modules(15.9.3.33) and determining which infinitesimal class has a unitary representative, which follows from(15.9.4.13)(15.9.4.16), (15.9.4.15)(15.9.4.17), (15.9.4.20)(15.9.4.22), (15.9.4.24). □

Cor. (15.9.4.26). Similar as in(15.9.3.34), by(15.9.3.25), we can classify all irreducible unitary representations of $GL(2,\mathbb{R})$.

15.10 Cuspidal Representations

1 GL(n)

References are [Local Langlands Correspondence for GL(2)], [Bushnell and P. Kutzko. The admissible dual of GL(N) via compact open subgroups].

Prop. (15.10.1.1) [Bushnell-Kutzko]. All cuspidal representations of $GL(n, F)$ can be constructed by induction from open subgroups.

Proof: Cf.[Bushnell, C. and P. Kutzko, The admissible dual of $GL(N)$ via compact open subgroups, Princeton University Press, Princeton (1993).] □

2 SL(n)

[Bushnell and P. Kutzko.The admissible dual of SL(N)]

15.11 Admissible Representations of GL(n) over p-Adic Number Fields

Main references are [Bum98], [Representation theory of GL(n) over non-Archimedean local fields, Prasad],[B-Z76], [C.J. Bushnell and P.C. Kutzko, The admissible dual of GL(N) via compact open subgroups, Princeton university press, Princeton, (1993).]

Notation (15.11.0.1).

- Use notations defined in Classical Representation Theory.
- Let K be a p-adic local field or a finite field.
- Use group-theoretic notations as in(16.3.0.3).
- Fix a non-trivial character ψ of K with conductor $\mathfrak{p}^{-n(\psi)}$.
- Choose the Haar measure dx on K that is self-dual w.r.t. ψ as in(10.11.3.33).
- For $\alpha \in \mathbb{A}^{n-1}(K)$, let $\psi_{N,\alpha}$ be a character of $N(K)$ given by $\psi_N(g) = \sum_i \psi(\alpha_i g_{i,i+1})$.

Def. (15.11.0.2) [p-adic Local Fields]. If K is a p-adic local field, let $\mathcal{O}_K$ the ring of integers in K, $\mathfrak{p}$ the maximal ideal in $\mathcal{O}_K$, and ϖ a fixed uniformizer of $\mathfrak{p}$.

Denote $\mathcal{K} = GL(n, \mathcal{O}_K)$, $G_n^0 = \det^{-1}(\mathcal{O}^*) \subset GL(n, K)$.

Define subgroups $\mathrm{Unip}_k(n, K)$ of $\mathrm{Unip}(n, K)$ as $\mathrm{Unip}_k(n, K)$ is the group of unipotent matrices that $v(e_{ij}) \geq k(i-j)$. Then $\cup_{k>0} \mathrm{Unip}_k(n, K) = \mathrm{Unip}(n, K)$. In particular, $\mathrm{Unip}(n, K)$ is exhausted by compact open subgroups.

For any character χ of $\mathcal{O}_K^*$, by continuity, there is a minimum v that $c(1 + \mathfrak{p}^v) = 1$, and $\mathfrak{p}^v$ is called the **conductor** of χ.

1 Basics

References are [Representations of p-adic Groups Bernstein]. [Bum98]Chap4.

Geometry

Prop. (15.11.1.1). $GL(n, K)$ is unimodular, and the modular function of $B(K)$ is $\Delta_B(\begin{bmatrix} x & y \\ & z \end{bmatrix}) = \frac{z}{x}$ by(10.11.1.20). Also denote $\delta = \Delta_B^{-1}$.

Def. (15.11.1.2) [Unramified Quasi-Characters]. A **unramified quasi-character** on F is a quasi-character χ that $\chi(\mathcal{O}_K^\times) = 0$.

Define $\alpha(\chi) = \chi(\varpi)$ if χ is unramified and 0 otherwise, called the **Satake parameter** of χ.

Prop. (15.11.1.3) [Diagonal Quasi-Characters]. Let $\chi_1, \ldots, \chi_n$ be quasi-characters of K^*, then define two quasi-characters χ, χ' on $T(K)$:

$$\chi(\mathrm{diag}(y_1, \ldots, y_n)) = \chi_1(y_1) \ldots \chi_n(y_n), \quad \chi(\mathrm{diag}(y_1, \ldots, y_n)) = \chi_n(y_1) \ldots \chi_1(y_n).$$

When $n = 2$, the quasi-character χ on $T(K)$ is called **regular** if $\chi_1 \neq \chi_2$, and **dominant** if $|\chi_1(\varpi)| < |\chi_2(\varpi)|$.

Prop. (15.11.1.4) [Iwasawa Decomposition]. $GL(n, K) = B(K)\mathcal{K}$, in particular, $B(K)\backslash G$ is compact.

Proof: Prove by induction on n. $n=1$ is clear. Given a $g \in GL(n,K)$, we consider its bottom row, as let x_{n_k} be the term of minimal multiplicative valuation, then we can right multiply by a permutation matrix $w \in K$ that x_{nn} is of minimal valuation. Now right multiply by a matrix k, which is 1 on the diagonal and $k_{ni} = -x_i x_n^{-1}$ on the bottom row, then $k \in K$, and gk has bottom row$= e_n$. Thus we can induct and find a $k_0 \in \mathcal{K}$ that $gk_0 \in B(K)$. □

Prop. (15.11.1.5) [p-adic Cartan Decomposition]. A complete set of double coset representatives for $\mathcal{K}\backslash GL(n,K)/\mathcal{K}$ consists of diagonal matrices $\{\begin{bmatrix}\varpi^a & \\ & \varpi^b\end{bmatrix}, a \leq b \in \mathbb{Z}\}$.

Proof: This follows directly from Smith normal form(11.7.6.7). □

Cor. (15.11.1.6). $GL(n,K)$ is σ-compact.

Def. (15.11.1.7) [Principal Congruence Subgroups]. There is a map $\pi : \mathcal{K} \to GL(n, \mathcal{O}_K/(\varpi^m))$, the kernel of which is called the **principal congruence subgroup** of level m, denoted by $\mathcal{K}_m$.

Def. (15.11.1.8) [Partition and Groups]. Let $\alpha = (n_1, \ldots, n_k)$ be a partition of n, define

$$\mathrm{GL}_\alpha = \mathrm{GL}(n_1) \times \ldots \times \mathrm{GL}(n_k), \quad \mathcal{K}_\alpha = \mathcal{K} \cap GL_\alpha(F), \quad B_\alpha = B \cap \mathrm{GL}_\alpha, \quad D_\alpha = D \cap \mathrm{GL}_\alpha$$

And for a principal congruence subgroup $\mathcal{K}_m$ of $GL(n,K)$, $\mathcal{K}_m \cap GL_\alpha(F)$ is called a principal congruence subgroup of $GL_\alpha(F)$.

Denote U_α the subgroup of U_n That $a_{ij} = 0$ for i,j in the same segment of α and $i \neq j$. Let $P_\alpha = \mathrm{GL}_\alpha \ltimes U_\alpha$ be the parabolic subgroup corresponding to .

For $\beta \prec \alpha$, denote

$$U_\beta(\alpha) = U_\beta \cap \mathrm{GL}_\alpha, \quad P_\beta(\alpha) = P_\beta \cap \mathrm{GL}_\alpha = \mathrm{GL}_\beta \ltimes U_\beta(\alpha).$$

Let $N = \mathcal{K}_m \cap G_\alpha$ be a principal congruence subgroup, denote

$$N_\beta^+(\alpha) = N \cap U_\beta(\alpha), \quad N_\beta^-(\alpha) = N \cap \overline{U}_\beta(\alpha), \quad N_\beta^0(\alpha) = N \cap GL_\beta(F).$$

Moreover, define $K_0(\mathfrak{a}) = \pi^{-1}(B(\mathcal{O}_F/\mathfrak{a})), K_1(\mathfrak{a}) = \pi^{-1}(N(\mathcal{O}_F/\mathfrak{a}))$. In particular, $K_0(\mathfrak{p})$ are called the **Iwahori subgroup**, a vector is called **Iwahori fixed** iff it is $K_0(\mathfrak{p})$-fixed.

Prop. (15.11.1.9) [Iwahori Factorizations]. If $\mathfrak{a} \neq \mathcal{O}$, there are **Iwahori factorizations**

$$K_0(\mathfrak{a}) = N_-(\mathfrak{a})T(\mathcal{O})N(\mathcal{O}), \quad K_1(\mathfrak{a}) = N_-(\mathfrak{a})T(\mathfrak{a})N(\mathcal{O})$$

$$N = N_\beta^-(\alpha)N_\beta^0(\alpha)N_\beta^+(\alpha) = N_\beta^+(\alpha)N_\beta^0(\alpha)N_\beta^-(\alpha)$$

Proof: This is by column and row reduction. Cf.[Bernstein-Zelevinsky 1, P32].? □

Cor. (15.11.1.10). Denote $K_0 = K_0(\mathfrak{a})$ or $K_1(\mathfrak{a})$, and $T_0 = T(\mathcal{O})$ or $T(\mathfrak{a})$ respectively, then we can decompose the Haar measure on K_0 as

$$\int_{K_0} \varphi(k)dk = \int_{N_-(\mathfrak{a})}\int_{T_0}\int_{N(\mathcal{O})} \varphi(n_- t_0 n)dndt_0dn_- = \int_{N_-(\mathfrak{a})}\int_{T_0}\int_{N(\mathcal{O})} \varphi(nt_0n_-)dndt_0dn_-.$$

Proof: Use(10.11.1.39), noticing all groups here are compact. □

Cor. (15.11.1.11) [Iwahori-Bruhat Decomposition].

$$GL(2,K)=B(K)K_0(\mathfrak{p})\coprod B(K)w_0K_0(\mathfrak{p}).$$

? How about the general case?

Proof: By pulling back the Bruhat decomposition of $GL(2,\mathcal{O}/\mathfrak{p})$ to $\mathcal{K}=GL(2,\mathcal{O})$, we have

$$\mathcal{K}=K_0(\mathfrak{p})\cup K_0(\mathfrak{p})w_0K_0(\mathfrak{p}).$$

The Iwahori factorization shows $K_0(\mathfrak{p})=(K_0(\mathfrak{p})\cap B(K))N_-(\mathfrak{p})$. Then this implies

$$\mathcal{K}=K_0(\mathfrak{p})\cup(K_0(\mathfrak{p})\cap B(K))w_0K_0(\mathfrak{p}),$$

because $w_0^{-1}N_-(\mathfrak{p})w_0\in K_0(\mathfrak{p})$. Then Iwasawa decomposition $G=BK$ gives the desired result. Notice this decomposition is clearly disjoint. □

Prop. (15.11.1.12).

- Any open normal subgroup of $GL(2,K)$ must contain $SL(2,K)$.
- If a subgroup of $GL(2,K)$ contains $N(K)$ and an open subgroup, then it must contain $SL(2,K)$.

Proof: 1: this normal subgroup contains $\begin{bmatrix}1&a\\&1\end{bmatrix}$ for $|a|$ small enough, and it is also a group, but $\begin{bmatrix}t&\\&t^{-1}\end{bmatrix}^{-1}\begin{bmatrix}1&a\\&1\end{bmatrix}\begin{bmatrix}t&\\&t^{-1}\end{bmatrix}=\begin{bmatrix}1&at^{-1}\\&1\end{bmatrix}$, thus it contains all $N(K)$. and then by item2 it contains $SL(2,K)$. Now for any f.d. irreducible smooth representation of $GL(2,K)$, choose a basis $v_1,\ldots,v_n$, then there is an open normal subgroup fixing all v_i, thus $SL(n,F)$ acts trivially on V, and then it factors through $\det:GL(2,K)\to K^\times$, and any irreducible representation of $K^\times$ is of 1-dimensional by Schur's lemma, so V must be 1-dimensional.

2: It contains some matrix that is not upper-triangular, so it contains $SL(2,K)$ by(2.1.6.9). □

Hecke Algebras

Prop. (15.11.1.13) [Spherical Idempotents]. The Hecke algebra $\mathcal{H}_{GL(n,K)}$(15.1.5.19) has a spherical idempotent(2.4.4.10) $e_{\mathcal{K}}$, where the anti-involution is given by transposition.

Then via the correspondence(15.1.5.23), $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is called a **spherical represnetation** if its corresponding $\mathcal{H}_{GL(n,K)}$-module is spherical(2.4.4.11). Equivalently, it contains a $\mathcal{K}$-fixed vector. And the dimension of spherical vectors is≤ 1 by(2.4.4.11).

Proof: For the invariance of $\mathcal{H}[e_{\mathcal{K}}]$, notice that $\mathcal{H}[e_{\mathcal{K}}]=\mathcal{H}_{\mathcal{K}}$ is the subspace of $\mathcal{K}$-bi-invariant functions on G, but we have the p-adic Cartan decomposition(15.11.1.5), so the value of $\varphi\in H[e_{\mathcal{K}}]$ are determined by restriction on the diagonal matrices, but they are invariant under transposition. This shows $e_{\mathcal{K}}$ is spherical. □

Prop. (15.11.1.14) [Transpose Invariant Distribution]. If $\mathcal{D}$ is a distribution on $GL(n,K)$ that is invariant under conjugation, then it is also invariant under transpose.

Proof: This follows from(15.1.5.18), as we look at the conjugate action of G on itself, with σ being the transposition. Conjugate action is constructive, by(8.2.1.23), and $g^\sigma=g^{-t}$, and a matrix is conjugate to its traspose(2.3.4.18). □

Prop. (15.11.1.15) [Gelfand-Kazhdan]. If $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n, K))$, then:

- If π_1 is defined by $\pi_1(g) = \pi(g^{-t})$, then $\pi^\vee \cong \pi_1$.
- suppose $n = 2$ and ω is the central character of π, then if $\pi_2 = \pi \otimes (\omega^{-1} \circ \deg)$, then $\pi^\vee \cong \pi_2$.

Proof: 1: It is clear that the character(15.1.5.34) of a representation is conjugation invariant, thus by(15.11.1.14) it is transpose invariant.

Now the character of π_1 is $\chi_1(\varphi) = \chi(\varphi'')$, where $\varphi''(g) = \varphi(g^{-t})$, and this equals $\chi(\varphi')$ where $\varphi'(g) = \varphi(g^{-1})$, because the character is transpose invariant. It is also clear that $\widehat{\varphi'} = \pi(\varphi)^t$ on a finite space V^K, then $\widehat{\chi}(\varphi) = \chi(\varphi') = \chi_1(\varphi)$, so by(15.1.5.39) $\pi \cong \pi_1$.

2: If $n = 2$, we use further the property that if $g = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then

$$g^{-1} = (\deg g)^{-1} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} = (\deg g)^{-1} \begin{bmatrix} & 1 \\ -1 & \end{bmatrix} g^t \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}^{-1}$$

then the assertion is clear using item1. □

Cor. (15.11.1.16). Let π be an admissible representation of $GL(n, K)$, then π is irreducible iff $\pi^\vee$ is irreducible.

Smooth Representations

Def. (15.11.1.17) [Twists]. Let $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$, for any quasi-character χ of $K^\times$, denote $\pi(\chi)$ the representation $\pi \otimes (\chi \circ \det)$. And for $s \in \mathbb{C}$, denote $\pi(s)$ the representation of π tensored by the 1-dimensional representation $g \mapsto |\det(g)|^s$

Prop. (15.11.1.18) [Admissible Representation of $\mathbb{G}_m^N(K)$]. Any non-zero $(\pi, V) \in \mathrm{Rep}^{\mathrm{adm}}(\mathbb{G}_m^N(K))$ contains a 1-dimensional invariant subspace.

Proof: Consider the restriction on $\mathbb{G}_m^n(\mathcal{O}_K)$, by(15.1.5.32), $V = \oplus_{\chi \in \widehat{(\mathcal{O}_K^*)^k}} V_\chi$, and $\dim V_\chi < \infty$. As $(1, \ldots, \varpi, \ldots, 1)$ commutes with $\mathbb{G}_m^n(\mathcal{O}_F)$, it preserves V_χ for each χ. And these elements commute, so they have a common eigenvalue, which means V has a 1-dimensional invariant subspace. □

Lemma (15.11.1.19). Let $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n, K))$, then $\pi|_{G_n^0}$ splits into a finite direct sum of irreducible representations of G_n^0.

Proof: This follows from(15.1.2.11). □

Lemma (15.11.1.20). If $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n, K))$ satisfies V is generated by V^{K_m}, then for any submodule V', V' is generated by $V^N \cap V'$.

Proof: Cf.[B-Z76]P38. □

Prop. (15.11.1.21) [Irreducible Smooth Representation is Admissible]. For any connected reductive group G over a p-adic number field F, $\mathrm{Irr}^{\mathrm{alg}}(G(F)) = \mathrm{Irr}^{\mathrm{adm}}(G(F))$.

Proof: **?** We only prove for $G = \mathrm{GL}(n)$.

By(15.11.2.9)(15.11.2.10) and(15.11.2.8), it suffices to prove for π quasi-cuspidal. But then this follows from(15.11.2.12)(15.11.1.19) and(15.1.5.55). □

Prop. (15.11.1.22)[Howe]. Let $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(GL(n,K))$, then π is of finite length iff it is admissible and f.g..

Proof: A finite length representation is admissible by(15.11.1.21) and(15.1.5.31). For the converse, as V is f.g., take N compact open s.t. V is generated by V^N, and $\dim V^N < \infty$ as V is admissible. Then by(15.11.1.19): $V' \to V' \cap V^N$ is an injection from the set of subrepresentations of V to the set of subspaces of V^N, thus V is of finite length. □

Finite dimensional Representations

Prop. (15.11.1.23). Any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$ has dimension 1.

Proof: By the no-small-subgroup argument, the kernel of this representation contains an open normal subgroup. But any open normal subgroup of $GL(2,V)$ contains $SL(2,V)$ by(15.11.1.12), thus this is a representation of $K^\times$, which must be of 1-dimensional by(15.11.1.18). □

Lemma (15.11.1.24)[2-Dimensional Smooth Representation of $K^\times$]. Any $\rho \in \mathrm{Rep}^{\mathrm{adm,dim}=2}(K^\times)$ is one of the following form:

- $\rho(t) = \mathrm{diag}(\xi(t), \xi'(t))$, where ξ, ξ' are two quasi-characters of $K^\times$.
- $\rho(t) = \xi(t)\begin{bmatrix} 1 & v(t) \\ & 1 \end{bmatrix}$, where ξ is a quasi-character of $K^\times$.

Proof: There exists a 1-dimensional invariant subspace spanned by x by(15.11.1.18), on which $K^\times$ acts by a quasi-character ξ, and consider the quotient space, on which $K^\times$ acts by a quasi-character ξ'. choose y that is linearly-independent of x, then $\rho(t)y = \xi'(t)y + \lambda(t)x$, and

$$\lambda(tu) = \xi'(u)\lambda(t) + \lambda(u)\xi(t)$$

which is symmetric in t, u.

If $\xi \neq \xi'$,

$$\lambda(t)(\xi(u) - \xi'(u)) = \lambda(u)(\xi(t) - \xi'(t))$$

therefore $\lambda(t) = C(\xi(t) - \xi'(t))$, so $z = y - Cx$ is fixed by $\rho(K^\times)$.

If $\xi - \xi'$, then λ/ξ is an additive character of $K^\times$, thus it is trivial on $\mathcal{O}^*$, so $\lambda(t) = cv(t)$. □

Zelevinsky Segments

Def. (15.11.1.25) [Zelevinsky Segments]. For $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, a **Zelevinsky segment** $\Delta(\pi, m)$ is an ordered m-tuple $(\pi, \pi(1), \ldots, \pi(m-1))$ of cuspidal representations of $GL(n,K)$.

For two segments $\Delta(\pi_1, m)$ and $\Delta(\pi_2, n)$, $\Delta(\pi_1, m)$ **precedes** $\Delta(\pi_2, n)$ if $\Delta(\pi_1, m) \cap \Delta(\pi_2, n) = \varnothing$ and $(\Delta(\pi_1, m), \Delta(\pi_2, n))$ is another segment. They are called **linked segements** if one precedes another.

Def. (15.11.1.26) [Dual Segments]. For a segment $\Delta(\pi, m) = (\pi, \pi(1), \ldots, \pi(m-1))$, its **dual segment** $\Delta^\vee$ is the segment $(\pi^\vee(1-m), \pi^\vee(2-m), \ldots, \pi) = \Delta(\pi^\vee(1-m), m)$.

Def. (15.11.1.27) [$\pi(\Delta)$]. Let $\Delta = \Delta(\pi, m)$ be a Zelevinsky segment of length m and degree mn, we can define an admissible representation $\pi(\Delta)$ of $GL(mn, K)$ given by

$$\pi(\Delta) = \pi \times \pi(1) \times \ldots \times \pi(m-1) = I_{P(n,n,\ldots,n)}^{GL(mn,K)}(\otimes \pi_i)$$

Def. (15.11.1.28) [Zelevinsky Conditions]. A tuple of Zelevinsky segments $\Delta_1, \ldots, \Delta_r$ is said to satisfy the **Zelevinsky condition** if for each $i < j$, Δ_i doesn't precedes Δ_j.

2 Cuspidal Representations

Jacquet Functors

Def. (15.11.2.1) [Jacquet Functors]. Let $P = LU$ be a parabolic subgroup of G, if (π, V) be a representation of $G(F)$, then $V_U = V/(\text{span}\{\rho(u)v - v | u \in U\}) = V/V(U)$ is naturally a $L \cong P/U$ representation, so we can define the **Jacquet functor**:

$$J_P^G : \text{Rep}^{\text{alg}}(G(F)) \to \text{Rep}^{\text{alg}}(L(F)) : V \mapsto V_U.$$

Given a character ψ of $U(F)$, similarly $V_{U,\psi} = V/(\text{span}\{\rho(u)v - \psi(u)v | u \in U\}) = V/V(U, \psi)$ is a $Z(K)$-module, we can also define similarly the **twisted Jacquet functor**

$$J_{P,\psi}^G : \text{Rep}^{\text{alg}}(G(F)) \to \text{Rep}^{\text{alg}}(Z(K)) : V \mapsto V_{U,\psi}.$$

For convenience, define the **normalized Jacquet functor**: $r_P^G = \sqrt{\frac{\Delta_P}{\Delta_G}} \otimes J_P^G$.

$J_P^G, J_{P,\psi}^G, r_P^G$ are exact functors, by(15.1.2.4).

Prop. (15.11.2.2). For the the minimal parabolic subgroup $P = B(K)$, $J_{N,\psi_{a,N}}(V) \cong J_{N,\psi_U}(V)$ for $a \in \mathbb{G}_m^{n-1}(F) \times 1$.

Proof: This is because $\pi(a)$ maps $V(N, \psi_{a,N})$ isomorphically to $V(N, \psi_N)$, thus induces an isomorphism $J_{N(K),\psi_{a,N}}(V) \cong J_{N(K),\psi_N}(V)$. □

Prop. (15.11.2.3). $J_P^G, J_{P,\psi}^G, r_P^G$ map smooth representations of finite length to smooth representations of finite length(because it is f.g.).

Proof: If V is a f.g. G-module, then it is a f.g. P-module, because $G = PK$, and Kv_i is of f.d. for any $v \in V$. Thus the quotient V_U of V is also f.g..

For finite length?, Cf.[Bernstein-Zelevinsky2, P8]. □

Lemma (15.11.2.4) [Jacquet]. If (π, V) is a smooth representation of $GL(n, K)$, then using the notation as in(15.11.1.10), where $\mathfrak{a}$ is a proper ideal, V^{K_0} and $V^{N_-(\mathfrak{a})T_0}$ have the same image in the Jacquet module $J(V)$.

Proof: One inclusion is trivial, for the other, if $x \in V^{N_-(\mathfrak{a})T_0}$ then $x_1 = \int_{K_0} \pi(k)xdk$ lies in V^{K_0}, so it suffices to show x and x_1 have the same image in $J(V)$. But by(15.11.1.10)

$$x_1 = \int_{N_-(\mathfrak{a})} \int_{T_0} \int_{N(\mathcal{O})} \pi(nt_0n_-)xdndt_0dn_- = \int_{N(\mathcal{O})} \pi(n)xdn$$

and notice $p(\pi(n)x) = p(x)$. □

Prop. (15.11.2.5) [Jacquet Modules are Admissible]. Let (π, V) be a smooth representation of $GL(2, K)$, then

- Using the notation as in(15.11.1.10), if $\mathfrak{a}$ is a proper ideal, then the projection map $p : V \mapsto J(V)$ induces a surjection of $V^{K_0} \to J(V)^{T_0}$.
- If (π, V) is admissible, then $J(V)$ is also admissible representation of $T(F)$.

? For $GL(n, K)$ case, Cf.[Bernstein-Zelevinksy1, P33].?

Proof: 2 follows from 1 because we can choose $T_0 = T(\mathfrak{a})$ to be arbitrarily small, then it is of f.d., thus admissible.

For 1, notice fist that any $x \in J(V)^{T_0}$ is an image of a $x_1 \in V^{T_0}$, because $p(\pi(t)x) = \pi(t)p(x) = p(x)$, thus we can choose $x_1 = \frac{1}{V(T_0)}\int_{T_0}\pi(t)xdt$.

Thus for any f.d. subspace $\overline{U}$ of $J(V)^{T_0}$, we can find a f.d. $U \subset V^{T_0}$ that is mapped isomorphically onto $\overline{U}$. Now U is fixed by some $N_-(\mathfrak{p}^n)$ for n large, so U is fixed by $N_-(\mathfrak{p}^n)T_0$. Notice $\mathfrak{a} = \mathfrak{p}^m$ for some m, and

$$\pi(d)N_-(\mathfrak{p}^n)T_0\pi(d)^{-1} = N_-(\mathfrak{a})T_0, \quad d = \begin{bmatrix} \varpi^{n-m} & \\ & 1 \end{bmatrix},$$

so $\pi(d)U$ is stabilized by $N_-(\mathfrak{a})T_0$. Hence by lemma(15.11.2.4), $\pi(d)p(U) = p(\pi(d)U) \subset p(V^{K_0})$, so the dimension of $\overline{U}$ is bounded by dimension of V^{K_0}, so we can choose $\overline{U}$ just to be $J(V)^{T_0}$. Now $\pi(d)$ commutes with $T(F)$, so we have $\pi(d)J(V)^{T_0} = J(V)^{T_0} \subset p(V^{K_0})$. The reverse containment is clear. □

Parabolic Induction

Def. (15.11.2.6) [Parabolic Induction]. Let $P = LU$ be a parabolic subgroup of G, let $\mathrm{pr}: P \to P/U \cong L$, the **parabolic induction** functor I_P^G is the functor

$$I_P^G : \mathrm{Rep}^{\mathrm{alg}}(L) \to \mathrm{Rep}^{\mathrm{alg}}(G) : \rho \mapsto \mathrm{Ind}_P^G(\rho \circ \mathrm{pr})(15.1.5.41).$$

Prop. (15.11.2.7)[Parabolic Induction and Jacquet Functor]. For any parabolic subgroup P, I_P^G is right adjoint to the normalized Jacquet functor r_P^G.

Proof: For $\sigma \in \mathrm{Rep}^{\mathrm{alg}}(L), \rho \in \mathrm{Rep}^{\mathrm{alg}}(G)$,

$$\mathrm{Hom}_{P/U}(\sqrt{\frac{\Delta_P}{\Delta_G}} \otimes (\mathrm{res}_P^G(\sigma))_U, \rho) \cong \mathrm{Hom}_P(\mathrm{res}_P^G(\sigma), \sqrt{\frac{\Delta_G}{\Delta_P}} \otimes (\rho \circ \mathrm{pr})) = \mathrm{Hom}_G(\sigma, \mathrm{Ind}_P^G(\rho \circ \mathrm{pr})).$$

□

Prop. (15.11.2.8). I_P^G maps admissible representations to admissible representations and maps finite length representations to finite length representations.

Proof: By(15.1.5.51) and Iwasawa decomposition.

For finte length**?** □

Cuspidal Representation

Main references are [The Local Langlands Correspondence: The non-Archimedean case, 1994], [Induced Representations of Reductive p-Adic Groups, Berstein Zelevinsky].

Def. (15.11.2.9) [Cuspidal Representations]. $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(G(F))$ is called a **quasi-cuspidal representation** if for any proper parabolic subgroup $P = LU$ of G, $r_P^G(V) = 0$. A **cuspidal representation** is a representation that is both quasi-cuspidal and admissible. The category of cuspidal representations is denoted by $\mathrm{Rep}^{\mathrm{cusp}}(G(F))$.

Prop. (15.11.2.10) [Cuspidal Dichotomy]. If $\pi \in \mathrm{Irr}^{\mathrm{alg}}(G(F))$, then either π is (quasi-)cuspidal, or π is a subrepresentation of $I_P^G(\rho)$, where $P = LU$ is a proper parabolic subgroup of G, and $\rho \in \mathrm{Irr}^{\mathrm{alg}}(L(F))$ is (quasi-)cuspidal.

Proof: If π is not (quasi-)cuspidal, choose a minimal parabolic P that $r_P^G(\pi)\neq 0$. As $r_P^G(\pi)$ is f.g.(15.11.2.3), by(15.1.2.8), it has an irreducible subquotient σ. Then

$$0\neq \mathrm{Hom}_M(r_P^G\pi,\sigma)=\mathrm{Hom}_G(\pi,I_P^G\sigma).$$

And by minimality, σ is (quasi-)cuspidal by(15.11.2.5). □

Prop. (15.11.2.11) [Representation from Finite Case]. Let (π_0,V_0) be an irreducible cuspidal representation of $GL(2,\mathbb{F}_q)$, then it is representation of $\mathcal{K}$ by the projection $\mathcal{K}\to GL(2,\mathbb{F}_q)$, with central character ω_0. Extend ω_0 to a character ω of $K^\times$, then extend π_0 to a representation of $\mathcal{K}Z(K)$ with central character ω. Finally let $(\pi,V)=\mathrm{ind}_{\mathcal{K}Z(K)}^{GL(2,K)}\pi_0$. Then π is a unitarizable cuspidal irreducible admissible representation of $GL(2,K)$.

Proof: To show it is admissible, we use Mackey's intertwining formula(15.1.5.50). By(15.1.5.32), it suffices to show for any $\rho\,\mathrm{ind}\,\mathrm{Irr}^{\mathrm{adm}}(\mathcal{K})$, $\dim\mathrm{Hom}_{\mathcal{K}}(\pi_0,\rho)<\infty$. By p-adic Cartan decomposition(15.1.5.50), a representative set for $\mathcal{K}\backslash G/\mathcal{K}Z(K)$ is $\{\begin{bmatrix}1&\\&\varpi^n\end{bmatrix},0\leq n\in\mathbb{Z}\}$. Notice π_0 is of f.d., thus it suffices to show that only f.m. $\mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0,\rho^{\varpi^n})\neq 0$. For this, notice that by continuity, for n large, $\rho^{\varpi^n}(\begin{bmatrix}1&b\\&1\end{bmatrix})=\mathrm{id}$ for any $b\in\mathcal{O}$, thus any $\varphi\in\mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0,\rho^{\varpi^n})\neq 0$ factors through the Jacquet module of π, which is 0 as π_0 is cuspidal.

By(15.1.5.52), π is unitarizable. And then by(15.1.5.53), it suffices to show that $\dim\mathrm{End}(\pi)=1$. By Mackey theory again,

$$\mathrm{Hom}_G(\pi,\pi)\subset\mathrm{Hom}_G(\pi,\mathrm{Ind}_{\mathcal{K}Z(K)}^{GL(2,K)}\pi_0)=\prod_{n\geq 0}\mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0,\rho^{\varpi^n})$$

by the same reason as above, for $n>0$, this is 0, and for $n=0$, this has dimension 1 because π_0 is an irreducible representation of K.

It remains to show π is cuspidal: Use Mackey theory again. By Iwasawa decomposition, a representative set for $\mathcal{K}\backslash G/\mathcal{K}Z(K)$ is $\{\begin{bmatrix}1&\\&\varpi^n\end{bmatrix},0\leq n\in\mathbb{Z}\}$. Now it suffices to show $\mathrm{Hom}_{\mathrm{Unip}(2,K)}(\pi_0,1)=0$. But this is because π_0 is cuspidal. □

Thm. (15.11.2.12) [Harish-Chandra]. then for $(\pi,V)\in\mathrm{Rep}^{\mathrm{alg}}(GL(n,K))$, the following are equivalent:

- π is quasi-cuspidal.
- For any principal congruence subgroup $\mathcal{K}_m$, the function $D_{\xi,K}:G\to V:g\mapsto\pi(e_K)\pi(g^{-1})\xi$ has compact support modulo $Z(K)$.
- Every matrix coefficient of π is compactly supported modulo $Z(K)$.
- The restriction of π to G_n^0 is compact.

Proof: $2\to 3$ is verbatim as that of(15.1.5.55), $3\to 4$ is easy. $4\to 2$ follows from the definition of compact representations and the fact $GL(n,K)/G_n^0Z(K)$ is finite.

$1\iff 2$: Cf.[Bernstein-Zelevinsky, P34].? □

Cor. (15.11.2.13) [Contragradient of Cuspidal Representations]. For $\pi\in\mathrm{Rep}^{\mathrm{cusp}}(GL(n,K))$, $\widehat{\pi}\in\mathrm{Rep}^{\mathrm{cusp}}(GL(n,K))$ too.

3 Whittaker Models

Def. (15.11.3.1) [Whittaker Functionals & Whittaker Models]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{alg}}(GL(n,K))$,

- a **Whittaker functional** on V is a $\mathrm{Unip}(n,K)$-map $\lambda : V \to \psi_N$.(Compare with(16.1.3.9).)
- a **Whittaker model** is a subrepresentation of $\mathrm{Ind}_{\mathrm{Unip}(n,K)}^{GL(n,K)}(\psi_N)$ that is isomorphic to π and consists of functions φ of moderate growth.

An irreducible smooth representation having a Whittaker functional is called a **generic representation**.

Remark (15.11.3.2). Generic representations are important because for any global number field F and $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$, all the local components π_v are generic, by(16.3.3.7).

Whittaker models are important because we can use it to attach local Euler factors for such representations.

Prop. (15.11.3.3).

- The definition of generic is independent of ψ, by(15.11.2.2).
- π is generic iff $\pi^\vee$ is generic.?
- For a quasi-character χ of $K^\times$, π is generic iff $\pi(\chi)$ is generic, as $J_{\mathrm{Unip}(n,K),\psi_N}(\pi) = J_{\mathrm{Unip}(n,K),\psi_N}(\pi(\chi))$.

Prop. (15.11.3.4) [Transpose Invariant Distribution]. If $\Delta \in \mathscr{D}(GL(n,K))$ is a distribution that satisfies

$$\lambda(u)\Delta = \psi_N(u)^{-1}\Delta, \quad \rho(u)\Delta = \psi_N(u)\Delta,$$

where ψ is defined in(16.1.3.9), then Δ is stable under involution $\iota : GL(n,K) \to GL(n,K) : \iota(g) = w^0 g^t w^0$(15.11.0.1).

Proof: Firstly notice that ι fixes $N(K)$, and $\psi_N(\iota(g)) = \psi_N(g)$, so $\iota(\Delta)$ also satisfies these equations, so we can replace Δ by $\Delta - \iota(\Delta)$, then assume $\iota(\Delta) = -\Delta$ and prove $\Delta = 0$.

Consider the group G that is a semi-direct product

$$1 \to N(K) \times N(K) \to G \to \mathbb{F}_2$$

and $\iota \in \mathbb{F}_2$ acts on $N(K) \times N(K)$ by $(u_1, u_2) \mapsto (\iota(u_2)^{-1}, \iota(u_1)^{-1})$.

Define a character χ on G by $\chi((u_1,u_2)) = \psi_N(u_1)^{-1}\psi_N(u_2), \chi(\iota) = -1$, then G acts on $GL(n,K)$ by

$$\sigma((u_1,u_2)) = \lambda(u_1)\rho(u_2), \quad \sigma(\iota) = \iota$$

then the conditions are summarized into a single condition:

$$\sigma(g)\Delta = \chi(g)\Delta.$$

We only prove for $n = 2$:?

Consider the action of $N(K) \times N(K)$ on $GL(2,K)$ by left-right action, then we can use(15.1.5.17) and(15.1.5.18), because the action is constructive, by(8.2.1.23), and $\iota N(K)\iota = N(K)$, and ι preserves orbits except for $\mathrm{diag}\{a,d\}, a \neq d$.

But there are no desired distribution on this orbit: this orbit is homeomorphic to $N(K)$ via $u \mapsto u\mathrm{diag}(a,d)$, and the distribution is transferred to a left invariant distribution, thus by(15.1.5.11) it is just the Haar measure

$$\Delta(f) = c_1 \int_{N(K)} f(u \begin{bmatrix} a & b \\ & d \end{bmatrix})\psi_N(u) du.$$

We notice using a right-invariant version of(15.1.5.11) that

$$\Delta(f) = c_2 \int_{N(K)} f(\begin{bmatrix} a & b \\ & d \end{bmatrix} u)\psi_N(u)du = c_2 \int_{N(K)} f(u \begin{bmatrix} a & b \\ & d \end{bmatrix})\psi_N(\begin{bmatrix} a & b \\ & d \end{bmatrix}^{-1} u \begin{bmatrix} a & b \\ & d \end{bmatrix})du$$

as $N(K)$ is unimodular. Notice now $c_1\psi_N(u) = c_2\psi_N(\begin{bmatrix} a & b \\ & d \end{bmatrix}^{-1} u \begin{bmatrix} a & b \\ & d \end{bmatrix})$ cannot happen for all u, as this implies $c_1 = c_2$ by choosing $u = I$, and then $\psi(x) = \psi(ax/d)$, which is impossible by(10.11.3.35). So if some u this is not equal, then we find a function supported at a nbhd of u, then this two distributions cannot be equal. □

Prop. (15.11.3.5)[Local Multiplicity One Theorem]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$, the space of Whittaker functionals has dimension≤ 1.

Proof: Define another representation $\pi'(g) = \pi(\iota(g)^{-1})$, then this representation is isomorphic to π_1 defined in(15.11.1.15)($\pi(w^0)$ is an isomorphism), which is isomorphic to the contragradient of π, so there is a pairing on V that

$$(\pi(g)\xi, \eta) = (\xi, \pi(\iota(g))\eta).$$

Now for any smooth functional Λ, there is an element $[\Lambda]$ that $(\xi, [\Lambda]) = \Lambda(\xi)$.

Now for any linear functional Λ on V and $\varphi \in \mathcal{H}_G$, we can define another smooth linear function $(\Lambda * \varphi)(\xi) = \Lambda(\pi(\varphi)\xi)$. Then clearly $\varphi * (\varphi_1 * \varphi_2) = (\Lambda * \varphi_1) * \varphi_2$. We need the following lemma:

Lemma (15.11.3.6).

- $\pi(g)[\Lambda * \varphi] = [\Lambda * \rho(\iota(g)^{-1})\varphi]$.
- If L is a smooth functional, $[L * \varphi] = \pi(\iota(\varphi))[L]$.
- If L is a Whittaker functional, $[\Lambda * \lambda(u)\varphi] = \psi_N(u)[\Lambda * \varphi]$.

Proof: 1:

$$\begin{aligned}(\xi, \pi(g)[\Lambda * \varphi]) &= (\pi(\iota(g))\xi, [\Lambda * \varphi]) = (\Lambda * \varphi)(\pi(\iota(g))\xi) \\ &= \int_G \Lambda(\pi(h)\pi(\iota(g))\xi)\varphi(h)dh = \int_G \Lambda(\pi(h)\xi)\varphi(h\iota(g)^{-1})dh = (\xi, [\Lambda * \rho(\iota(g)^{-1})\varphi]).\end{aligned}$$

2: $(\xi, [L * \varphi]) = (L * \varphi)(\xi) = L(\pi(\varphi)\xi) = (\pi(\varphi)\xi, [L]) = (\xi, \pi(\iota(\varphi))[L])$.
3:

$$\begin{aligned}(\xi, [\Lambda * \lambda(u)\varphi]) = (\Lambda * \lambda(u)\varphi)(\xi) &= \int_G \Lambda(\pi(g)\xi)\varphi(u^{-1}g)dg \\ &= \int_G \Lambda(\pi(u)\pi(g)\xi)\varphi(g)dg \\ &= \psi_N(u)(\Lambda * g)(\xi) = \psi_N(u)(\xi, [\Lambda * \varphi])\end{aligned}$$

□

Now if Λ_1, Λ_2 are two Whittaker functionals, we will show they are propositional: we define a distribution Δ on G that $\Delta(\varphi) = \Lambda_1([\Lambda_1 * \varphi])$, then by the lemma above, (15.11.3.4) can be applied to $\overline{\Delta}$ so we have $\Delta = \iota(\Delta)$.

Next we show for any linear functional Λ, $V = \{[\Lambda * \varphi] | \varphi \in \mathcal{H}\}$: Notice the RHS is G-invariant by(15.11.3.6), and it is not empty by smoothness technique. To go further, need another lemma:

Lemma (15.11.3.7). If $\varphi \in \mathcal{H}$ satisfies $\Lambda_1 * \varphi = 0$, then $\Lambda_2 * \varphi = 0$.

Proof: Firstly, all $\Lambda_1 * \pi(g)\varphi = 0$, which follows from(15.11.3.6) item1. Hence,

$$\Lambda_2([\Lambda_1 * \lambda(g)\iota(\varphi)]) = \Delta(\iota(\rho(\iota(g)^{-1})\varphi)\varphi) = \Delta(\rho(\iota(g)^{-1})\varphi) = \Lambda_2([\Lambda_1 * \rho(\iota(g)^{-1})\varphi]) = 0.$$

hence by linearity, for any $\sigma \in \mathcal{H}$, $\Lambda_2([\Lambda_1 * \sigma * \iota(\varphi)]) = 0$, which by(15.11.3.6) item2 is equivalent to $\Lambda_2(\pi(\varphi)[\Lambda_1 * \varphi]) = 0 = (\Lambda_2 * \varphi)[\Lambda_1 * \varphi]$, because $\Lambda_1 * \sigma$ is smooth. But we know $[\Lambda * \varphi]$ can be any $v \in V$, thus $\Lambda_2 * \varphi = 0$. □

By the lemma, we can define a map $T : V \to V : T([\Lambda_1 * \varphi]) = [\Lambda_2 * \varphi]$, which is a G-homomorphism by(15.11.3.6), and it is defined on all of V, so $T\xi = c\xi$ for some c, then we see $\Lambda_2 = c\Lambda_1$, by a smoothness technique. □

Cor. (15.11.3.8) [Local Multiplicity One]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{alg}}(GL(n, K))$, there exists at most one Whittaker model for π.

Proof: A Whittaker model is equivalent to a $GL(n, K)$-homomorphism $V \to \mathrm{Ind}_{\mathrm{Unip}(n,K)}^{GL(n,K)}(\mathbb{C}_{\psi_N})$, which by smooth Frobenius reciprocity(15.1.5.44) is equivalent to a $N(K)$-homomorphism $V \to \mathbb{C}_{\psi_N}$, which is just a Whittaker functional. So this proposition is equivalent to(15.11.3.5). □

Prop. (15.11.3.9). A Whittaker functional for (π, V) is the same as a linear functional on $J_{\mathrm{Unip}(n,K),\psi_N}(V)$.

Cor. (15.11.3.10). For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$, $\dim J_{\mathrm{Unip}(n,K),\psi_N}(V) \le 1$, by(15.11.3.5).

Existence of Whittaker Models

Def. (15.11.3.11) [Sheaf on F associated to V]. As $\mathrm{Unip}(2) \cong \mathbb{A}^1$, any smooth representation V of $\mathrm{Unip}(2, K)$ corresponds to a smooth $\mathcal{H}(F)$-module by(15.1.5.23), thus we can view it as a $C_c^\infty(F)$-module by

$$\varphi(v) = \int_{\mathrm{Unip}(2,K)} \widehat{\varphi}(x)\pi(u)v dx.$$

Then this module is smooth thus non-degenerate by(15.1.5.23), then we can define $\mathcal{S}(V)$ the sheaf associated to V, as in(15.1.5.7).

Cor. (15.11.3.12). Let V be a smooth $B(K)$-sheaf and let $a \in K$, then the stalk

$$\mathcal{S}(V)_a \cong \begin{cases} J(V) & a = 0 \\ J_{\psi_a}(V) \cong J_\psi(V) & a \neq 0 \end{cases}.$$

Proof: By definition(15.1.5.7), the stalk is V modulo the subgroup consisting of elements v that $\chi_U \cdot v = 0$, where $U = a + \mathfrak{p}^k$ for some large k. Back the definition of $\mathcal{S}(V)$, consider the Fourier transform

$$\widehat{\chi_{a+\mathfrak{p}^k}}(x) = \overline{\psi(ax)}V(\mathfrak{p}^k)\chi_{\mathfrak{p}^{n-k}}(x)$$

where $\mathfrak{p}^n$ is the conductor of ψ. Thus

$$\chi_{a+\mathfrak{p}^k} v = C \int_{\mathfrak{p}^{n-k}} \overline{\psi(ax)}\pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})v dx = 0$$

for large k, which is equivalent to $v \in V_{N,\psi_a}$ by(15.1.2.6). Finally, $J_{\psi_a}(V) \cong J_\psi(V)$ by(15.11.2.2). □

Cor. (15.11.3.13) [Existence of Whittaker Functional]. $(\pi, V) \in \mathrm{Rep}^{\mathrm{adm}}(\mathrm{GL}(2, K))$ has a Whittaker functional unless it factors through the determinant map. In particular, if π is irreducible, then $\dim J_\psi(V) = 1$ iff it is not 1-dimensional, or to say, it is ∞-dimensional.

Proof: The existence of a Whittaker functional is equivalent to the fact $J_\psi(V) \neq 0$, which is the stalk of the sheaf $\mathcal{S}(V)$. If it vanishes, then $\mathcal{S}(V)$ is a skyscraper sheaf by(15.11.3.12), and by the correspondence of $\mathcal{S}(V)$ and V(15.1.5.7), V equals $\Gamma(F, \mathcal{S}(V)) = J(V)$, thus $\mathrm{Unip}(2, K)$ acts trivially on V.

So also all the conjugates of $\mathrm{Unip}(2, K)$ acts trivially, so $SL(2, K)$ acts trivially, by6, thus the representation factors through the quotient $K^\times$, the rest is clear.

Finally, if it is irreducible, then it factors through the determinant map iff $V \cong \mathbb{C}$ and $\pi(g) = \chi(\det(g))$, by(15.11.1.18). So $J_\psi(V) = 0$ as ψ is non-trivial. □

Prop. (15.11.3.14)[GL(n) **Case].** In fact, $\pi = Q(\Delta_1, \ldots, \Delta_k) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$ is generic iff no two of Δ_i are linked, in which case

$$\pi = Q(\Delta_1) \times \ldots \times Q(\Delta_k).$$

In particular, π is generic iff its Gelfand-Kirillov dimension is maximal among those irreducible admissible representations with the same cuspidal supports.

Proof: Cf.[Induced Representations of Reductive p-Adic Groups, Zelevinsky(1980)].**?** □

Kirillov Model

Def. (15.11.3.15) [Kirillov Model]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{alg}}(GL(n, K))$, a **Kirillov model** $\mathcal{K}(\pi)$ is a subrepresentation of $\mathrm{Ind}_{\mathrm{Unip}(n,K)}^{P_{n-1,1}(F)}(\psi)$ that is isomorphic to $\pi|_{B_1(F)}$, and consist of functions on $B_1(F)$ that φ is compactly supported on T_1(Notice this condition is automatic by(15.11.3.19)).

When $n = 2$, it is equivalently a subspace of $C^\infty(K^\times)$ with an action of $B_1(F)$ that satisfies

$$[\pi(\begin{bmatrix} a & b \\ & 1 \end{bmatrix})\varphi](x) = \psi(bx)\varphi(ax)$$

and isomorphic to (π, V) via the isomorphism $v \mapsto \varphi_v$.

Proof: The last assertion is because $B_1(F) = \mathrm{Unip}(2, K)T_1(F)$, thus the value of a function in $\mathrm{Ind}_{N(K)}^{B_1(F)}(\psi)$ is determined by its restriction on $T_1(F) \cong K^\times$. □

Prop. (15.11.3.16). The action of $B_1(F)$ on $C_c^\infty(K^\times)$ as defined in(15.11.3.15) is irreducible.

Proof: Let U be a non-zero invariant subspace of $C_c^\infty(K^\times)$, we will show that for any $a \in K^\times$, U contains χ_U for any sufficiently small nbhd U of a. Let $\varphi \in U$ and $\varphi(b) \neq 0$, then by action of $\begin{bmatrix} b/a & \\ & 1 \end{bmatrix}$, we may assume $\varphi(a) \neq 0$.

If $f \in C_c^\infty(F)$, f acts on φ via

$$\pi(f)\varphi = \int_F f(x)\pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\varphi dx,$$

which in fact a finite sum of elements in $N(K)v$. Then $\pi(f)\varphi(y) = \int_F f(x)\psi(xy)\varphi(y)dx = \widehat{f}(y)\varphi(y)$. By the isomorphism $\mathcal{H}_{\mathcal{F}} \cong C_c^\infty(F)$(15.1.5.26), we can choose f that $\widehat{f} = \varphi(a)^{-1}\chi_U$ for a small nbhd U of a that φ is constant on U, then $\pi(f)\varphi = \chi_U$. □

Lemma (15.11.3.17). For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, if $\dim V = \infty$, then $V^{\mathrm{Unip}(2,F)} = 0$.

Proof: Cf.[Bump, P464]**?**

The stabilizer of v is open, thus by(15.11.1.12) it is fixed by all $SL(2,K)$. Also it is fixed by the center $Z(K)$. Now $GL(2,K)/SL(2,K)Z(K) \cong K^\times/(K^\times)^2$ which is finite by(12.2.3.6), thus the invariant subspace generated by v is of f.d., contradiction. □

Lemma (15.11.3.18). If $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, and Λ is a Whittaker functional on V, then for $v \neq 0 \in V$, there exists some $a \in K^\times$ that $\Lambda(\pi(\begin{bmatrix} a & \\ & 1 \end{bmatrix})v) \neq 0$.

Proof: For any $a \in K^\times$, it is clear that the kernel of the map $v \mapsto \Lambda(\pi(\begin{bmatrix} a & \\ & 1 \end{bmatrix})v)$ contains V_{N,ψ_a}**??** but by local multiplicity one(15.11.3.5), $\dim J_{\psi_a}(V) \leq 1$, and this map is non-trivial because Λ is non-trivial, thus the kernel is exactly V_{N,ψ_a}.

Thus if $\Lambda(\pi(\begin{bmatrix} a & \\ & 1 \end{bmatrix})v) = 0$, then v is the section of $\mathcal{S}(V)$ that vanishes at all $a \neq 0$, thus for any $x \in F$, $v' = v - \pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})v$ vanishes at every $a \in F$, thus $v' = 0$. Then $v = 0$ by(15.11.3.17). □

Prop. (15.11.3.19) [Kirillov Model and Whittaker Model]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, if it has a Whittaker functional Λ, then it has a Whittaker model $\mathcal{W}$ consisting of functions $W_v(g) = \Lambda(\pi(g)v)$, and we can define functions on $K^\times$ by

$$\varphi_v(a) = W_v(\begin{bmatrix} a & \\ & 1 \end{bmatrix}).$$

Then G acts on $\mathcal{K}(\pi)$ by acting on the subscript. Then it is a Kirillov model for V, and consists of functions that is compactly supported on F.

Conversely, if $\{\varphi_v | v \in V\}$ is a Kirillov model for (π, V), then we can construct functions on $GL(2,K)$ by $W_v(g) = \varphi_{\pi(g)v}(1)$. Then this is a Whittaker model for V.

Proof: The equations can be checked by hand. To given an action $\pi(\varphi_v) = \varphi_{\pi(g)v}$ on $\{\varphi_v | v \in V\}$, we need to show that $W_v \mapsto \varphi_v$ is injective, which is true by(15.11.3.18). Then $v \mapsto \pi_v$ is an isomorphism.

It remains to show that $\varphi_v \in C_c^\infty(K^\times)$. As π is a smooth representation, for any v, W_v is stable under $N(\mathfrak{p}^k)$ for some k, thus by equation above, $\varphi_v(a) = \psi_a(n)\varphi_v(a)$ for all a and $n \in N(\mathfrak{p}^k)$. Then if $|a|$ is sufficiently large, $\psi_a(n) \neq 0$ for some $n \in N(\mathfrak{p}^k)$, implying $\varphi_v(y) = 0$. □

Prop. (15.11.3.20) [Kirillov Model and Jacquet Functor]. Let V be a generic irreducible admissible representation of $GL(2,K)$, thus having a Kirillov model by(15.11.3.19), thus we can identify V with a space of functions on $K^\times$, and there is an exact sequence of vector spaces

$$0 \to C_c^\infty(K^\times) \to \mathcal{K}(\pi) \to J_{\mathrm{Unip}(2,K)}(\pi) \to 0.$$

Proof: V_N is generated by elements of the form $v' = \pi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})v - v$. Notice $\varphi_{v'}(y) = (\psi(xy) - 1)\varphi_v(y)$, as ψ is continuous, when $|y|$ is small, $\varphi_{v'}(y) = 0$.

To show that if $C_c^\infty(K^\times) \subset V_N$, notice V_N is non-zero, because $\dim V = \infty$ but $\dim J(V)$ is finite(15.11.4.20). Notice V_N is stable under $B(K)$ action, thus it must be $C_c^\infty(K^\times)$ by(15.11.3.16). □

Prop. (15.11.3.21). If (π, V) is an irreducible generic admissible representation of $GL(2,K)$ thus having a Kirillov model. If χ is a quasi-character of $T(F)$ that $\pi(t)\overline{\varphi}_v = (\delta^{1/2}\chi)(t)\overline{\varphi}_v \in J(V)$, then for $|t|$ small, $\varphi_v(t)$ is a constant multiple of $|t|^{1/2}\chi_1(t)$.

Proof: Let $t_0 \in \mathfrak{p}\backslash\mathfrak{p}^2$, then

$$\pi(\begin{bmatrix} t_0 & \\ & 1\end{bmatrix})\varphi - |t_0|^{1/2}\chi_1(t_0)\varphi \in V_N,$$

thus by(15.11.3.20), there exists some $\varepsilon(t_0) > 0$ that

$$\varphi(tu) - |t|^{1/2}\chi_1(t)\varphi(u) = 0$$

for $t = t_0$ and $|u| \leq \varepsilon(t_0)$. Because both sides are locally constant on t, by the compactness of $\mathfrak{p}\backslash\mathfrak{p}^2$, there exists some $\varepsilon > 0$ that for the equation is true for all $t \in \mathfrak{p}\backslash\mathfrak{p}^2$ and $|u| \leq \varepsilon$.

Now any element $t \in \mathfrak{p}$ can be factored into product of elements in $\mathfrak{p}\backslash\mathfrak{p}^2$, so by induction this is true for any $t \in \mathfrak{p}$. Thus we are done. □

Lemma (15.11.3.22) [Gelfand Uniqueness Principle]. Let $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(2,K))$, and let χ be a quasi-character of $K^\times$, then there are at most two essentially different values of s that there are at least two linear functionals $L : V \to \mathbb{C}$ that satisfies

$$L(\pi(\begin{bmatrix} y & \\ & 1\end{bmatrix})v) = \chi(y)|y|^s L(v).$$

Remark (15.11.3.23). In fact, for any s, there exists at most one such linear functional**?**.

Proof: If $\dim V = 1$, this is trivial. Otherwise $\dim V = \infty$ and (π, V) has a Kirillov model. Identify V with its Kirillov model. Suppose L_1, L_2 are two linear functionals that satisfies the equation, consider their restriction to $V_N = C_c^\infty(K^\times)$, on which $B_1(F)$ acts, thus L_1, L_2 are linearly dependent when restricted to V_N by(15.1.5.12). Thus there exists constants c_1, c_2 that $c_1L_1 + c_2L_2$ factors through $J(V)$. $\dim J(V) \leq 2$ by(15.11.4.20). So by(15.11.1.24) for all but two possible choices of s, $c_1L_1 + c_2L_2 = 0$, thus there are two linear functionals only for possibly two choices of s. □

4 Bernstein-Zelevinsky Classification

Thm. (15.11.4.1) [Bernstein-Zelevinsky].

1. For any Zelevinsky segment Δ of length m, the representation $\pi(\Delta)$ has length 2^{m-1}.
2. Let Δ be a Zelevinsky segment, then $\pi(\Delta)$ has a unique irreducible subrepresentation $Z(\Delta)$ and a unique irreducible quotient representation $Q(\Delta)$.
3. Let $(\Delta_1, \ldots, \Delta_r)$ be a tuple of Zelevinsky segments satisfying the Zelevinsky condition(15.11.1.28), then $Q(\Delta_1) \times \ldots \times Q(\Delta_r) \in \mathrm{Rep}^{adm}(GL(\sum n_i m_i, F))$ admits a unique irreducible quotient $Q(\Delta_1, \ldots, \Delta_r)$. Moreover, $Q(\Delta_1, \ldots, \Delta_r)$ is independent of the order of $\Delta_1, \ldots, \Delta_r$(also need to satisfy the Zelevinsky condition).
4. Any irreducible representation (π, V) of $GL(n,K)$ is isomorphic to one of the form $\pi \cong Q(\Delta_1, \ldots, \Delta_r)$ where $\Delta_i = \Delta(\pi_i, m_i)$ and $\sum n_i m_i = n$. for a unique tuple of segments $(\Delta_1, \ldots, \Delta_r)$ satisfying Zelevinsky condition up to permutation.

5. Let $(\Delta_1, \ldots, \Delta_r)$ be a tuple of segments satisfying the Zelevinsky condition, then $Q(\Delta_1, \ldots, \Delta_r)$ is irreducible iff no two elements are linked.
6. $Q(\Delta_1, \ldots, \Delta_r)^\vee = Z(\Delta_1^\vee, \ldots, \Delta_r^\vee)$.
7. Dual statement of item$3-6$ holds for $Z(\Delta_1) \times \ldots \times Z(\Delta_r)$, which admits a unique irreducible subrepresentation $Z(\Delta_1, \ldots, \Delta_r)$.

Proof: □

Cor. (15.11.4.2) [Principal Series]. $\mathcal{B}(\chi_1, \chi_2)$ is irreducible except the following two cases:

- If $\chi_2 = \chi_1(1)$, then $\mathcal{B}(\chi_1, \chi_2)$ has a 1-dimensional invariant subspace and the quotient representation is irreducible.
- If $\chi_2 = \chi_1(-1)$, then $\mathcal{B}(\chi_1, \chi_2)$ has an irreducible invariant subspace of codimension 1.

In these cases, the infinity-dimensional irreducible representations are called the **Steinberg representations** $\sigma(\chi_1, \chi_2)$, and the one-dimensional representation is denoted by $Z(\chi_1, \chi_2)$.

Proof: Firstly we prove if $\mathcal{B}(\chi_1, \chi_2)$ has a non-trivial subspace, then it has a non-trivial subspace of dimension 1 or codimension 1: Let V' be the invariant subspace and V'' the quotient space, by the exactness of Jacquet functor(15.11.2.1) and(15.11.3.10), at least one of $J_\psi(V'), J_\psi(V'')$ vanishes. If $J_\psi(V') = 0$, then by(15.11.3.13) it factors through the determinant map, thus it has a 1-dimensional invariant space. If $J_\psi(V'') = 0$, then we can use(15.11.4.9) and(15.1.5.28) to dualize.

Next, if $\mathcal{B}(\chi_1, \chi_2)$ has a 1-dimensional subspace $V = \{f\}$, then $\pi(g)f = \rho(\det(g))f$ for some quasi-character ρ of $K^\times$. Now consider the fact $f \in \mathcal{B}(\chi_1, \chi_2)$, take $b = \mathrm{diag}(y, y^{-1})$, then $(\delta^{1/2}\chi)(b) = 1$, showing $\chi_1\chi_2^{-1} = |\cdot|^{-1}$. The codimension1 case is dual by(15.1.5.28) and(15.11.4.9), so $\mathcal{B}(\chi_1, \chi_2)$ is irreducible except when $\chi_1\chi_2^{-1} = |\cdot|^{\pm 1}$.

Finally, if $\chi_1\chi_2^{-1} = |\cdot|^{-1}$, let $\chi_1 = \chi|\cdot|^{-1/2}$, then $f(g) = \chi(\det(g))$ is an invariant 1-dimensional subspace, and this is the only 1-dimensional invariant subspace that factors through the determinant map, because if $f(g) = \chi'(\det(g)) \in \mathcal{B}(\chi_1, \chi_2)$, then $\chi' = \chi_1|\cdot|^{1/2} = \chi_2|\cdot|^{-1/2} = \chi$.

Also the quotient representation is irreducible because the same argument by Jacquet module shows if it is non-irreducible, then it has an invariant subspace of dimension 1 that G action factors through the determinant map or of codimension 1, which means there are two invariant 1-dimensional subspace that the G-action factors through the determinant map, or a invariant subspace of codimension1 of $\mathcal{B}(\chi_1, \chi_2)$, the latter case contradicting the argument above. For the former case, we get a 2-dimensional subrepresentation of $\mathcal{B}(\chi_1, \chi_2)$ that factors through the determinant map. The argument above shows it is generated by $\chi(\det())$ and some function f, but f must satisfy $f(g) = \chi(\det(g))f(1) + a$, which is possible only if $a = 0$, so $f = \chi \circ \det$, contradiction.

The codimension 1 case is dual by(15.1.5.28) and(15.11.4.9). □

Cor. (15.11.4.3) [Steinberg Representation]. Consider the segment $\Delta(|\cdot|^{\frac{1-n}{2}}, n)$ of length n and degree n, then $(\pi(\Delta), V)$ is the space of functions $B\backslash G \to \mathbb{C}$. Thus $Z(\Delta)$ is the trivial representation, and $Q(\Delta)$ is called the (standard)**Steinberg representation**, denoted by St_n. It is self-dual.

If $n = 2$, then $\pi(\Delta)$ has length 2, thus there are an exact sequences,

$$0 \to 1 \to |\cdot|^{-1/2} \times |\cdot|^{1/2} \to \mathrm{St}_2 \to 0, \quad 0 \to \mathrm{St}_2 \to |\cdot|^{1/2} \times |\cdot|^{-1/2} \to 1 \to 0$$

Cor. (15.11.4.4) [Classification of $\mathrm{Irr}^{\mathrm{adm}}(GL(2, K))$]. The $n = 2$ case is particularly clear: any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(2, K))$ has the following possibilities:

1. π is cuspidal.

2. $\pi = Q(\chi|\cdot|^{-1/2}, \chi|\cdot|^{1/2})$, which equals $\mathrm{St}_2(\chi)$.
3. $\pi = \chi_1 \times \chi_2$, where χ_1, χ_2 are not linked, which is the principal series.
4. $\pi = Q(\chi|\cdot|^{1/2}, \chi|\cdot|^{-1/2})$, which equals $\mathbb{1}(\chi)$.

Def. (15.11.4.5) [Cuspidal Supports]. For a $\pi = Q(\Delta_1, \ldots, \Delta_r) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, where $\Delta_i = (\pi_i, m_i)$, define the **cuspidal supports** of π as the set

$$\mathrm{Supp}(\pi) = \{\pi_i(j)\}_{1 \le i \le r, 1 \le j \le m_i - 1}.$$

Principal Series Representations

Def. (15.11.4.6) [Principal Series Representations]. Given a diagonal quasi-character χ of $T(F)$, define the **principal series representation** of G as

$$\mathcal{B}(\chi_1, \ldots, \chi_n) = I_{B(K)}^{G(F)}(\chi)(15.1.5.41) = \{f \in C^\infty(G) | f(\begin{bmatrix} y_1 & & * \\ & \ldots & \\ & & y_n \end{bmatrix} g) = \chi_1(y_1)\ldots\chi_n(y_n)|y_1^{n-1}y_2^{n-3}\ldots y_n^{-n+1}|^{1/2} f$$

It is admissible of finite length by(15.11.2.8). If it is irreducible, its isomorphism class is denoted by $\pi(\chi_1, \chi_2)$.

Lemma (15.11.4.7). By(15.1.5.48), we have a map $P : C_c^\infty(G(F)) \to \mathcal{B}(\chi_1, \ldots, \chi_n)$:

$$(P\varphi)(g) = \int_{B(K)} \varphi(b^{-1}g)(\delta^{1/2}\chi)(b)db$$

Then this map is intertwining and surjective. Moreover, we have

$$P(\lambda(b)^{-1}\varphi) = (\delta^{-1/2}\chi)(b)P(\varphi), \quad b \in B(K)$$

Prop. (15.11.4.8). The representation $B(\chi_1, \ldots, \chi_n)$ admits at most one Whittaker functional. In other words, $\dim J_\psi(B(\chi_1, \ldots, \chi_n)) \le 1$. in fact, it is exactly one, as will be shown by(15.11.4.2) and(15.11.3.13).

Proof: Let $\Lambda : V \to \mathbb{C}$ be a Whittaker functional, then we define a distribution Δ on $GL(2,K)$ as $\Delta(\varphi) = \Lambda(P\varphi)$. Then

$$\lambda(b)\Delta = (\delta^{-1/2}\chi)(b)\Delta, b \in B(K), \quad \rho(n)\Delta = \psi_N(n)^{-1}\Delta, n \in N(K)$$

by(15.11.4.7). Because P is surjective(15.11.4.7), it suffices to show that these Δ are unique up to scalar.

Consider the left-right action of $B(K) \times N(K)$ on $G(F)$, then there are $n!$ orbits $B(K)WN(K)$ by Bruhat decomposition(11.7.6.6). For $w \ne 1$, the orbit $B(K)wN(K)$ is isomorphic to $B(K) \times N(K)$ via $(b,n) \mapsto bwn^{-1}$, thus the restriction of Δ on $B(K)wN(K)$ must be of the form

$$\Delta_1(\varphi) = C \int_{B(K)} \int_{N(K)} \varphi(bwn^{-1})\psi_N(n)(\delta^{1/2}\chi^{-1})(b)dbdn$$

by(15.1.5.11). This is the unique map that satisfies the condition.

As for the distribution on $B(K)$, the same reasoning shows the restriction of Δ on $B(K)$ must be of the form

$$\Delta_2(\varphi) = C \int_{B(K)} \varphi(b)(\delta^{1/2}\chi^{-1})(b)db,$$

but it satisfies $\rho(n)\Delta_2 = \Delta_2$, so there are no distribution on $B(K)$. Finally, (15.1.5.3) gives us the result. $\square$

Cor. (15.11.4.9). The contragradient of $\chi_1 \times \ldots \times \chi_n$ is $\chi_1^{-1} \times \ldots \times \chi_n^{-1}$.

Proof: If $f \in \mathcal{B}(\chi_1, \chi_2)$, $f' \in \mathcal{B}(\chi_1^{-1}, \chi_2^{-1})$, then the pairing $(f, f') = \int_K f(k)f'(k)dk$ is G-invariant by(10.11.1.45), so this defines a smooth functional $l_{f'}$, and it is non-degenerate, the mapping $f' \mapsto l_{f'}$ is injective(by letting $f = 1/f'$ on a $B(K)$-orbit that f' is non-zero) from $\mathcal{B}(\chi_1^{-1}, \chi_2^{-1})$ to $\mathcal{B}(\chi_1, \chi_2)^\vee$. Now by symmetry the other side is also injective, and we are done because $(V^\vee)^\vee = \cong V$(15.1.5.30). □

Cor. (15.11.4.10). $\mathrm{Hom}(\mathcal{B}(\chi_1, \ldots, \chi_n), \mathcal{B}(\mu_1, \ldots, \mu_n)) \neq 0$ only if $\{\chi_1, \ldots, \chi_n\} = \{\mu_1, \ldots, \mu_n\}$.

Proof: By smooth Frobenius reciprocity(15.1.5.44),

$$\mathrm{Hom}_G(\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)) \cong \mathrm{Hom}_{B(K)}(\mathcal{B}(\chi_1, \chi_2), \delta^{1/2}\mu).$$

The proof below is similar to that of(15.11.4.8): For such a map Λ, we define a distribution $\Delta(\varphi) = \Lambda(P(\varphi))$, then

$$\lambda(b)\Delta = (\delta^{-1/2}\chi)(b)\Delta, \quad \rho(b)\Delta = (\delta^{-1/2}\mu^{-1})(b)\Delta, \quad b \in B(K).$$

So by the exact sequence(15.1.5.3), such distribution exists on one of the orbits $B(K)wN(K)$.

If such a distribution exists on $B(K)wN(K)$ for $w \neq 1$, then noticing $\rho(n)\Delta = \Delta$ for $n \in N(K)$, by(15.1.5.11)

$$\Delta(\varphi) = \int_{B(K)} \int_{N(K)} \varphi(bwn^{-1})(\delta^{1/2}\chi^{-1})(b)dbdn,$$

then we apply $\rho(t)$ with t diagonal, then

$$\begin{aligned}(\delta^{-1/2}\mu^{-1})(t)\Delta(\varphi) = (\rho(t)\Delta)(\varphi) &= \int_{N(K)} \int_{B(K)} \varphi((bwt^{-1}w^{-1})w(tnt^{-1})^{-1})(\delta^{1/2}\chi^{-1})(b)dbdn \\ &= \delta(t)^{-1}(\delta^{-1/2}\chi^{-1})(wtw^{-1})\Delta(\varphi)\end{aligned}$$

via change of variables(10.11.1.16). Notice that $\delta(t) = \delta(wtw^{-1})^{-1}$, thus $\mu(t) = \chi(wtw^{-1})$, which means $\chi_i = \mu_{w(i)}$.

Similarly, if such a distribution exists on $B(K)$, then

$$\Delta(\varphi) = \int_{B(K)} \varphi(b)(\delta^{1/2}\chi^{-1})(b)db.$$

Apply $\rho(b)$, then $\delta^{-1/2}\chi(b) = (\delta^{-1/2}\mu)(b)$, so $\chi_i = \mu_i$. □

Intertwining Integrals and Whittaker Functional

Prop. (15.11.4.11)[Intertwining Integral]. Let ξ_i be two characters of $K^\times$, and $\chi_i = |\cdot|^{s_i}\xi_i$, $(\pi, V) = \mathcal{B}(\chi_1, \chi_2)$, $(\pi', V') = \mathcal{B}(\chi_2, \chi_1)$. Define for $f \in V$,

$$Mf : GL(2, K) \to \mathbb{C} : Mf(g) = \int_{N(K)} f(w_0ug)du$$

then if $\mathrm{Re}(s_1 - s_2) > 0$, the integral is absolutely convergent, $Mf \in V'$, and M is a nonzero intertwining, so $V \cong V'$ if they are both irreducible.

Proof: Should compare this proof with(15.9.4.18).

For the convergence, it suffices to check for $\begin{bmatrix}1 & x\\ & 1\end{bmatrix}$, $|x|$ large, but then

$$f(\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g) = f(\begin{bmatrix}x^{-1} & -1\\ & x\end{bmatrix}\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}g) = |x|^{-1}(\chi_1^{-1}\chi_2)(x)f(\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}g)$$

and because f is locally constant, when $|x|$ is large, $f(\begin{bmatrix}1 & \\ x^{-1} & 1\end{bmatrix}g) = f(g)$, thus the convergence on the unbounded region is dominated by

$$\int_{|x|>q^N}|x|^{-1}|(\chi_1^{-1}\chi_2)(x)|dx = \int_{|x|>q^N}|x|^{-s_1+s_2-1}dx,$$

which converges for $\mathrm{Re}(s_1-s_2)>0$.

To show $Mf\in V'$, we need to check

$$Mf(\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g) = Mf(g),\quad Mf(\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g) = |y_1/y_2|^{1/2}\chi_2(y_1)\chi_1(y_2)Mf(g).$$

The first is trivial and for the second:

$$Mf(\begin{bmatrix}y_1 & \\ & y_2\end{bmatrix}g) = \int_F f(\begin{bmatrix}y_2 & \\ & y_1\end{bmatrix}\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & y_2y_1^{-1}x\\ & 1\end{bmatrix}g)dx$$

so it is clear.

Finally M is clearly intertwining, and it is not trivial by looking at the function f:

$$f = |y_1/y_2|^{1/2}\chi_1(y_1)\chi_2(y_2)\chi_{\mathcal{O}_F}(x),\ \text{where } g = \begin{bmatrix}y_1 & z\\ & y_2\end{bmatrix}\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}$$

and vanish if $g\in B(K)$. Notice the representation of g is unique by Bruhat decomposition. Then $Mf(1)=1$. □

Prop. (15.11.4.12) [Analytic Continuation of Intertwining Integral]. Let ξ_i be two characters of $K^\times$, $\chi_i = |\cdot|^{s_i}\xi_i$, $(\pi_{s_1,s_2}, V_{s_1,s_2}) = \mathcal{B}(\chi_1,\chi_2)$, $(\pi'_{s_2,s_1}, V'_{s_2,s_1}) = \mathcal{B}(\chi_2,\chi_1)$.

Notice that by Iwasawa decomposition(15.11.1.4), an arbitrary $f\in\mathcal{B}(\chi_1,\chi_2)$ is determined by its restriction on K, and if a function f_0 on K satisfies

$$f_0(\begin{bmatrix}y_1 & x\\ & y_2\end{bmatrix}k) = \xi_1(y_1)\xi_2(y_2)f_0(k), y_1, y_2\in\mathcal{O}^*,$$

then f_0 can extends uniquely to an element $f_{s_1,s_2}\in V_{s_1,s_2}$ for any s_1,s_2, called the **flat sections** of f_0.

Then the intertwining integral Mf_{s_1,s_2} defined in(15.11.4.11) is analytic for the dominant χ in the flat family, and has an analytic continuation to all s_1,s_2 that $\chi_1\neq\chi_2$, and defines a nonzero operator $V_{s_1,s_2}\to V'_{s_2,s_1}$.

Proof: The proof is parallel to that of(15.11.4.11).

$$Mf_{s_1,s_2}(g)=\int_{|x|\leq q^N} f_{s_1,s_2}(\begin{bmatrix} & -1\\ 1 & \end{bmatrix}\begin{bmatrix} 1 & x\\ & 1\end{bmatrix}g)dx+\int_{x\geq q^{N+1}}|x|^{-s_1+s_2-1}(\xi_1^{-1}\xi_2)(x)dx f_{s_1,s_2}(g)$$

the first term can easily be extended, and the second term vanishes if $\xi_1^{-1}\xi_2$ ramifies, and equals something like a multiple of $\frac{(\chi_1^{-1}\chi_2(\varpi))^{N+1}}{1-\chi_1^{-1}\chi_2(\varpi)}$, which extends unless $\chi_1=\chi_2$.

For the intertwining property, it is because equalities maintain along analytic continuation, in particular, it is non-trivial as $Mf_{s_1,s_2}(1)=1$. □

Cor. (15.11.4.13). $Z(\chi_1,\chi_2)\cong Z(\chi_2,\chi_1)$, $\sigma(\chi_1,\chi_2)\cong\sigma(\chi_2,\chi_1)$. If $\mathcal{B}(\chi_1,\chi_2)$ is irreducible, then $\pi(\chi_1,\chi_2)\cong\pi(\chi_2,\chi_1)$. Moreover, there are no other isomorphisms between these representations.

Proof: It suffices to show there are no other isomorphisms, and this is by(15.11.4.10). □

Prop. (15.11.4.14) [Whittaker functional of $\mathcal{B}(\chi_1,\chi_2)$]. There is a Whittaker functional on $\mathcal{B}(\chi_1,\chi_2)$ defined by

$$\Lambda(f)=\int_F f(w_0\begin{bmatrix} 1 & x\\ & 1\end{bmatrix})\psi(-x)dx.$$

This integral is absolutely convergent if χ is dominant and is analytic for the flat family of χ, by method the same as in the proof of(15.11.4.11). And this can also be extended to all χ(as flat section(15.11.4.12)) by defining

$$\Lambda(f)=\lim_{k\to\infty}\int_{\mathfrak{p}^{-k}} f(w_0\begin{bmatrix} 1 & x\\ & 1\end{bmatrix})\psi(-x)dx.$$

Remark (15.11.4.15). Compare with(16.3.3.3).

Proof: This makes sense because it stabilize as $k\to\infty$: when k is large,

$$\int_{\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}} f(w_0\begin{bmatrix} 1 & x\\ & 1\end{bmatrix})\psi(-x)dx=q^{-k-1}f(1)\int_{\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}}\psi(-x)(\chi_1^{-1}\chi_2)(x)dx$$

By continuity(See the proof of(15.11.4.11)). If $\psi(t)\neq 0$, choose k large that $\chi_1^{-1}\chi_2(x)=\chi_1^{-1}\chi_2(x+t)$ for any $x\in\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}$, thus this integral vanishes. □

Remark (15.11.4.16). For general n, this method won't work, and another method is used in**??**Bernstein, J., Letter to Piatetski-Shapiro (1985). To appear in Cogdell and Piatetski-Shapiro (book in preparation).] to extend analytically.

Prop. (15.11.4.17). If $\mathcal{B}(\chi_1,\chi_2)$ is irreducible, with the notations in(15.11.4.11), the intertwining integral $M:\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1)$ satisfies

$$\Lambda'\circ M=\xi_1\xi_2^{-1}(-1)\gamma(1-s_1+s_2,\xi_1^{-1}\xi_2,\psi)\Lambda,$$

where Λ is the Whittaker functional defined in(15.11.4.14), and $\gamma(s,\chi,\psi)$ is the local constant defined in(19.2.2.8).

Proof: Cf.[Bump, P485].**?** □

Cor. (15.11.4.18) [Composition of Intertwining Integrals]. If $\mathcal{B}(\chi_1,\chi_2)$ is irreducible, M : $\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1)$, M' : $\mathcal{B}(\chi_2,\chi_1)\to\mathcal{B}(\chi_1,\chi_2)$ are intertwining integrals, then $M'\circ M$ is the scalar $\gamma(1-s_1+s_2,\xi_1^{-1}\xi_2,\psi)\gamma(1+s_1-s_2,\xi_1\xi_2^{-1},\psi)$.

If $\mathcal{B}(\chi_1,\chi_2)$ is reducible, $M'\circ M=0$.

Proof: The irreducible case follows from the proposition. For the reducible case, let $\chi_1\chi_2^{-1}=|\cdot|$, the intertwining integral $\mathcal{B}(\chi_2,\chi_1)\to\mathcal{B}(\chi_1,\chi_2)$ is non-zero, so the image is ether $\mathcal{B}(\chi_1,\chi_2)$ or $\pi(\chi_1,\chi_2)$. In the first case, $\mathcal{B}(\chi_2,\chi_1)$ has a infinite dimensional proper quotient, contradiction. The intertwining integral $\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\chi_2,\chi_1)$ is non-zero, so the image is either $\mathcal{B}(\chi_2,\chi_1)$ or $\sigma(\chi_1,\chi_2)$. In the first case, $\mathcal{B}(\chi_1,\chi_2)$ has a 1-dimensional quotient, contradiction. □

Jacquet Module

Prop. (15.11.4.19) [Jacquet Module of $\mathcal{B}(\chi_1,\ldots,\chi_n)$]. Let χ_i be quasi-characters of $K^\times$, then the Jacquet module of $\chi_1\times\ldots\times\chi_n$ has dimension $n!$.

And if $n=2$, the representation of $T(F)$ on the Jacquet module is isomorphic to the representation

$$t\mapsto\begin{cases}\begin{bmatrix}(\delta^{1/2}\chi)(t) & \\ & (\delta^{1/2}\chi')(t)\end{bmatrix}, & \chi_1\neq\chi_2\\ (\delta^{1/2}\chi)(t)\begin{bmatrix}1 & v(t_1/t_2)\\ & 1\end{bmatrix}, & \chi_1=\chi_2=\chi\end{cases}.$$

Proof: Firstly we show $\dim J(\mathcal{B}(\chi_1,\chi_2))=2$: Let $\Lambda:V\to\mathbb{C}$ be a functional that $\Lambda(\rho(n)v)=\Lambda(v)$ for $n\in N(K)$, then we define a distribution Δ on $GL(2,K)$ as $\Delta(\varphi)=\Lambda(P\varphi)$. Then

$$\lambda(b)\Delta=(\delta^{-1/2}\chi)(b)\Delta, b\in B(K),\quad \rho(n)\Delta=\Delta, n\in N(K)$$

by(15.11.4.7). Because P is surjective(15.11.4.7), it suffices to show that there are exactly two linearly independent such Δ.

Consider the left-right action of $B(K)\times N(K)$ on $GL(2,K)$, then there are $n!$ orbits $B(K)WN(K)$ by Bruhat decomposition(11.7.6.6). For $w\neq 1$, the orbit $B(K)wN(K)$ is isomorphic to $B(K)\times N(K)$ via $(b,n)\mapsto bwn^{-1}$, thus the restriction of Δ on it must be of the form

$$\Delta_1(\varphi)=C\int_{B(K)}\int_{N(K)}\varphi(bwn^{-1})(\delta^{1/2}\chi^{-1})(b)dbdn$$

by(15.1.5.11).

As for the distribution on $B(K)$, the same reasoning shows the restriction of Δ on $B(K)$ must be of the form

$$\Delta_2(\varphi)=C\int_{B(K)}\varphi(b)(\delta^{1/2}\chi^{-1})(b)db,$$

and it truly satisfies $\rho(n)\Delta_2=\Delta_2$. Finally, (15.1.5.3) gives us the result.

Next we consider $J(V)$ as a 2-dimensional $T(F)$-representation must be of the two forms in(15.11.1.24), it suffices to distinguish these two cases.

Denote $V=\mathcal{B}(\chi_1,\chi_2)$. Consider for any quasi-character μ of $T(F)$,

$$\mathrm{Hom}_{T(F)}(J(V),\delta^{1/2}\mu)\cong\mathrm{Hom}_{B(K)}(V,\delta^{1/2}\mu)\cong\mathrm{Hom}_{GL(2,K)}(V,\mathcal{B}(\mu_1,\mu_2))$$

So(15.11.4.10)(15.11.4.13) can be used, so if $\chi_1\neq\chi_2$, there are two μ that can make the Hom group non-vanish, so it is the first case. If $\chi_1=\chi_2$, then V is irreducible, and there is only one μ that makes this Hom group non-vanish, and the Hom group is of dimension1 by Schur's lemma, so it is the second case. □

Prop. (15.11.4.20) [Jacquet Module is Finite Dimensional]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n, K))$, $\dim J_{\mathrm{Unip}(n,K)}(V) \leq n!$, and if it is nonzero, then π is a subrepresentation of some $\mathcal{B}(\chi_1, \ldots, \chi_n)$.

Proof: By(15.11.2.10), π is isomorphic to a subrepresentation of some $\mathcal{B}(\chi_1, \ldots, \chi_n)$. Then by exactness of Jacquet functor(15.11.2.1), $J(V)$ is a subspace of $J(\mathcal{B}(\chi_1, \ldots, \chi_n))$, which has dimension $n!$(15.11.4.19). □

Prop. (15.11.4.21) [Jacquet Functor of $\sigma(\chi_1, \chi_2)$]. Suppose χ_1, χ_2 are characters of $K^\times$ that $\chi_1\chi_2^{-1} = |\cdot|^{-1}$, then $\mathcal{B}(\chi_1, \chi_2)$ is reducible, then the Jacquet modules of $\pi(\chi_1, \chi_2)$ and $\sigma(\chi_1, \chi_2)$ are 1-dimensional, and the characters of $T(F)$ they afford are $\delta^{1/2}\chi$ and $\delta^{1/2}\chi'$.

Proof: Clearly the Jacquet module of a representation $\mathbb{1}(\chi)$ is of dimension 1, so by the exactness of Jacquet functor(15.11.2.1) and(15.11.4.19), the Jacquet functor for $\sigma(\chi_1, \chi_2)$ is also of dimension 1.

For the determination of the Jacquet module, notice for any representation (π, V) of $GL(2, K)$,

$$\mathrm{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) \cong \mathrm{Hom}_{B(K)}(V, \delta^{1/2}\mu) \cong \mathrm{Hom}_{GL(2,K)}(V, \mathcal{B}(\mu_1, \mu_2)).$$

So for $\pi = \pi(\chi_1, \chi_2)$, $\mathrm{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) = \mathbb{C}$ for $\mu = \chi$, so $J(\pi(\chi_1, \chi_2))$ is $\delta^{1/2}\chi$. For $\pi = \sigma(\chi_1, \chi_2)$, then $\mathrm{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) = \mathbb{C}$ for $\mu = \chi'$ by(15.11.4.13), so $J(\sigma(\chi_1, \chi_2))$ is $\delta^{1/2}\chi'$. □

Kirillov Modules of Principal Series

Prop. (15.11.4.22) [Kirillov Model of Principal Series]. Let $\pi(\chi_1, \chi_2)$ be an irreducible principal series,

- If $\chi_1 \neq \chi_2$, then the Kirillov model of $\pi(\chi_1, \chi_2)$ consists of smooth functions φ on $K^\times$ that is compactly supported on F and $\varphi(t)$ is a linear combination of the function $|t|^{1/2}\chi_1(t)$ and $|t|^{1/2}\chi_2(t)$ when $|t|$ is small.
- If $\chi_1 = \chi_2$, then the Kirillov model of $\pi(\chi_1, \chi_1)$ consists of smooth functions φ on $K^\times$ that is compactly supported on F and $\varphi(t)$ is a linear combination of the function $|t|^{1/2}\chi_1(t)$ and $v(t)|t|^{1/2}\chi_1(t)$ when $|t|$ is small.

Proof: First assume that $\chi_1 = \chi_2$, then by(15.11.4.19), there are two functions φ_1, φ_2 that satisfies

$$\pi(t)\overline{\varphi}_1 = (\delta^{1/2}\chi)(t)\overline{\varphi}_1, \quad \pi(t)\overline{\varphi}_2 = (\delta^{1/2}\chi)(t)\overline{\varphi}_2 + v(t_1/t_2)(\delta^{1/2}\chi)(t)\overline{\varphi}_1.$$

Then by(15.11.3.21), $\varphi_1(u) = C|u|^{1/2}\chi_1(u)$ for $|u|$ small, and because $\overline{\varphi}_1 \neq 0 \in J(V)$, $C \neq 1$ by(15.11.3.20), and we can assume that $C = 1$. Then for any $t_0 \in \mathfrak{p}\backslash\mathfrak{p}^2$,

$$\pi(\begin{bmatrix} t_0 & \\ & 1 \end{bmatrix})\varphi_2 - |t_0|^{1/2}\chi_1(t_0)[\varphi_1 + \varphi_2] \in V_N.$$

Thus by(15.11.3.20), there exists some constant $\varepsilon(t_0)$ that

$$\varphi_2(tu) = |t|^{1/2}\chi_1(t)\varphi_2(u) + |tu|^{1/2}\chi_1(tu).$$

is true for $t = t_0$ and $|u| \le \varepsilon(t_0)$. Notice both sides are locally constant on t, so this is true for t near t_0. Because $\mathfrak{p}\backslash\mathfrak{p}^2$ is compact, there is a ε that this is true for any $t \in \mathfrak{p}\backslash\mathfrak{p}^2$ and $|u| \le ve$.

Now any element $t \in \mathfrak{p}$ can be factored into product of elements in $\mathfrak{p}\backslash\mathfrak{p}^2$, so by induction

$$\varphi_2(tu) = |t|^{1/2}\chi_1(t)\varphi_2(u) + v(t)|tu|^{1/2}\chi_1(tu).$$

for any $t \in \mathfrak{p}$ and $|u| \le \varepsilon$. So the theorem is true for φ_1 and φ_2, thus true for any other function because they differs from a linear combination of these two by an element in V_N, which vanishes for $|t|$ small, by(15.11.3.20).

Case1 is similar and easier. □

Prop. (15.11.4.23) [Kirillov Model of Steinberg Representations]. Let $\sigma(\chi_1, \chi_2)$ be a Steinberg representation of $GL(2, K)$, where $\chi_1\chi_2^{-1} = |\cdot|^{-1}$, then the Kirillov model of $\sigma(\chi_1, \chi_2)$ consists of smooth functions φ on $K^\times$ that is compactly supported on F and $\varphi(t)$ is a constant multiple of $|t|^{1/2}\chi_2(t)$ when $|t|$ is small.

Proof: The proof is the same as that of(15.11.4.22), with(15.11.4.21) used instead of(15.11.4.19). □

5 Spherical Representations

Def. (15.11.5.1) [Normalized Spherical Vector]. Let $\chi_1, \ldots, \chi_n$ be nonramified quasi-characters of $K^\times$, then $\mathcal{B}(\chi_1, \ldots, \chi_n)$ contains a K-fixed vector φ_K that is defined to be

$$\varphi_{\mathcal{K}}(bk) = (\delta^{1/2}\chi)(b), b \in B(K), k \in \mathcal{K}$$

Notice this is well-defined, because for $u \in B(K) \cap \mathcal{K}$, $(\delta^{1/2}\chi)(u) = 1$. $\varphi_{\mathcal{K}}$ is $\mathcal{K}$-spherical, and we refer to it the **normalized spherical vector** in V. Such a $\mathcal{B}(\chi_1, \ldots, \chi_n)$ is called a **unramified principal series** if it is irreducible.

Notice when $n = 2$ and $\chi_2 = \chi_1|\cdot|$, this spherical vector just spans the 1-dimensional invariant subspace in(15.11.4.2).

Prop. (15.11.5.2) [Satake Isomorphism]. There is an isomorphism

$$S : \mathcal{H}_K \cong \mathbb{C}[t_1, t_1^{-1}, \ldots, t_n, t_n^{-1}]^W.$$

s.t. if $\varphi \in \mathcal{H}_K$, for any spherical principal series $\pi(\chi_1, \ldots, \chi_n)$ and a spherical vector v, $\pi(\varphi)v = S(\varphi)(\alpha_1, \ldots, \alpha_n)$, where $\alpha_i = \chi(\chi_i)$ are the Satake parameters of χ_i.

Remark (15.11.5.3). For general Satake isomorphism, Cf.(15.12.0.3).

Proof: Cf.[Spherical representations and the Satake isomorphism]**?** □

Cor. (15.11.5.4). When $n = 2$, under the Satake isomorphism, the Hecke operators $T(\mathfrak{p}) = \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix}$ and $R_p = \varpi I$ are mapped to

$$q^{1/2}(t_1 + t_2), \quad t_1 t_2,$$

resp.

Proof: For any unramified spherical representation with Satake parameters α_1, α_2, using the representative of $\mathcal{K}\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}\mathcal{K}$ over $\mathcal{K}$ as in(16.2.3.9),

$$(T(\mathfrak{p})\varphi_{\mathcal{K}})(1) = \int_{\mathcal{K}\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}\mathcal{K}} \varphi_K(g)dg = \sum_{\gamma\in K\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}K/K} \varphi_K(\gamma)$$

$$= (\Delta^{1/2}\chi)(\begin{bmatrix}1 & \\ & \varpi\end{bmatrix}) + q(\Delta^{1/2}\chi)(\begin{bmatrix}\varpi & \\ & 1\end{bmatrix}) = q^{1/2}(\alpha_1+\alpha_2)$$

and similarly for $R(\mathfrak{p})$. □

Cor. (15.11.5.5) [Spherical Representation of $GL(n,K)$]. Every irreducible admissible spherical representation (π, V) of $GL(n,K)$ is of the form $Q(\Delta_1, \Delta_2, \ldots, \Delta_n)$ where $\Delta_i = (\chi_i, 1)$, χ_i are unramified quasi-characters.

Proof: Use the Satake isomorphic to find Satake parameters of unramified quasi-characters χ_i that makes the representation of $\mathcal{H}_K \cong \mathbb{C}[t_1, t_1^{-1}, \ldots, t_n, t_n^{-1}]^W$ isomorphic to that of π, then by(2.4.4.3), $\chi_1 \times \chi_2 \times \ldots \times \chi_n$ has a unique irreducible subquotient that has the came spherical character as π, then by(2.4.4.12), this subquotient is isomorphic to π. Now use the fact we can change the order of χ_i s.t. it is just $Q(\Delta_1, \Delta_2, \ldots, \Delta_n)$. □

Prop. (15.11.5.6) [Intertwining Operator on Spherical Vector]. For χ_1, χ_2 unramified with Satake parameter α_i, consider $M : \mathcal{B}(\chi_1, \chi_2) \to \mathcal{B}(\chi_2, \chi_1)$, then

$$M\varphi_{K,\chi} = \frac{1 - q^{-1}\alpha_1\alpha_2^{-1}}{1 - \alpha_1\alpha_2^{-1}}\varphi_{K,\chi'}.$$

Proof: Clearly this equation is true up to scalar because M is intertwining, so it suffices to calculate $(M\varphi_K)(1)$. For this, we assume χ is dominant(15.11.5.2) because we can use analytic continuation. Then

$$(M\varphi_K)(1) = \int_F \varphi_K(w_0\begin{bmatrix}1 & x\\ & 1\end{bmatrix})dx.$$

The integral is 1 on $\mathcal{O}$, and for $m > 0$, on $\mathfrak{p}^{-m}\backslash\mathfrak{p}^{-m+1}$, by(15.11.4.11), it equals $q^{-m}\alpha_1^m\alpha_2^{-m}q^m(1 - q^{-1})$, so the total sum is $1 + (1-q^{-1})\alpha_1\alpha_2^{-1}/(1-\alpha_1\alpha_2^{-1})$. □

Prop. (15.11.5.7). If χ_1, χ_2 are nonramified, $V = \mathcal{B}(\chi_1, \chi_2)$, $K_0(\mathfrak{p})$ is the Iwahori subgroup(15.11.1.8), then the composition

$$V^{K_0(\mathfrak{p})} \hookrightarrow V \to J(V)$$

is an isomorphism. In particular, it is of dimension 2.

Proof: Firstly notice $V^{K_0(\mathfrak{p})}$ has dimension≤ 2, because of the decomposition(15.11.1.11) and definition, and $J(V)$ has dimension2 by(15.11.4.19), so it suffices to show the map is surjective. The image is just $J(V)^{T(\mathcal{O})}$ by(15.11.2.5). But by(15.11.4.19) and the fact χ_i are nonramified, all of $J(V)$ are $T(\mathcal{O})$-fixed, thus $J(V)^{T(\mathcal{O})} = J(V)$. □

Cor. (15.11.5.8) [Casselman Basis]. When $\chi_1 \neq \chi_2$, we can easily find a basis of $V^{K_0(\mathfrak{p})}$, that is

$$L_1(\varphi) = \varphi(1), \quad L_0(\varphi) = (M\varphi)(1)$$

where M is intertwining integral defined in(15.11.4.12). These are $N(K)$-invariant, thus define functionals on $J(V) \cong V^{K_0(\mathfrak{p})}$. They are linearly independent checked on $T(F)$.

Then the dual basis $\varphi_0, \varphi_1 \in V^{K_0(\mathfrak{p})}$ are called the **Casselman basis**.

φ_0 has a simple form: using Iwahori-Bruhat decomposition(15.11.1.11),

$$\varphi_0(g) = \begin{cases} (\Delta^{1/2}\chi)(b) & g = bw_0k \in B(K)wK_0(\mathfrak{p}) \\ 0 & \text{otherwise} \end{cases}.$$

Proof: It is easily verified that this formula is well-defined and defines a Iwahori-fixed vector, so it suffices to valuate it by L_i. Clearly $L_1(\varphi_0) = 0$, and for $L_0(\varphi_0)$, notice that

$$w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \in B(K)w_0K_0(\mathfrak{p})$$

iff $x \in \mathcal{O}$, so $L_0(\varphi_0) = 1$. □

Lemma (15.11.5.9). When $\chi_1 \neq \chi_2$ nonramified and $m \geq 0$, the function

$$F_m(g) = \int_{\mathcal{O}} \varphi_K(g \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} a_m)dx, \quad a_m = \begin{bmatrix} \varpi^m & \\ & 1 \end{bmatrix}$$

is an Iwahori-fixed vector, and

$$F_m = q^{-m/2}\alpha_2^m M(\varphi_K)(1)\varphi_0 + q^{-m/2}\alpha_1^m \varphi_1$$

Proof:

$$\int_{K_0(\mathfrak{p})} \pi(ka_m)\varphi_K dk = \int_{N_-(\mathfrak{p})} \int_{T(\mathcal{O})} \int_{N(\mathcal{O})} \varphi_K(gn_-t_0na_m)dndt_0dn_- \text{(15.11.1.9)}$$

noticing that $a_m^{-1}t_0n_-a_m \in K$ as $m \geq 0$, so the integrand is independent of t_0, n_- and equals F_m, and it is clearly Iwahori-fixed. And

$$c_1 = L_1(F_m) = F_m(1) = \varphi_K(a_m) = (\Delta^{1/2}\chi)(a_m) = q^{-m/2}\alpha_1^m.$$

Similarly, for χ dominant,

$$c_0 = L_0(F_m) = \int_{N(K)} F_m(w_0n)dn = \int_{N(K)} \int_{N(\mathcal{O})} \varphi_K(w_0nn'a_m)dn'dn.$$

By Fubini, the n' can be omitted, thus it equals $(M\varphi_K)(a_m) = (\Delta^{1/2}\chi')(a_m)$. □

Spherical Whittaker Function and Spherical Functions

See [Casselman, W., The unramified principal series of p-adic groups I: the spherical function, Compositio Math. 40 (1980), 387-406.] and [Casselman, W. and J. Shalika, The unramified principal series of p-adic groups II: the Whittaker function, Compositio Math. 40 (1980), 207-231.] for more general calculations.

Def. (15.11.5.10) [Spherical Whittaker Function]. The **spherical Whittaker function** of a generic spherical representation is the spherical vector W^0 in the Whittaker model normalized that $W_0(1) = 1$?.

For $n = 2$, we can define another normalization $W_0(g) = \Lambda(\pi(g)\varphi_K)$, where Λ is the Whittaker functional defined in(15.11.4.14) and φ_K is the normalized spherical vector defined in(15.11.5.1).

Prop. (15.11.5.11). We may assume that the conductor of ψ is $\mathcal{O}$, because any other character is of the form $x \mapsto \psi(ax)$, thus

$$W_0(g, \psi_a) = \int_F \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)\psi(-ax)dx = |a|^{-1/2}\chi_2(a)W_0(\begin{bmatrix} a & \\ & 1 \end{bmatrix} g, \psi),$$

(and also by analytic continuity). In particular, $\mu(\mathcal{O}) = 1$(12.4.6.6).

Notice that

$$W_0(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \begin{bmatrix} z & \\ & z \end{bmatrix} gk) = \psi(x)\omega(z)W_0(g), z \in K^\times, k \in K,$$

where $\omega = \chi_1\chi_2$, so to calculate W_0, it suffices to compute $W_0(\begin{bmatrix} \varpi^m & \\ & 1 \end{bmatrix} = a_m)$.

Remark (15.11.5.12). We want to calculate the spherical Whittaker function W_0 explicitly because it is used to evaluate the local part of the global L-function(19.2.6.3).

Lemma (15.11.5.13) [Calculating W_0]. For $\mathcal{B}(\chi_1, \chi_2)$ with Satake parameters α_1, α_2, the spherical Whittaker function satisfies

$$W_0(1) = 1 - q^{-1}\alpha_1\alpha_2^{-1}, \quad W_0(a_m) = 0$$

for $m < 0$.

Proof: As in the proof of(15.11.4.11), because φ_K is K-invariant, we have

$$\int_{\mathcal{O}} \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = 1,$$

$$\int_{\mathfrak{p}^{-1}\backslash\mathcal{O}} \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = q^{-1}\alpha_1\alpha_2^{-1} \int_{\mathfrak{p}^{-1}\backslash\mathcal{O}} \psi(-x)dx = -q^{-1}\alpha_1\alpha_2^{-1},$$

$$\int_{\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}} \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = q^{-k-1}\alpha_1^{k+1}\alpha_2^{-k-1} \int_{\mathfrak{p}^{-k-1}\backslash\mathfrak{p}^{-k}} \psi(-x)dx = 0, \quad k \geq 1$$

For $W_0(a_m)$, choose $x \in \mathcal{O}$ that $\psi(\varpi^m x) \neq 1$, then

$$W_0(a_m) = W_0(a_m \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) = W_0(\begin{bmatrix} 1 & \varpi^m \\ & 1 \end{bmatrix} a_m) = \psi(\varpi^m x)W_0(a_m)$$

so $W_0(a_m) = 0$. □

Lemma (15.11.5.14) [Functional Equation]. For fixed g, $W_0(g)$ is an analytic function of α_1, α_2, and $(1 - q^{-1}\alpha_1\alpha_2^{-1})^{-1}W_0(g)$ is symmetric in α_1, α_2.

Proof: The Whittaker functional is defined by calculated by continuation(15.11.4.14), and for χ dominant, W_0 is analytic(15.11.4.14), thus by calculation in(15.11.5.13), its value at 1 is identically 1, thus so does its analytic continuation. Then to check after switching α_1, α_2 it is the same meromorphic function, it suffices to show for all irreducible principal series $\mathcal{B}(\chi_1, \chi_2)$. But in this case, $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\chi_2, \chi_1)$, so their Whittaker model thus spherical Whittaker function differ only by a scalar, thus the same. □

Prop. (15.11.5.15) [Calculating W_0].

$$(1 - q^{-1}\alpha_1\alpha_2^{-1})^{-1}W_0(a_m) = \begin{cases} q^{-m/2}\frac{\alpha_1^{m+1}-\alpha_2^{m+1}}{\alpha_1-\alpha_2} & m \geq 0 \\ 0 & m < 0 \end{cases}$$

Proof: By**??** we can assume χ is dominant and use analytic continuation.

$$W_0(a_m) = \int_F F_m(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx,$$

by(15.11.4.14)(15.11.5.9) and a change of variable. Then use(15.11.5.9), we see that

$$W_0(a_m) = C_1 q^{-m/2}\alpha_1^m + C_0 q^{-m/2}\alpha_2^m$$

where

$$C_0 = (M\varphi_K)(1)\int_F \varphi_0(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx$$

And $\int_F \varphi_0(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\psi(-x)dx = 1$, by the same consideration as in the proof of(15.11.5.8).

Finally, $(M\varphi_K)(1)$ can be calculated by(15.11.5.6), and the requirement of(15.11.5.14) will determine C_1. □

Prop. (15.11.5.16) [Spherical Function]. For a spherical irreducible admissible representation (π, V) of $GL(2, K)$, its contragradient $\widehat{V}$ is also spherical(2.4.4.11). Then we define the **spherical function**

$$\sigma(g) = (\pi(g)v, \widehat{v})$$

where $v, \widehat{v}$ are spherical and normalized that $\langle v, \widehat{v}\rangle = 1$. This is bi-invariant under K-action By(15.11.5.5).

By(15.11.5.5), (π, V) is of the form $\chi(\det(g))$ or $\pi(\chi_1, \chi_2)$ for π_i nonramified. In the former case the spherical function is just $\chi \circ \det$. Now we only consider the latter interesting case, for which there is a spherical functional $\widehat{v} : \varphi \mapsto \int_K \varphi(k)dk$, and it is 1 on the normalized spherical vector v(15.11.5.1), and

$$\sigma(g) = \int_K (\pi(g)\varphi_K)(k)dk = \int_K \varphi_K(kg)dk$$

Prop. (15.11.5.17) [Macdonald Formula]. The spherical function for unramified principal series behave well under $Z(K)$-action and is K-binvariant, so in order to compute it, it suffices to compute its value on a_m. We have:

$$\sigma(a_m) = \frac{q^{-m/2}}{1+q^{-1}}[\alpha_1^m \frac{1 - q^{-1}\alpha_2\alpha_1^{-1}}{1 - \alpha_2\alpha_1^{-1}} + \alpha_2^m \frac{1 - q^{-1}\alpha_1\alpha_2^{-1}}{1 - \alpha_1\alpha_2^{-1}}]$$

Proof: First notice that

$$\int_K F_m(k)dk = \int_K\int_{\mathcal{O}} \varphi_K(k\begin{bmatrix}1 & x\\ & 1\end{bmatrix}a_m)dxdk = \int_K \varphi_K(ka_m)dk$$

by a change of variable. Then by(15.11.5.9), this equals

$$[\int_K \varphi_0(k)dk]q^{-m/2}\alpha_2^m\frac{1-q^{-1}\alpha_1\alpha_2^{-1}}{1-\alpha_1\alpha_2^{-1}} + [\int_K \varphi_1(k)dk]q^{-m/2}\alpha_1^m.$$

Next we calculate $\int_K \varphi_0(k)dk$ directly: By(15.11.5.8), this equals the volume of $K\cap(K_0(\mathfrak{p})w_0K_0(\mathfrak{p})) = K_0(\mathfrak{p})w_0K_0(\mathfrak{p})$. $K/K_0(\mathfrak{p}) \cong GL(2,\mathbb{F}_q)/B(\mathbb{F}_q)$ has cardinality $q+1$, and by pulling back the Bruhat decomposition of $GL(2,\mathbb{F}_q)$, $K_0(\mathfrak{p})w_0K_0(\mathfrak{p})$ consists of q left cosets of $K_0(\mathfrak{p})$. So

$$\int_K \varphi_0(k)dk = \frac{q}{1+q}.$$

Finally the expression is symmetric in α_1,α_2, because the spherical vectors in $V,\widehat{V}$ are unique(2.4.4.11), and $\widehat{\mathcal{B}(\chi_1,\chi_2)} = \mathcal{B}(\chi_2,\chi_1)$. Also, the expression is a combination of α_i^m and the coefficient is independent of m, so it can be determined as above. □

6 Unitarizable, Tempered & L^2 Representations

Def. (15.11.6.1) [L^2-Representations]. An admissible irreducible representation (π,V) of G is called **essentially square-integrable** if for any $v\in V$ and $\lambda\in V^\vee$, the matrix coefficients $c_{v,\lambda}$ is L^2 on K.

It is called **square-integrable** if moreover the central character ω_π is unitary.

Remark (15.11.6.2) [Casselman]. For any smooth representation of $GL(n,K)$, there exists a unique real-valued quasi-character χ that the central character of $\pi\otimes(\chi\circ\det)$ is unitary.

Def. (15.11.6.3) [Tempered Representations]. Let G be a reductive group over F and π an admissible representation of $G(F)$, then π is called an **essentially tempered representation** if the matrix coefficients of π are all contained in $L^{2+\varepsilon}(K)$ for any $\varepsilon>0$.

It is called a **tempered representation** if moreover the central character ω_π is unitary.

Prop. (15.11.6.4) [Jacquet, Zelevinsky].

- $\pi\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is essentially square-integrable iff it is of the form $Q(\Delta)$ for a single Zelevinsky segment Δ.
- $\pi\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is square-integrable iff it is of the form $Q(\Delta)$ for a single Zelevinsky segment, and the central character of $\sigma(\frac{m-1}{2})$ is unitary, where $\Delta=\Delta(\sigma,m)$.
- $\pi\in\mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$ is tempered iff $\pi=Q(\Delta_1,\ldots,\Delta_r)$, where each $Q(\Delta_i)$ is square-integrable.

Proof: Cf.[Generic Representations, Jacquet(1977)]. □

Cor. (15.11.6.5) [Classification of Irreducible tempered representations of $GL(2)$]. Irreducible tempered representations of $GL(2,K)$ are one of the following form:

- Cuspidal representation with unitary central characters.

- Steinberg representations with unitary central characters.
- Principal representations $\mathcal{B}(\chi_1,\chi_2)$ with χ_1,χ_2 unitary.

Proof: Cf.[G-H11]P365. □

Cor. (15.11.6.6)[Tempered Representation is Generic]. Irreducible tempered representations are precisely generic ones $Q(\Delta_1)\times\ldots\times Q(\Delta_r)$ s.t. each $Q(\Delta_i)$ has a unitary central character.

Proof: It suffices to show that no two Δ_i,Δ_j are linked. But notice if $\Delta_i=(\sigma_i,m_i)$, then $\sigma(i)(\frac{m_i-1}{2})$ is the central character, so there are no chance that they are linked. □

Unitarizable Representations

Lemma (15.11.6.7) [Possibility of Unitarization of Principal Series]. If $\mathcal{B}(\chi_1,\chi_2)$ admits an invariant non-degenerate Hermitian pairing, then either χ_1,χ_2 are all characters or $\chi_1=\overline{\chi_2}^{-1}$.

Proof: There is an anti-linear $GL(2,K)$-map $\mathcal{B}(\chi_1,\chi_2)\to\mathcal{B}(\overline{\chi_1},\overline{\chi_2})$ which is conjugation, so if there is a $GL(2,K)$-invariant Hermitian pairing on $\mathcal{B}(\chi_1,\chi_2)$, $(f_1,f_2)\mapsto(f_1,\overline{f_2})$ will be a non-degenerate $GL(2,K)$-invariant bilinear pairing

$$\mathcal{B}(\chi_1,\chi_2)\times\mathcal{B}(\overline{\chi_1},\overline{\chi_2})\to\mathbb{C}.$$

So $\mathcal{B}(\chi_1,\chi_2)\cong\mathcal{B}(\overline{\chi_1}^{-1},\overline{\chi_2}^{-1})$, so χ_i are characters or $\chi_1=\overline{\chi_2}^{-1}$ by(15.11.4.10). □

Lemma (15.11.6.8). If χ_1,χ_2 are characters, then $\mathcal{B}(\chi_1,\chi_2)$ is unitarizable, by(15.1.5.52).

Lemma (15.11.6.9). Let $\chi_s=\chi_0|\cdot|^s$, where χ_0 is a character of F. If $s\neq 0,1/2$ is a real number (so that $\mathcal{B}(\chi_s,\chi_{-s})$ is irreducible), then $\mathcal{B}(\chi_s,\chi_{-s})$ is unitarizable iff $-1/2<s<1/2$.

Proof: Because $\mathcal{B}(\chi_s,\chi_{-s})=\chi_0\otimes\mathcal{B}(|\cdot|^s,|\cdot|^{-s})$, we can assume $\chi_0=1$. Let $M_s:\mathcal{B}(\chi_s,\chi_{-s})\to\mathcal{B}(\chi_{-s},\chi_s)$ be the intertwining integral(15.11.4.12), then we see the sesquilinear pairing

$$(f_1,f_2)=\int_K(M_sf_1)(k)\overline{f_2(k)}dk$$

is G-invariant and non-degenerate by the proof of(15.11.4.9). For an irreducible representation, such a pairing must be unique, so we are reduced to checking this representation is positive/negative definite.

Consider the Iwahori-fixed vector $f_0=\Delta^{s+1/2}(b)$ for $g=bk$ as defined in(15.11.5.8), then as s varies, f_0 forms a flat section. We calculate (f_0,f_0) for $s>0$ and then use continuation:

In this case,

$$(f_0,f_0)=V(K_0(\mathfrak{p}))\int_F f_0(w_0\begin{bmatrix}1&x\\&1\end{bmatrix})dx$$

and

$$\begin{bmatrix}&-1\\1&\end{bmatrix}\begin{bmatrix}1&x\\&1\end{bmatrix}\in B(K)K_0(\mathfrak{p})$$

iff $x\notin\mathcal{O}$, in which case

$$\begin{bmatrix}&-1\\1&\end{bmatrix}\begin{bmatrix}1&x\\&1\end{bmatrix}=\begin{bmatrix}x^{-1}&-1\\&x\end{bmatrix}\begin{bmatrix}1&\\x^{-1}&1\end{bmatrix}.$$

So

$$(f_0, f_0) = \frac{1}{q+1}\int_{|x|>1} |x|^{-1-2s}dx = \frac{1-q^{-1}}{1+q}\frac{q^{-2s}}{1-q^{-2s}}.$$

We then consider the spherical vector φ_K(15.11.5.1), then(15.11.5.6) shows

$$(\varphi_K, \varphi_K) = \frac{1-q^{-1-2s}}{1-q^{-2s}}.$$

which is positive if $|s| > 1/2$. So if $\mathcal{B}(\chi_s, \chi_{-s})$ is unitarizable, $|s| < 1/2$.

Now for $|s| < 1/2$, we show $\mathcal{B}(\chi_s, \chi_{-s})$ is unitary: Modify the intertwining operator $M_s^* = (1-q^{-2s})M_s$, then it is definable for $s = 0$, by calculation in(15.11.4.12), so the modified Hermitian product

$$(\cdot, \cdot)^* = (1-q^{-2s})(-, -)$$

is defined at $s = 0$, and is positive/negative definite, because in this case it is irreducible and unitarizable(15.11.6.8). The eigenvalue of this Hermitian form deforms continuously, and it is never zero because it is non-degenerate as said above(only when $s \neq 1/2$ because we need M_s to be isomorphism), so it is always definite and $\mathcal{B}(\chi_s, .\chi_{-s})$ is unitarizable. □

Prop. (15.11.6.10) [Unitarizable Principal Series]. An irreducible principal series $\mathcal{B}(\chi_1, \chi_2)$ is unitary iff either χ_1, χ_2 are all characters, or there is a unitary character χ_0 and $-1/2 < s < 1/2$ that $\chi_1 = \chi_0 |\cdot|^s, \chi_1 = \chi_0 |\cdot|^{-s}$, called **complementary series representations**.

Proof: Follows immediately from the lemmas above(15.11.6.8)(15.11.6.7)(15.11.6.9). □

15.12 Local Langlands for $\mathrm{GL}(n)$ over p-Adic Fields

Main references are [?], [Bus19] and [The Local Langlands correspondence, the Non-Archimedean Case, Kudla(1994)].

Notation (15.12.0.1).
- Let $K \in p$-`LField`.

Prop. (15.12.0.2). If G/K is a split almost simple algebraic group, then it is isogenous to one of the following groups: $\mathrm{SL}(n), \mathrm{SO}(n), \mathrm{Sp}(n), G_2, F_4, E_6, E_7, E_8$.

It is false in general that maximal compact subgroups of G are conjugate. However, there are **special maximal compact subgroups**, and an irreducible admissible representation of $G(F)$ is called **spherical** if it is fixed by the special maximal compact subgroup.

Proof: ? □

Prop. (15.12.0.3) [Langland's Formation of the Satake Isomorphism]. If G is split, then $\mathcal{H}_K$ is isomorphic to ring generated by the characters of irreducible analytic f.d. representations of ${}^L G$, and the spherical representations of $G(K)$ are parametrized by the semisimple conjugacy classes in ${}^L G^0$.

If G is non-split but splits over an unramified Galois extension Ω/K, let Φ be the Frobenius element in $G(\Omega/F)$, and consider the cosets $\widehat{G} \subset {}^L G$, then $\mathcal{H}_K$ is isomorphic to the ring of functions on the this coset that are generated by the restrictions of characters of irreducible representations of ${}^L G$, and the spherical representations of $G(F)$ are parametrized by the semisimple conjugacy classes in ${}^L G$ in this coset.

1 Local Langlands for p-adic $\mathrm{GL}(n)$

References are [M. Harris, R. Taylor: The geometry and cohomology of some simple Shimura varieties], [The Local Langlands Correspondence for GL(n) over p-adic Fields, Wedhorn], [Yao17].

Cor. (15.12.1.1) [LLC for $\mathrm{GL}(1)$].

Local class field theory told us that W_K^{ab} is isometric to $K^\times$, And notice by Schur's lemma, any smooth representation of $K^\times$ is 1-dimensional and factors through some U_K.

And a Weil-Deligne representation is now a continuous $W_K^{\mathrm{ab}} \to \mathbb{C}^*$. but it must factor through some U_K, so these two are equivalent.

Lemma (15.12.1.2) [Jacquet-Langlands]. Let E/K be a quadratic extension and χ a quasi-character of W_E, $\rho : W_F \to GL(2,\mathbb{C})$ the induced representation of W_F, then $\pi(\rho)$ in(16.4.1.10) exists.

Proof: Cf.[Bump, P556].? □

Thm. (15.12.1.3) [LLC for $\mathrm{GL}(n)$]. There exists a unique collection of bijections rec_n between sets:

$$\mathrm{rec}_n : \mathrm{Irr}^{\mathrm{adm}}(GL(n,F)) \cong \mathfrak{wd}^{\varphi-ss}_{\dim -n}(W_F).$$

satisfying the following properties:
- For a quasi-character χ of K^*, $\mathrm{rec}_1(\chi) = \chi \circ \mathrm{Art}$.
- For every pair $\pi_1, \pi_2 \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$,

$$L(\pi_1 \times \pi_2, s) = L(\mathrm{rec}_{n_1}(\pi_1) \otimes \mathrm{rec}_{n_2}(\pi_2), s), \quad \varepsilon(\pi_1 \times \pi_2, s) = \varepsilon(\mathrm{rec}_{n_1}(\pi_1) \otimes \mathrm{rec}_{n_2}(\pi_2), s).$$

- For a quasi-character χ of K^* and $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,K))$, $\mathrm{rec}_n((\chi\circ\det)\otimes\pi) = \mathrm{rec}_n(\pi)\otimes\mathrm{rec}_1(\chi)$.
- For any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$ with central character ω, $\det\circ\mathrm{rec}_n(\pi) = \mathrm{rec}_1(\omega)$.
- For any $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$, $\mathrm{rec}_n(\pi^\vee) = \mathrm{rec}_n(\pi)^*$.

Moreover, these bijections also preserves two more invariants:

- Conductor: $c(\pi) = c(\mathrm{rec}_n(\pi))$.
- Depth: $d(\pi) = d(\mathrm{rec}_n(\pi))$.

Proof: Cf.[Harris-Taylor] and [Laumon, G., M. Rapoport and U. Stuhler, $\mathcal{D}$-elliptic sheaves and the Langlands correspondence, Invent. Math. 113 (1993), 217-338.] □

Lemma (15.12.1.4) [Plan of Proof]. By Bernstein-Zelevinsky classification(15.11.4.1), it suffices to construct rec_n for irreducible cuspidal representations, then for any $\pi = Q(\Delta_1,\ldots,\Delta_r) \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$, where $\Delta_i = \Delta_i(\pi_i, m_i), \sum n_i m_i = n$, we can define

$$\mathrm{rec}_n(\pi) = \oplus_{i=1}^r \mathrm{Sp}_{m_i}(\mathrm{rec}_{n_i}(\pi_i)).$$

By work of Henniart, it suffices to prove there exist maps rec_n on irreducible cuspidal representations that satisfies these properties, because it will be automatically bijective and unique. His method is to use the numerical local Langlands correspondence.

Remark (15.12.1.5). it seems Scholze's approach bypasses Henniart numerical local Langlands correspondence.

Prop. (15.12.1.6). Under the local langlands correspondence(15.12.1.3), $\pi \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$ is

- supercuspidal iff $\mathrm{rec}_n(\pi)$ is irreducible.
- essentially square integrable iff $\mathrm{rec}_n(\pi)$ is indecomposable.
- generic iff $L(\mathrm{ad}\circ\mathrm{rec}_n(\pi), s)$ has no pole at $s = 1$.

Proof: □

Prop. (15.12.1.7) [Inertia Correspondence]. Under the local langlands correspondence(15.12.1.3), for $\pi,\pi' \in \mathrm{Irr}^{\mathrm{adm}}(GL(n,F))$,

- $\pi|_K \cong \pi'|_K$ iff $\mathrm{rec}_n(\pi)|_{I_F} \cong \mathrm{rec}_n(\pi')|_{I_K}$.
- (Paskunas)Let τ be a Weil-Deligne inertia type of I_K that extends to an n-dimensional irreducible F-semisimple representation of W_K, then there exists a unique irreducible smooth representation σ_τ of K s.t. for any irreducible infinite-dimensional representation π of $GL(n,F)$, $\pi|_K$ contains σ_τ iff $\mathrm{rec}_n(\pi)|_{I_F} \cong \sigma$.

Proof: □

Prop. (15.12.1.8) [LLC for GL(2)]. Under the classification of $\mathrm{Irr}^{\mathrm{adm}}(GL(2,F))$ given in(15.11.4.4), the corresponding Weil-Deligne representations are

1. For π supercuspidal, $\mathrm{rec}_2(\pi) = (\rho, 0)$, ρ irreducible, by(15.12.1.6).
2. For principal series $\chi_1\times\chi_2$, $\mathrm{rec}_2(\pi) = (\chi_1\otimes\chi_2, 0)$.
3. For $1(\chi)$, $\mathrm{rec}_2(\pi) = (\chi\oplus\chi(1), 0)$.
4. For $\pi = \mathrm{St}_2(\chi)$, $\mathrm{rec}_2(\chi) = \mathrm{Sp}_2(\chi) = (\chi\oplus\chi(1), N)$, where N sends χ to $\chi(1)$.

5 Description of the Langlands Correspondence

16 Automorphic Representations & Global Langlands Conjecture

16.1 Automorphic Representations over Archimedean Local Fields

Main References are [Bum98], [Bor97], [Automorphic Forms and L-Functions for the Group $GL(n,\mathbb{R})$, Goldfeld] and [A Course given by Liang Xiao]. Notice that [?] has many gaps, and these gaps can be filled by [Bor97] or [P-R94].

Notation (16.1.0.1).

- Let $K = \mathbb{R}$ or $\mathbb{C}$.
- $G = GL(n,K)^+, G_1 = SL(n,K), K = SO(n,K)$.
- Use notations defined in Arithmetic of Algebraic Groups.
- Use notations defined in Arithmetic Subgroups.
- B is the upper triangular matrices, $N(K)$ the group of unipotent upper triangular matrices in G, T the group of diagonal matrices, $Z(K)$ the group of scalar matrices.
- Define right regular action ρ of G on $C^\infty(G)$, and also the left regular action λ. We will write dX for $X \in \mathfrak{g}$ as the representation of Lie algebra of G via ρ, then it commutes with λ. So it induces a map of $U(\mathfrak{g})$ to the ring of left G-invariant differential operators on G(15.9.1.1).
- Fix a character ψ of K, define a character ψ_N on $N(K)$ by

$$\varphi_N(u) = \psi(\sum_{i=1}^{n-1} u_{i,i+1}).$$

Notation (16.1.0.2). If $n = 2$,

- G acts on $\mathcal{H}$ through linear fractional transformation(11.7.4.10) and fixes the measure $y^{-2}\mathrm{d}x\mathrm{d}y$. We will denote a,b,c,d the linear functionals on $\mathrm{Mat}(2,\mathbb{R})$ s.t. for $\gamma \in \mathrm{Mat}(2,\mathbb{R})$, $\gamma = \begin{bmatrix} a(\gamma) & b(\gamma) \\ c(\gamma) & d(\gamma) \end{bmatrix}$.
- Use the Lie algebra notations(2.5.2.11):

$$H = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \quad R = \frac{1}{2}\begin{bmatrix} 1 & i \\ i & -1 \end{bmatrix}, \quad L = \frac{1}{2}\begin{bmatrix} 1 & -i \\ -i & -1 \end{bmatrix} \quad W = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} = iH.$$

  and the Casimir element in $\mathcal{Z} = Z(U(\mathfrak{g}))$:

$$\Delta = -\frac{1}{4}(H^2 + 2RL + 2LR).$$

- Let Γ be a discrete subgroup of G that the volume of $\Gamma\backslash\mathscr{H}$ is finite, we may also assume that $-1 \in \Gamma \subset SL(2,\mathbb{R})$.
- Let χ be a character of Γ and ω be a character of the center $Z(\mathbb{R}) \subset G$(the scalar matrices). Assume that $\omega(-1) = \chi(-1)$.

1 Basics

Prop. (16.1.1.1). In the coordinate(11.7.4.3), we have the following equation:

$$\frac{\partial}{\partial R} = e^{2i\theta}(iy\frac{\partial}{\partial x} + y\frac{\partial}{\partial y} + \frac{1}{2i}\frac{\partial}{\partial\theta}), \quad \frac{\partial}{\partial L} = e^{-2i\theta}(-iy\frac{\partial}{\partial x} + y\frac{\partial}{\partial y} - \frac{1}{2\,\mathrm{i}}\frac{\partial}{\partial\theta}), \quad \frac{\partial}{\partial H} = -i\frac{\partial}{\partial\theta}$$

So in particular

$$\Delta = \frac{\partial^2}{\partial\Delta^2} = -y^2(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}) + y\frac{\partial^2}{\partial x\partial\theta}.$$

Proof: $H = -iW$, and $\exp(tW) = k_t = \begin{bmatrix}\cos t & \sin t\\ -\sin t & \cos t\end{bmatrix}$, so $dW = \partial/\partial\theta$ is clear.

For dR, first notice that

$$k_\theta\exp(tR) = \exp(e^{2ti\theta}R)k_\theta,$$

as

$$\begin{aligned} k_\theta\exp(tR)k_{-\theta} = C^{-1}\begin{bmatrix}e^{i\theta} & \\ & e^{-i\theta}\end{bmatrix}\exp(te)\begin{bmatrix}e^{-i\theta} & \\ & e^{i\theta}\end{bmatrix}C &= C^{-1}\begin{bmatrix}e^{i\theta} & \\ & e^{-i\theta}\end{bmatrix}\begin{bmatrix}1 & t\\ & 1\end{bmatrix}\begin{bmatrix}e^{-i\theta} & \\ & e^{i\theta}\end{bmatrix}C\\ &= C^{-1}\begin{bmatrix}1 & e^{2i\theta}t\\ & 1\end{bmatrix}C\\ &= \exp(e^{2i\theta}tR)\end{aligned}$$

where C is the Cayley transformation, notation as in(2.5.2.11),

Now

$$(dRf)(g) = \frac{d}{dt}f(bk_\theta\exp(tR)) = \frac{d}{dt}f(b\exp(e^{2i\theta}tR)k_\theta) = e^{2i\theta}\frac{d}{dt}f(b\exp(tR)k_\theta)$$

Then notice

$$R = 1/2H + \begin{bmatrix}0 & i\\ 0 & 0\end{bmatrix} + 1/2\begin{bmatrix}1 & 0\\ 0 & -1\end{bmatrix}, \quad \exp(tR) \sim k_{t/2} + \begin{bmatrix}1 & it\\ & 1\end{bmatrix} + \begin{bmatrix}e^{t/2} & \\ & e^{-t/2}\end{bmatrix}$$

so we get the desired result.

For dL the calculation is similar to that of dR. □

Def. (16.1.1.2) [Cusps]. A **cusp** of Γ is a point in $\mathbb{P}^1(\mathbb{R})$ whose stablizer in Γ contains a non-trivial parabolic element(11.7.4.2).

Let ∞ be a cusp, then $\{\pm 1\}\Gamma_\infty = \{\pm 1\}\langle\begin{bmatrix}1 & r\\ & 1\end{bmatrix}\rangle$ for some $r > 1$. Then if $\Gamma_\infty = \langle-\begin{bmatrix}1 & r\\ & 1\end{bmatrix}\rangle$, then it is called an **irreducible cusp**, otherwise it is called a **regular cusp**. Similarly, for any other cusp $a = \xi(\infty)$, where $\xi \in SL(2,\mathbb{R})$, we called a is regular/irregular cusp iff ∞ is regular/irregular cusp w.r.t. $\Gamma' = \xi^{-1}\Gamma\xi$.

Def. (16.1.1.3) [Form Spaces]. Let $C^\infty(\Gamma\backslash G,\chi,\omega)$ be the space of smooth functions $F:G\to\mathbb{C}$ that

$$F(\gamma g)=\chi(\gamma)F(g),\quad \gamma\in\Gamma, g\in G,$$

$$F(zg)=\omega(z)F(g),\quad z\in Z(\mathbb{R}), g\in G.$$

Let the subspace $C_c^\infty(\Gamma\backslash G,\chi,\omega)$ be those functions f that $|f|$ is compactly supported in G_1. Similarly we define $C(\Gamma\backslash G,\chi,\omega)$ and $C_c(\Gamma\backslash G,\chi,\omega)$.

Define $C(\Gamma\backslash G,\chi,k)$ or $C_c(\Gamma\backslash G,\chi,k)$ to be the subspace of $C(\Gamma\backslash G,\chi)$ or $C_c(\Gamma\backslash G,\chi)$ consisting of functions F s.t. $\rho(k_\theta)F=e^{ik\theta}F$.

When ω is the character of $Z(\mathbb{R})$ that $\omega(Z(\mathbb{R}^+))=1$, then we denote $C^\infty(\Gamma\backslash G,\chi)=C^\infty(\Gamma\backslash G,\chi,\omega)$.

Def. (16.1.1.4) [Archimedean Automorphic Forms]. Let the space of **automorphic forms** $\mathcal{A}(\Gamma\backslash G,\chi,\omega)$ be the subspace of $C^\infty(\Gamma\backslash G,\chi,\omega)$ consisting of K-finite and $\mathcal{Z}$-finite functions satisfies the **condition of moderate growth**:

$$|F(g)|<C||g||^N$$

for some $C,N>0$, where the height on G is induced from the inclusion

$$G\to M(n,\mathbb{R})\times M(n,\mathbb{R}):g\mapsto(g,g^{-1}).$$

When ω is trivial on $Z^+(\mathbb{R})$, let $\mathcal{A}(\Gamma\backslash G,\chi,k)$ be the subspace of $\mathcal{A}(\Gamma\backslash G,\chi)$ consisting of functions f that $\rho(k_\theta)(f)=e^{ik\theta}f$.

Automorphic forms are real analytic, by(16.1.1.29).

Def. (16.1.1.5) [Cuspidal Forms]. If ∞ is a cusp of Γ, then $\{\pm1\}\Gamma_\infty=\{\pm1\}\langle\begin{bmatrix}1&r\\&1\end{bmatrix}\rangle$, so a $F\in\mathcal{A}(\Gamma\backslash G,\chi,\omega)$ is called **cuspidal** at ∞ iff $\chi(\tau_r)\neq1$ or

$$\int_0^r F(\begin{bmatrix}1&x\\&1\end{bmatrix}g)dx=0.$$

for any $g\in G$. Notice this is independent of r chosen.

More generally, if a is a cusp of Γ, then choose $\xi\in SL(2,\mathbb{R})$ that $\xi(\infty)=a$, then for $F\in\mathcal{A}(\Gamma\backslash G,\chi,\omega)$, $F'(g)=F(\xi g)\in\mathcal{A}(\Gamma'\backslash G,\chi',\omega)$, where $\Gamma'=\xi^{-1}\Gamma\xi,\chi'(\gamma')=\chi(\xi\gamma'\xi^{-1})$(Because left and right actions commute). Then F is called **cuspidal** at a iff F' is cuspidal at ∞.

The subspace of cuspidal forms is denoted by $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)\subset\mathcal{A}(\Gamma\backslash G,\chi,\omega)$.

Prop. (16.1.1.6) [Hecke Operators]. Similar as in(16.2.3.6), we can define the action of $\mathcal{R}_N$ on $C^\infty(\Gamma_0(N)\backslash\mathcal{G},\chi_d)$:

$$T_\alpha(f)(g)=\sum_i\chi_d(\alpha_i)^{-1}f(\alpha_i g),\quad \text{if }\Gamma_0(N)\alpha\Gamma_0(N)=\coprod_i\Gamma_0(N)\alpha_i.$$

and preserves automorphic or cuspidal forms.

Proof: This is an action because if $\Gamma_0(N)\alpha\Gamma_0(N)=\coprod_i\Gamma_0(N)\alpha_i,\Gamma_0(N)\beta\Gamma_0(N)=\coprod_j\Gamma_0(N)\beta_j$, then $[\alpha][\beta]=\coprod_{i,j}\Gamma_0(N)\alpha_i\beta_j$.

Also $f(\gamma x)=\chi(\gamma)f(x)$ for $\gamma\in\Gamma_0(N)$ because $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is right $\Gamma_0(N)$-invariant. □

$\Gamma\backslash\mathcal{H}$

Def. (16.1.1.7) [Right Weight Action]. There are right actions of $GL(2,\mathbb{R})^+$ on $C^\infty(\mathcal{H})$ defined to by

$$(f|_k g)(z) = (\frac{c\overline{z}+d}{|cz+d|})^k f(\frac{az+b}{cz+d})$$

Proof: It is an action because**?** ☐

Def. (16.1.1.8) [Holomorphic Right Weight Action]. Besides the right weight action(16.1.1.7), there is another family of actions:

$$f[\gamma]_k(z) = \deg(\gamma)^{k/2}(cz+d)^{-k} f(\frac{az+b}{cz+d}).$$

Proof: This is an action because**?** ☐

Remark (16.1.1.9). This action is related to that of(16.1.1.7) via(16.1.2.9).

Lemma (16.1.1.10). If f is a holomorphic function on $\mathcal{H}$ and $\gamma \in SL_2(\mathbb{R})$ satisfies $\gamma^n \neq 1$ for any $n \neq 0$ and $f[\gamma]_k = f$, then $f = 0$.

Proof: Use a Cayley transformation $\mathcal{H} \to \mathbb{D}$ to map the fixed point to origin, then γ corresponds to $\mathrm{diag}(\alpha, \alpha^{-1})$, where α is not a root of unity. Then if $f(z) = \sum a_n z^n$, the formula $f[\gamma]_k = f$ says $a_n\alpha^{2n+k} = a_n$. Because $\alpha^{2n+k} \neq 1$ for any n, $a_n = 0$ for any n, thus $f = 0$. ☐

Def. (16.1.1.11) [Form Spaces]. if Γ is a discrete subgroup of G_1, let $C^\infty(\Gamma\backslash\mathcal{H}, \chi, k)$ be the space of smooth functions on $\mathcal{H}$ that

$$f|_k\gamma = \chi(\gamma)f, \quad \gamma \in \Gamma.$$

And elements in $C^\infty(\Gamma\backslash\mathcal{H}, 1, 0)$ are called **automorphic functions**.

Let the subspace $C_c^\infty(\Gamma\backslash\mathcal{H}, \chi, k)$ be those functions f that $|f|$ is compactly supported in $\Gamma\backslash\mathcal{H}$.

Def. (16.1.1.12) [Behavior at Cusps]. If ∞ is a cusp of Γ, then Γ contains some $\tau_r = \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix}$ for $r > 0$, then a continuous function $f(x+iy)$ on $\mathcal{H}$ is called

- **of at most linear exponential growth** at ∞ iff $|f(x+iy)| = O(e^{Ny})$ for $y \to \infty$
- **of moderate growth** at ∞ iff $|f(x+iy)| = O(y^N)$ for $y \to \infty$.
- **decay rapidly** at ∞ iff $|f(x+iy)| \leq y^{-N}$ for some $N > 0$.
- **cuspidal** at ∞ iff either $\chi(\tau_r) \neq 1$ or $\int_0^r f(z+u)du = 0$ for any $z \in \mathcal{H}$.

If f is meromorphic on $\mathcal{H}$ then we have a Fourier expansion

$$f(z) = \sum_{n=-\infty}^{\infty} a_n e^{2\pi inz/r} = \sum_{n=-\infty}^{\infty} a_n q^n = T(q).$$

Then f is called **meromorphic/holomorphic/vanishes** at the cusp ∞ iff $T(q)$ does at 0.

The general cusp case is reduced to the ∞ case the same way as in(16.1.1.5). Notice this is independent of possible r chosen.

Prop. (16.1.1.13) [Hecke Operators]. Similar as in(16.2.3.6), we can define the action of $\mathcal{R}_N$ on $C^\infty(\Gamma_0(N)\backslash\mathcal{H},\chi_d,k)$:

$$T_\alpha(f)=\sum_i \chi_d(\alpha_i)^{-1}f|_k\alpha_i \text{(16.1.1.7)},\quad \text{if } \Gamma_0(N)\alpha\Gamma_0(N)=\coprod_i \Gamma_0(N)\alpha_i.$$

and preserves automorphic or cuspidal automorphic forms.

Proof: This is an action because if $\Gamma_0(N)\alpha\Gamma_0(N)=\coprod_i\Gamma_0(N)\alpha_i, \Gamma_0(N)\beta\Gamma_0(N)=\coprod_j\Gamma_0(N)\beta_j$, then $[\alpha][\beta]=\coprod_{i,j}\Gamma_0(N)\alpha_i\beta_j$.

Also $T_\alpha(f)|_k\gamma=T_\alpha(f)$ for $\gamma\in\Gamma_0(N)$ because $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is right $\Gamma_0(N)$-invariant. □

L^2-Spaces

Def. (16.1.1.14) [Inner Product on Form Spaces]. Notice that if $f,g\in C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$(16.1.1.11), then $f\overline{g}$ is invariant under action of Γ, so we define the Hilbert space $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ as the square-integrable functions in the inner product(16.1.0.1):

$$(f,g)=\int_{\Gamma\backslash\mathscr{H}} f(z)\overline{g}(z)\frac{dxdy}{y^2}.$$

Def. (16.1.1.15) [L^2-Spaces]. $L^2(\Gamma\backslash G,\chi)$ is defined to be the space of functions on G that is χ-invariant and that is square integrable on $\Gamma\backslash G_1$(because it can descend) with the quotient Haar measure(11.7.4.3)(notice that the absolute value descents to $\Gamma\backslash G_1$) that satisfies conditions in(16.1.1.3).

$L^2_0(\Gamma\backslash G,\chi)$ is the subspace of $L^0(\Gamma\backslash G,\chi)$ of cuspidal elements, where cuspidality is defined the same way as in(16.1.1.5) but in the sense that holds for a.e. g.

$L^2(\Gamma\backslash G,\chi,k)$ be the subspace of $L^2(\Gamma\backslash G,\chi)$ consisting of functions F that $\rho(k_\theta)F=e^{ik\theta}F$.

Prop. (16.1.1.16). The space $C_c(\Gamma\backslash G,\chi)$ is dense in $L^2(\Gamma\backslash G,\chi)$.

Proof: Firstly we show $C_c(\Gamma\backslash G,\chi)$ is dense in $L^2(\Gamma\backslash G,\chi)$. Let $\mathcal{F}$ be a Poincaré fundamental domain for Γ in $SL_2(\mathbb{R})$(16.1.1.24), then elements in $C_c(\mathcal{F})$ can be extended to elements of $C_c(\Gamma\backslash G,\chi)$, and in this way, $L^2(\Gamma\backslash G,\chi)$ is identified with $L^2(\mathcal{F})$, so the claim follows from(10.4.8.5). □

Cor. (16.1.1.17). The right regular action of G extends to a continuous unitary representation of G on $L^2(\Gamma\backslash G,\chi)$. $L^2_0(\Gamma\backslash G,\chi)$ is invariant under this representation.

Proof: We must verify continuity, and this is clear using the proposition because we can choose a compact supported function f to approximate, then the right action is uniformly continuous. The unitaricity is clear. The invariance of $L^2_0(\Gamma\backslash G,\chi)$ is clear. □

Remark (16.1.1.18). Can this be extended to arbitrary locally compact group G?**?**, compare with(10.11.2.9).

Prop. (16.1.1.19) [Two Form Spaces Equal]. There is an isomorphism of Hilbert spaces

$$\sigma_k: C^\infty(\Gamma\backslash\mathscr{H},\chi,k)\cong C^\infty(\Gamma\backslash G,\chi,k):(\sigma_k f)(g)=(f|_k g)(i).$$

that preserves the inner products thus induces an isomorphism

$$\sigma_k: L^2(\Gamma\backslash\mathscr{H},\chi,k)\cong L^2(\Gamma\backslash G,\chi,k)$$

And we have(16.1.2.1):

$$\sigma_{k+2}R_k = dR\sigma_k, \quad \sigma_{k-2}L_k = dL\sigma_k, \quad \sigma_k\Delta_k = \Delta\sigma_k.$$

Also cuspidality and the behaviors at the cusps are compatible.

Also if $\Gamma = \Gamma_0(N)$, this isomorphic is compatible with the Hecke operator actions(16.1.1.13) and(16.1.1.6).

Proof: It can be verified that the inverse of σ_k is given by

$$f(z) = F(\begin{bmatrix} y & x \\ & 1 \end{bmatrix})$$

More precisely, if coordinates(11.7.4.3),

$$F(u,x,y,\theta) = f(x+iy)e^{ik\theta}, \quad f(z) = F(0,x,y,0).$$

Check the left action of Γ and $Z^+(\mathbb{R})$: For Γ actions(16.1.1.11) and(16.1.1.3), this is because $\sigma_k(f)(\gamma g) = f|_k(\gamma g)(i) = \sigma_k(f|_k\gamma)$. Finally check that σ_k preserves inner product, which is immediate from(16.1.1.14)(16.1.1.15) and(11.7.4.3).

The equations between R_k, L_k and R, L are easily verified from(16.1.1.1).

Th action of Hecke operators are compatible by the form $(\sigma_k f)(g) = (f|_k g)(i)$ as above.

Compatibility of behaviors at cusps: It suffices to check growth conditions, and this follows from**??**. □

Technicalities

Prop. (16.1.1.20).

$$k_\theta \begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} = \begin{bmatrix} y_1y_2D(\theta)^{-1} & \xi D(\theta)^{-1} \\ & D(\theta) \end{bmatrix} k_{\theta'}.$$

where

$$\theta' = \arctan(\frac{y_1}{y_2}\tan\theta), \quad D(\theta) = \sqrt{y_1^2\sin^2\theta + y_2^2\cos^2\theta}, \quad \xi = (y_2^2 - y_1^2)\sin\theta\cos\theta.$$

Proof: Hint: find θ' first. □

Prop. (16.1.1.21)[Gelfand]. Let $G = GL(n,\mathbb{R})^+, K = SO(n)$, denote $C_c^\infty(K\backslash G/K)$ to be the smooth functions $\varphi \in C^\infty(G)$ that $\varphi(k_1gk_2) = \varphi(g)$, then $C_c^\infty(K\backslash G/K)$ is commutative.

Proof: Consider the map $\varphi \mapsto \widehat{\varphi} : \widehat{\varphi}(g) = \varphi(g^t)$, then it is an anti-involution of $C_c^\infty(K\backslash G/K)$:

$$(\widehat{\varphi_1 * \varphi_2})(g) = \int_G \varphi_1(g^th)\varphi_2(h^{-1})dh = \int_G \widehat{\varphi_2}(h^{-t})\widehat{\varphi_1}(h^tg)dh = \int_G \widehat{\varphi_2}(h)\widehat{\varphi_1}(h^{-1}g)dh = (\widehat{\varphi_2} * \widehat{\varphi_1})(g)$$

But we find $\widehat{\varphi} = \varphi$, because we can use(11.7.6.1), $\varphi(g) = \varphi(d) = \widehat{\varphi}(d) = \widehat{\varphi}(g)$. □

Prop. (16.1.1.22). Let $G = GL(2,\mathbb{R})^+, K = SO(2)$, let σ be a character of K, then $C_c^\infty(K\backslash G/K,\sigma)$ is commutative.

Proof: The proof is the same as that of(16.1.1.21), but modified as

$$\widehat{\varphi}(g) = \varphi(\begin{bmatrix} -1 & \\ & 1 \end{bmatrix} g^t \begin{bmatrix} -1 & \\ & 1 \end{bmatrix}).$$

□

Siegel Sets

Def. (16.1.1.23) [Siegel Sets].

Prop. (16.1.1.24) [Poincaré Fundamental Domain]. Fundamental domain for $\Gamma \subset GL(2,\mathbb{R})$ acting on $\mathscr{H}$ is defined in(10.11.1.35). There is a well-shaped open subset F with a set $F \subset F' \subset \overline{F}$ that F' is a fundamental domain for Γ acting on $\mathscr{H}$.

Notice that if $\mathcal{F}$ is a fundamental domain for Γ in $\mathscr{H} \cong SL_2(\mathbb{R})/SO(2,\mathbb{R})$, then the inverse image of $\mathcal{F}$ is a fundamental domain for Γ in $SL_2(\mathbb{R})$, because a.e. $z \in \mathscr{H}$ is not fixed by any $\gamma \in \Gamma$.

Proof: Choose a $z \in \mathscr{H}$ which is not fixed by any $\gamma \in \Gamma$, then for any $\gamma \in \Gamma$, draw the circle of points that have the same distance to z and $\gamma(z)$, then the intersection of all the part containing z is a fundamental domain.? □

Prop. (16.1.1.25) [Siegel]. If a Poincare fundamental domain Ω has finite area, then $\partial\Omega$ is a union of f.m. geodesics, and $\partial\overline{\Omega} \cap X$ is finite, and $\Gamma(\partial\overline{\Omega} \cap X)$ is the set of cusps for Γ.

Proof: The volume of Ω has a relation with the angles of geodesics of Ω, so it can only have f.m. vertices with interior angle$< 0.9\pi$. And the Γ-orbits of these angles intersect $\overline{\Omega}$ at f.m. vertices, which is because they consists of Γ-conjugates with the same distance with z_0, and a compact set meets f.m. geodesics of Ω, because Γz_0 is discrete in $\mathscr{H}$. In particular, Γ has f.m. vertices in the boundary.

Now if Γ has infinitely many vertices, there is a vertex b that all its Γ-conjugates have angles$> 0.9\pi$, then consider the Γ-conjugates of Ω with a vertex b, then all their angle at $b > 0.9\pi$, but this cannot be possible geometrically.

For any cusp x of Γ, suppose the Poincare fundamental domain is defined using z, notice there is a $\gamma \in \Gamma$ that $d(\gamma x, z)$ attains minimum, then γx must by in the boundary of Γ, as $d(\gamma_0 z, \gamma x) = d(z, \gamma x)$, and no other z are closer to γx. □

Prop. (16.1.1.26) [Siegel Set and Fundamental Set]. Siegel set is a nicely shaped substitutes for a fundamental domain:

- Let $a_1, \ldots, a_n \in \mathbb{R} \cup \{\infty\}$ be a representation of the Γ-orbits of cusps of Γ(16.1.1.25), let $\xi \in SL(2,\mathbb{R})$ be chosen that $\xi_i(a_i) = \infty$. If $c > 0, d > 0$ be chosen suitably, then the set $\cup \xi_i^{-1}\mathcal{F}_{c,d}$ contains a fundamental domain of Γ.
- Suppose ∞ is a cusp of Γ, then if d is large enough, then $\mathcal{F}_d^\infty$ contains a fundamental domain for Γ.

Proof: 1: $\xi_i\Gamma\xi_i^{-1}$ contains a unipotent subgroup generated by $\begin{bmatrix} 1 & \delta_i \\ & 1 \end{bmatrix}$, so if $d \geq \delta_i$, then $\xi_i^{-1}\mathcal{F}_{c,d}$ contains a nbhd of the cusp a_i in the fundamental domain F of Γ. so $F - \cup\xi_i^{-1}\mathcal{F}_{c,d}$ is precompact in $\mathscr{H}$, by(16.1.1.25). Now if $c = 0, d = \infty$, then $F - \cup\xi_i^{-1}\mathcal{F}_{c,d} = \varnothing$, then this is true for some c, d.

For 2: because ∞ is a cusp, we may assume $F \in \mathscr{H} \cap \{x > 0\}$. If d is large, then d will contain each of the pieces $\xi_i^{-1}\mathcal{F}_{c,d} \cap F$ in item1. □

Prop. (16.1.1.27) [Compatibility of Growth Conditions]. Let $G/\mathbb{R}$ be semisimple, f be a function on $\Gamma\backslash G(\mathbb{R})$, then the following are equivalent:

- f is of moderate growth/rapidly decreasing.
- f is of moderate growth/rapidly decreasing on each cusp of Γ.
- f is of moderate growth/rapidly decreasing on each Siegel set $\mathfrak{S}_{i,c,d}$.

Proof: Cf.[Bor97]P5.11.? We only prove for $SL(2,\mathbb{R})$. □

Harish-Chandra Theorem

Thm. (16.1.1.28) [Harish-Chandra]. If G is semisimple and $f \in C^\infty(G)$ be both K-finite and $\mathcal{Z}$-finite, then

- f is real analytic.
- $U(\mathfrak{g})f$ is an admissible $(\mathfrak{g}, K)$-module.
- There exists $\alpha \in C_c^\infty(G)$ that

$$\alpha(kgk^{-1}) = \alpha(g), \forall k \in K, \quad f * \alpha = f.$$

- If $|f(g)| < C||g||^N$, then all $U(\mathfrak{g})f$ satisfies similar inequalities with the same N, i.e. f is uniformly of moderate growth.

Proof: We prove only for $G = \mathrm{SL}(2)$. See [Harish-Chandra, Discrete series for semisimple Lie groups, II. Explicit determination of the characters. Acta. Math. 116 (1966)] or [Gan's notes, P24] for the general case.?

Because W lies in the Lie algebra of K and $W = iH$, the hypothesis implies $\mathcal{R}f$ is f.d., where $\mathcal{R} = \mathbb{C}[\Delta, H]$. Let V be the smallest closed G-invariant subspace of $C^\infty(G)$ containing f and let $V_0 = U(\mathfrak{g})f$.

We first prove that

$$V_0 = \bigoplus_{-\infty}^{\infty}(V_0 \cap V(n)).$$

Notice there is a continuous projection of V onto $V(n)$:

$$E_n\varphi(g) = \frac{1}{2\pi}\int_0^{2\pi} e^{-in\theta}\varphi(gk_\theta)d\theta,$$

because f is K-finite, there is an N s.t. $f = \sum_{n=-N}^N E_n f$. Then notice any Df is also K-finite because D is combination of polynomials in R, L, H and R, L, H shift the weights, so the LHS is contained in the RHS. It's left to show now $E_n Df \in V_0$ for any n: $E_n Df$ can be extracted using Lagrange polynomial in H, so it is clearly in V_0.

Next we show $V_0 \cap V(n)$ is of f.d.: Let $f_1, \ldots, f_k$ be a basis of $\mathcal{R}f$, because each f_k is K-finite. so if we use the decomposition of $U(\mathfrak{sl}_2(\mathbb{C}))$(2.5.8.24), only the R, L shifting of the $E_n f$ will be considered, and clearly each $V_0 \cap V(n)$ is of f.d.

Now we show f is analytic: because f is $\mathcal{Z}$-finite, there is an equation $P(\Delta)f = 0$ where P is a monic function, and because Δ commutes with E_k and f is K-finite, $P(\Delta)E_k f = 0$. Now the $P(\Delta)E_k f = P(\Delta_k)E_k f$ by(16.1.1.1) and(16.1.2.1), and $P(\Delta_k)$ is an elliptic operator, so $E_k f$ is analytic by(10.13.8.5).

Now we show V is the closure of V_0: Suppose not, then by Hahn-Banach there is a non-zero continuous linear functional Λ on V that $\Lambda(V_0) = 0$. If $F \in C^\infty(G)$, let $\varphi_F(g) = \Lambda(\rho(g)F)$, and let $\varphi = \varphi_f$. Clearly $dX\varphi_F = \varphi_{dXF}$, so $D\varphi_F = \varphi_{DF}$, which implies φ is $\mathcal{Z}$-finite and smooth, and also K-finite because f does. So by what we have proved, φ is analytic. But now φ is analytic and $D\varphi(1) = \varphi_{Df}(1) = 0$ because $Df \in V_0$, so $\varphi = 0$ by Taylor expansion. So $\Lambda(\rho(g)f) = 0$ for any g, contradiction because $\rho(g)f$ is dense in V.

So actually $V(n) \subset V_0$, because $E_n V_0 = V_0 \cap V(n) \subset V(n)$ is dense, and $V_0 \cap V(n)$ is of f.d., so $V(n) \subset V_0 = V_n$(10.9.1.8) and $V_0 = \oplus V(n)$ is an admissible $(\mathfrak{g}, K)$-module.

Let J be the convolution algebra(because G is unimodular) of functions α that $\alpha(kgk^{-1})=\alpha(g)$, then it can be checked that convolution $-*\alpha$ commutes with action of K, so $f*J$ is in the same K-type space as f, thus K-finite and in a f.d. space.

Now we can approximate f by $f*J$: choose a Dirac sequence $\{\alpha_n\}\in C_c^\infty(G_1)$, we may replace $\{\alpha_n\}$ by the function $\beta_n(g)=\int_K\alpha_n(k^{-1}gk)dk$ to obtain a Dirac sequence in J. Then $f*\alpha_n\to f$ uniformly on compact sets. But $f*J$ is f.d., so there are some $f*\alpha=f$.

Finally for the growth estimate, it suffices to check for $D\in\mathfrak{g}$. Then $dX(f)=dX(f*\alpha)=f*(dX\alpha)$, from which the estimate is clear. □

Cor. (16.1.1.29) [Automorphic Forms Generate Admissible $(\mathfrak{g},K)$-Modules]. The space $\mathcal{A}(\Gamma\backslash G,\chi,\omega)$ and $\mathcal{A}_0(\Gamma\backslash G,\chi,\omega)$ are stable under the action of $U(\mathfrak{g})$, and for $f\in\mathcal{A}(\Gamma\backslash G,\chi,\omega)$, f is analytic and $U(\mathfrak{g})f$ is an admissible $(\mathfrak{g},K)$-module.

Moreover, if f satisfies condition of moderate growth(16.1.1.4) and $D\in U(\mathfrak{g})$, then Df satisfies similar conditions with the same constant N.

Proof: It suffices to prove for $\mathcal{A}(\Gamma\backslash G,\chi,\omega)$ because the cuspidality condition is clearly preserved by right action.

We want to use Harish-Chandra theorem(16.1.1.28) on $G(K)/Z(K)$. Now $|f|$ is constant on each fiber of $G(K)\to G(K)/Z(K)$. it suffices to compare the norm on $G(K)$ and $G(K)/Z(K)$.

We do this only for $GL(2,\mathbb{R})$**?**

The condition of moderate growth is compatible because the minimal $||g||$ in a $Z(\mathbb{R})$-orbit is achieved when $\deg g=1$(16.1.1.4). So all the assertion follows from that of(16.1.1.28) and its proof. □

2 Maass Forms

Maass Forms

Def. (16.1.2.1) [Maass Operator]. A **Maass differential operators** on $C^\infty(\mathcal{H})$ is defined to be

$$R_k=(z-\overline{z})\frac{\partial}{\partial z}+\frac{k}{2}=iy\frac{\partial}{\partial x}+y\frac{\partial}{\partial y}+\frac{k}{2},\quad L_k=-(z-\overline{z})\frac{\partial}{\partial\overline{z}}-\frac{k}{2}=-iy\frac{\partial}{\partial x}+y\frac{\partial}{\partial y}-\frac{k}{2}$$

and

$$\Delta_k=-y^2(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2})+iky\frac{\partial}{\partial x}=-L_{k+2}R_k-\frac{k}{2}(1+\frac{k}{2})=-R_{k-2}L_k+\frac{k}{2}(1-\frac{k}{2})$$

Δ_k is a symmetric(unbounded) operator on $L^2(\mathcal{H})$ with domain $C_c^\infty(\mathcal{H})$.

Proof: For the formula:**?**

For the symmetry: composed with the measure, the order2 part is just the ordinary Laplacian, and the order 1 part becomes $iy^{-1}\frac{\partial}{\partial x}$, then notice

$$\int_{\mathcal{H}}iy^{-1}(\frac{\partial f}{\partial x}\overline{g}+f\frac{\partial\overline{g}}{\partial x})dxdy=i\int_{\mathcal{H}}d(y^{-1}f\overline{g}dy)=0$$

as f,g are compactly supported. □

Prop. (16.1.2.2) [Maass Operator and Weight Action]. For $f\in C^\infty(\mathcal{H}),g\in G$,

$$(R_kf)|_{k+2}g=R_k(f|_kg),\quad(L_kf)|_{k-2}g=L_k(f|_kg),\quad(\Delta_kf)|_kg=\Delta_k(f|_kg)$$

Proof: For R_k, because scalar doesn't matter, we may assume $g\in SL_2(\mathbb{R})$, and let $w=\frac{az+b}{cz+d}$, then

$$\frac{\partial}{\partial z}=\frac{\partial w}{\partial z}\frac{\partial}{\partial z}=(cz+d)^{-2}\frac{\partial}{\partial w},\quad (w-\overline{w})=\frac{z-\overline{z}}{|cz+d|^2}.$$

So

$$(w-\overline{w})\frac{\partial}{\partial w}=(\frac{(cz+d)^2}{|cz+d|^2})(z-\overline{z})\frac{\partial}{\partial z}.$$

And for any smooth function $\varphi\in C^\infty(\mathscr{H})$,

$$(z-\overline{z})\frac{\partial}{\partial z}((\frac{c\overline{z}+d}{|cz+d|})^k\varphi)=(z-\overline{z})(\frac{c\overline{z}+d}{|cz+d|})^k\frac{\partial\varphi}{\partial z}+\frac{k}{2}[(\frac{c\overline{z}+d}{|cz+d|})^{k+2}-(\frac{c\overline{z}+d}{|cz+d|})^k]\varphi.$$

This is because

$$\frac{\partial}{\partial z}|cz+d|=\frac{c}{2}\frac{|cz+d|}{cz+d},\quad \frac{\partial}{\partial z}(\frac{c\overline{z}+d}{|cz+d|})^k=-\frac{k}{2}c(z-\overline{z})\frac{(c\overline{z}+d)^k}{|cz+d|^k(cz+d)}=\frac{k}{2}[(\frac{c\overline{z}+d}{|cz+d|})^{k+2}-(\frac{c\overline{z}+d}{|cz+d|})^k].$$

Thus,

$$\begin{aligned}R_k(f|_kg)&=[(z-\overline{z})\frac{\partial}{\partial z}+\frac{k}{2}](\frac{c\overline{z}+d}{|cz+d|})^kf(w)=[(z-\overline{z})(\frac{c\overline{z}+d}{|cz+d|})^k\frac{\partial}{\partial z}+\frac{k}{2}(\frac{c\overline{z}+d}{|cz+d|})^{k+2}]f(w)\\&=(\frac{c\overline{z}+d}{|cz+d|})^{k+2}[(w-\overline{w})\frac{\partial}{\partial w}+\frac{k}{2}]f(w)=((R_kf)|_{k+2}g)(z).\end{aligned}$$

The case of L_k is similar, and Δ_k follows. □

Cor. (16.1.2.3). The operator R_k,L_k,Δ_k maps functions between $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$ and arises and decreases weights respectively.

Prop. (16.1.2.4). For $f\in C^\infty(\Gamma\backslash\mathscr{H},\chi,k),g\in C^\infty(\Gamma\backslash\mathscr{H},\chi,k+2)$, if one of them decays rapidly at all cusps, then(16.1.1.14)

$$(R_kf,g)=(f,-L_{k+2}g).$$

In particular, $\Delta_k=-L_{k+2}R_k-\frac{k}{2}(1+\frac{k}{2})$ is symmetric on the subspace of $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ consisting of rapidly decaying functions(Δ is unbounded and defined only on $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$ now, but will be extended to $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ in(16.1.4.5) when $\Gamma\backslash\mathscr{H}$ is compact).

Proof: Let $\omega=y^{-1}f(z)\overline{g(z)}d\overline{z}$. It can be shown by definition and using(10.5.1.8) that $\omega(\gamma z)=\omega(z)$, so ω descends to a differential form on $\Gamma\backslash\mathscr{H}$, and because one of f,g decays rapidly at all cusps,

$$\begin{aligned}0=\int_{\Gamma\backslash\mathscr{H}}d(y^{-1}f(z)\overline{g(z)}d\overline{z})&=\int_{\Gamma\backslash\mathscr{H}}[\frac{\partial}{\partial y}(y^{-1}f\overline{g})+i\frac{\partial}{\partial x}(y^{-1}f\overline{g})]dx\wedge dy\\&=\int_{\Gamma\backslash\mathscr{H}}[(iy\frac{\partial f}{\partial x}+y\frac{\partial f}{\partial y})\overline{g}-\overline{(iy\frac{\partial g}{\partial x}-y\frac{\partial g}{\partial y})}f-f\overline{g}]\frac{dxdy}{y^2}\\&=\int_{\Gamma\backslash\mathscr{H}}[(R_kf)\overline{g}+f\overline{(L_{k+2}g)}]\frac{dxdy}{y^2}.\end{aligned}$$

so the conclusion follows. □

Cor. (16.1.2.5). If λ is an eigenvector of Δ_k on $C^\infty(\Gamma\backslash H,\chi,k)$, then either $\lambda=\frac{l}{2}(1-\frac{l}{2})$, where $1\le l\le k$ and $l\equiv k\mod 2$, or $\lambda\ge\frac{\varepsilon}{2}(1-\frac{\varepsilon}{2})$, where $\varepsilon=0$ or 1 that $k\equiv\varepsilon\mod 2$. In particular, eigenvalues of Δ_0 are≥ 0 and eigenvalues of Δ_1 are $\ge 1/4$.

Proof: This can be done by repeatedly using $\Delta_{k-2}L_k = L_k\Delta_k$ to reduce Δ_ε, or can be deduced from(16.1.4.11). □

Def. (16.1.2.6) [Maass Forms]. A twisted **Maass Form** of weight k and parameter s for Γ is an element in $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$(16.1.1.11) that is an eigenform for Δ_k of eigenvalue $\lambda = \frac{1}{4} - s^2$ and is of moderate growth at cusps of Γ(16.1.1.12). The space of Maass forms are denoted by $\mathcal{A}_{Maass}(\Gamma\backslash\mathscr{H},\chi,k)$. The space of cuspidal Maass forms are denoted by $\mathcal{A}_{CuspMaass}(\Gamma\backslash\mathscr{H},\chi,k)$.

A Maase form of weight 0 and $\chi = 1$ is sometimes just a Maass form. The space of Maass form is denoted by $\mathcal{A}_{\mathrm{Maass}}(\Gamma\backslash\mathscr{H})$.

Def. (16.1.2.7) [Weak Maass Forms]. A **weak Maass form** of weight k and parameter s for Γ is an element in $C^\infty(\Gamma\backslash\mathscr{H},\chi,k)$(16.1.1.11) that is an eigenform for Δ_k of eigenvalue $\lambda = \frac{1}{4} - s^2$ and is of at most linear exponential growth at cusps of Γ(16.1.1.12). A **harmonic Maass form** is a Maass form of eigenvalue $\lambda = \frac{1}{4} - s^2$ where s is an integer.

Prop. (16.1.2.8) [Hecke Operators on Maass Forms]. If $\Gamma = \Gamma_0(N)$, the space of Maass forms is stable under the action of the Hecke algebra on $C^\infty(\Gamma_0(N)\backslash\mathscr{H},\chi,k)$(16.1.1.13), by(16.1.2.2).

Def. (16.1.2.9) [Holomorphic Modular Forms as Maass Forms]. There is a bijection

$$M_k(\Gamma,\chi) \cong \mathcal{A}_{Maass}(\Gamma\backslash\mathscr{H},\chi,k)^{L_k=0} : f \mapsto y^{k/2}f$$

that induces a bijection

$$S_k(\Gamma,\chi) \cong \mathcal{A}_{CuspMaass}(\Gamma\backslash\mathscr{H},\chi,k)^{L_k=0}.$$

Proof: Direct calculation shows $L_k(y^{k/2}f(z)) = 2iy^{(k+2)/2}\frac{\partial}{\partial\bar{z}}f(z)$, and by(10.5.1.8),

$$\begin{aligned}(\mathrm{Im}(z)^{k/2}f(z))|_k\gamma &= (\frac{c\bar{z}+d}{|cz+d|})^k\,\mathrm{Im}(\gamma z)^{k/2}f(\gamma z) = (\frac{c\bar{z}+d}{|cz+d|})^k\cdot\frac{\mathrm{Im}(z)^{k/2}}{|cz+d|^k}f(\gamma z)\\ &= \mathrm{Im}(z)^{k/2}(cz+d)^{-k}f(z) = \mathrm{Im}(z)^{k/2}(f[\gamma]_k)(z)\end{aligned}$$

so their invariant properties are compatible. Also, if f is a holomorphic modular form, then each $y^{k/2}f[\gamma]_k$ is bounded by a polynomial of y at ∞, and conversely, if $f(q)$ is bounded by a polynomial of $\log(1/|q|)$, then**??** shows f is holomorphic at each cusp. And the cuspidal condition

$$\int_0^r \mathrm{Im}(z)^{k/2}f(z+u)du = \mathrm{Im}(z)^{k/2}\int_0^r f(z+u)du = 0$$

just means f is a cusp form. □

Prop. (16.1.2.10) [Non-holomorphic Eisenstein series is a Maass Form]. The non-holomorphic Eisenstein series $E(s,\nu+1/2)$ is a Maass form of parameter ν for $\Gamma(1)$.

Proof: $E(s,\nu+1/2)$ is automorphic and of moderate growth by(19.2.5.6) and(19.2.5.4).

To show $E(s,\nu+1/2)$ is an eigenfunction of Δ, if $\mathrm{Re}(\nu) > 1/2$, notice $\Delta(y^{\nu+1/2}) = (\frac{1}{4}-\nu^2)y^{\nu+1/2}$, and Δ is invariant under action of $SL(2,\mathbb{Z})$, thus each $\mathrm{Im}(\gamma(y^{\nu+1/2}))$ is an eigenfunction for Δ of eigenvalue $\frac{1}{4}-\nu^2$, so the same is true for $E(s,\nu+1/2)$.

For general ν, this can be seen from the Fourier coefficients of $E(s,\nu+1/2)$(19.2.5.5):**?** □

Prop. (16.1.2.11) [Maass Forms as Automorphic Forms]. If $f \in \mathcal{A}_{\text{Maass}}(\Gamma\backslash\mathscr{H},\chi,k)$, then $\sigma_k(f) \in C^\infty(\Gamma\backslash G,\chi,k)$(16.1.1.19), and is an eigenform of Δ. In particular it is K-finite, $\mathcal{Z}$-finite, of moderate growth by(16.1.1.19), and it is cuspidal iff $\sigma_k(f)$ is cuspidal, so $\sigma_k(f) \in \mathcal{A}(\Gamma\backslash G,\chi,k)$. And f is cuspidal iff $\sigma_k(f)$ is cuspidal.

In fact, there are a bijections

$$\mathcal{A}_{\text{Maass}}(\Gamma\backslash H,\chi,k,\lambda) \cong \mathcal{A}(\Gamma\backslash G,\chi,k,\lambda),\quad \mathcal{A}_{\text{Maass}}(\Gamma\backslash H,\chi,k) \cong \mathcal{A}(\Gamma\backslash G,\chi,k)^{\Delta-ss}$$

$$\mathcal{A}_{CuspMaass}(\Gamma\backslash H,\chi,k) \cong \mathcal{A}_0(\Gamma\backslash G,\chi,k),\quad \mathcal{A}_{CuspMaass}(\Gamma\backslash H,\chi) \cong \mathcal{A}_0(\Gamma\backslash G,\chi) = L^2_0(\Gamma\backslash G,\chi)^{K-\text{fin}}.$$

this is because when f is cuspidal, Δ is semisimple on the finite dimensional subspace $\mathcal{Z}f$ because of the spectral decomposition of $L^2_0(\Gamma\backslash G,\chi,k)$(16.1.4.8).

Cor. (16.1.2.12) [Modular Forms as Automorphic Forms]. Combine this and(16.1.2.9), we get a bijection

$$M_k(\Gamma,\chi) \cong \mathcal{A}(\Gamma\backslash G,\chi,k)^{L=0}$$

that induces a bijection

$$S_k(\Gamma,\chi) \cong \mathcal{A}_0(\Gamma\backslash G,\chi,k)^{L=0}.$$

Cor. (16.1.2.13) [Finitely Many Maass Forms of Given Type]. $\dim \mathcal{A}_{\text{Maass}}(\Gamma_0(N)\backslash\mathscr{H},\chi,k,\lambda) < \infty$.

Proof: This follows from(16.1.1.29). □

Conj. (16.1.2.14) [Selberg Conjecture]. Let Γ be a congruence subgroup, for any cuspidal Maass form f, the eigenvalue λ of Δ_0 satisfies $\lambda \geq 1/4$, or equivalently, the parameter s is purely imaginary. In this case, the cuspidal representation generated by f is tempered.

This conjecture is true for $\Gamma = \Gamma(1)$ but wrong for some other congruence subgroups.

Harmonic Maass Forms

References are [Harmonic Maass Forms, Mock Modular Forms, And Quantum Modular Forms, Ken Ono], [Harmonic Maass Forms and Mock Modular Forms Theory and Applications].

Def. (16.1.2.15) [Harmonic Maass Forms]. A **harmonic Maass form** is a weak Maass form(16.1.2.7) of eigenvalue $\frac{k}{2}(1-\frac{k}{2})$, where k is an integer.

Any modular form corresponds to a harmonic Maass form, by(16.1.2.9).

Def. (16.1.2.16) [Mock Modular Forms]. A **Mock modular form** is the holomorphic part of a harmonic Maass form.

3 Whittaker Models

Def. (16.1.3.1) [Whittaker Function Space]. For $\psi \in \widehat{\mathbb{R}}$, denote $W_\psi =$ the space of smooth functions f on $GL(n,\mathbb{R})^+$ that satisfies

$$f(ug) = \psi_{\text{Unip}(n)}(u)f(g),\quad u \in \text{Unip}(n)$$

A function $f \in W$ is called:

- of **moderate growth** if for any compact set $\Omega \subset G$, $|f(\begin{bmatrix} y & \\ & 1 \end{bmatrix} g)| < C|y|^k$ for some $C, k > 0$ for any $g \in \Omega$ when $|y| \to \infty$.
- **rapidly decreasing** if for any compact set $\Omega \subset G$ and $k \in \mathbb{R}$, $|f(\begin{bmatrix} y & \\ & 1 \end{bmatrix} g)| < C|y|^k$ for some C for any $g \in \Omega$ when $|y| \to \infty$.

Lemma (16.1.3.2) [Whittaker Function]. Let $\mu, \lambda \in \mathbb{C}$ and $k \in \mathbb{Z}$. Let $W(\lambda, \mu, k)$ be the space of functions $f \in W$(16.1.3.1) on G s.t. $\Delta f = \lambda f$, $If = \mu f$, $f \in (C^\infty(G))^k$ and f is of moderate growth, then $W(\lambda, \mu, k)$ is 1-dimensional, and functions in this space are actually rapidly decreasing and analytic.

Moreover, the operators R, L map $W(\lambda, \mu, k)$ into $W(\lambda, \mu, k+2)$, $W(\lambda, \mu, k-2)$ respectively.

Also, for $|y| \to 0$ and μ imaginary, $W(\lambda, \mu, k)$ is bounded by a $|y|^{-1/2}$ for some $\varepsilon > 0$.

Proof: For $f \in W(\lambda, \mu, k)$, in coordinate(11.7.4.3), we have

$$f(g) = u^\mu \psi(x) e^{ik\theta} w(y), \quad w(y) = f(\begin{bmatrix} y^{1/2} & \\ & y^{-1/2} \end{bmatrix})$$

Thus it suffices to study the behavior of $w(y)$. By the expression of Δ(16.1.1.1), if $\psi(x) = e^{iax}$, then

$$w'' + (-a^2 + \frac{k}{2y} + \frac{\lambda}{y^2})w = 0$$

And this is the Whittaker's equation, and the only moderate growth function is rapidly decreasing and analytic. This is by direct calculation in [A course of Modern Analysis, Whittaker/Watson(1927)]**?**.

For the action of R, L, they preserve W because they are right actions. And Rf, Lf have the same eigenvalue of Δ, I because Δ, I are in the center of $U(\mathfrak{g})$. They shift the weight by(16.1.1.19) and(16.1.2.2). □

Prop. (16.1.3.3) [Uniqueness of Whittaker Models for $GL(2, \mathbb{R})$]. For $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}, K))$, there exists at most one space $W(\pi, \psi) \in W$ consisting of K-finite functions $f \in W$ that is of moderate growth, and is invariant under the action of $U(\mathfrak{g})$ and K, and is infinitesimal equivalent to (π, V).

Moreover, functions in $W(\pi, \psi)$ are actually rapidly decreasing and analytic. The space $W(\pi, \psi)$ is called the **Whittaker model** of π, if it exists.

Proof: By(15.9.3.9), Δ, I acts by scalars λ, μ on V. By(15.9.3.26) or(15.9.3.34) if $V^k \neq 0$, then $\dim V^k = 1$. If $V^k \neq 0$, then the image of V^k under the isomorphism with $W(\pi, \psi)$ is in the space $W(\lambda, \mu, k)$. Thus $W(\pi, \psi)$ is the direct sum of the $W(\lambda, \mu, k)$ for all k that $V^k \neq 0$, so uniquely determined by(16.1.3.2). And the rapid decreasing and analytic properties are also consequences of(16.1.3.2). □

Prop. (16.1.3.4). If $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}, K))$ has a Whittaker model, then there exists some $\xi \in V$ that $W_\xi(1) \neq 0$.

Proof: Because K intersect each connected component of G, we can assume some W_ξ is non-zero on K^0, thus by analyticity(16.1.3.3), its derivatives at 1 are not identically 0, thus there exists some $D \in U(\mathfrak{g})$ that $DW_\xi(1) = W_{D\xi}(1) \neq 0$. □

Prop. (16.1.3.5) [Whittaker Models for $GL(n,\mathbb{C})$]. This result is true if $\mathbb{R}$ is replaced by $\mathbb{C}$.

Proof: Cf.[Automorphic Forms on GL(2), Jacquet/Langlands (1970) Thm5.3. P232]**?**. □

Prop. (16.1.3.6) [Fourier-Maass Expansion].

Proof: □

Cor. (16.1.3.7) [Rapidly Decreasing]. Cuspidal automorphic Forms are rapidly decreasing at any Siegel set.

Proof: Cf.[Gan's Notes, P26].**?** □

Prop. (16.1.3.8) [Existence of Whittaker Models]. The Whittaker model exists for the

Prop. (16.1.3.9) [Shalika's Local Multiplicity One Theorem]. Given a unitary irreducible representation V of $GL(n,F)$, a **Whittaker functional** on V^∞ is a $N(F)$-map $\lambda : V^\infty \to \psi_N$.

Then the space of Whittaker functionals on V^∞ is at most 1-dimensional.

Proof:

□

4 The Spectral Problem

The Spectral Problems for $\Gamma\backslash\mathscr{H}$ Compact

Def. (16.1.4.1). In this subsection we assume $\Gamma\backslash G_1$ is compact, or equivalently $\Gamma\backslash\mathscr{H}$ is compact, because K is compact. This condition makes $C^\infty(\Gamma\backslash\mathscr{H},\chi) = L^2(\Gamma\backslash\mathscr{H},\chi)$, and will make the decomposition having only discrete parts(16.1.4.2).

Prop. (16.1.4.2) [$L^2(\Gamma\backslash G,\chi)$ Totally Decomposable]. The space $L^2(\Gamma\backslash G,\chi)$ decomposes into a Hilbert space direct sum of subspaces that are invariant and irreducible under the right regular action ρ.

Proof: This follows from(16.6.2.3). □

Lemma (16.1.4.3). Let σ be the character on K that $\sigma(k_\theta) = e^{-ik\theta}$, $C_c^\infty(K\backslash G/K,\sigma)$ is commutative by(16.1.1.22), let ξ be a character of it. Let $H(\xi)$ be the subspace of $f \in L^2(\Gamma\backslash G,\chi,k)$ that $\pi(\varphi)f = \xi(\varphi)f$ for $\varphi \in C_c^\infty(K\backslash G/K,\sigma)$.

Then $H(\xi)$ are of f.d. and different $H(\xi), H(\eta)$ are orthogonal that $\oplus_\xi H(\xi) = L^2(\Gamma\backslash G,\chi,k)$.

Proof: Suppose $0 \in f \in H(\xi)$, then by(15.9.4.1), we can find a $\varphi \in C_c^\infty(K\backslash G/K,\sigma)$ s.t. $\rho(\varphi)f \neq 0$. And by hypothesis $\rho(\varphi)f = \xi(\varphi)f$, thus $\xi(\varphi) \neq 0$, and f is an eigenvalue of $\rho(\varphi)$ which is compact and self-adjoint, so the $\xi(\varphi)$-eigenspace of $\rho(\varphi)$ is f.d. and $H(\varphi)$ is contained in this space, thus f.d.

To show the orthogonality, choose $\varphi \in C_c^\infty(K\backslash G/K,\sigma)$ that $\xi(\varphi) \neq \eta(\varphi)$. Considering $\varphi = \varphi_1 + i\varphi_2$, where $\rho(\varphi_1), \rho(\varphi_2)$ are both self-adjoint, then we mays assume φ is self-adjoint. Then $H(\xi), H(\eta)$ are contained in different eigenspaces of $\rho(\varphi)$, so they are orthogonal.

Finally for the direct sum, it suffices to show that if f is orthogonal to all $H(\xi)$, then $f = 0$. Given f, let $\varphi_0 \in C_c^\infty(K\backslash G/K,\sigma)$ be chosen that $\rho(\varphi_0)f$ is near f that $\rho(\varphi_0)f, f$ are not orthogonal(15.9.4.1).

Consider the eigenspace decomposition of $\rho(\varphi_0)$ on $L^2(\Gamma\backslash G,\chi,k)$, then $f = f_0 + f_1 + f_2 + \ldots$, then $\rho(\varphi_0)f = \lambda_1 f + \lambda_2 f + \ldots$. Because f is not orthogonal to $\rho(\varphi_0)f$, thus f_i is not orthogonal to f for some $i \geq 1$. Let V be the λ_i-eigenvalue of $\rho(\varphi_0)$, then V is f.d. and invariant under $\rho(\varphi)$ for all $\varphi \in C_c^\infty(K\backslash G/K,\sigma)$ because $C_c^\infty(K\backslash G/K,\sigma)$ is commutative(16.1.1.22). So V is a direct sum of elements of the spaces $H(\xi)$, so V is orthogonal to f, contradiction. □

Prop. (16.1.4.4). The space $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ decomposes into a Hilbert space direct sum of eigenspaces for Δ_k.

Proof: By(16.1.1.19), it suffices to prove for $L^2(\Gamma\backslash G,\chi,k)$ and Δ. Because Δ are in the center of $U(\mathfrak{g})$, $H(\xi)$ are all Δ-invariant. So we finish by the lemma(16.1.4.3), as each $H(\xi)$ is f.d. so Δ is a self-adjoint operator on $H(\xi)$, because $C_c^\infty(\Gamma\backslash G,\chi)$ is dense(16.1.1.16). So it is a direct sum of Δ-eigenspaces. □

Prop. (16.1.4.5).

- The eigenvalues λ_i of Δ_k on $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ tends to ∞, and satisfies $\sum\lambda_i^{-2}<\infty$.
- The laplacian Δ_k has an extension to a self-adjoint operator on the Hilbert space $L^2(\Gamma\backslash\mathscr{H},\chi,k)$.

Proof: Cf.[Bump P185].**?** □

The Spectral Problems for General Case

Prop. (16.1.4.6) [Gelfand, Graev and Piatetski-Shapiro]. Let $\varphi\in C_c^\infty(G)$, then

- There exists a constant $C(\varphi)$ that for all $f\in L_0^2(\Gamma\backslash G,\chi,\omega)$, we have $||\rho(\varphi)f||_{C(G)}\le C(\varphi)||f||_2$.
- $\rho(\varphi)$ is a compact operator on $L_0^2(\Gamma\backslash G,\chi,\omega)$.

Notice this generalizes(16.6.2.1).

Proof: We may assume Γ has cusps, otherwise this is proved in(16.6.2.1). Conjugating Γ by an element of $SL(2,\mathbb{R})$, we may assume that ∞ is a cusp for Γ, and Γ_∞ is generated by $\begin{bmatrix}1&1\\&1\end{bmatrix}$. Then it suffices to prove that

$$\sup_{g\in\mathscr{G}_{c,d}}|\rho(\varphi)f(g)|\le C_0||f||_2,$$

because we can do the same for other cusps of Γ, and use(16.1.1.26) to show that $\sup_{g\in F}|\rho(\varphi)f(g)|\le C_0||f||_2$, hence for all $g\in\mathscr{H}$.

Now let $\varphi_\omega(g)=\int_{R^*}\varphi(zg)\omega(z)dz$, then

$$\begin{aligned}\rho(\varphi)f(g)&=\int_{Z(R)\backslash G}f(gh)\varphi_\omega(h)dh\\&=\int_{Z(\mathbb{R})\backslash G}f(h)\varphi_\omega(g^{-1}h)dh\\&=\int_{\Gamma_\infty Z(\mathbb{R})\backslash G}\sum_{\gamma\in\Gamma_\infty}f(\gamma h)\varphi_\omega(g^{-1}\gamma h)dh\\&=\int_{\Gamma_\infty Z(\mathbb{R})\backslash G}K(g,h)f(h)dh,\end{aligned}$$

where $K(g,h)=\sum_{\gamma\in\Gamma_\infty}\chi(\gamma)\varphi_\omega(g^{-1}\gamma h)$. Then we can estimate the kernel $K(g,h)$ and show it decays rapidly for h when g is fixed, and this will give the disired result, Cf.[Bump, P286]**?**.

2: Let $X(\Gamma)$ be the space obtained by compactifying $\Gamma\backslash G_1$ by adjoining cusps, and let Σ be the image of the unit ball in $L_0^2(\Gamma\backslash G,\chi,\omega)$ under $\rho(\varphi)$, then we can extend each $|\rho(\varphi)f|$ to $X(\Gamma)$ that it vanish at the cusps, by the corollary to item1 below(16.1.4.7), then Σ is bounded in the L^∞-norm by item1, and it is also equicontinuous, because its derivatives can be bounded uniformly for f:

$$(X\rho(\varphi)f)(g)=\rho(\varphi_X)f(g),\quad\varphi_X(g)=\frac{d}{dt}\varphi(\exp(-tX)g)$$

so the conclusion of item1 applied to φ_Xs shows the uniformly boundedness. Now Arzela-Ascoli shows that Σ is precompact in $C(X(\Gamma))$, thus also in $L^2(X(\Gamma))$. □

Cor. (16.1.4.7). If $\varphi \in C_c^\infty(G)$, $f \in L_0^2(\Gamma\backslash G, \chi, \omega)$, then $\rho(\varphi)f$ is smooth and rapidly decreasing at cusps.

Proof: This is contained in the proof of(16.1.4.6) above, Cf.[Bump, P286]**?**. □

Prop. (16.1.4.8)[$L_0^2(\Gamma\backslash G, \chi, \omega)$ Totally Decomposable]. The space $L_0^2(\Gamma\backslash G, \chi, \omega)$ decomposes into a Hilbert space direct sum of irreducible subrepresentations of G, and if H is such a subrepresentation, then the $H^{K-\text{fin}} \subset H$ is dense, and $H^{K-\text{fin}} \in \mathrm{Irr}^{\text{adm}}((\mathfrak{g}, K))$ is contained in $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega)$.

Moreover, $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega)$ is just the smooth part of $L_0^2(\Gamma\backslash G, \chi, \omega)$.

Proof: The proof is exactly the same as that of(16.1.4.2), but where we use(16.1.4.6) in place of(16.6.2.1). Lemma(15.9.4.1) is indispensable.

$H^{K-\text{fin}} \in \mathrm{Irr}^{\text{adm}}((\mathfrak{g}, K))$ by(15.9.4.4). To show it is contained in $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega)$, it suffices show that $H^k \subset \mathcal{A}_0(\Gamma\backslash G, \chi, \omega)$ for any k. For this, if $0 \neq f \in H_k$, choose by(15.9.4.1) a function $\varphi \in C_c^\infty(G)$ that $\rho(\varphi)f \neq 0$, thus we can assume $\rho(\varphi)(f) = f$ by(15.9.4.1) and(16.6.2.1), as $\dim H^k < \infty$ by(15.9.4.3). Then by(16.1.4.7) f is smooth and decay rapidly, and it is clearly K-finite and $\mathcal{Z}$-finite, thus $f \in \mathcal{A}_0(\Gamma\backslash G, \chi, \omega)$.

The last assertion follows as any cuspidal form decays rapidly thus is contained in $L_0^2(\Gamma\backslash G, \chi, \omega)$(16.1.3.7). □

Cor. (16.1.4.9) [Finite Multiplicity].

- $L_0^2(\Gamma\backslash G, \chi, \omega) = \bigoplus_\pi \pi^{m(\pi)}$, where for each π, $m(\pi)$ is finite.
- Let $\mathcal{A}(\Gamma\backslash G, \chi, \omega, \lambda)$ be the λ-eigenspace of Δ on $\mathcal{A}(\Gamma, \chi, \omega)$, and $\mathcal{A}(\Gamma\backslash G, \chi, \omega, \lambda, k)$ be the k-part in K-decomposition of $\mathcal{A}(\Gamma\backslash G, \chi, \omega, \lambda)$, and $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega, \lambda, k)$ the cuspidal part, then $\mathcal{A}_0(\Gamma\backslash G, \chi, \omega, \lambda, k)$ is of f.d.

Proof: 1: Let (π, V) be an irreducible unitary representation of G, let k be chosen that $V^k \neq 0$, let $0 \neq \xi \in V^k$, then by(15.9.4.1) there is a $\varphi \in C_c^\infty(G)$ that $\pi(\varphi)\xi = \xi$ and $\pi(\varphi)$ is self-adjoint by(15.9.4.1) and(16.6.2.1), as $\dim H^k < \infty$ by(15.9.4.3). Now consider for any continuous linear map $T: V \to L_0^2(\Gamma\backslash G, \chi, \omega)$, $T\xi$ lies in the 1-eigenspace of the compact self-adjoint operator $\rho(\varphi)$, which is of f.d. as $\rho(\varphi)$ is compact by(16.1.4.6). Of course, T is determined by $T\xi$ because V is irreducible, so these T form a f.d. vector space, so the multiplicity is finite.

2: This follows from the first, because by(16.1.4.8) the K-finite parts of an irreducible subrepresentation of $L_0^2(\Gamma\backslash G, \chi, \omega)$ are just the space of cuspidal forms contained in it, and λ, k determined the action of Δ, I, so there are at most onw representation of G that satisfies these, by classification in(15.9.3.34) and(15.9.3.10), and they appear for finite multiplicity by item1, and for each of them, the k-part is of f.d., because they are admissible(15.9.4.4). So the conclusion follows. □

Remark (16.1.4.10) [Fundamental Theorem of Harish-Chandra]. In fact, Harish-Chandra showed that for any finite codimensional ideal $J \subset \mathcal{Z}$, The subspace $\mathcal{A}(\Gamma, \chi, \omega, J)$ of automorphic forms annihilated by J is an admissible $(\mathfrak{g}, K)$-module.

In particular, any irreducible admissible $(\mathfrak{g}, K)$-module π appears in $\mathcal{A}(\Gamma, \chi, \omega)$ with finite multiplicity.**?**

Thm. (16.1.4.11) [Main Theorem]. Let $\chi(-1) = (-1)^\varepsilon$, $\varepsilon = 0, 1$, (16.1.4.2) shows the representation $\mathcal{H} = L_0^2(\Gamma\backslash G, \chi)$ decomposes into Hilbert space direct sums of irreducible representations, and Δ

acts as real scalars λ on each irreducible subspace(15.9.3.33), and μ acts by 0. So comparing the classification of representations of $GL(2,\mathbb{R})$(15.9.4.25), we can list what representation can appear in it by looking at eigenvalues λ of Δ:

- There is only one f.d. irreducible unitary subrepresentation of G occurring in $\mathscr{H}$, the trivial representation.
- If $\lambda \neq \frac{k}{2}(1-\frac{k}{2})$ for any $k \geq 1 \in \mathbb{Z}$ and $k \equiv \varepsilon \mod 2$, then $\lambda \geq \frac{\varepsilon}{2}(1-\frac{\varepsilon}{2})$, and this subrepresentation is isomorphic to $P(\lambda,\varepsilon)$. And let $k' \equiv \varepsilon \mod 2$ be any integer, then the multiplicity of $P(\lambda,\varepsilon)$ is equal to the multiplicity of the eigenvalue λ of $\Delta_{k'}$ on $L^2(\Gamma\backslash\mathscr{H},\chi,k')$ because $L^2(\Gamma\backslash\mathscr{H},\chi,k') \cong L^2(\Gamma\backslash G,\chi,k')$ by(16.1.1.19).
- If $\lambda = \frac{k}{2}(1-\frac{k}{2})$ for some $k \geq 1 \in \mathbb{Z}$ and $k \equiv \varepsilon \mod 2$, then this subrepresentation is isomorphic to either $D^+(k)$ or $D^-(k)$, and $D^{\pm}(k)$ have the same multiplicity in $\mathscr{H}$, equal to the dimension $\dim(M_k(\Gamma,\chi))$(16.2.1.10) of holomorphic modular forms of weight k for Γ.
  Also if $k' \equiv \varepsilon \mod 2$ is any integer$\geq k$(resp. $\leq -k$), then the multiplicity of $D^+(k)$(resp. $D^-(k)$) is equal to the multiplicity of the eigenvalue λ of $\Delta_{k'}$ on $L^2(\Gamma\backslash\mathscr{H},\chi,k')$ because $L^2(\Gamma\backslash\mathscr{H},\chi,k') \cong L^2(\Gamma\backslash G,\chi,k')$ by(16.1.1.19).

Proof: These follow from classification of irreducible representations of $GL(2,\mathbb{R})$(15.9.4.26).

Relation with modular forms: by(15.9.3.28), the multiplicity of $D^+(k)$ equals the dimension of the $\frac{k}{2}(1-\frac{k}{2})$-eigenspace of Δ_k on $L^2(\Gamma\backslash\mathscr{H},\chi,k)$, and any f in this eigenspace is annihilated by L_k by(16.1.2.1)(16.1.2.3). But(16.1.2.9) shows the dimension of space of functions annihilated by L_k equals the dimension of modular forms of weight k. Finally notice that complex conjugation interchanges $L^2(\Gamma\backslash\mathscr{H},\chi,k)$ and $L^2(\Gamma\backslash\mathscr{H},\chi,-k)$ and $\overline{\Delta_k} = \Delta_{-k}$(16.1.2.1), so the multiplicity of $D^+(k)$ and $D^-(k)$ equal. □

Eisenstein Series

Prop. (16.1.4.12). Let $\mathcal{A}^2(\Gamma\backslash G,\chi,\omega) = \mathcal{A}(\Gamma\backslash G,\chi,\omega) \cap L^2(\Gamma\backslash G,\chi,\omega)$, then this is exactly the space of smooth K-finite $\mathcal{Z}$-finite vectors in the discrete spectrum $L^2_{disc}(\Gamma\backslash G,\chi,\omega)$.

Proof:

□

16.2 Modular Forms

Main References are [D-S16], [1-2-3 of Modular Forms] and [Mil17c]. This section is a continuation of the discussion of Automorphic Forms in16.1 and use the same notations.

1 Modular Forms

Def. (16.2.1.1) [Congruence Subgroups]. Let $\Gamma(N)$ be the inverse image of $1 \in SL(2,\mathbb{Z}/N)$ in the mapping $SL(2,\mathbb{Z}) \to SL(2,\mathbb{Z}/N)$, then a subgroup Γ of $SL(2,\mathbb{Z})$ is called a **congruence subgroup** iff it contains $\Gamma(N)$ for some N.

In particular, a congruence subgroup has finite index in $\Gamma(1)$.

Lemma (16.2.1.2) [Cartan Decomposition]. There is a complete set of coset representatives for $SL(2,\mathbb{Z})\backslash GL(2,\mathbb{Q})^+/SL(2,\mathbb{Z})$ consisting of the diagonal matrices $\mathrm{diag}(d_1,d_2)$, where $d_1,d_2 \in \mathbb{Q}^\times$ and d_1/d_2 is a positive integer.

More generally, for $N > 0$,

$$GL(2,\mathbb{Q})^+ = \coprod_{d_1,d_2\in\mathbb{Q}^\times, d_1/d_2\in\mathbb{Z}_+} SL(2,\mathbb{Z}) \begin{bmatrix} d_1 & \\ & d_2 \end{bmatrix} \Gamma_0(N).$$

Also, let Σ be the set of primes dividing N, $\mathbb{Z}_\Sigma$ be the localization of $\mathbb{Z}$ at these primes, and $G_0(N)$ be the subgroup of $GL(2,\mathbb{Z}_\Sigma)^+$ consisting of matrices $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ s.t. $c \in N\mathbb{Z}_\Sigma$. Then

$$G_0(N) = \coprod_{d_1,d_2\in\mathbb{Z}_\Sigma, d_1/d_2\in\mathbb{Z}_+} \Gamma_0(N) \begin{bmatrix} d_1 & \\ & d_2 \end{bmatrix} \Gamma_0(N).$$

Proof: The first assertion follows from(11.7.6.7), noticing the sign.

For the second assertion, for any $g \in G_0(N)$, let $g = \gamma_1 \,\mathrm{diag}(d_1,d_2)\gamma_2$ where $D = d_1/d_2 \in \mathbb{Z}$ and $(D,N) = 1$. Then for any $\begin{bmatrix} a & b \\ Dc & d \end{bmatrix} \in \Gamma_0(N)$, we can change (γ_1,γ_2) to $(\gamma_1 \begin{bmatrix} a & Db \\ c & d \end{bmatrix}, \begin{bmatrix} a & b \\ Dc & d \end{bmatrix}\gamma_2)$, in this way if $\gamma_2 = \begin{bmatrix} x & y \\ z & w \end{bmatrix}$, we can change z to $Dxc + dz$. Now take k s.t. $(kx + z, N) = 1$, and let c be chosen s.t. $N|D(kz + x)c + z$, and $d = kDc + 1$, then $(Dc, d) = 1$, and we can find a, b s.t. $ad - Dbc = 1$. Then for this (a, b, c, d), $\begin{bmatrix} a & b \\ Dc & d \end{bmatrix}\gamma_2 \in \Gamma_0(N)$.

Finally, if $g \in G_0(N)$ and $\gamma_2 \in \Gamma_0(N)$, then automatically $\gamma_1 \in \Gamma_0(N)$. □

Prop. (16.2.1.3) [Conjugate of Congruence Subgroup]. If Γ is a congruence subgroup of level N and $\alpha \in GL(2,\mathbb{Q})^+$, then $\alpha^{-1}\Gamma\alpha$ is a congruence subgroup.

In particular, $\alpha\Gamma\alpha^{-1} \cap \Gamma$ is also a congruence subgroup, and if $\alpha \in SL(2,\mathbb{Z})$ with $\delta(\alpha) = D$, then $\alpha^{-1}\Gamma\alpha$ is a congruence subgroup of level DN.

Proof: Let M_1, M_2 be positive integers s.t. $M_1\alpha, M_2\alpha^{-1} \in M(2,\mathbb{Z})$.(In the second case we can take $M_1 = 1, M_2 = D$). If A is a matrix that $A \equiv 1 \mod M_1M_2N$, then $\alpha^{-1}(A-1)\alpha \equiv 1 \mod N$. Thus $\alpha^{-1}\Gamma\alpha$ contains $\Gamma(M_1M_2N)$. □

Cor. (16.2.1.4) [Congruence Topology]. We can define a topology on the group $GL(2,\mathbb{Q})^+$ given by a basis at the origin given by the open subgroup $\Gamma(N)$. Then(16.2.1.3) can be used to show that this is truly a topology. In fact, it is restriction on $SL(2,\mathbb{Z})$ is the same as the topology given by the inclusion $SL(2,\mathbb{Z})\subset SL(2,\widehat{\mathbb{Z}})$.

But unfortunately, $SL(2,\mathbb{Z})$ is not compact in this topology, because otherwise $SL(2,\mathbb{Z})$ is closed in $SL(2,\widehat{\mathbb{Z}})$, contradiction.

Lemma (16.2.1.5). The action of $\Gamma(1)=SL(2,\mathbb{Z})$ on $\mathcal{H}$ is properly discontinuous(3.11.1.13).

Proof: Cf.[Bump P18]. □

Prop. (16.2.1.6). The subset $F=\{z\in\mathcal{H}||\operatorname{Re}(z)|<1/2,|z|>1\}$ is a fundamental domain for $\Gamma(1)=SL_2(\mathbb{Z})$, and moreover, let $S=\begin{bmatrix}0&-1\\1&0\end{bmatrix}$ and $T=\begin{bmatrix}1&1\\0&1\end{bmatrix}$, then $S^2=-1,(ST)^3=(TS)^3=-1$, and

(1) two elements z,z' of $\overline{F}$ are equivalent under $\Gamma(1)$ iff
  (a) $\operatorname{Re}(z)=-1/2$ and $z'=z+1$, then $z'=T(z)$.
  (b) $|z|=1$ and $z'=-\frac{1}{z}$, then $z'=S(z)$.
(2) Let $z\in\overline{F}$, if the stabilizer of z is not ± 1, then
  (a) $z=i$ and $\operatorname{Stab}(i)=\langle S\rangle$.
  (b) $z=\rho=e^{2\pi i/6}$ and $\operatorname{Stab}(\rho)=\langle TS\rangle$.
  (c) $z=\omega$, and $\operatorname{Stab}(\omega)=\langle ST\rangle$.

Proof: 1: Let Γ' be the subgroup of $\Gamma(1)$ generated by S and T. By(10.5.1.8),

$$\operatorname{Im}(\gamma(z))=\frac{\operatorname{Im}(z)}{|cz+d|^2}.$$

and there is a $\gamma\in\Gamma'$ that $|cz+d|$ attains the minimal value, then $\operatorname{Im}(\gamma(z))$ attains a maximal value. Now there is a n that $z'=\operatorname{Re}(T^n\gamma(z))\in[-1/2,1/2]$. Now I claim that $|z'|\geq 1$, because otherwise

$$\operatorname{Im}(Sz')=\operatorname{Im}(-1/z')=\frac{\operatorname{Im}(z')}{|z'|^2}>\operatorname{Im}(z'),$$

contradiction.

2: Suppose $z,z'\in\overline{F}$ are Γ-conjugate, we can assume $\operatorname{Im}(z)\leq\operatorname{Im}(z')$. Suppose $z'=\gamma(z)$ and $z=x+iy$, then

$$(cx+d)^2+(cy)^2\leq 1.$$

Then $|c|<2$. If $c=0$, then $d=\pm1$, and γ is a translation, thus we are in case $1.(a)$. If $c=1$, then $d=0$, unless $z=\rho$ or ω. If $d=0$, then $\gamma=\begin{bmatrix}a&1\\-1&\end{bmatrix}$, thus $\gamma(z)=a-\frac{1}{z}$. If $a=0$, then we are in case $1.(b)$, and if $a\neq 0$, then $z=\rho$ or ω. and the $c=-1$ case is similar. □

Def. (16.2.1.7) [Elliptic Points]. A point $z\in\mathcal{H}$ is called a **elliptic point** if it is the fixed point of an elliptic element γ of Γ(11.7.4.2).

Prop. (16.2.1.8). Let Γ be a discrete subgroup of $SL(2,\mathbb{R})$ and z an elliptic point of Γ, then the stabilizer Γ_z of z in Γ is a finite cyclic subgroup .

Proof: Because $SL(2,\mathbb{R})$ acts transitively on $\mathcal{H}$, by conjugacy we can assume the elliptic point is i for another Γ'. Then the stablizer of i in $SL(2,\mathbb{R})$ is $SO(2,\mathbb{R})\cong S^1$, and $SO(2,\mathbb{R})\cap\Gamma'$ is a compact and discrete subgroup, so it is finite cyclic. □

Prop. (16.2.1.9) [Cusps and Elliptic Points for $\Gamma(1)$].

- The cusps of $\Gamma(1)$ are exactly $\mathbb{P}^1(\mathbb{Q})$, and each of them is $\Gamma(1)$-equivalent to ∞.
- The elliptic points of $\Gamma(1)$ are exactly those that are $\Gamma(1)$-conjugate to i or $\rho=(1+\sqrt{3})/2$, with corresponding stablizer group cyclic of order 4 and 6.

Proof: 1: Clearly ∞ is fixed by the parabolic matrix $T=\begin{bmatrix}1&1\\&1\end{bmatrix}$. Now for any m/n that m,n is coprime, there exists integers r,s that $rm-sn=1$. Let $\gamma=\begin{bmatrix}m&s\\n&r\end{bmatrix}$, then $\gamma(\infty)=m/n$ thus m/n is also a cusp. Conversely, every parabolic matrix is conjugate to T, thus its fixed point is conjugate to ∞, which means the fixed point is in $\mathbb{Q}\cup\{\infty\}$.

2: For the elliptic points of $\Gamma(1)$, use(16.2.1.6). □

Def. (16.2.1.10) [Meromorphic Modular Forms]. Let Γ be a discrete subgroup of $SL(2,\mathbb{R})$, $k>0$ and χ is a character of Γ that $\chi(-1)=(-1)^k$, the space of (twisted)**meromorphic modular forms** $M_k^!(\Gamma,\chi)$ is the space of all holomorphic functions $\mathcal{H}\to\mathbb{C}$ that satisfies

- f is meromorphic.
- $f[\gamma]_k=\chi(\gamma)f$(16.1.1.8).
- f is meromorphic at the cusps(16.1.1.12), equivalently, $f[\gamma]_k$ are all meromorphic at ∞ for $\gamma\in GL(2,\mathbb{Q})^+$.

And it is called a **holomorphic modular form** iff it is holomorphic and holomorphic at cusps(16.1.1.12).

A meromorphic modular form of weight 0 is called a **modular function**.

Denote $M_k^!(\Gamma,1)=M_k^!(\Gamma)$, $M_k(\Gamma,1)=M_k(\Gamma)$, and moreover we denote by $S_k(\Gamma,\chi)$ the set of **holomorphic cusp forms** consisting of all $f\in M_k(\Gamma,\chi)$ that vanishes at the cusps(16.1.1.12), and denote $S_k(\Gamma,1)=S_k(\Gamma)$.

Denote by $M^!(\Gamma)=\oplus_{k\geq 0}M_k^!(\Gamma)$ the graded ring of meromorphic modular forms, $M(\Gamma)=\oplus_{k\geq 0}M_k(\Gamma)$ the graded algebra of holomorphic modular forms for Γ, $\otimes_{k\geq 0}S_k(\Gamma)$ is a graded ideal of $M(\Gamma)$.

Def. (16.2.1.11) [Hauptmodul]. Let Γ be a discrete subgroup of $SL(2,\mathbb{R})$ with exactly one cusps, $k>0$, a **Hauptmodul** for Γ is an element in $M^!(\Gamma)$ s.t. it is holomorphic on $\mathcal{H}$ and has a simple pole at the cusp with residue 1, i.e. its Fourier series at the cusp is of the form

$$f(\tau)=q^{-1}+a_0+a_1q+\ldots.$$

Prop. (16.2.1.12) [Petersson Inner Product]. Let $f\in M_k(\Gamma,\chi)$ and $g\in S_k(\Gamma,\chi)$, then we see $f\overline{g}y^k$ is invariant under the action of Γ, thus we can define

$$(f,g)=(f,g)_{\Gamma,k}=\frac{1}{[SL(2,\mathbb{Z}):\{\pm\}\Gamma]}\int_{\Gamma\backslash\mathcal{H}}f\overline{g}y^k\frac{dxdy}{y^2},$$

which is finite, and restricts to an inner product on $S_k(\Gamma,\chi)$. Moreover, this inner form is invariant of the Γ chosen.

Proof: To show it is finite, notice that $\Gamma\backslash\mathcal{H}$ is a finite translations of the fundamental domain of $\Gamma(1)$, and for $\alpha\in SL(2,\mathbb{Z})$,

$$\int_{\alpha(D)} f\overline{g}y^k\frac{dxdy}{y^2}=\int_D f\circ\alpha\overline{g\circ\alpha}y(\alpha(z))^k\frac{dxdy}{y^2}=\int_D f[\alpha]_k\overline{g[\alpha]_k}y^k\frac{dxdy}{y^2},$$

and $f[\alpha]_k, g[\alpha]_k$ are modular forms for $\Gamma'=\alpha^{-1}\Gamma\alpha, \chi'(\gamma')=\chi(\alpha\gamma\alpha^{-1})$, thus it suffices to prove the integral is finite on the fundamental domain F for $\Gamma(1)$(16.2.1.6). For this, notice g is of exponential decay for y, thus the integral is bounded by $\int_{y_1}^\infty e^{-cy}y^{k-2}dy<\infty$. □

Prop. (16.2.1.13). If $\alpha\in GL(2,\mathbb{R})^+$, $f\in M_k(\Gamma)$ and $g\in S_k(\alpha^{-1}\Gamma\alpha)$, then

$$(f[\alpha]_k,g)_{\alpha^{-1}\Gamma\alpha}=(f,g[\alpha^{-1}]_k)_\Gamma.$$

Proof: This is because for there is an isomorphism $\alpha:\alpha^{-1}\Gamma\alpha\backslash\mathcal{H}\cong\Gamma\backslash H$, and for any left Γ-invariant function φ,

$$\int_{\alpha^{-1}\Gamma\alpha\backslash H}\varphi(\alpha(\tau))d\mu(\tau)=\int_{\Gamma\backslash H}\varphi(\tau)d\mu(\tau)$$

and $[f\overline{g[\alpha^{-1}]}y^k](\alpha\tau)=[f[\alpha]_k\overline{g}y^k](\tau)$. □

Prop. (16.2.1.14) [Twisted Modular Forms]. For each Dirichlet character χ mod N, we can define a character of $\Gamma_0(N)$:

$$\chi_d(\begin{bmatrix}a&b\\c&d\end{bmatrix})=\chi(d).$$

Then we can define $M_k(N,\chi)=M_k(\Gamma_0(N),\chi)$(16.2.1.10) and $S_k(N,\chi)=S_k(\Gamma_1(N))\cap M_k(N,\chi)$. Then there are direct sum decompositions:

$$M_k(\Gamma_1(N))=\bigoplus_{\chi,\chi(-1)=(-1)^k}M_k(N,\chi),\quad S_k(\Gamma_1(N))=\bigoplus_{\chi,\chi(-1)=(-1)^k}S_k(N,\chi),$$

where the summation is over all Dirichlet character mod N. Moreover, the summands are orthogonal w.r.t. the Petersson inner product(16.2.1.12).

Proof: Cf.[Diamond, P418]. □

Cor. (16.2.1.15) [Reduction to $\Gamma_0(N)$]. For any congruence subgroup $\Gamma(N)$, there exists $\alpha\in GL(2,\mathbb{Q})^+$ s.t. $\begin{bmatrix}1&\\&N\end{bmatrix}\Gamma_1(N)\begin{bmatrix}1&\\&1/N\end{bmatrix}\subset\Gamma(N)$. Thus if $f\in M_k(\Gamma(N))$, $f[\mathrm{diag}(1,N)]_k\subset M_k(\Gamma_1(N))$, which is a combination of modular forms in $M_k(\Gamma_0(N),\chi)$. Thus the study of congruence modular forms reduces to the study of $M_k(N,\chi)$.

Derivatives

2 Modular Curves and Jacobians

Prop. (16.2.2.1) [Local Picture]. Let D be the unit disk and Δ be a finite group acting on D and fixing 0, then by Schwarz lemma, Δ is a finite subgroup of $\mathrm{Aut}(D,0)\cong\mathbb{R}/\mathbb{Z}$, so it is a finite cyclic group. If $|\Delta|=m$, then z^m is invariant under Δ and defines a function on $\Delta\backslash D$. It is a homeomorphism from $\Delta\backslash D$ to D, thus defines a complex structure on $\Delta\backslash D$.

Let $X = \{z \in \mathbb{C} | \operatorname{Im}(z) > c\}$ and h an integer. Let $\mathbb{Z}$ acts on X by $nz = z + nh$. This action can extend to $X^* = X \cup \{\infty\}$, and we can consider the quotient space $\mathbb{Z}\backslash X^*$. The function $q(z) = e^{2\pi i z/h}$ is a homeomorphism from $\mathbb{Z}\backslash X^*$ onto the open disk of radius $e^{-2\pi c/h}$ and center 0, which defines a complex structure on $\mathbb{Z}\backslash X^*$.

Lemma (16.2.2.2) [Modular Curves for $\Gamma(1)$]. Let $\mathcal{H}^* = \mathcal{H} \cup \{\infty\}$, the Riemann surface $\Gamma(1)\backslash\mathcal{H}^*$ is compact and of genus 0, so isomorphic to the Riemann surface.

Proof: We first define a complex structure on $\Gamma(1)\backslash\mathcal{H}$: Let $p : \mathcal{H} \to \Gamma(1)\backslash\mathcal{H}$ be the quotient map, and let Q be a point of $\mathcal{H}$ mapping to P. If Q is not an elliptic point, then we can choose a nbhd of Q that maps isomorphically to a nbhd of P, so we can define the complex structure near P.

If $Q = i$, then the map $z \mapsto \frac{z-i}{z+i}$ maps some open nbhd of i to an open disk D' with center 0, and the action of S is transformed to the action $z \mapsto -z$. By the local picture, $f(z) = (\frac{z-i}{z+i})^2$ is invariant under action of S and defines a complex structure near $p(i)$. Similarly, if $Q = \rho$, then $g(z) = (\frac{z-\rho}{z-\overline{\rho}})^3$ is invariant under the action of ST, and defines a complex structure near $p(\rho)$.

The space $\Gamma\backslash\mathcal{H}$ we get is not compact, and it can be compactified by adding a point ∞, the resulting space is compact because it is a quotient space of $\overline{D} \cup \{\infty\}$, which is compact. And we give a complex structure on the resulting space: The function $q = e^{2\pi i z}$ is a function mapping a nbhd of ∞ in the fundamental domain to an open disk with center 0, and thus giving a complex structure near ∞.

It can be seen directly that $\Gamma(1)\backslash\mathcal{H}^*$ is homeomorphic to a sphere, and then use the fact any Riemann surface of genus 0 is isomorphic to S^1(5.11.8.2). □

Prop. (16.2.2.3) [Modular Curves for Γ]. For a congruence group Γ, the quotient space $\Gamma\backslash\mathcal{H}$ can be compactified to a Riemann surface $X(\Gamma)$ by adjoining n points, where n is the number of cusps of Γ.

Proof: The quotient space $\Gamma\backslash\mathcal{H}$ can be given a complex structure exactly the same way as $\Gamma(1)\backslash\mathcal{H}$, and it can be compactified by adding $\mathbb{P}^1(\mathbb{Q})$, which has only f.m. orbits under action of Γ, by(16.2.1.9) and the fact Γ has finite index in $\Gamma(1)$. For the complex structure: if h is the smallest positive integer that $T^h \in \Gamma$, then $q = e^{2\pi i z/h}$ is a homeomorphism of a nbhd of ∞ in $\Gamma\backslash\mathcal{H}$ to some open disk of 0, thus defines a complex structure near ∞. For any other cusps α, let $\gamma \in \Gamma(1)$ satisfies $\alpha = \gamma(\infty)$, then $z \mapsto q(\gamma^{-1}(z))$ defines a complex structure near α. □

Def. (16.2.2.4) [Notations]. Let Γ be a congruence subgroup, then we denote

$$Y(\Gamma) = \Gamma\backslash\mathcal{H}, \quad X(\Gamma) = \Gamma\backslash\mathcal{H}^*.$$

Also abbreviate $Y(\Gamma(N))$ to $Y(N)$, $X(\Gamma(N))$ to $X(N)$, and $Y(\Gamma_0(N))$ to $Y_0(N)$, and $X(\Gamma_0(N))$ to $X_0(N)$.

Prop. (16.2.2.5) [Modular Form as Differential Forms]. A holomorphic modular form of degree k in $M_k(\Gamma)$ is just a holomorphic differential form on $X(\Gamma)$ of degree k, and its dimension can be calculated, see Dimension Formulae.

Similarly, an automorphic function for Γ is the same as a function on $X(\Gamma)$(16.2.2.3). In particular, if it is holomorphic and vanishes at cusps, then it is constant.

Proof: ? □

Cor. (16.2.2.6) [Hauptmodul]. Let Γ be a congruence subgroup with only 1 cusp, a **Haptmodul** is the unique meromorphic modular form that has only a simple pole at the cusp with residue 1.

Modular Curves over $\mathbb{Q}$

Prop. (16.2.2.7) $[X_0(N)]$**.** The field $C(X_0(N))$ of modular functions for $\Gamma_0(N)$ is generated by $j(z)$ and $j(Nz)$ over $\mathbb{C}$, and the minimal polynomial $F(j,Y)$ of $j(Nz)$ over $C(j)$ has degree $d = [PSL(2,\mathbb{Z}) : \overline{\Gamma}_0(N)]$(16.2.4.1), and $F(j,Y) \in \mathbb{Z}[j,Y]$.

When $N > 1$, $F(X,Y)$ is symmetric in X, Y, and when $N = p$ is a prime,

$$F(X,Y) \equiv X^{p+1} + Y^{p+1} - X^pY^p - XY \mod p.$$

Proof:

□

Cor. (16.2.2.8). The field of functions on $X(1)$ is $\mathbb{C}(j)$.

Action of Hecke Algebras

Prop. (16.2.2.9) [Double Coset Operators]. There is an action of $\mathcal{R}$ on $X_1(\Gamma)$

Modular Jacobians

Def. (16.2.2.10) [Modular Jacobians]. Define $J_1(N) = \mathrm{Jac}(X_1(N)), J_0(N) = \mathrm{Jac}(X_0(N))$, which is defined over the same field as the defining field of $X_1(N)$ or $X_0(N)$.

3 Hecke Algebra

Def. (16.2.3.1) $[G(N)]$**.** Define $G(N) = \cup_{\alpha\in GL(2,\mathbb{Q})^+}\Gamma_0(N)\alpha\Gamma_0(N)$.

Def. (16.2.3.2) [Hecke Algebra]. Notation as in(16.2.1.2), if $\alpha \in \Gamma_0(N)\backslash G(N)/\Gamma_0(N)$, then $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is finite, and if $N = 1$, there is a set of representatives $\{\alpha_1, \ldots, \alpha_h\}$ s.t.

$$\Gamma(1)\alpha\Gamma(1) = \coprod_i \Gamma(1)\alpha_i = \coprod_i \alpha_i\Gamma(1) = \Gamma(1)\alpha_i^t.$$

Let $\mathcal{R}'_N$ be the free Abelian group generated by $\Gamma_0(N)\backslash G(N)$ s.t. if $\Gamma_0(N)\alpha\Gamma_0(N) = \sum_i \Gamma_0(N)\alpha_i$, then $[\alpha][\beta] = \sum_i[\alpha_i\beta]$.

Define the **Hecke algebra** $\mathcal{R}_N$ of $\Gamma_0(N)$ to be the subalgebra of $\mathcal{R}'_N$ consisting by right $\Gamma_0(N)$-invariant elements. Then $\mathcal{R}_N$ is isomorphic to the free Abelian group generated by the double coset $\Gamma_0(N)\backslash G(N)/\Gamma_0(N)$, and is commutative.

Remark (16.2.3.3). Compare this definition with that of(15.1.5.19).

Proof:

$$\begin{aligned}\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N) &\cong \Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)\alpha^{-1}\\ &\cong \Gamma_0(N)\cap\alpha\Gamma_0(N)\alpha^{-1}\backslash\alpha\Gamma_0(N)\alpha^{-1}\\ &\cong \alpha^{-1}\Gamma_0(N)\alpha\cap\Gamma_0(N)\backslash\Gamma_0(N)\end{aligned}$$

which is finite by(16.2.1.3).

By decomposition(16.2.1.2), the transposition on $G(N)$ is an involution that identifies every double coset $\Gamma(1)\alpha\Gamma(1)$, thus $\sum_i \Gamma(1)\alpha_i = \sum_i \alpha_i^t\Gamma(1)$, and also $\Gamma(1)\alpha_i \cap \alpha_i^t\Gamma(1) \neq \varnothing$, as $\Gamma(1)\alpha_i\Gamma(1) = \Gamma(1)\alpha_i^t\Gamma(1)$, thus we can replace α_i by some element in $\Gamma(1)\alpha_i \cap \alpha_i^t\Gamma(1)$.

To show $\mathcal{R}_N$ is commutative, for any $\sigma \in \Gamma(1)\backslash GL(2,\mathbb{Q})^+/\Gamma(1)$, denote $\deg(\sigma)$ to be the cardinality of $\Gamma(1)\backslash\Gamma(1)\sigma\Gamma(1)$, $\sigma[i], i \le \deg(\sigma)$ be a set of representatives, and let $m(\alpha,\beta,\sigma[i])$ be the cardinality of $\{(i,j)|\Gamma(1)\alpha_i\beta_j = \Gamma(1)\sigma[i]\}$, then $m(\alpha,\beta,\sigma[i])$ is independent of i as right action by $\Gamma(1)$ permutes $\{(i,j)\}$. Also we see $m(\alpha,\beta,\sigma[i])$ equals $1/\deg(\sigma)$ times the number of pairs $\{(i,j)|[\sigma] = [\alpha_i\beta_j]\}$, because $[\sigma] = [\alpha_i\beta_j]$ iff $\alpha_i\beta_j \in \Gamma(1)\sigma[i]$ for some i.

Then

$$m(\alpha,\beta,\sigma[i]) = \frac{1}{\deg(\sigma)}\#\{(i,j)|[\sigma] = [\alpha_i\beta_j]\} = \frac{1}{\deg(\sigma)}\#\{(i,j)|[\sigma^t] = [\beta_j^t\alpha_i^t]\} = m(\beta,\alpha,\sigma^t[i]).$$

But as $\sigma^t[i]$ is a permutation of $\sigma[i]$, we see $\mathcal{R}$ is commutative. □

Hecke Operators

Prop. (16.2.3.4). If Γ_1,Γ_2 are congruence subgroups of X, then for any $\alpha \in GL^+(2,\mathbb{Q})$, the double coset

$$\Gamma_1\alpha\Gamma_2 = \coprod_i \Gamma_1\beta_i$$

for some $\beta_i \in GL^+(2,\mathbb{Q})$. Then we can define a map

$$\mathrm{Div}(X(\Gamma_1)) \to \mathrm{Div}(X(\Gamma_2)) : [\tau] \mapsto [\beta_i\tau],$$

which induces a morphism $\mathrm{Jac}(\Gamma_1) \to \mathrm{Jac}(\Gamma_2)$**?**.

Prop. (16.2.3.5) [Action on Modular Forms]. Let Γ_1,Γ_2 be congruence subgroups of $GL^+(2,\mathbb{R})$, then

Prop. (16.2.3.6) [Hecke Operators]. The Hecke algebra $\Gamma\backslash GL^+(2,\mathbb{R})/\Gamma$ acts on $M_k(\Gamma)$ via

$$T_\alpha(f) = \sum_i f[\alpha_i]_k\text{(16.1.1.8)}, \quad \text{if } \Gamma\alpha\Gamma = \coprod_i \Gamma\alpha_i.$$

and preserves $S_k(\Gamma)$.

Proof: This is an action because if $\Gamma_0(N)\alpha\Gamma_0(N) = \coprod_i \Gamma_0(N)\alpha_i, \Gamma_0(N)\beta\Gamma_0(N) = \coprod_j \Gamma_0(N)\beta_j$, then $[\alpha][\beta] = \coprod_{i,j}\Gamma_0(N)\alpha_i\beta_j$.

Also $T_\alpha(f)[\gamma]_k = T_\alpha(f)$ for $\gamma \in \Gamma_0(N)$ because $\Gamma_0(N)\backslash\Gamma_0(N)\alpha\Gamma_0(N)$ is right $\Gamma_0(N)$-invariant. And they are holomorphic at cusps because f is holomorphic at cusps thus all $f[\alpha_i]_k$ are holomorphic at cusps. Moreover, if f vanishes at cusps, then all $f[\alpha_i]_k$ vanishes at cusps. □

$\Gamma_0(N), \Gamma_1(N)$ Cases

Prop. (16.2.3.7) [Self-Adjointness]. The action of $\mathcal{R}_N$ on $S_k(\Gamma(N))$ is self-adjoint w.r.t to the Petersson inner product(16.2.1.12).

Proof: First notice $(\chi_d(\alpha)^{-1}f[\alpha]_k, g) = (f, \chi_d(\alpha)g[\alpha^{-1}]_k)$ for any $\alpha \in G_0(N)$ by(16.2.1.13), and $f,g \in M_k(N,\chi)$, thus $(\chi_d(\alpha)^{-1}f[\alpha]_k, g)$ only depends on the double coset $\Gamma_0(N)\alpha\Gamma_0(N)$. Thus

$$(T_\alpha f, g) = \sum_i(\chi_d(\alpha_i)^{-1}f[\alpha_i]_k, g) = \deg(\alpha)(\chi_d(\alpha)^{-1}f[\alpha]_k, g) = \deg(\alpha)(f, \chi_d(\alpha)g[\alpha^{-1}]_k)$$

However, $\det(\alpha)\alpha^{-1}$ has the same Smith normal form as α, thus it is in the same double coset as α, thus

$$\deg(\alpha)(f, \chi_d(\alpha)g[\alpha^{-1}]_k) = \deg(\alpha)(f, \chi_d(\alpha)^{-1}g[\alpha]_k) = (f, T_\alpha g).$$

□

Cor. (16.2.3.8) [Hecke Eigenforms]. The Hecke algebra is commutative and acts as self-adjoint operators on $S_k(N,\chi)$, thus there is a basis consisting of eigenfunctions for each T_α, called the **Hecke eigenforms**.

Prop. (16.2.3.9) [$T(n)$]. Let $T(n)$ be the sum of operators $T_{\mathrm{diag}(d_1,d_2)}$ where $d_1,d_2\in\mathbb{N}, d_2|d_1$ and $d_1d_2=n$.

Equivalently by Cartan decomposition, if Δ_n is the subset of $GL(2,\mathbb{Z})\cap G_0(N)$ consisting of matrices of determinant n, then

$$\Delta_n=\coprod_{a,d>0,ad=n,b \mod d}\Gamma_0(N)\begin{bmatrix}a & b\\ & d\end{bmatrix}$$

and

$$T(n)f=\sum_{a,d>0,ad=n,b \mod d}\chi(d)^{-1}f[\begin{bmatrix}a & b\\ & d\end{bmatrix}]_k.$$

Proof: By column reduction, we can make any matrix in Δ_n the form as above, and if two elements of the form $\begin{bmatrix}a & b\\ & d\end{bmatrix}$ differ by an element of $\Gamma_0(N)$, they differ by an upper-triangular matrix in $\Gamma_0(N)$, thus a,d are determined, and also $b \mod d$. □

Cor. (16.2.3.10).

- $T(1)=\mathrm{id}$.
- If $(m,n)=1$, then $T(m)\cdot T(n)=T(mn)$.
- If p is a prime that $(p,N)=1$ and $n\geq 1$, then $T(p^n)\cdot T(p)=T(p^{n+1})+pR(p)\cdot T(p^{n-1})$, where $R(p)$ is the coset $\Gamma_0(N)\begin{bmatrix}p & \\ & p\end{bmatrix}$.
- $\mathcal{R}_N$ is generated by $T(p),R(p),R(p)^{-1}$.

Proof: 1: Trivial.
2: This follows from Chinese remainder theorem.
3: Omitted. □

Prop. (16.2.3.11) [Explicit Hecke Operators]. Let $f=\sum A(m)q^m\in S_k(N,\chi)$, then for $(n,N)=1$, $T(n)f$ has a Fourier expansion

$$T(n)f=\sum B(m)q^m,$$

where

$$B(m)=\sum_{ad=n,a|m}(\frac{a}{d})^{k/2}\chi(d)^{-1}dA(\frac{md}{a}).$$

Proof:

$$\begin{aligned}(T(n)f)(z)&=\sum_{ad=n}\sum_{b \mod d}(\frac{a}{d})^{k/2}\chi(d)^{-1}f(\frac{az+b}{d})\\&=\sum_{ad=n}\sum_{b \mod d}(\frac{a}{d})^{k/2}\sum_{m=1}^{\infty}A(m)\exp(2\pi i\frac{amz}{d})\exp(2\pi i\frac{mb}{d})\end{aligned}$$

$$= \sum_{m=1}^{\infty} \sum_{ad=n,d|m} (\frac{a}{d})^{k/2}\chi(d)^{-1}dA(m)\exp(2\pi i\frac{amz}{d})$$

Thus $B(m) = \sum_{ad=n,a|m}(\frac{a}{d})^{k/2}\chi(d)^{-1}dA(\frac{md}{a})$. □

Prop. (16.2.3.12) [Normalized Hecke Eigenforms]. If $f = \sum c_n q^n \neq 0 \in M_k(N,\chi)$ that satisfies

$$T(n)f = n^{1-k/2}\chi(n)^{-1}\lambda(n)f$$

for all $(n,N) = 1$ and $\lambda(n) \in \mathbb{C}$, then $c_1 \neq 0$, and if f is normalized that $c_1 = 1$, then $c_n = \lambda(n)$ for all such n. In particular, c_n are all real, because $T(n)$ is Hermitian(16.2.3.7).

Proof: By(16.2.3.11),

$$n^{1-k/2}\lambda(n)A(m) = \sum_{ad=n,a|m}(\frac{a}{d})^{k/2}\chi(d)^{-1}dA(\frac{md}{a}),$$

thus for $(m,n) = 1$, $\lambda(n)A(m) = A(mn)$, and $\lambda(n) = A(n)$. □

New Forms

Def. (16.2.3.13) [Old and New Forms]. Let $\alpha_d = \mathrm{diag}(d,1)$, and let $S_k(\Gamma_1(N))[d]$ be the subspace of $S_k(\Gamma_1(N))$ consisting of elements of the form $f + g[\alpha_d]_k$, $f, g \in S_k(\Gamma_1(N/d))$, and let

$$S_k(\Gamma_1(N))_{\text{old}} = \sum_{p\in\mathbf{P},p|N} S_k(\Gamma_1(N))[p],$$

called the space of **old forms of level** N. Also the space

$$S_k(\Gamma_1(N))_{\text{new}} = S_k(\Gamma_1(N))_{\text{old}}^{\perp},$$

called the space of **new forms of level** N.

Remark (16.2.3.14). Omitting the $p \in \mathbf{P}$ condition in the definition of oldforms doesn't change the space.

Remark (16.2.3.15). The dimension of newforms and oldforms are calculated by [Dimensions of the Spaces of Cusp Forms and Newforms on $\Gamma_0(N)$ and $\Gamma_1(N)$].

Prop. (16.2.3.16). $S_k(\Gamma_1(N))_{\text{old}}$ and $S_k(\Gamma_1(N))_{\text{new}}$ are both stable under action of $\mathcal{R}_N$. In particular, they have a orthogonal basis of Hecke eigenforms for the Hecke operators, by(16.2.3.7)(16.2.3.8).

Proof: By(16.2.3.10), for $R(n)$, $R(n)(f + g[\alpha_p]) = R(n)f + (R(n)g)[\alpha_p]$, for $T(\ell)$, $\ell \neq p$, $T(\ell)(f + g[\alpha_p]) = T(\ell)f + (T(\ell)g)[\alpha_p]$ because d is prime to ℓ. □

Prop. (16.2.3.17) [Strong Multiplicity One]. If $f \in S_k(\Gamma_0(N),\chi)_{\text{new}}$, $f' \in S_k(\Gamma_0(N'),\chi)_{\text{new}}$ are normalized new eigenforms having the same eigenvalues for a.e. T_p, then $N = N'$ and $f = f'$.

Proof: Cf.[On some results of Artin and Lehner, Casselman].**?** □

4 Dimension Formulae

Def. (16.2.4.1) [Notations]. In this subsection,

- Γ is a congruence subgroup of $SL_2(\mathbb{Z})$.
- g is the genus of $X(\Gamma)$.
- d is the degree of the map $X(\Gamma) \to X(1)$ which is equal to $[SL(2,\mathbb{Z}) : \{\pm 1\}\Gamma]$.
- ε_2 the number of elliptic points with period 2.
- ε_3 the number of elliptic points with period 3.
- ε_∞ the number of cusps.
- $\varepsilon_\infty^{\text{reg}}$ the number of regular cusps(16.1.1.2).
- ε_∞^{irr} the number of irregular cusps.

Prop. (16.2.4.2) [Genus Formula].

$$g = 1 + \frac{d}{12} - \frac{\varepsilon_2}{4} - \frac{\varepsilon_3}{3} - \frac{\varepsilon_\infty}{2}.$$

Proof: Cf. [Diamond, P68].? □

Prop. (16.2.4.3) [Zeros and Poles of Automorphic Forms]. Let f be a meromorphic forms for Γ of weight $2k$, then

$$\frac{1}{2}\sum_{Q \text{ elliptic points with period 2}} \operatorname{ord}_Q(f) + \frac{1}{3}\sum_{Q \text{ elliptic points with period 3}} \operatorname{ord}_Q(f) + \sum_{Q \text{ others}} \operatorname{ord}_Q(f) = kd/6,$$

where the sum is over a set of representatives for points in $\Gamma\backslash\mathcal{H}^*$.

Proof: Cf.[Milne, P53]. □

Prop. (16.2.4.4) [Dimension Formulae for k Even]. If k is even, then

$$\dim(M_k(\Gamma)) = \begin{cases} \frac{(k-1)d}{12} + (\frac{1}{4} - \{\frac{k}{4}\})\varepsilon_2 + (\frac{1}{3} - \{\frac{k}{3}\})\varepsilon_3 + \frac{1}{2}\varepsilon_\infty & k \geq 2 \\ 1 & k = 0 \\ 0 & k < 0 \end{cases}$$

and

$$\dim(S_k(\Gamma)) = \begin{cases} \frac{(k-1)d}{12} + (\frac{1}{4} - \{\frac{k}{4}\})\varepsilon_2 + (\frac{1}{3} - \{\frac{k}{3}\})\varepsilon_3 - \frac{1}{2}\varepsilon_\infty & k \geq 4 \\ g & k = 2 \\ 0 & k \leq 0 \end{cases}$$

Proof: Cf.[Diamond P87]. □

Cor. (16.2.4.5) [Modular Forms for $SL(2,\mathbb{Z})$].

$$M(\Gamma(1)) = \mathbb{C}[E_4, E_6], \quad S(\Gamma(1)) = \Delta \cdot M(\Gamma(1)).$$

Thus for $k \geq 4$ even,

$$\dim(S_k(\Gamma(1))) = \begin{cases} \lfloor \frac{k}{12} \rfloor - 1 & k \equiv 2 \mod 12 \\ \lfloor \frac{k}{12} \rfloor & \text{otherwise} \end{cases}.$$

$$M_k(\Gamma(1)) = S_k(\Gamma(1)) \oplus \mathbb{C}E_k.$$

Proof: Cf.[Diamond P88]. □

Cor. (16.2.4.6). $M(\Gamma(1)) = M(\Gamma(1),\mathbb{Z})\otimes\mathbb{C}$, $S(\Gamma(1)) = S(\Gamma(1),\mathbb{Z})\otimes\mathbb{C}$(16.2.8.4).

Proof: By(16.2.5.8), E_4, E_6 have Fourier coefficients in $\mathbb{Z}$. □

Prop. (16.2.4.7) [Dimension Formulae for k Odd]. For k odd,

- if $k<0$ or $-I\in\Gamma$, then $M_k(\Gamma)=S_k(\Gamma)=0$.
- If $k\geq 3$, $-I\notin\Gamma$, then

$$\dim(M_k(\Gamma)) = (k-1)(g-1) + \lfloor\frac{k}{3}\rfloor\varepsilon_3 + \frac{k}{2}\varepsilon_\infty^{\text{reg}} + \frac{k-1}{2}\varepsilon_\infty^{irr}$$

$$\dim(S_k(\Gamma)) = (k-1)(g-1) + \lfloor\frac{k}{3}\rfloor\varepsilon_3 + (\frac{k}{2}-1)\varepsilon_\infty^{\text{reg}} + \frac{k-1}{2}\varepsilon_\infty^{irr}$$

- If $k=1$, $-I\notin\Gamma$, then

$$\dim(M_1(\Gamma))\begin{cases} = \varepsilon_\infty^{\text{reg}}/2 & \varepsilon_\infty^{\text{reg}} > 2g-2 \\ \geq \varepsilon_\infty^{\text{reg}}/2 & \varepsilon_\infty^{\text{reg}}\leq 2g-2\end{cases},\quad \dim(S_1(\Gamma)) = \dim(M_1(\Gamma)) - \varepsilon_\infty^{\text{reg}}/2.$$

Proof: Cf.[Diamond P91]. □

Explicite Dimension Formulae for $\Gamma(N),\Gamma_1(N),\Gamma_0(N)$

Lemma (16.2.4.8).

$$SL(2,\mathbb{Z})\to SL(2,\mathbb{Z}/NZ)$$

is surjective.

Proof: Cf.[D-S16]P101. □

Prop. (16.2.4.9) [Degree].

- The degree of the mapping $X(N)\to X(1)$ is

$$d = d_N = [SL(2,\mathbb{Z}):\{\pm 1\}\Gamma(N)] = \begin{cases} 1/2N^3\prod_{p|N}(1-1/p^2) & N>2 \\ 6 & N=2\end{cases}$$

- There is a coset decomposition $\Gamma_1(N) = \coprod_{j=1}^N \Gamma(N)\begin{bmatrix}1 & j\\ & 1\end{bmatrix}$, in particular, $d = [SL(2,\mathbb{Z}) : \{\pm 1\}\Gamma_1(N)] = d_N/N, N\geq 2$.
- There is a coset decomposition $\Gamma_0(N) = \coprod_{y \bmod N,(y,N)=1}\Gamma_1(N)\begin{bmatrix}x & k\\ N & y\end{bmatrix}$, where x,k are chosen that $xy-kN=1$. In particular, $d=[SL(2,\mathbb{Z}):\Gamma_0(N)] = 2d/N\varphi(N), N\geq 2$.

Proof: 1: By(16.2.4.8), the map $SL(2,\mathbb{Z})\to SL(2,\mathbb{Z}/N\mathbb{Z})$ is surjective, so $[\Gamma(N):\Gamma(1)] = \#SL(2,\mathbb{Z}/N\mathbb{Z})$. Let $N=\prod p_i^{n_i}$, then $SL(2,\mathbb{Z}/N\mathbb{Z})\cong\prod_i SL(2,\mathbb{Z}/p_i^{n_i}\mathbb{Z})$, and calculating depending on e_{11} is invertible or e_{12} is invertible, $\#SL(2,\mathbb{Z}/p_i^{n_i}\mathbb{Z}) = 2(p^{n_i}-p^{n_i-1})p^{2n_i} - (p^{n_i}-p^{n_i-1})^2p^{n_i} = p_i^{3n_i}-p_i^{3n_i-2}$. Thus $\#SL(2,\mathbb{Z}/N\mathbb{Z}) = N^3\prod_{p|N}(1-p^{-2})$, and we get the desired formula. □

Prop. (16.2.4.10) [Elliptic Points].

Cor. (16.2.4.11) [Elliptic Points of $X_0(p)$]. Let p be a prime, then
- $\varepsilon_3(\Gamma_0(p)) = 1 + (\frac{-1}{p})$, where $(\frac{-1}{2}) = 0$.
- $\varepsilon_2(\Gamma_0(p)) = 1 + (\frac{-3}{p})$, where $(\frac{-3}{2}) = -1$.

Proof: Firstly there is a coset decomposition $\Gamma(1) = \Gamma_0(p)\alpha_j$, where $\alpha_j = \begin{bmatrix}1 & \\ j & 1\end{bmatrix}$ when $j = 0, \ldots, p-1$ and $\alpha_\infty = \begin{bmatrix}1 & -1\\ 1 & 0\end{bmatrix}$:

Because $-1 \in \Gamma_0(p)$, if $\alpha_j(i)$ or $\alpha(\omega)$ is an elliptic point, we may assume that it is fixed by an element of order 4 or 6 resp. by(16.2.1.9). Notice $\alpha_j(i)$ is an elliptic point or equivalently $\alpha_j \begin{bmatrix}0 & -1\\ 1 & 0\end{bmatrix} \alpha_j^{-1} \in \Gamma_0(p)$ iff $j \neq \infty$ and $j^2 + 1 \equiv 0 \mod p$. Thus $\varepsilon_2(\Gamma_0(p))$ equals the number of solutions to $j^2 = 1$, which is $1 + (\frac{-1}{p})$. Similarly $\alpha_j(\omega)$ is an elliptic point or equivalently $\alpha_j \begin{bmatrix}0 & -1\\ 1 & 1\end{bmatrix} \alpha_j^{-1} \in \Gamma_0(p)$ iff $j \neq \infty$ and $j^2 - j + 1 \equiv 0 \mod p$. Thus $\varepsilon_2(\Gamma_0(p))$ equals the number of solutions to $j^2 = 1$, which is $1 + (\frac{-1}{p})$. □

Lemma (16.2.4.12). Let $s = a/c, s' = a'/c' \in \mathbb{P}^1(\mathbb{Q})$ with $(a,c) = (a',c') = 1$, then for any $\gamma \in SL(2,\mathbb{Z})$,

$$s' = \gamma(s) \iff \begin{bmatrix}a'\\ c'\end{bmatrix} = \pm\gamma \begin{bmatrix}a\\ c\end{bmatrix}.$$

Proof: □

Lemma (16.2.4.13). Let $s = a/c, s' = a'/c' \in \mathbb{P}^1(\mathbb{Q})$ with $(a,c) = (a',c') = 1$, then
- $\Gamma(N)s' = \Gamma(N)s \iff \begin{bmatrix}a'\\ c'\end{bmatrix} \equiv \pm \begin{bmatrix}a\\ c\end{bmatrix} \mod N$
- $\Gamma_1(N)s' = \Gamma_1(N)s \iff \begin{bmatrix}a'\\ c'\end{bmatrix} \equiv \pm \begin{bmatrix}a+jc\\ c\end{bmatrix} \mod N$, for some j.
- $\Gamma_0(N)s' = \Gamma_0(N)s \iff \begin{bmatrix}ya'\\ c'\end{bmatrix} \equiv \begin{bmatrix}a+jc\\ c\end{bmatrix} \mod N$, for some y relatively prime to N and some j.

Proof: Use(16.2.4.12).

1: One direction is clear, for the other, If $\begin{bmatrix}a'\\ c'\end{bmatrix} \equiv \pm \begin{bmatrix}a\\ c\end{bmatrix} \mod N$, take b,d that $ac - bd = 1$, then $\gamma = \begin{bmatrix}a & b\\ c & d\end{bmatrix}$ maps $\begin{bmatrix}1\\ 0\end{bmatrix}$ to $\begin{bmatrix}a\\ c\end{bmatrix}$. As $\Gamma(N)$ is normal in $\Gamma(1)$, it suffices to prove for $\begin{bmatrix}a\\ c\end{bmatrix} = \begin{bmatrix}1\\ 0\end{bmatrix}$. Then $a' \equiv 1 \mod N$, take integers β, δ that $a'\delta - c'\beta = (1-\alpha')/N$, let $\gamma = \begin{bmatrix}a' & \beta N\\ c' & \delta N\end{bmatrix}$, then $\gamma \in \Gamma(N)$ and $\begin{bmatrix}a'\\ c'\end{bmatrix} = \gamma \begin{bmatrix}1\\ 0\end{bmatrix}$.

2 follows from 1 and the coset decomposition $\Gamma_1(N) = \coprod_{j=1}^N \Gamma(N) \begin{bmatrix}1 & j\\ & 1\end{bmatrix}$.

3: There is a coset decomposition $\Gamma_0(N)=\coprod_{y \mod N,(y,N)=1}\Gamma_1(N)\begin{bmatrix}x&k\\N&y\end{bmatrix}$, where x,k are chosen that $xy-kN=1$. Then

$$\begin{aligned}\Gamma_0(N)s'=\Gamma_0(N)s &\iff \begin{bmatrix}a'\\c'\end{bmatrix}\equiv\pm\begin{bmatrix}xa+kc+jcy\\cy\end{bmatrix} \mod N,\exists j,(y,N)=1\\ &\iff \begin{bmatrix}ya'\\c'\end{bmatrix}\equiv\begin{bmatrix}a+jc\\cy\end{bmatrix} \mod N,\exists j,(y,N)=1\end{aligned}$$

□

Prop. (16.2.4.14) [Cusps].

- $\varepsilon_\infty(\Gamma_0(N))=\sum_{d|N}\varphi((d,N/d))$.
-

Proof: 1: By(16.2.4.13), if $\Gamma_0(N)s'=\Gamma_0(N)s$, then $\begin{bmatrix}ya'\\c'\end{bmatrix}\equiv\begin{bmatrix}a+jc\\c\end{bmatrix} \mod N$, which means first $(c,N)=(c',N)$. So we consider the equivalence classes with $(c,N)=d$. In this case any equivalence class has a representative that $c=d$. Consider the equivalence relations between them, then $\begin{bmatrix}a'\\d\end{bmatrix}$ represents the same cusp as $\begin{bmatrix}a\\d\end{bmatrix}$ iff $(y_0+iN/d)a'\equiv a+jd \mod N$ for some i,j, which is equivalent to $a'\equiv y_0a \mod (c,N,a'N/d)=(d,N/d)$. So there are $\sum_{d|N}\varphi((d,N/d))$ many equivalence classes(cusps). □

Prop. (16.2.4.15) [Regular Cusps]. All the cusps of $\Gamma_0(N)$ and $\Gamma(N)$ are regular. The only irregular cusp of $\Gamma_1(N)$ are $s=1/2$ for $N=4$.

Proof: Cf.[**?**]P103. □

Lemma (16.2.4.16). Lists of statistics for $\Gamma_0(N),\Gamma_1(N),\Gamma(N)$.

Γ	d	ε_2	ε_3	ε_∞
$\Gamma_0(N),N>2$	$\frac{2d_N}{N\varphi(N)}$	$\begin{cases}\prod_{p\mid N}(1+(\frac{-1}{p})) & 4\nmid N\\ 0 & 4\mid N\end{cases}$	$\begin{cases}\prod_{p\mid N}(1+(\frac{-3}{p})) & 9\nmid N\\ 0 & 9\mid N\end{cases}$	$\sum_{d\mid N}\varphi((d,N/d))$

$\Gamma_1(4)$	6	0	0	3
$\Gamma_1(N),N>4$	d_N/N	0	0	$\frac{1}{2}\sum_{d\mid N}\varphi(N)\varphi(N/d)$
$\Gamma(1)(\Gamma_1(1))$	1	1	1	1
$\Gamma(N),N>1$	d_N	0	0	d_N/N

where

$$d_N=\begin{cases}1/2\prod_{p|N}N^3(1-1/p^2) & N>2\\ 6 & N=2\end{cases}.$$

Proof: Cf.[Diamond P107]. □

Prop. (16.2.4.17) [List of Dimension Formulae]. Lists of dimension formulae for $\Gamma_0(N), \Gamma_1(N), \Gamma(N)$.

Γ	g	$\dim(M_k(\Gamma))\&\dim(S_k(\Gamma))$, $2\mid k, k\geq 2$	$\dim(M_k(\Gamma))\&\dim(S_k(\Gamma))$, $2\mid k+1, k\geq 3$
$\Gamma_0(N), N>2$	expression too long	expression too long	expression too long
$\Gamma_1(2)(\Gamma_0(2))$	0	$\lfloor\frac{k}{4}\rfloor\pm 1$	0
$\Gamma_1(3)$	0	$\lfloor\frac{k}{3}\rfloor\pm 1$	$\lfloor\frac{k}{3}\rfloor\pm 1$
$\Gamma_1(4)$	0	$\frac{k-1\pm 3}{2}$	$\frac{k-1\pm 2}{2}$
$\Gamma_1(N), N>4$	$1+\frac{d_N}{12N}-\frac{1}{4}\sum_{d\mid N}\varphi(d)\varphi(N/d)$	$\frac{(k-1)d_N}{12N}\pm\frac{1}{4}\sum_{d\mid N}\varphi(d)\varphi(N/d)$	$\frac{(k-1)d_N}{12N}\pm\frac{1}{4}\sum_{d\mid N}\varphi(d)\varphi(N/d)$
$\Gamma(1)(\Gamma_1(1))$	0	1	1
$\Gamma(2)$	0	$\frac{k-1\pm 3}{2}$	0
$\Gamma(N), N>2$	$1+\frac{d_N(N-6)}{12N}$	0	$\frac{(k-1)d_N}{12N}\pm\frac{d_N}{2N}$

Proof: This follows from(16.2.4.4)(16.2.4.7)(16.2.4.16) and(16.2.4.15). □

Remark (16.2.4.18). The only case that is not calculated is the dimensions of $\dim(M_1(\Gamma))$.

Cor. (16.2.4.19) [Low Genus Cases]. For $N\in\mathbb{Z}_+$,

- $g(X(N))=0$ iff $N\in\{1,2,3,4,5\}$.
- $g(X(N))=1$ iff $N=6$.
- $g(X_1(N))=0$ iff $N\in\{1,2,3,4,5,6,7,8,9,10,12\}$.
- $g(X_1(N))=1$ iff $N\in\{11,14,15\}$.
- $g(X_0(N))=0$ iff $N\in\{1,2,3,4,5,6,7,8,9,10,12,13,16,18,25\}$.
- $g(X_0(N))=1$ iff $N\in\{11,14,15,17,19,20,21,24,27,32,36,49\}$.

Proof: If $N=\prod_p p^{e_p}$,

1, 2:

3, 4:

$$g(X_1(N))=1+\frac{1}{24}\prod_{p\mid N}p^{2e_p}(1-\frac{1}{p^2})-\frac{1}{4}\prod_p p^{e_p-2}(p-1)[(p+1)-e_p(p-1)],$$

so if $g(X_1(N))=0$,

$$\prod_p\frac{p^{e_p}(p+1)}{[(p+1)+e_p(p-1)]}<6.$$

Then it can be verified that $e_2\leq 3, e_3\leq 2, e_5\leq 1, e_7\leq 1, e_{11}\leq 1$, $e_p=0$ for $p>11\in\mathbf{P}$. Then the assertion follows. 4 is similar.

5, 6:? □

Applications

Prop. (16.2.4.20). Use dimension formula to prove four square problem, Cf.[D-S16]Chap1.

5 Eisenstein Series

Def. (16.2.5.1) [Eisenstein Series]. Let Γ be a congruence subgroup of $\Gamma(1)$, define the space of **Eisenstein series** $E_k(\Gamma,\chi)$ to be the orthogonal complement of $S_k(\Gamma,\chi)$ in $M_k(\Gamma,\chi)$. Also denote $E_k(\Gamma)=E_k(\Gamma,1)$.

Prop. (16.2.5.2) [Dimensions of Eisenstein Series]. Notation as in(16.2.4.1), by(16.2.4.4) and(16.2.4.7), the dimensions of the space of Eisenstein series satisfy:

$$\dim(E_k(\Gamma))=\begin{cases}\varepsilon_\infty & k\geq 4, 2|k\\ \varepsilon_\infty-1 & k=2\\ 1 & k=0\\ \varepsilon_\infty^{\text{reg}} & k\geq 3, 2|k+1, -1\notin\Gamma\\ \varepsilon_\infty^{\text{reg}}/2 & k=1, -1\notin\Gamma\\ 0 & k<0 \text{ or } 2|k+1, -1\in\Gamma\end{cases}$$

And also the dimension of $E_k(\Gamma_0(N)),E_k(\Gamma_1(N)),E_k(\Gamma(N))$ can be read off from(16.2.4.17).

Eisenstein Series for $\Gamma(1)$

Def. (16.2.5.3). In this subsubsection, denote $q=e^{2\pi iz}$.

Prop. (16.2.5.4) [Weakly Modular Forms and Lattices]. Let $\mathcal{L}$ be the set of lattices in $\mathbb{C}$, If $F:\mathcal{L}\to\mathbb{C}$ is a function of weight $2k$, i.e. $F(\lambda\Lambda)=\lambda^{-2k}F(\Lambda)$ for $\lambda\in\mathbb{C}^*$, then $f(z)=F(\Lambda(z,1))$ is a weakly modular form on $\mathcal{H}$ for $\Gamma(1)$ of weight $2k$, and this is a bijection between functions of weight $2k$ on $\mathcal{L}$ and weakly modular functions on $\mathcal{H}$ for $\Gamma(1)$ of weight $2k$.

Proof: By the hypothesis, there is a function f on $\mathcal{H}$ that for any w_1,w_2 with $w_1/w_2\in\mathcal{H}$,

$$F(\Lambda(w_1,w_2))=w_2^{-2k}f(w_1/w_2).$$

Then the invariance of F under $SL(2,\mathbb{Z})$ action implies f is weakly modular of weight $2k$. □

Prop. (16.2.5.5)[Eisenstein Series for $SL(2,\mathbb{Z})$]. Let $k>2$ be an even integer and Λ a lattice of $\mathbb{C}$, define the **Eisenstein series of weight** k to be

$$G_k(\Lambda)=\sum_{\omega\in\Lambda,\omega\neq 0}\frac{1}{\omega^k},$$

and also for a complex number z, let Λ_z be the lattice generated by 1 and z, and let $G_k(z)=G_k(\Lambda_z)$. Then $G_k(z)\in M_k(\Gamma(1))$, and

$$G_k(z)=2\zeta(k)+2\frac{(2\pi i)^k}{(k-1)!}\sum_{n=1}^\infty\sigma_{k-1}(n)q^n$$

And denote

$$E_k(z)=G_k(z)/2\zeta(k)=1-\frac{2k}{B_k}\sum_{n=1}^\infty\sigma_{k-1}(n)q^n$$

the **normalized Eisenstein series**.

Proof: $G_k(z)$ is weakly modular of weight k by(16.2.5.4). For the expansion, notice by(10.5.3.11),

$$\pi\cot(\pi z) = \frac{1}{z} + \sum_{n=1}^{\infty}(\frac{1}{z+n} + \frac{1}{z-n}),$$

and by definition

$$z\cot(\pi z) = \pi i - \frac{\pi i}{1-q} = \pi i - 2\pi i\sum_{n=1}^{\infty} q^n$$

where $z \in \mathcal{H}$.

Taking $(k-1)$-th derivative of this, we get

$$\sum_{n\in\mathbb{Z}} \frac{1}{(z+n)^k} = \frac{(-2\pi i)^k}{(k-1)!}\sum_{n=1}^{\infty} n^{k-1}q^n,$$

thus

$$\begin{aligned} G_k(z) &= \sum_{(m,n)\neq(0,0)} \frac{1}{(nz+m)^k} \\ &= 2\zeta(k) + 2\sum_{n=1}^{\infty}\sum_{m\in\mathbb{Z}} \frac{1}{(nz+m)^k} \\ &= 2\zeta(k) + \frac{2(-2\pi i)^k}{(k-1)!}\sum_{n=1}^{\infty}\sum_{a=1}^{\infty} a^{k-1}q^{an} \\ &= 2\zeta(k) + 2\frac{(2\pi i)^k}{(k-1)!}\sum_{n=1}^{\infty}\sigma_{k-1}(n)q^n \end{aligned}$$

Finally the assertion about $E_k(z)$ follows from(19.6.4.1).

To show the Eisenstein series is orthogonal to any cusp form, notice for any cusp form $f \in \mathcal{S}_k(\Gamma(1))$,

$$f(\gamma(z))(\mathrm{Im}(\gamma z))^k = f(z)\overline{\tau(\gamma,z)}^{-k}\,\mathrm{Im}(z)^k$$

and by(16.2.5.5)

$$G_k(z) = \sum_{(m,n)\neq 0\in\mathbb{Z}^2} \frac{1}{(mz+n)^k} = \sum_{\Gamma(1)_\infty\backslash\Gamma(1)} \frac{1}{\tau(\gamma,z)^k},$$

so

$$\begin{aligned} \int_{\Gamma(1)\backslash\mathcal{H}} f(z)\overline{G_k(z)}y^k\frac{dxdy}{y^2} &= \int_{\Gamma(1)\backslash\mathcal{H}}\sum_{\Gamma(1)_\infty\backslash\Gamma(1)} f(z)\overline{\tau(\gamma,z)}^{-k}y^k\frac{dxdy}{y^2} \\ &= \int_{\Gamma(1)\backslash\mathcal{H}}\sum_{\Gamma(1)_\infty\backslash\Gamma(1)} f(\gamma z)(\mathrm{Im}(\gamma z))^k\frac{dxdy}{y^2} \\ &= \int_{\Gamma(1)_\infty\backslash\mathcal{H}} f(z)(\mathrm{Im}\,z)^k\frac{dxdy}{y^2} \\ &= \int_0^{\infty}[\int_0^1 f(x+iy)dx]y^{k-2}dy = 0 \end{aligned}$$

as f is a cusp form. □

Cor. (16.2.5.6). By(16.2.5.5) and(8.5.1.12):

$$E_4(z)=1+240\sum_{n=1}^{\infty}\sigma_3(n)q^n,\quad E_6(z)=1-504\sum_{n=1}^{\infty}\sigma_5(n)q^n$$

$$E_8(z)=1+480\sum_{n=1}^{\infty}\sigma_7(n)q^n,\quad E_{10}(z)=1-264\sum_{n=1}^{\infty}\sigma_9(n)q^n$$

$$E_{12}(z)=1+\frac{65520}{691}\sum_{n=1}^{\infty}\sigma_3(n)q^n,\quad E_{14}(z)=1-24\sum_{n=1}^{\infty}\sigma_5(n)q^n.$$

Cor. (16.2.5.7) [Ramanujan Identities]. By(16.2.4.5), $\dim M_6(\Gamma(1)) = \dim M_8(\Gamma(1)) = \dim M_{10}(\Gamma(1)) = \dim M_{14}(\Gamma(1)) = 1$, thus there are equations

$$E_4^2=E_8,\quad E_4E_6=E_{10},\quad E_6E_8=E_4E_10=E_{14}$$

which give equations like:

$$\sigma_7(n)=\sigma_3(n)+120\sum_{m=1}^{n-1}\sigma_3(m)\sigma_3(n-m)$$

$$11\sigma_9(n)=21\sigma_5(n)-10\sigma_3(n)+1054\sum_{m=1}^{n-1}\sigma_3(m)\sigma_5(n-m).$$

Prop. (16.2.5.8) [Discriminant Function]. By(16.2.5.6), we can define the **discriminant function**

$$\Delta(q(z))=\frac{1}{1728}(E_4^3-E_6^2)=q-24q^2+252q^3-1472q^4+\tau(5)q^5+\ldots.$$

So $\Delta(z)\subset S_{12}(\Gamma(1))$, and the coefficients $\tau(n)$ are called the **Ramanujan τ-function**.

Cor. (16.2.5.9).

$$E_6^2-E_{12}=(-1008-\frac{24\cdot 2730}{691})\Delta.$$

In particular, $\tau(n)\equiv\sigma_{11}(n) \mod 691$.

Proof: Consider $E_6^2-E_{12}\in\mathcal{S}_{12}(\Gamma(1))$, and $\mathcal{S}_{12}(\Gamma(1))$ is 1-dimensional and generated by Δ(16.2.4.5), thus $E_6^2-E_{12}=c\Delta$ for some constant $c\in\mathbb{C}$. By comparing the degree 1 term of both sides:

$$\Delta(q(z))=\frac{1}{1728}(E_4^3-E_6^2)=q-24q^2+\ldots.$$

$$E_{12}(z)=1+\frac{24\cdot 2730}{691}\sum_{n=1}^{\infty}\sigma_{11}(n)q^n,\quad E_6(z)=1-504\sum_{n=1}^{\infty}\sigma_5(n)q^n$$

by(16.2.5.6) and(16.2.5.8), so $c=-1008-\frac{24\cdot 2730}{691}$. Then the formula

$$691(E_6^2-E_{12})=691c\Delta,$$

modulo 691 gives $\tau(n)\equiv\sigma_{11}(n) \mod 691$. □

Cor. (16.2.5.10) [j-Function]. By(16.2.4.3), the discriminant function $\Delta(z)$ has exactly one simple zero at ∞, thus we can define the **j-function** on $\mathcal{H}$ as

$$j:\mathcal{H}\to\mathbb{C}, j(q(z))=\frac{E_4(z)^3}{\Delta(q(z))}=\frac{1}{q}+744+196884q+21493760q^2+864299970q^3+\ldots\in\frac{1}{q}+\mathbb{Z}[[q]]$$

which is an automorphic function for $\Gamma(1)$, and it subjects onto $\mathbb{C}$.

Proof: To show it surjects onto $\mathbb{C}$, notice it induces a holomorphic map $X(1)\cong\mathbb{P}^1\to\mathbb{P}^1$, and it maps ∞ to ∞ with no ramification, thus it has degree 1, so it is surjective. □

Prop. (16.2.5.11).

$$\Delta(q(z))=\eta(q(z))^{24}=q\prod_{n=1}^{\infty}(1-q^n)^{24}.$$

where $\eta(z)$ the Dedekind eta function from(8.5.2.6), and $\dim(\mathcal{S}(SL(2,\mathbb{Z})))=1$, spanned by Δ.

Proof: We show that $\eta^{24}(z)$ is a holomorphic cusp form in $S_{12}(\Gamma(1))$, and it has a first order pole at ∞ by the expression, and has no zero on $\mathcal{H}$, thus it divides every cusp form in $S_{12}(\Gamma(1))$, and the quotient is a holomorphic modular function, thus is a constant. The assertion follows by comparing coefficients.

To show this, it suffices to show

$$\eta(\gamma(z))=\varepsilon(\gamma)(cz+d)^{1/2}\eta(z)$$

for every $\gamma\in\Gamma(1)$, where $\varepsilon(\gamma)$ is a 24-th root of unity. Because $[\gamma]_k$ is an action(16.2.1.10), by6, it suffices to show for $S=\begin{bmatrix} & -1\\ 1 & \end{bmatrix}$ and $T=\begin{bmatrix}1 & 1\\ & 1\end{bmatrix}$. The case for T is clear from the last expression of $\eta(z)$. For S: **?** □

Def. (16.2.5.12) [Poincaré Series]. Let Γ be a congruence subgroup, $T=\begin{bmatrix}1 & 1\\ & 1\end{bmatrix}$. Let h be the minimal positive integer that $T^h\subset\Gamma$, and define Γ_0 the subgroup of Γ generated by T^h. Then we define the **Poincaré series of weight $2k$ and character n for** Γ to be the series

$$\varphi_n(z)=\sum_{\Gamma_\infty\backslash\Gamma'}\frac{\exp(\frac{2\pi in\gamma(z)}{h})}{(cz+d)^{2k}},$$

where Γ' is the image of Γ in $\Gamma(1)/\{\pm1\}$.

Prop. (16.2.5.13). For $k\geq1, n\geq0$, The Poincaré series converges absolutely on compact subsets of $\mathcal{H}$, and is invariant under Γ-action, and it is a modular form of weight $2k$ for Γ. Moreover,

- $\varphi_0(z)$ vanishes at all finite cusps, and $\varphi_0(\infty)=1$.
- for $n\geq1$, $\varphi_n(z)$ are cusp forms.

Proof: Cf.[Mil, P62]. □

Prop. (16.2.5.14). The Poincaré series $\varphi_n(z)$ of weight $2k$ spans $S_{2k}(\Gamma)$.

Proof: Cf.[Mil17c]P62. □

General Eisenstein Series

Quasimodular Forms

Def. (16.2.5.15) [Almost Modular Forms and Quasimodular Forms]. For a discrete subgroup Γ of $SL(2,\mathbb{R})$, let $\widehat{M}_k^{\le p}(\Gamma)$ be the space of functions in $C^\infty(\mathcal{H})$ of the form $F(z)=\sum_{r=0}^p f_r(z)(-4\pi y)^{-r}$, where f_r are holomorphic on $\mathcal{H}$ and holomorphic at the cusps, and $F[\gamma]_k = F$ for any $\gamma\in\Gamma$. Also denote $\widehat{M}_k(\Gamma)=\cup_{p=0}^\infty \widehat{M}_k^{\le p}(\Gamma)$ and the graded ring $\widehat{M}_*(\Gamma)=\oplus_{k\ge 0}\widehat{M}_k(\Gamma)$, called the space of **almost modular forms**.

The graded ring $\widetilde{M}_*(\Gamma)$ consists of constant terms of functions in $\widehat{M}_*(\Gamma)$. Any almost modular function is determined by its constant term, so $\widetilde{M}_*(\Gamma)$ is canonically isomorphic to $\widehat{M}_*(\Gamma)$.?

Def. (16.2.5.16) [$E_2(z)$]. Denote

$$G_2(z)=\frac{1}{2}\sum_{n\neq 0}\frac{1}{n^2}+\sum_{m\neq 0}\sum_{n\in\mathbb{Z}}\frac{1}{(mz+n)^2}.$$

This summation is convergent but not absolutely convergent, and

$$E_2(z)=\frac{6}{\pi^2}G_2(z)=1-24q-72q^2+\ldots\in\widetilde{M}_2^{\le 1}(\Gamma(1))$$

with

$$G_2^*=G_2(z)-\frac{\pi}{2\,\mathrm{Im}(z)},\quad E_2^*(z)=\frac{6}{\pi^2}G_2^*=E_2(z)-\frac{3}{\pi y}\in\widehat{M}_2^{\le 1}(\Gamma(1)).$$

In particular, $E_2(z)$ satisfies

$$E_2[\gamma]_2(z)=E_2(z)+\frac{12}{2\pi i}\frac{c}{cz+d}.$$

Proof: □

Prop. (16.2.5.17) [Derivations of Modular Forms]. Let $f\in M_k(\Gamma(1))$, then

$$Df=f'=\frac{1}{2\pi i}\frac{\partial}{\partial z}f=q\frac{\partial}{\partial q}f=\sum_{n=1}^\infty na_nq^n$$

satisfies

$$(Df)[\gamma]_{k+2}(z)=(Df)(z)+\frac{k}{2\pi i}\frac{c}{cz+d}f(z).$$

In particular, by(16.2.5.16), $\theta_k(f)=D(f)-\frac{k}{12}E_2f\in M_{k+2}(\Gamma(1))$, called the **Serre derivation** of f.

Proof: This follows form differentiating the equation $f(\frac{az+b}{cz+d})=(cz+d)^kf(z)$. □

Cor. (16.2.5.18).

$$D(E_2)=\frac{E_2^2-E_4}{12},\quad D(E_4)=\frac{E_2E_4-E_6}{3},\quad D(E_6)=\frac{E_2E_6-E_4}{2}$$

Proof: $D(E_4)$ and $D(E_6)$ follows from(16.2.5.17) by comparing coefficients, for $D(E_2)$, differentiating the equation $E_2(\frac{az+b}{cz+d}) = (cz+d)^2 E_2(z) + \frac{12}{2\pi i}c(cz+d)$, we get

$$D(E_2)[\gamma]_4(z) = D(E_2)(z) + \frac{2c}{2\pi i}\frac{E_2(z)}{cz+d} + \frac{12c^2}{(2\pi i)^2}\frac{1}{(cz+d)^2}.$$

Thus by(16.2.5.16), we see $D(E_2) - \frac{E_2^2}{12} \in M_4(\Gamma(1))$, then we can compare coefficients. □

Prop. (16.2.5.19) [Structure of $\widetilde{M}_*(\Gamma)$]. Let Γ be a discrete subgroup of $SL(2,\mathbb{R})$, then

- $D(\widetilde{M}_k^{\leq p}(\Gamma)) \subset \widetilde{M}_{k+2}^{\leq p+1}(\Gamma)$. In particular, $D(\widetilde{M}_*(\Gamma)) \subset \widetilde{M}_*(\Gamma)$.
- If $\varphi \in \widetilde{M}_2^{\leq 1}(\Gamma)$, then $\widetilde{M}_k^{\leq p}(\Gamma) = \oplus_{r=0}^p M_{k-2r}(\Gamma)\varphi^r$, for all $k, p \geq 0$. In particular, $\widetilde{M}_*(\Gamma(1)) = \mathbb{C}[E_2, E_4, E_6]$.
- If $\varphi \in \widetilde{M}_2^{\leq 1}(\Gamma)$, then for $p, k \geq 0$,

$$\widetilde{M}_k^{\leq p}(\Gamma) = \begin{cases} \oplus_{r=0}^p D^r(M_{k-2r}(\Gamma)), & p < k/2 \\ \oplus_{r=0}^{k/2-1} D^r(M_{k-2r}(\Gamma)) \oplus \mathbb{C}\cdot D^{k/2-1}\varphi, & p \geq k/2 \end{cases}$$

Proof: Cf.[BGHZ]P59. □

6 Eichler-Shimura Relations

7 Moduli Characterization

Prop. (16.2.7.1) [Elliptic Curves and Modular Curves]. Modular curves $Y_0(N), Y_1(N), Y(N)$ parametrizes elliptic curves over $\mathbb{C}$ with additional structures.

Proof: □

Thm. (16.2.7.2) [Modularity Theorem]. Any elliptic curve over $\mathbb{C}$ with rational j-invariant arises from a modular form.

8 Arithmetics

Prop. (16.2.8.1) [Number Field of f]. If $f \in S_k(\Gamma_1(N))$ is a normalized eigenform, then the coefficients $a_n(f)$ are algebraic integers, and generate a number field K_f, called the **number field of** f.

Proof: Cf.[Diamond, P238]. □

Prop. (16.2.8.2). if $f \in S_2(N,\chi)$ is a normalized eigenform, then for any $\sigma \in \mathrm{Gal}_{\mathbb{Q}}$, f^σ is also a normalized eigenform in $S_2(N,\chi^\sigma)$, where $\chi^\sigma(n) = \chi(n)^\sigma$. And if f is a newform, then so is f^σ.

Proof: Cf.[Diamond, P239].? □

Cor. (16.2.8.3) [Integrality of Modular Forms]. $S_2(\Gamma_1(N))$ has a basis of modular forms with integral coefficients.

Proof: Let $f \in S_2(\Gamma_1(N))$ be a newform of level $M|N$, and K_f the number field of f. Let $\alpha_1, \ldots, \alpha_d$ be a $\mathbb{Z}$-basis of $\mathcal{O}_K$, and $\Sigma^\infty = \{\sigma_1, \ldots, \sigma_d\}$ the set of embeddings of K into $\mathbb{C}$. Let

$$g_i = \sum_{j=1}^{d} \sigma_j(\alpha_i) f^{\sigma_j},$$

then by linear independence of characters, the matrix $(\sigma_i(\alpha_j))$ is non-degenerate, so $\mathrm{span}\{g_1, \ldots, g_d\} = \mathrm{span}\{f, \ldots, f^{\sigma_d}\}$, and $g_i \in S_2(\Gamma_1(N))$ by(16.2.8.2). Then by(16.2.3.13), applying this for all old and new forms of $S_2(\Gamma_1(N))$, the assertion follows. □

Prop. (16.2.8.4)[Integral Modular Forms]. If $A \subset \mathbb{C}$ be a subring, denote $M_k(\Gamma, A) = M_k(\Gamma) \cap A[[q]]$

9 Modular Forms Mod p

Def. (16.2.9.1) [Modular Forms Mod p]. Define $M_k(\Gamma, \mathbb{F}_p) = M_k(\Gamma, \mathbb{Z}) \otimes \mathbb{F}_p$, called the space of **modular forms mod p of weight k**.

Prop. (16.2.9.2) [Serre's Equality]. There is an isomorphism $M_{p+1}(SL(2,\mathbb{Z}), \mathbb{F}_p) \cong M_2(\Gamma_0(p), \mathbb{F}_p)$

Proof: Because $E_k(z)1 - \frac{2k}{B_k}\sum_{n=1}^\infty \sigma_{k-1}(n)q^n$, and by Kummer's congruence(20.3.1.1) $\mathrm{ord}_p(B_{p-1}) = -1$, thus $E_{p-1} \mod 1 \mod p$. Then multiplying by $E_{p-1} : M_2(\Gamma_0(p), \mathbb{F}_p) \to M_{p+1}(\Gamma_0(p), \mathbb{F}_p)$ raises the level by $p-1$. Then we compose with the natural averaging map $M_{p+1}(\Gamma_0(p), \mathbb{F}_p) \to M_{p+1}(SL(2,\mathbb{Z}), \mathbb{F}_p)$, which is dual to the natural inclusion $M_{p+1}(SL(2,\mathbb{Z}), \mathbb{F}_p) \to M_{p+1}(\Gamma_0(p), \mathbb{F}_p)$.

Why isomorphism.? □

10 Non-Congruent Modular Forms

Cf.[Non-Congruuent Modular Forms, Ling Long].

Thm. (16.2.10.1) [Unbounded Denominators Conjecture]. Let N be any positive integer and let $f(\tau) \in \mathbb{Z}[[q^{1/N}]]$ for $q = \exp(\pi i \tau)$ be a holomorphic function on the upper half plane. Suppose there exists an integer k and a finite index $\Gamma \subset SL(2,\mathbb{Z})$ that f is Γ-invariant, and f is meromorphic at the cusps of Γ, then $f(\tau)$ is a modular form for some congruent subgroup of $SL(2,\mathbb{Z})$.

Proof: Cf.[the Unbounded Denominator Conjecture]. □

3

16.3 Adelic Automorphic Representations

Main references are [Bum98], [Gan07], [G-H11], [Borel, Casselman, Automorphic forms, representations and L-function (Corvallis)], [Automorphic Forms on GL(2), Jacquet and Langlands(1970)]. [Introduction to Langlands Program, Cogdell].

Notation (16.3.0.1).
- Use notations defined in Adeles and Ideles.
- Use notations defined in Admissible Representations of $\mathrm{GL}(n)$ over p-Adic Number Fields.
- Use notations defined in Arithmetic of Algebraic Groups.
- Use notations defined in Automorphic Representations over Archimedean Local Fields.
- Fix a global field F and let $\mathbf{A} = \mathbf{A}_F$.
- Fix a linear algebraic group $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}\,/F$ with center Z.
- Fix a central character $\omega : Z(\mathbf{A}_F)/Z(F) \to \mathbb{C}^\times$. Notice if $G = \mathrm{GL}(2)$, ω is just a Hecke character.

Def. (16.3.0.2) [Lie Algebra]. Let $\mathfrak{g}_\infty = \mathrm{Lie}(G(\mathbf{A}_\infty))$ be the Lie algebra of $G(\mathbf{A})$, $\mathcal{Z} = Z(U(\mathfrak{g}_\infty))$.

Notation (16.3.0.3) [Group-Theoretic Notations].
- If $G = \mathrm{GL}(n)$, B is the Borel subgroup of upper triangular matrices, $\mathrm{Unip}(n)$ is the subgroup of upper triangle unipotent matrices.
- M_n is the **mirabolic subgroup** of B with $a_{n,n} = 1$, which is isomorphic to $\mathrm{GL}(n-1) \ltimes \mathbb{A}^n$.
- T the group of diagonal matrices. T_1 is the subgroup of T that $a_{nn} = 1$.
- Denote w^0 the matrix$= \sum_{i=1}^n e_{i,n-i}$.
- If $n = 2$, denote $w_0 = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}, w_1 = \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}$,
$$t(y) = \begin{bmatrix} y & \\ & y^{-1} \end{bmatrix}, \quad n(z) = \begin{bmatrix} 1 & z \\ & 1 \end{bmatrix} \quad y \in F^*, z \in F.$$
following6.

Def. (16.3.0.4). For $\alpha \in F^{n-1}$, let $\psi_{N,\alpha}$ be a character of $N(F)$ given by $\psi_N(g) = \sum_i \psi(\alpha_i g_{i,i+1})$. For $\alpha = (1, \ldots, 1)$, denote $\psi_{N,\alpha}$ by ψ_N.

Def. (16.3.0.5) [Global Norm]. Take an embedding $G \hookrightarrow \mathrm{GL}(n)$ over F. Define the norm on $G(\mathbf{A}_F)$ by
$$||g|| = \prod_v \max(|g_{ij}|_v, |g_{ij}^{-1}|_v).$$
Notice in non-Archimedean places $||g||_v = 1$ for $g \in GL(m, \mathcal{O}_v)$, so it is definable.

Remark (16.3.0.6) [Delete]. The reason to formulate automorphic forms in the Adelic setting:

1: we want a theory that deals with $\mathcal{A}(G, \Gamma)$ for all choices of Γ simultaneously.

2: we want a framework in which the roles of the $(\mathfrak{g}, K)$-action and the $\mathcal{H}(G, \Gamma)$-action are parallel, i.e. so that they are actions of the same kind.

3: To describe the process of attaching an L-function to a classical modular form in terms of representation theory, it is cleanest to use the adelic framework, as demonstrated in Tate's thesis.

4: The questions about the absolute Galois group $\mathrm{Gal}_{\mathbb{Q}}$, like what finite groups are quotients of $\mathrm{Gal}_{\mathbb{Q}}$, or where there extensions of $\mathbb{Q}$ with given ramification conditions, can be understood via automorphic forms. And automorphic forms can be understood via Langlands dual groups.

1 Automorphic Representations

Admissible Representations and Tensor Product Theorem

Def. (16.3.1.1) [Admissible Representations]. A **smooth representation** of $G(\mathbf{A}_F)$ is defined to be a commuting smooth $G(A_f)$-action and a $(\mathfrak{g}_\infty, K_\infty)$-module structure(13.3.3.5). The category of smooth representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Rep}^{\mathrm{alg}}(G/F)$.

Any $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(G(\mathbf{A}_F))$ induces a representation of $K = K_f \times K_\infty$. Then this representation is called an **admissible representation** iff every vector is K-finite, and for any irreducible representation ρ of K, $\dim V^\rho < \infty$. By(15.1.5.32), it can be checked that this is equivalent to: for any irreducible representation ρ_∞ of K_∞ and an open compact subgroup $U \subset K_f$, $\dim V^{\rho_\infty} \cap V^U < \infty$. The category of admissible representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Rep}^{\mathrm{adm}}(G/F)$.

Def. (16.3.1.2) [Restricted Tensor Representation]. Given a set of locally compact groups G_v and a.e. their compact subgroups K_v, $(\rho_v, V_v) \in \mathrm{Rep}^{\mathrm{alg}}(G_v), \xi_v^0 \in V_v^{K_v}$ are given for a.e. v, then we can define the **restricted tensor representation**

$$(\rho, V) = \bigotimes_v{}' (\rho_v, V_v, \xi_v^0)$$

of $G(\mathbf{A}_F) = \prod'(G_v, K_v)$ on $\otimes_v' V_v$ by

$$\rho(\otimes_v g_v)(\otimes_v \xi_v) = \otimes_v \rho_v(g_v)\xi_v.$$

Def. (16.3.1.3) [Global Hecke Algebra]. For $v \in \Sigma_F$, let $\mathcal{H}_{G(F_v)}$ be the Hecke algebras constructed in(15.1.5.19) and(15.9.4.11). As $\mathcal{H}_{G(F_v)}$ has a spherical idempotent $e_v^0 = e_{K_v}$(16.3.1.1), we can define the **global Hecke algebra**

$$\mathcal{H}_{G(\mathbf{A}_F)} = \bigotimes_v{}' (\mathcal{H}_{G(F_v)}, e_v^0).$$

Then by definition of representations in(16.3.1.12) and(15.9.4.12)(15.1.5.23),

$$\mathrm{Rep}^{\mathrm{alg}}(G(\mathbf{A}_F)) = \mathrm{Rep}^{\mathrm{alg}}(\mathcal{H}_{G(\mathbf{A}_F)}).$$

Thm. (16.3.1.4) [Tensor Product Theorem, Flath]. For $(\rho, V) \in \mathrm{Irr}^{\mathrm{adm}}(G/F)$, there exists uniquely for each $v \in \Sigma_F^\infty$ a $(\rho_v, V_v) \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}_\infty, K_v))$, and for each $v \in \Sigma_F^{\mathrm{fin}}$ a $(\pi_v, V_v) \in \mathrm{Irr}^{\mathrm{alg}}(G(F_v))$ s.t. for a.e. v, V_v contains a non-zero K_v-fixed vector ξ_v^0, and

$$(\rho, V) = \bigotimes{}' (\rho_v, V_v, \xi_v^0).$$

Conversely, any such a restricted tensor product is in $\mathrm{Irr}^{\mathrm{adm}}(G/F)$.

Proof: By considering the global Hecke algebra, this follows immediately from(16.3.1.3) and(15.9.4.12)(15.1.5.23) □

Cor. (16.3.1.5)[Contragradient Representations]. For any $\rho = \otimes_v \rho_v \in \mathrm{Irr}^{\mathrm{adm}}(G/F)$, we can define the **contragradient** of ρ as $\widehat{\rho} = \otimes_v \widehat{\rho_v}$(15.1.2.7) $\in \mathrm{Irr}^{\mathrm{adm}}(G/F)$.

Cor. (16.3.1.6)[Irreducible Representations of K].

$$\mathrm{Irr}(K) = \bigotimes_v{}' \mathrm{Irr}(K_v).$$

Proof: This is similar to the proof of(16.3.1.4). □

Automorphic Representations

Def. (16.3.1.7) [L^2-Space]. Define $L^2(G/F,\omega)$ the space of all measurable functions φ on $G(A)$ that satisfies

$$\varphi(zg) = \omega(z)\varphi(g), \forall z \in Z(A), \quad \varphi(\gamma g) = \varphi(g), \forall \gamma \in G(F)$$

and square integrable module the center:

$$\int_{Z(A)G(F)\backslash G(A)} |\varphi(g)|^2 dg < \infty.$$

Then the right action of $G(A)$ on $L^2(G(F)\backslash G(A),\omega)$ is continuous, by(10.11.2.9).

Def. (16.3.1.8) [Cuspidality]. A function $\varphi \in L^2(G(F)\backslash G(\mathbf{A}_F),\omega)$ is called **cuspidal** iff for any proper parabolic subgroup $P = MU$, where U is the unipotent radical,

$$\int_{U(F)\backslash U(\mathbf{A}_F)} \varphi(ng)dn = 0$$

a.e. $g \in G(\mathbf{A}_F)$. The closed space of all cuspidal elements in $L^2(G(F)\backslash G(\mathbf{A}_F),\omega)$ is denoted by $L^2_0(G(F)\backslash G(A),\omega)$. $L^2_0(G(F)\backslash G(A),\omega)$ is stable under the right action of $G(A)$.

Thus a function $\varphi \in L^2(GL(n,F)\backslash GL(n,\mathbf{A}_F),\omega)$ is cuspidal iff

$$\int_{M_{r\times s}(F)\backslash M_{r\times s}(A)} \varphi(\begin{bmatrix} I_r & X \\ & I_s \end{bmatrix} g)dX = 0$$

a.e. g for any $r + s = n, 1 < r < n$, as these are the maximal proper parabolic subgroups of $\mathrm{GL}(n)$.

Def. (16.3.1.9)[Smooth Functions on $G(\mathbf{A}_F)$].

- The space $C^\infty(G(\mathbf{A}_F))$ of **smooth functions on** $G(\mathbf{A}_F)$ is defined to be the restricted tensor product $\bigotimes' C^\infty(G_v)$ w.r.t. $f_{v,0} = \chi_{\mathcal{K}_v}$.
- The space $C_c^\infty(G(\mathbf{A}_F))$ of **compactly supported smooth functions on** $G(\mathbf{A}_F)$ is defined to be the restricted tensor product $\bigotimes' C_c^\infty(G_v)$ w.r.t. $f_{v,0} = \chi_{K_v}$. $C_c^\infty(G(A))$ acts on $L^2(G(F)\backslash G(\mathbf{A}_F),\omega)$.
- $G(\mathbf{A}_F)$ acts on $C^\infty(G(\mathbf{A}_F))$ by right translation, and induces an action of $\mathfrak{g}_\infty$ thus an action of $U(\mathfrak{g}_\infty)$ on it. A function f is called $\mathcal{Z}$-finite if it is contained in a f.d. space that is invariant under the action of $\mathcal{Z}$.
- A **K-finite function** $f \in C^\infty(G(\mathbf{A}_F))$ is a vector that is contained in a f.d. space that is right-invariant under K. Equivalently, it is $\mathcal{K}_\infty$-finite and is right-invariant under an open compact subgroup of $G(A_f)$.

- A function $f \in C^\infty(G(\mathbf{A}_F))$ is said to **have moderate growth** iff $|f(g)| \leq C||g||^N$(16.3.0.1) for some constant $C > 0$ and any $g \in G(\mathbf{A}_F)$.
- A function $f \in C^\infty(G(\mathbf{A}_F))$ is said to be **rapidly decreasing** if for any $k \in \mathbb{Z}_+$, $|f(g)| \leq C_k||g||^{-k}$ for any $g \in G(\mathbf{A}_F)$ and some constant C_k.

Def. (16.3.1.10) [Adelic Automorphic Forms]. We denote by $\mathcal{A}(G/F,\omega)$ the space of **adelic automorphic forms** consisting of smooth functions on $G(\mathbf{A}_F)$(16.3.1.9) that satisfies

- $\varphi(zg) = \omega(z)\varphi(g), \forall z \in Z(A), \quad \varphi(\gamma g) = \varphi(g), \forall \gamma \in G(F)$.
- K-finite and $\mathcal{Z}$-finite(16.3.1.9).
- of moderate growth(16.3.1.9).

And the space $\mathcal{A}_0(G/F,\omega)$ of **cusp forms** the automorphic forms that is cuspidal in sense of(16.3.1.8). $\mathcal{A}(G/F,\omega)$ is a $(\mathfrak{g}_\infty, K_\infty)$-module, and $G(A_F^f)$ acts smoothly on it. The subspace $\mathcal{A}_0(G/F,\omega)$ is stable under both actions.

Prop. (16.3.1.11) [Analytic Properties]. Any automorphic form f is real analytic when restricted to $G(\mathbf{A}_\infty)$, and is of moderate growth.

Any cusp form f is rapidly decreasing. In particular, $f \in L^2_0(G/F)$ if G is semisimple.

Proof: It is real analytic by(16.1.1.29). The growth condition reduces immediately to the Archimedean case(16.1.3.7). □

Def. (16.3.1.12) [Automorphic Representations]. $\mathcal{A}(G/F,\omega)$ and $\mathcal{A}_0(G/F,\omega)$ afford smooth representations of $GL(n,A)$ by definition(16.3.1.10). So we define an **automorphic representation** to be an irreducible smooth representation of $G(A)$ that can be realized as a quotient of a subrepresentation of $\mathcal{A}(G/F,\omega)$, and an **automorphic cuspidal representation** to be an irreducible smooth representation of $G(\mathbf{A}_F)$ that can be realized as a subrepresentation of $\mathcal{A}_0(G(F)\backslash G(\mathbf{A}),\omega)$. The category of automorphic representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Irr}^{\mathrm{auto}}(G/F,\omega)$. The category of cuspidal representations of $G(\mathbf{A}_F)$ is denoted by $\mathrm{Irr}^{\mathrm{cusp}}(G/F,\omega)$.

Remark (16.3.1.13). There is a general method of constructing subrepresnetations of $\mathcal{A}(G(F)\backslash G(A),\omega)$ using Eisenstein series**?**, but no known methods for constructing subrepresnetations of $\mathcal{A}_0(G(F)\backslash G(A),\omega)$.

Thm. (16.3.1.14) [Automorphic Representations are Admissible, Harish-Chandra].

$$\mathrm{Irr}^{\mathrm{cusp}}(G/F,\omega) \subset \mathrm{Irr}^{\mathrm{auto}}(G/F,\omega) \subset \mathrm{Irr}^{\mathrm{adm}}(G/F).$$

Proof: Le $V_1 \subset V_2 \subset \mathcal{A}(G(F)\backslash G(A),\omega)$ be submodules s.t $V_2/V_1 \cong \pi$, then we can assume V_2 is generated by an element $f \in V_2 \backslash V_1$, because otherwise change V_2 by the submodule V_2' generated by f and V_1 by $V_1 \cap V_2'$.

f is killed by an ideal J_∞ of finite codimension in $\mathcal{Z}_\infty$, and is invariant under the action of a compact open subset $U \subset G(\mathbf{A}_F^f)$. Let

$$G(F)\backslash G(A)/U = \coprod_i \Gamma_i \backslash G(A_\infty)$$

as in(13.3.3.13), then there is an isomorphism of $(\mathfrak{g}_\infty, K_\infty)$-modules

$$\mathcal{A}(G(F)\backslash G(A),\omega,J_\infty)^U \cong \oplus_i \mathcal{A}(\Gamma_i\backslash G(A_\infty),1,\omega_\infty,J_\infty)(16.1.4.10),$$

which is admissible by the fundamental theorem of Harish-Chandra(16.1.4.10). Thus $V_2 \subset \mathcal{A}(G(F)\backslash G(A),\omega,J)^U$ is also admissible. □

2 $\mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$

Main references are [Bum98]Chap3.

Basics

Prop. (16.3.2.1). $GL(n,\mathbf{A}_F)$ is unimodular.

Proof: This is because $GL(n,F_v)$ is unimodular for any $v\in\Sigma_F$ and because we can calculate the restricted product measure by(12.4.5.5). □

Def. (16.3.2.2) [Congruence Subgroups]. For $N\in\mathbb{Z}_+$, define the congruence subgroup(13.3.2.3) $\mathcal{K}_0(N)\subset GL(2,\mathbf{A}_F^f)$ as follows: $\mathcal{K}_0(N)=\prod_{v\in\Sigma_F^{\mathrm{fin}}}\mathcal{K}_0(N)_v$, where

$$\mathcal{K}_0(N)_v=\begin{cases}GL(2,\mathcal{O}_v) & v\nmid N\\ \mathcal{K}_0(N_v)\subset F_v(15.11.1.8) & v|N\end{cases}$$

Prop. (16.3.2.3). If $F=\mathbb{Q}$, then the inclusion induces homeomorphisms

$$\Gamma_0(N)\backslash GL(2,\mathbb{R})^+\cong GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N).$$

$$\Gamma_0(N)\backslash SL(2,\mathbb{R})\cong GL(2,\mathbb{Q})Z(A)\backslash GL(2,A)/K_0(N)$$

Thus the definition of congruence subgroups(16.2.1.1) are compatible with that of(13.3.3.13)

Proof: Because $\mathrm{Cl}(\mathbb{Q})=1$ and $\det(\mathcal{K}_0(N))=\prod_{v\in\Sigma_F^{\mathrm{fin}}}\mathcal{O}_v^*$, item3 of(13.3.3.12) shows

$$GL(2,A)=GL(2,\mathbb{Q})GL(2,\mathbb{R})K_0(N)=GL(2,\mathbb{Q})GL(2,\mathbb{R})^+K_0(N),$$

so the map

$$GL(2,\mathbb{R})^+\to GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N)$$

is surjective. Now if g'_∞ and g_∞ has the same image, then $g'_\infty=\gamma g_\infty k_0$, so $g'_\infty=\gamma_\infty g_\infty,\gamma_f=k_0^{-1}$. Then γ_∞ belongs to $\Gamma_0(N)$. Thus there is a bijection

$$\Gamma_0(N)\backslash GL(2,\mathbb{R})^+\cong GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N).$$

2 follows from 1 by modulo the center. □

Cor. (16.3.2.4). The quotient space $GL(n,F)Z(A)\backslash GL(n,A)$ has finite measure.

Proof: For the general case, Cf.[Humphreys, Arithmetic Groups, (1980)**?**].

Because $K_0(N)$ is compact, it suffices to prove that $GL(n,F)Z(A)\backslash GL(n,A)/K_0(N)$ has finite measure(because $GL(n,F)$ and $GL(n,A)$ are both unimodular, the measure is compatible). But this space is homeomorphic to $\Gamma_0(N)\backslash SL(2,\mathbb{R})$, which has finite measure because $\Gamma(1)\backslash SL(2,\mathbb{R})$ does and $\Gamma_0(N)$ is of finite index in $\Gamma(1)$. □

Def. (16.3.2.5) [Global Siegel Sets]. For $c,d>0$, then the global Siegel set $\mathfrak{S}_{c,d}=K_f\times\mathfrak{S}_{c,d,\infty}$??. And denote $\overline{\mathfrak{S}_{c,d}}$ its image in $Z(A)\backslash GL(2,A)$.

Prop. (16.3.2.6). For c,d suitable chosen, $GL(2,A)=GL(2,F)\mathfrak{S}_{c,d}$.

Proof: We prove only for $F=\mathbb{Q}$**?**: This is true for $c\le\sqrt{3}/2$ and $d\ge 1$ because of the shape of the fundamental domain of $GL(2,\mathbb{R})$ for $SL(2,\mathbb{Z})$(16.2.1.6). □

Prop. (16.3.2.7) [Contragradient Representations]. For $(\pi,V)\in\mathrm{Irr}^{\mathrm{adm}\,/\,\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega)$,

- its contragradient $(\widehat{\pi},\widehat{V})\in\mathrm{Irr}^{\mathrm{adm}\,/\,\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega^{-1})$, and $\widehat{V}$ can be chosen to be the space of all functions $g\mapsto\varphi(g^{-t})$.
- if $n=2$, then $\widehat{\pi}\cong\pi\otimes(\omega^{-1}\circ\det)$.

Proof: It suffices to analyze each place. Notice for cuspidal representations, it suffices to show for finite places, because we can use strong multiplicity one(16.3.3.8).

For admissible case we only prove for $n=2$ and F totally real(the problem is we haven't studied $\mathbb{C}$).**?**

Let $\widehat{V}$ be the space of functions of the form $\widehat{\varphi}(g)=\varphi(g^{-t})$, then the right action of G on $\widehat{V}$ corresponds back to the restriction of the right action composed with the automorphism $g\mapsto g^{-t}$. Thus the result follows from(15.11.1.15) and its Archimedean analogy for $(\mathfrak{g}_\infty,K_\infty)$-modules(15.9.3.35). □

Spectral Problem

Prop. (16.3.2.8) [Gelfand, Graev and Piatetski-Shapiro]. Let $\varphi\in C_c^\infty(GL(n,A))$, then

- There exists a constant $C(\varphi)$ that for all $f\in L^2_0(GL(n,F)\backslash GL(n,A),\omega)$, we have $||\rho(\varphi)f||_{C(G)}\le C(\varphi)||f||_2$.
- $\rho(\varphi)$ is a compact operator on $L^2_0(GL(n,F)\backslash GL(n,A),\omega)$.

Proof: The proof is the same as that of(16.1.4.6), but use global Siegel sets(16.3.2.5), Cf.[Bump, P297]**?**. □

Cor. (16.3.2.9) [$L^2_0(GL(n,F)\backslash GL(n,A),\omega)$ Totally Decomposable]. The space $L^2_0(GL(n,F)\backslash GL(n,A),\omega)$ decomposes into a Hilbert space direct sum of irreducible invariant subspaces over $GL(n,A)$.

Proof: The proof is exactly the same as(16.1.4.2), but where we use(16.3.2.8) in place of(16.6.2.1) and lemma**??** in place of lemma(15.9.4.1). □

Prop. (16.3.2.10) [Irreducible Cuspidal Representations Admissible]. If $(\pi,V)\in\mathrm{Irr}^{\mathrm{uni}}(GL(n,A))$ is contained in the decomposition of $\mathcal{H}=L^2_0(GL(n,F)\backslash GL(n,A),\omega)$ in(16.3.2.9), then $V^{K-\mathrm{fin}}\subset V$ is dense, $V^{K-\mathrm{fin}}\subset\mathcal{A}_0(GL(n,F)\backslash GL(n,A),\omega)\in\mathrm{Rep}^{\mathrm{alg}}(\mathrm{GL}(n)/F,\omega)$.

In particular,

$$\mathcal{A}_0(GL(n,F)\backslash GL(n,A),\omega)\subset L^2_0(GL(n,F)\backslash GL(n,A),\omega),$$

and

$$\mathcal{A}_0(GL(n,F)\backslash GL(n,A),\omega)=\bigotimes_{\pi\in\mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F,\omega)} m_\pi\pi$$

by(16.3.1.11) and(16.3.2.9).

Proof: This is general by(15.9.4.4), and for the containment in $\mathcal{A}_0$ by a similar argument as in(16.1.4.8) using a similar lemma as lemma(16.1.4.7).

The irreducible smooth $GL(n,A)$-representations are admissible by(16.3.1.14). □

Adelization

Prop. (16.3.2.11) [Global Hecke Algebra]. There are isomorphisms

$$\Gamma_0(N)\backslash G_0(N)/\Gamma_0(N)(16.2.1.2) \cong \prod_{v\in\mathbf{P}\backslash S_f(N)}{}' K_v\backslash GL(2,\mathbb{Q}_v)/K_v.$$

$$\Gamma_0(N)\backslash G_0(N) \cong \prod_{v\in\mathbf{P}\backslash S_f(N)}{}' K_v\backslash GL(2,\mathbb{Q}_v)$$

which induces an isomorphism $\mathcal{R}_N \cong \prod_{v\in\mathbf{P}\backslash S_f(N)} \mathcal{H}_{K_v}$(16.2.3.2)(15.11.1.13).

Prop. (16.3.2.12) [Adelization of Maass Forms]. Let χ be a Dirichlet character (mod N) and ω be the adelized Hecke character of χ(12.4.5.32), then define a character λ_d of $K_0(N)$(16.3.2.2) by

$$\lambda_d(\begin{bmatrix}a & b\\ c & d\end{bmatrix}) = \prod_{v\in S_f(N)} \omega_v(d_v).$$

By(16.3.2.3) there is a homeomorphism

$$\Gamma_0(N)\backslash GL(2,\mathbb{R})^+ \cong GL(2,\mathbb{Q})\backslash GL(2,A)/K_0(N),$$

which induces a map

$$f\mapsto \varphi_f : C^\infty(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi_d|\cdot|^\lambda) \to C^\infty(GL(2,\mathbb{Q})\backslash GL(2,A),\omega|\cdot|^\lambda) : \varphi(\gamma g_\infty k_0) = f(g_\infty)\lambda_d(k_0)$$

and this map identifies K-finiteness, $\mathcal{Z}$-finiteness and moderate growth, thus induces a map

$$\mathcal{A}(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi_d) \to \mathcal{A}(GL(2,\mathbb{Q})\backslash GL(2,A),\omega)$$

compatible with $(\mathfrak{g}_\infty, K_\infty)$-action, and the image are the automorphic forms satisfying $\pi(k_0)\varphi = \lambda(k_0)\varphi$ for $k_0\in K_0(N)$.

This map also identifies cuspidality, thus it induces a map

$$\mathcal{A}_0(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+,\chi_d) \to \mathcal{A}_0(GL(2,\mathbb{Q})\backslash GL(2,A),\omega)$$

Proof: To show that $\varphi_f(zg) = \omega(z)\varphi_f(g)$ for $z\in A^*$, notice by(12.4.5.30), $Z(A^\times) = Z(\mathbb{Q}^\times)Z(\mathbb{R}_+^\times)(Z(A)\cap K_0(N))$, and for these elements $\varphi_f(zg) = \lambda(z)\varphi_f$, as ω is trivial on $\prod_{v\notin S_f(N)}\mathcal{O}_v^\times$.

It identifies moderate growth because $A^\times = \mathbb{Q}^\times\mathbb{R}_+^\times\prod_{v\nmid\infty}\mathcal{O}_v^\times$ again.

To show cuspidality, notice $x\mapsto \gamma(\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)$ is left-invariant under a if $g^{-1}\begin{bmatrix}1 & a\\ & 1\end{bmatrix}g\in K_0(N)$. but such a is open in A, thus contains some open compact subgroup $U_f\subset A_f$. Notice by strong approximation, $A = \mathbb{Q}\times\mathbb{R}\times U_f$, thus there is an isomorphism $\mathbb{R}/M\cong A/FU_f$. Now let $g = \gamma g_\infty k_0$, then

$$\int_{A/F}\varphi_f(\begin{bmatrix}1 & a\\ & 1\end{bmatrix}g) = C\int_{\mathbb{R}/M}\varphi_f(\begin{bmatrix}1 & x\\ & 1\end{bmatrix}g)dx = C\lambda(k_0)\int_0^M f(\gamma^{-1}\begin{bmatrix}1 & x\\ & 1\end{bmatrix}\gamma g_\infty),$$

which vanishes for each g iff f is cuspidal at every cusp. For similar reason, φ_f is of moderate growth iff f is of moderate growth at every cusp. □

Remark (16.3.2.13). Similar isomorphism happens for more general congruence subgroups, for example, we can change $\Gamma_0(N)$ to $\Gamma_1(N)$ and change $K_0(N)$ to

$$U_1(N) = \{\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathrm{GL}(2, \widehat{\mathbb{Z}}) : c \equiv 0 (\mathrm{mod}\ \ N), d \equiv 1 (\mathrm{mod}\ \ N)\}.$$

Prop. (16.3.2.14) [Strong Multiplicity One].

- Let f be a cuspidal eigenfunction in $\mathcal{A}_0(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+, \chi)$ of a.e. Hecke operators T_p for $p \nmid N$, then φ_f lies in an irreducible subspace of $L_0^2(GL(2,F)\backslash GL(2,A), \omega)$.
- If f, g are cuspidal eigenfunctions for a.e. Hecke operators in $\mathcal{A}_0(\Gamma_0(N)\backslash GL(2,\mathbb{R})^+, \chi)$ of a.e. Hecke operators T_p for $p \nmid N$, then $f = g$.

In particular, any Hecke eigenform generates a cuspidal representation.

Proof: 2: By(16.3.2.9), consider the projection of φ_f to any irreducible cuspidal representation π. By(16.3.2.11), φ_f is an eigenform of the Hecke operator T_p. But it is also eigenvalues of the Hecke operator R_p, But $\mathcal{H}_{\mathbb{Q}_p}$ is generated by T_p, R_p, R_p^{-1} by(16.2.3.10), so π_p is spherical with determined eigenvalues. But then π_v is determined by(2.4.4.12). Then π is determined by strong multiplicity one(16.3.3.8).

1 follows from 2 because if π is a component of $L_0^2(GL(2,F)\backslash GL(2,A), \omega)$ that the projection of φ_f is non-zero, then it has the same Hecke eigenvalue as φ_f, so it must be just φ_f by item2.

Cf.[Bump, P344]. □

Remark (16.3.2.15). WARNING: This is in general not true for groups other than $\mathrm{GL}(n)$. This is related to the theory of L-packets and A-packets.**?**

Remark (16.3.2.16) [Adelized Maass Forms]. Notice if f comes from a Maass form, then [G-H11] documented the properties of the adelized Maass form φ_f in detail.

Ramanujan Conjecture

Conj. (16.3.2.17) [Ramanujan]. If ω is unitary and $\rho = \otimes' \rho_v \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega)$, then for any $v \in \Sigma_F$, ρ_v is tempered(15.11.6.3).

Proof: □

Prop. (16.3.2.18). The Ramanujan conjecture(16.3.2.17) implies the Ramanujan-Petersson conjecture(19.2.6.16).

Proof: The Ramanujan-Petersson conjecture says the eigenvalue λ_p of T_p on f satisfies $|\lambda_p| \leq 2p^{1/2}$. Consider the irreducible cuspidal representation π_f generated by φ_f(16.3.2.14), then T_p is the same as the eigenvalue of the local Hecke algebra T_p on φ_f. But $\pi_{f,p}$ is unramified, thus by(15.11.6.10) it is unitary principal or complementary. But notice if the Satake parameters of $\pi_{f,p}$ are α_i, then $\lambda_p = p^{1/2}(\alpha_1 + \alpha_2)$, Then it suffices to show that $|\alpha_1 + \alpha_2| \leq 2$, which is equivalent to π_p being tempered(15.11.6.10). □

Conj. (16.3.2.19) [Generalized Ramanujan Conjecture]. Let G be a reductive group over a global field F, and $\pi \in \mathrm{Irr}^{\mathrm{cusp},generic}(G/F, \omega)$, then π is tempered. Notice this implies the Ramanujan conjecture, as any $\rho \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega)$ is generic(16.3.3.3).

Proof: □

Remark (16.3.2.20) [Arthur Conjecture]. In fact, Arthur extends this conjecture further, and explains the extent of failure of the Ramanujan conjecture for irreducible representations in the discrete spectrum of $L^2(G(\mathbb{F})\backslash G(\mathbb{A}))$, as well as the multiplicities in the discrete spectrum.

3 Whittaker Models

Def. (16.3.3.1)[Whittaker Models]. The notion of **Whittaker model** and **Whittaker functional**, genericness the same as in the local case(15.11.3.1).

Prop. (16.3.3.2) [Global uniqueness of Whittaker Models]. Let (π, V) be an irreducible admissible representation of $GL(2, A)$, then (π, V) has a Whittaker model w.r.t ψ iff each (π_v, V_v)(16.3.1.4) has a Whittaker model $\mathcal{W}(\pi_v, \psi_v)$. If this is the case, then $\mathcal{W}(\pi, \psi)$ is unique and

$$\mathcal{W}(\pi, \psi) = \bigotimes{}'(W_v, W_v^0)$$

where W_v^0 are the unique spherical function(15.11.5.15) of $\mathcal{W}_v$ normalized s.t. $W_v^0(K_v) = 1$.

Proof: Let $(\pi, V) = \otimes_v'(\pi_v, V_v)$ w.r.t a.e. spherical vectors ξ_v^0 by tensor product theorem(16.3.1.4), and (π_v, V_v) are spherical a.e. v.

Firstly if every (π_v, V_v) has a Whittaker model, the W in the proposition is truly a Whittaker model: functions in $\mathcal{W}(\pi, \psi)$ are clearly smooth and K-finite, and they have moderate growth because each local part is, and for a.e. v, $\mathcal{W}_v(\pi, \psi)$ is compactly supported on $|x|_v \leq 1$. And there is a canonical isomorphism of V onto $\mathcal{W}(\pi, \psi)$ by letting $(W_\xi)_v = W_v^0$ if $\xi_v = \xi_v^0$ and

$$W_\xi(g) = \prod_v W_{v,\xi_v}(g_v).$$

This is definable because $g_v \in K_v$ for a.e. v thus $W_{v,\xi_v}(g_v) = W_v^0(g_v) = 1$ for a.e. v.

Because the local Whittaker models are all rapidly decreasing, and the spherical Whittaker model vanishes for $|\xi_v|_v > 1$, thus W is also rapidly decreasing, and is a Whittaker model for π.

Secondly if $\mathcal{W}$ is a Whittaker model for (π, V), denote $\xi \mapsto W_\xi$ the isomorphism of V onto $\mathcal{W}$. Notice there exists some $\xi \in V$ that $W_\xi(1) \neq 0$: if $W_\xi(g_\infty g_f) \neq 0$, then $W_{\pi(g_f)\xi}(g_\infty) \neq 0$, and argue the same way as in(16.1.3.4). We may assume $\xi^0 = \otimes_v \xi_v^0$ that $W_{\xi^0}(1) = 1$.

Consider the "pullback" of W to $GL(n, F_v)$ via ξ, then they are clearly Whittaker models for (π_v, V_v) thus unique(13.3.1.5)(16.1.3.3), and also $W_{v,\xi_v^0}(1) = 1$. So W_v^0 exists a.e. uniquely. Now we prove W is of the form we said above, this will prove uniqueness.

Then we need to prove

$$W_\xi(g) = \prod_v W_{v,\xi_v}(g_v)$$

We only need to prove for one $\xi = \xi^0$, because $\mathcal{W}, \mathcal{W}(\pi_v, \psi_v)$ are both irreducible. And also we can assume $g_v = 1, a.e.$, because $(W_\xi)_v(g_v) = W_{v,\xi_v}(g_v) = 1$, a.e.. Then we are in the finite case and we can multiply by scalars at f.m. v s.t. this equation is true and nonzero for g. □

Thm. (16.3.3.3) [Fourier Expansion and Existence of Whittaker Models, Shalika]. Given $(\pi, V) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega)$, for $\Phi \in V$, define

$$W_\Phi(g) = \int_{\mathrm{Unip}(n,F)\backslash\,\mathrm{Unip}(n,A)} \Phi(ng)\psi_N(-n)dn,$$

then $GL(n, \mathbf{A}_F)$ acts on these functions, and they form a Whittaker model $\mathcal{W}(\pi, \psi)$. $W_\Phi(g)$ is called the **Fourier-Whittaker coefficients** for Φ.

And we have a Fourier expansion formula:

$$\Phi(g) = \sum_{\gamma \in \mathrm{Unip}(n-1,F)\backslash GL(n-1,F)} W_\Phi(\begin{bmatrix} \gamma & \\ & 1 \end{bmatrix} g),$$

which converges absolutely and uniformly on compact subsets of $GL(n, \mathbf{A}_F)$.

Remark (16.3.3.4). This is false for some other groups, for the reason that the Fourier inversion may not be true, thus it map happen that all the Fourier coefficients vanish. For example, holomorphic Siegel modular forms on $\mathrm{Sp}(2n)$ don't have Whittaker models.

Proof: We only prove for $n = 2$. For general case, see the beautiful paper[Sha74] of Shlika**?**.

For any $g \in GL(n, A)$, consider $F(n) = \varphi(ng)$ on $N(A)$, then it is a continuous function on $N(F)\backslash N(A)$, and $N(F)\backslash N(A)$ is compact(12.4.5.12), so by Fourier inversion formula(10.11.3.17),

$$F(x) = \sum_{\alpha \in F} C(\alpha)\psi(\alpha x), \quad C(\alpha) = \int_{\mathrm{Unip}(n,F)\backslash \mathrm{Unip}(n,A)} \varphi(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)\psi(-\alpha x)dx.$$

Now $C(0) = 0$ because φ is cuspidal, and if $\alpha \in F^\times$, as φ is automorphic,

$$\begin{aligned} C(\alpha) &= \int_{\mathrm{Unip}(n,F)\backslash \mathrm{Unip}(n,A)} \varphi(\begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g)\psi(-\alpha x)dx \\ &= \int_{A/F} \varphi(\begin{bmatrix} 1 & \alpha x \\ & 1 \end{bmatrix} \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g)\psi(-\alpha x)dx = W_\varphi(\begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g). \end{aligned}$$

So if we let $x = 0$, we get $\Phi(g) = \sum_{\alpha \in F^\times} W_\Phi(\begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g)$.

Now we show $\{W_\Phi\}$ is Whittaker model: they all satisfies $W_\Phi(ng) = \psi(n)W_\Phi(g)$ by construction, and because $W_{X\varphi} = XW_\varphi$, $\rho(g)W_\varphi = W_{\rho(g)\varphi}$, it is clear that this space is invariant under action of $GL(2, A_f)$ and $(\mathfrak{g}_\infty, K_\infty)$, and also it is of moderate growth in y because φ does(16.3.1.10) and $N(F)\backslash N(A)$ is compact, and it consists of K-finite vectors because V is admissible(16.3.2.10). Finally, the Fourier inversion shows that $\varphi \mapsto W_\varphi$ is non-zero, thus injective. □

Cor. (16.3.3.5) [Cuspidal Forms Decay Rapidly]. Any cuspidal form on $GL(2, \mathbf{A}_F)$ is rapidly decreasing for $|y| \to \infty$.

Moreover, it also decays rapidly when $|y| \to 0$.

Remark (16.3.3.6). This is proved already in(16.3.1.11).

Proof: To show it is rapidly decreasing, use the Fourier expansion formula, and the fact the Whittaker model is product of local Whittaker models. Also for $v \in \Sigma_F^{\mathrm{fin}}$, the local Kirillov model is compactly supported(15.11.3.19), and for $v \in \Sigma_F^\infty$, the Whittaker model is rapidly decreasing(16.1.3.3), notice for any $g \in GL(2, A)$, for any C, the number of $a \in K^*$ that $\varphi(\begin{bmatrix} a & \\ & 1 \end{bmatrix} g) \neq 0$ and $|a|_\infty < C$ is bounded by a polynomial of C, thus it is rapidly decreasing.

For $|y| \to 0$, as φ is automorphic, notice

$$\varphi(\begin{bmatrix} y & \\ & 1 \end{bmatrix}) = \varphi(w_0 \begin{bmatrix} 1 & \\ & y \end{bmatrix} w_0) = \omega(y)(\pi(w_0)\varphi)(\begin{bmatrix} y^{-1} & \\ & 1 \end{bmatrix}).$$

□

Cor. (16.3.3.7). Every local component of a cuspidal representation of $GL(n, A)$ is generic, by(16.3.3.2).

Prop. (16.3.3.8) [Strong Multiplicity One for $\mathrm{GL}(n)$]. If $(\pi, V), (\pi', V') \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$ satisfy $\pi_v \cong \pi'_v$ a.e. v, then $\pi \cong \pi'$, and $V = V' \subset \mathcal{A}_0(\mathrm{GL}(n, F)\backslash GL(n, \mathbf{A}_F))$.

Proof: We only prove for $n=2$ and the case π_1, π_2 are isomorphic on Archimedean places**?**. For general n, Cf.[Representations of the Group $GL(n,K)$ where K is a local field, Gelfand-Kazhdan], [Euler Subgroups, in Lie Groups and their Representations, Piatetski-Shapiro(1975)]. For the Archimedean places, Cf.[Base Change for $GL(2)$, Langlands(1980)Lemma3.1]

Firstly if $\pi_v \cong \pi'_v$ for every place v, then their corresponding Whittaker model is the same(multiplied by a scalar) by(16.3.3.2). Then by(16.3.3.3) we have a Fourier expansion formula

$$\varphi(g) = \sum_{\alpha\in F^*} W_\varphi(\begin{bmatrix}\alpha & \\ & 1\end{bmatrix} g).$$

Thus $V = V'$.

In case that $\pi_v \cong \pi'_v$ only outside a finite set S, we choose functions W_v, W'_v in the local Whittaker model for π_v, π'_v s.t. if $v \notin S$, $W_v = W'_v$ and W_v is the unique spherical function normalized that $W_v(K_v) = 1$ a.e. v, and if $v \in S$, they are chosen that

$$F(y) = W_v(\begin{bmatrix}y & \\ & 1\end{bmatrix}) = W'_v(\begin{bmatrix}y & \\ & 1\end{bmatrix}) \in C_c^\infty(F_v^\times),$$

which is possible by(15.11.3.20). And we define

$$\varphi(g) = \sum_{\alpha\in F^*} W(\begin{bmatrix}\alpha & \\ & 1\end{bmatrix} g), \quad \varphi'(g) = \sum_{\alpha\in F^*} W'(\begin{bmatrix}\alpha & \\ & 1\end{bmatrix} g),$$

$$W(g) = \prod_v W_v(g_v), \quad W'(g) = \prod_v W'_v(g_v).$$

as in(16.3.3.3).

Then we claim $\varphi = \varphi'$ on $GL(2,A)$: $\varphi \in V, \varphi' \in V'$ are automorphic, thus $\varphi = \varphi'$ on $GL(2,F)GL(2,\mathbf{A}_F^S)$ by continuity, which is just $GL(2,\mathbf{A}_F)$ by weak approximation, so we have a $\varphi \in V \cap V'$, meaning $V = V'$. □

4 Eisenstein Series

References are [Bump, Chap3].

Prop. (16.3.4.1)[Langlands]. For any $\rho \in \mathrm{Irr}^{\mathrm{auto}}(G/F,\omega)$, there exists a parabolic subgroup $P = MN$ and $\sigma \in \mathrm{Irr}^{\mathrm{cusp}}(M/F)$ that π is a subquotient of $I_P(\sigma)$.

Proof:

□

Remark (16.3.4.2). The pair (M,σ) may not be unique up to conjugacy. It is unique for $GL(n)$, by a theorem of Jacquet-Shalika, but in general it is false. For example, Waldspurger showed for $G = \mathrm{PGSp}(4)$ that there are cuspidal representations π that are abstractly isomorphic to a subquotient of some $I_P(\sigma)$ with σ cuspidal on $M = GL(2)$. These are called **CAP representations**.

16.4 Overview of the Langlands Program

1 Langlands Program

Main references are [Lan70]. Cf. Arthur's work on stabilization of trance formula, proof of the fundamental lemma by Laumon-Ngo, and inputs from Shin, Morel, Harris-etc..

Def. (16.4.1.1) [Langland Dual Groups]. For any connected reductive group G over a global field F, we want to define a complex analytic group ${}^LG_F$, and for each place $\mathfrak{p}$, a complex analytic group ${}^LG_{F_\mathfrak{p}}$, and complex analytic homomorphisms ${}^LG_{F_\mathfrak{p}} \to {}^LG_F$ defined up to conjugacy. The definition is given in [Lan70].

Then for each complex analytic representation σ of ${}^LG_F$ and automorphic representation π of $G_{A(F)}$, we want to define an L-function

$$L(s,\sigma,\pi) = \prod_{\mathfrak{p}} L(s,\sigma_\mathfrak{p},\pi_\mathfrak{p})$$

that is convergent in some right half plane, and

$$L(s,\sigma_\mathfrak{p},\pi_\mathfrak{p}) = \prod_{i=1}^n \frac{1}{1-\alpha_i|\varpi_\mathfrak{p}|^s}$$

for any non-Archimedean plane $\mathfrak{p}$, where $n = \deg(\sigma_\mathfrak{p})$.

Also there is a functional equation

$$L(s,\sigma,\pi) = \varepsilon(s,\sigma,\pi)L(1-s,{}^L\sigma,\pi)$$

with

$$\varepsilon(s,\sigma,\pi) = \prod_{\mathfrak{p}} \varepsilon(s,\sigma_\mathfrak{p},\pi_\mathfrak{p},\psi_{F_\mathfrak{p}})$$

for any non-trivial character ψ of $F\backslash A(F)$, where the product is finite.

Conj. (16.4.1.2). Is it possible to define the local L-functions $L(s,\rho,\pi)$ and the local factors $\varepsilon(s,\rho,\pi,\psi_F)$ at the ramified primes that

$$L(s,\sigma,\pi) = \prod_{\mathfrak{p}} L(s,\sigma_\mathfrak{p},\pi_\mathfrak{p})$$

is meromorphic in the entire complex plane with only a finite number of poles and satisfies the functional equation.

Conj. (16.4.1.3). Suppose G, G' are reductive groups over the local field F and G is quasi-split and G' is an inner twist of G, then ${}^LG_F = {}^LG'_F$. Is there a correspondence $\mathrm{Irr}(G'_F) \to \mathrm{Irr}(G_F)$ s.t. if $\pi = R(\pi')$, then $L(s,\rho,\pi) = L(s,\rho,\pi')$ for any representation ρ of ${}^LG_F$?

Conj. (16.4.1.4) [Local Functorial Lifting]. Let G, G' be two quasi-split groups over the local field F. Let G split over K and K' where $F \subset K \subset K'$. Suppose $\varphi : {}^LG'_{K'/F} \to {}^LG_{K/F}$ is a complex analytic homomorphism that makes the diagram

$$\begin{array}{ccc} {}^LG'_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^LG_{K/F} & \longrightarrow & G(K/F) \end{array}$$

commutative, is there a correspondence $r_\varphi : \mathrm{Irr}(G'_F) \to \mathrm{Irr}(G_F)$ that if $\pi = R_\varphi(\pi')$, then for any representation ρ of ${}^LG_F$,

$$L(s,\rho,\pi) = L(s,\rho\circ\varphi,\pi'), \varepsilon(s,\rho,\pi,\psi_F) = \varepsilon(s,\rho\circ\varphi,\pi',\psi_F).$$

Such a correspondence is called a **functorial lifting** of π'.

Some evidences of(16.4.1.6) is given in[Lan70]P17.

Global Langlands Conjectures

Prop. (16.4.1.5)[Langlands L-function]. Let F be a global field, $A = A_F$, and G a reductive algebra over F, (π, V) an automorphic cuspidal representation of $G(A)$, $(\pi, V) = \prod'(\pi_v, V_v)$. Let S be a finite set of primes including the Archimedean ones and places that π_v is ramified or the field Ω/F defining ${}^LG$ is unramified. Let $r : {}^LG \to GL(m,\mathbb{C})$ be a complex homomorphism, for $v \notin S$, let α_v be the semisimple conjugacy class in ${}^LG_v$ parametrizing π_v, then we define

$$L_v(s,\pi_v,r_v) = \frac{1}{\det(I - q_v^{-s}r_v(\alpha_v))}, \quad L_S(s,\pi,r) = \pi_{v\notin S}L_v(s,\pi_v,r_v)$$

called the **Langlands L-functions** attached to π and r. langlands proved in [Euler Products, 1971] that such a product is convergent and analytic for $\mathrm{Re}(s)$ sufficiently large.

Conj. (16.4.1.6) [Global Functorial Lifting]. Suppose G, G' are two quasi-split groups over the global field F. Let G split over K and K' where $F \subset K \subset K'$. Suppose $\varphi : {}^LG'_{K'/F} \to {}^LG_{K/F}$ is a complex analytic homomorphism that makes the diagram

$$\begin{array}{ccc} {}^LG'_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^LG_{K/F} & \longrightarrow & G(K/F) \end{array}$$

commutative. If $\mathfrak{P}'$ is a prime of K', $\mathfrak{P} = \mathfrak{P}' \cap K, \mathfrak{p} = \mathfrak{P}' \cap F$, then φ determines a homomorphism $\varphi_\mathfrak{p} : {}^LG'_{K'_{\mathfrak{P}'}/F_\mathfrak{p}} \to {}^LG_{K_\mathfrak{P}/F_\mathfrak{p}}$ that makes the diagram

$$\begin{array}{ccc} {}^LG'_{K'_{\mathfrak{P}'}/F_\mathfrak{p}} & \longrightarrow & G(K'_{\mathfrak{P}'}/F_\mathfrak{p}) \\ \downarrow{\scriptstyle\varphi_\mathfrak{p}} & & \downarrow \\ {}^LG_{K_\mathfrak{P}/F_\mathfrak{p}} & \longrightarrow & G(K_\mathfrak{P}/F_\mathfrak{p}) \end{array}$$

commutative. If $\pi' = \otimes_\mathfrak{p}\pi'_\mathfrak{p}$ is an automorphic representation of G'_F, is it true that $\pi = \otimes_\mathfrak{p} R_{\varphi_\mathfrak{p}}(\pi'_\mathfrak{p})$ is an automorphic representation of G_F? Such an automorphic representation is called a **functorial lifting** or π'.

Remark (16.4.1.7). This conjecture reduces the conjecture about a general group to the case of $GL(n,F)$, which can be handled, such as by [Zeta Functions of Simple Algebras, Godement/Jacquet].

Conj. (16.4.1.8). If(16.4.1.3) is true, if G, G' are defined over the global field F and G is quasi-split and G' is an inner twist of G, suppose $\pi' = \otimes_\mathfrak{p}\pi'_\mathfrak{p}$ is an automorphic representation of G'_F, is it true that $\pi = \otimes_\mathfrak{p}R(\pi'_\mathfrak{p})$ is an automorphism representation of G_F?

Conj. (16.4.1.9).

Relation to Artin L-Functions

If F is a local field and φ_F is a non-trivial additive character of F, then for any representation σ of $W_{K/F}$ we can define a local L-function $L(s,\sigma)$ and local factors $\varepsilon(s,\sigma,\psi_F)$ that if F is a global field and σ is a representation of $W_{K/F}$, then

$$L(s,\sigma) = \prod_{\mathfrak{p}} L(s,\sigma_{\mathfrak{p}}), \quad \varepsilon(s,\sigma) = \prod_{\mathfrak{p}} \varepsilon(s,\sigma_{\mathfrak{p}},\psi_{F_{\mathfrak{p}}})$$

satisfies the functional equation

$$L(s,\sigma) = \varepsilon(s,\sigma)L(1-s,{}^L\sigma).$$

Conj. (16.4.1.10). Suppose G is quasi-split over the local field F and splits over the Galois extension K. Let ${}^LU_K$ be a maximal compact subgroup of ${}^LG_F$. Let K' be a Galois extension of F containing K and let $\varphi : W_{K'/F} \to {}^LU_F$ be a homomorphism that makes the diagram

$$\begin{array}{ccc} W_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^LU_F & \longrightarrow & G(K/F) \end{array}$$

commutative, then there is an irreducible unitary representation $\pi(\varphi)$ of G_F s.t. for any representation σ of ${}^LG_F$, $L(s,\sigma,\pi(\varphi)) = L(s,\sigma\circ\varphi)$, and $\varepsilon(s,\sigma,\pi(\varphi),\psi_F) = \varepsilon(s,\sigma\circ\varphi,\psi_F)$.

Conj. (16.4.1.11). Suppose G is quasi-split over the local field F and splits over the Galois extension K. Let ${}^LU_K$ be a maximal compact subgroup of ${}^LG_F$. Let K' be a Galois extension of F containing K and let $\varphi : W_{K'/F} \to {}^LU_F$ be a homomorphism that makes the diagram

$$\begin{array}{ccc} W_{K'/F} & \longrightarrow & G(K'/F) \\ \downarrow{\scriptstyle\varphi} & & \downarrow \\ {}^LU_F & \longrightarrow & G(K/F) \end{array}$$

commutative. If $\mathfrak{P}'$ is a prime of K' and $\mathfrak{p} = \mathfrak{P}' \cap F$, then $\varphi_{\mathfrak{p}} = \varphi\circ\alpha_{\mathfrak{p}}$ takes $W_{K'_{\mathfrak{P}'}/F_{\mathfrak{p}}}$ into ${}^LU_{F_{\mathfrak{p}}}$. If $\pi(\varphi) = \otimes_{\mathfrak{p}}\pi(\varphi_{\mathfrak{p}})$, is $\pi(\varphi)$ an automorphic representation?

Relation to Elliptic Curves

Conj. (16.4.1.12). If C is an elliptic curved defined over a local number field F, we can associate to it a representation $\pi(C/F)$ of $GL(2,F)$**?**. If C is an elliptic curve defined over a global number field F, then for any place $\mathfrak{p}$, $\pi(C/F_{\mathfrak{p}})$ is defined. Is is true that $\pi(C/F) = \otimes_{\mathfrak{p}}\pi(C/F_{\mathfrak{p}})$ is an automorphism representation?

2 Local Langlands

Archimedean Local Langlands for $\mathrm{GL}(n)$

LLC for $\mathrm{GL}(n)$ over Function Fields

References are [G. Laumon, M. Rapoport, U. Stuhler: D-elliptic sheaves and the Langlands correspondence]. [V.G. Drinfeld: Elliptic modules, Mat. USSR Sbornik 23, pp. 561−592 (1974)], [V.G. Drinfeld: Elliptic modules II, Mat. USSR Sbornik 31, pp. 159–170 (1977)].

3 Global Langlands Correspondence

Def. (16.4.3.1)[L-Packets]. It is possible that two automorphic representations π and π' of $G(A)$ have the same L-function, and for any reductive group H over F and σ an automorphic representation of $H(A)$ and r_1 a complex analytic representation of ${}^LH$,

$$L_S(s,\pi\otimes\sigma,r\otimes r_1)=L_S(s,\pi'\otimes\sigma,r\otimes r_1).$$

In this case, π,π' are called to be in the same **L-packet**.

Prop. (16.4.3.2). Any L-packet is finite. And it is conjectured that every L-packet contains a generic representation.

4 Beyond Endoscopy

16.5 Automorphic Forms Beyond GL(2)

Prop. (16.5.0.1)[Ramakrishnan, 2000]. Multiplicity one theorem is true for cuspidal representations on $SL(2)$.

Proof: ☐

Prop. (16.5.0.2) [Blasius, 1994]. Multiplicity one theorem is false for cuspidal representations on $\mathrm{SL}(n), n \geq 3$.

Proof: ☐

1 Automorphic Forms on Unitary Groups

Main references are [Automorphic Forms on Unitary Groups, Eischen].

Unitary groups provide a particularly fruitful setting in which to work. Unitary groups have associated Shimura varieties, which provide convenient structure for studying algebraic aspects of automorphic forms (which, in turn, arise as sections of a vector bundle over Shimura varieties). We have substantial results about Galois representations associated to automorphic forms on unitary groups (e.g. [Ski12, Che04, Che09, CH13, Har10]). In addition, we have convenient representations of the L-functions associated automorphic forms on unitary groups, which are useful both for proving analytic properties and for extracting algebraic information (and even p-adic properties, as seen in [EHLS20]). Working with unitary groups has enabled major developments, including a proof of the main conjecture of Iwasawa Theory for GL2 [SU14] and the rationality of special values of certain automorphic L-functions (including [Shi00, Har97, Har08, Har84, Bou15]), as well as progress toward cases of the Bloch−Kato conjecture (including [SU06, Klo09, Klo15, Wan19]), and the Gan−Gross−Prasad conjecture (many recent developments, including [Xue14, Xue19, Zha14, Liu14, Yun11, JZ20, He17, BP20, BPLZZ21]).

2 Quaternionic Modular Forms

Main references are [Modular Forms on Exceptional Groups, Pollack].

3 Theta Correspondence

Classical Theta Functions

Def. (16.5.3.1) [Poisson Summation for Lattices]. Let V be a vector space of dimension n with an Haar measure μ, $\Gamma\subset V$ a full lattice, and $\Gamma'\subset V^\vee$ be its $\mathbb{Z}$-dual, Let $V=\mu(V/\Gamma)$, then for any Schwartz function $f\in\mathcal{S}(V)$,

$$\sum_{x\in\Gamma} f(x)=\frac{1}{V}\sum_{y\in\Gamma'}\widehat{f}(y).$$

Proof: This is just**??**. ☐

Def. (16.5.3.2) [Theta function]. Let $\Gamma\subset V$ be a real inner product space with an Haar measure μ normalized that for an orthonormal basis e_i of V, $V/\mathbb{Z}\{e_i\}$ has volume 1, then we can identify V with $V^\vee$ by this inner product. Let Γ be a full lattice, then its $\mathbb{Z}$-dual Γ' is identified with a lattice in V that $(x,y)\in\mathbb{Z}$ for any $x\in\Gamma, y\in\Gamma'$.

The **theta function** $\theta_\Gamma(z)$ is defined to be

$$\theta_\Gamma(z) = \sum_{x\in\Gamma} q^{-(x,x)/2} = \sum_{x\in\Gamma} e^{-\pi i z(x,x)}, \mathrm{Im}(z) > 0,$$

and

$$\Theta_\Gamma(t) = \theta_\Gamma(it) = \sum_{x\in\Gamma} e^{-\pi t(x,x)}$$

Cor. (16.5.3.3). With the notation as in(16.5.3.2), the theta function satisfies

$$\Theta_\Gamma(t) = \frac{t^{-n/2}}{\mu(V/\Gamma)}\Theta_{\Gamma'}(t^{-1})$$

Proof: Notice that $\Theta_{s\Gamma}(t) = \Theta_\Gamma(s^2 t)$, so this formula follows from(16.5.3.1) applied to $t^{-1/2}\Gamma$ and $f(x) = e^{-\pi(x,x)}$. □

Def. (16.5.3.4) [Self-Dual Lattices]. Situation as in(16.5.3.2), a **self-Dual Lattice** is a lattice Γ in V that $V' = V$. Equivalently, if $\{f_i\}$ is a $\mathbb{Z}$-basis of Γ, then the matrix $A = ((e_i, e_j))$ is a matrix with integer coefficients and determinant 1. The last equivalence is because $\Gamma' \subset \Gamma$ equals Γ if $\mu(V/\Gamma) = \mu(V/\Gamma')$, but this is equivalent to $\mu(V/\Gamma) = 1$, because $\mu(V/\Gamma)\cdot\mu(V/\Gamma') = 1$.

A self-dual lattice is called **even** iff $(x, x) \in 2\mathbb{Z}$ for any $x \in \Gamma$.

Example (16.5.3.5) [E_{8k}]. Let $V = \mathbb{R}^{8k}$ with the canonical inner product, denote E_{8k} the set of vectors $\sum_i x_i e_i$ in V that

$$2x_i \in \mathbb{Z}, x_i - x_j \in \mathbb{Z}, \sum_{i=1}^{8k} x_i \in 2\mathbb{Z}.$$

Notice E_8 is just the $\mathbb{Z}$-span of the root system E_8(2.7.3.2), and the root system just consists of all vectors in E_8 of length $\sqrt{2}$.

Then E_{8k} is a self-dual and even.

Cor. (16.5.3.6). Let $k \geq 2$, then all the vectors in E_{8k} of length $\sqrt{2}$ are $\{\pm e_i \pm e_j | i \neq j\}$.

Remark (16.5.3.7). For more examples of self-dual lattices, see[Ser73]Chap5.

Prop. (16.5.3.8) [Theta Function for Self-Dual Even Lattices]. Let $\Gamma \subset V$ be a self-dual even lattice(16.5.3.4), then the dimension n of V is divisible by 8, and the theta function $\theta_\Gamma(z)$ is a modular form for $\Gamma(1)$ of weight $n/2$.

Proof: We first show that

$$\theta_\Gamma(-1/z) = (-iz)^{n/2}\theta_\Gamma(z)$$

and because both sides are holomorphic functions on $\mathcal{H}$, it suffices to show this for $z = it, t > 0$. Thus it suffices to show

$$\Theta_\Gamma(t^{-1}) = t^{-n/2}\Theta_\Gamma(t).$$

And this is just(16.5.3.3), because Γ is self-dual(16.5.3.4).

Then $\theta_\Gamma[ST]_{n/2} = (-i)^{n/2}\theta_\Gamma$(16.2.1.6), but $(ST)^3 = 1$, so $(-i)^{3n/2} = 1$, so $8|n$, and $\theta_\Gamma \in M_{n/2}(\Gamma(1))$. □

Prop. (16.5.3.9)[Theta Function for Non-Even Self-Dual Lattices]. If we consider theta function for non-even self-dual lattices in $\mathbb{R}^n$, then we get a modular form of weight $n/2$ w.r.t. the subgroup of $SL(2,\mathbb{Z})$ generated by the elements S and T^2. This image of this subgroup has index 3 in $PSL(2,\mathbb{Z})$, and it has two cusps, thus two Eisenstein series.

In particular, we can apply this to the lattice $\{e_i\}$, and use this information to obtain formula giving the number of ways to represent an integer into a sum of n squares.

Proof: □

4 Weil Representations

We use notations as in3.

Def. (16.5.4.1) [Heisenberg Group of $O(V)$]. Let F be a local or finite field of characteristic$\neq 2$, (V,B) a quadratic space over F of dimension n, $O(V)=O(V,B)$. Then the **Heisenberg group** H is the group $V\times V\times F$ with the group law

$$(v_1^*,v_1,x_1)(v_2^*,v_2,x_2)=(v_1^*+v_2^*,v_1+v_2,x_1+x_2+B(v_2,v_1^*)-B(v_1,v_2^*)).$$

Let $\psi:F\to\mathbb{C}$ a non-trivial character. We may identify V with V^* via the pairing $(v,v^*)\mapsto\psi(-2B(v,v^*))$. Then the group $A(V)$(10.11.3.20) is $V\times V\times\mathbb{T}$ with multiplication

$$(v_1^*,v_1,t_1)(v_2^*,v_2,t_2)=(v_1^*+v_2^*,v_1+v_2,t_1t_2\psi(-2B(v_1,v_2^*))).$$

Then there is a surjective homomorphism $\tau:H\to A(V):(v^*,v,x)\mapsto(v^*,v,\psi(x)\psi(-B(v,v^*)))$.

$A(V)$ acts on $L^2(G)$: $(\rho(v^*,v,t)\Phi)(u)=t\psi(-2B(u,v^*))\Phi(u+v)$(10.11.3.21), and this induces an action π of H on $L^2(G)$: $(\rho(v^*,v,x)\Phi)(u)=t\psi(-2B(u,v^*))\Phi(u+v)$.

$SL(2,F)$ acts on H: $\begin{bmatrix}a&b\\c&d\end{bmatrix}(v_1,v_2,x)=(av_1+bv_2,cv_1+dv_2,x)$, and acts on $A(V)$: $\begin{bmatrix}a&b\\c&d\end{bmatrix}(v_1,v_2,t)=(av_1+bv_2,cv_1+dv_2,t\psi(-acB(v_1,v_1)-bdB(v_2,v_2)))$, these two actions are compatible with τ.

$O(V)$ acts on H: $g(v_1,v_2,x)=(gv_1,gv_2,x)$, and a similar action on $A(V)$, compatible with τ.

Recall the Fourier transform on V w.r.t. the pairing $(v,v^*)\mapsto\psi(-2B(v,v^*))$.

Prop. (16.5.4.2). There exists a unitary projective representation ω_1 of $Sp(2n,B)$ on $L^2(V)$ that for the subgroup $SL(2,F)\subset Sp(2n,B)$,

- For $g\in SL(2,F),h\in H$, $\omega_1(g)\pi(h)\omega_1(g)^{-1}=\pi(g(h))$.
- $(\omega_1(\begin{bmatrix}1&x\\&1\end{bmatrix})\Phi)(v)=\psi(xB(v,v))\Phi(v)$.
- $(\omega_1(\begin{bmatrix}a&\\&a^{-1}\end{bmatrix})\Phi)(v)=|a|^{d/2}\chi(a)\Phi(av)$, where $\chi(a)$ is any element that $|\chi(a)|=1$.
- $\omega_1(w_1)\Phi=\gamma(B)\widehat{\Phi}$, where $\gamma(B)$ is any element that $|\gamma(B)|=1$.

and there is a unitary representation ω_2 of $O(V)$ on $L^2(V)$ that

- $\omega_2(k)\pi(h)\omega_2(k)^{-1}=\pi(k(h))$.
- $(\omega_2(k)\Phi)(v)=\Phi(k^{-1}v)$.

- ω_2 commutes with ω_1.

where π is a Schrödinger representation of $A(V)$ on $L^2(V)$(10.11.3.21).

Proof: Because the action of $Sp(2n,B)$ on $A(V)$ is in $B_0(V)$, thus by(10.11.3.21), there are unitary automorphisms of $L^2(G)$ that

$$\omega_1(g)\pi(h)\omega_1(g)^{-1} = \pi(g(h)).$$

Now to check the properties of ω, it suffices to check this equation for $h=(v,0,1)$ or $(0,v,1)$ because these elements generate $A(V)$, using the fact ρ action on $L^2(V)$ is irreducible(10.11.3.21).**?**

For $O(V)$, just verify directly. □

Prop. (16.5.4.3)[dim V **Even Case**]. If F is a local or finite field of characteristic$\neq 2$, V has dimension $2n$, and if we define $\Delta = (-1)^n\det(B)\in F^*/(F^*)^2$, $\chi: F^*\to\{\pm 1\}$ the quadratic character $a\mapsto (\Delta,a)_F$(12.5.5.8), and $\gamma(B)$ as defined in(12.5.5.9), then the projection representation of $SL(2,F)$ in(16.5.4.2) is a true representation.

It suffices to check the relations(2.1.6.8). Use(12.5.5.14) to show that $\gamma(B)^2=\chi(-1)$. And it suffices to show that

$$w_1\begin{bmatrix}a^{-1} & \\ & a\end{bmatrix}\begin{bmatrix}1 & -a\\ & 1\end{bmatrix}w_1\begin{bmatrix}1 & -a^{-1}\\ & 1\end{bmatrix}\Phi = \begin{bmatrix}1 & a\\ & 1\end{bmatrix}w_1\Phi$$

The LHS equals $\gamma(B)^2|a|^{-n}\mathcal{F}(\Phi * F_{-a^{-1}B})$, which by(12.5.5.9) and(12.5.5.13) equals $\gamma(B)\mathcal{F}(\Phi)F_{aB}$, which is just the RHS.

Conj. (16.5.4.4) [Theta Correspondence(Special Case)]. Let ω be the action of $SL(2,F)\times O(V)$ on $L^2(V)$ as in(16.5.4.3) and(16.5.4.2), then its smooth part $C_c^\infty(V)$ is a smooth representation ω_∞. Let π_1 be an irreducible admissible representation of $SL(2,F)$, π_2 an irreducible admissible representation of $O(V)$, they are said to **correspond** iff there exists a non-zero intertwining operator $\omega_\infty\to\pi_1\otimes\pi_2$.

Then each π_1 can corresponds to at most one π_2, and vise versa.

Proof: This is proved for non-Archimedean local fields of odd residue characteristic by Waldspurger(1990). □

Def. (16.5.4.5) [Setup for Dihedral Weil Representation]. Let F be local or finite field, and E be a 2-dimensional commutative semisimple algebra over F, then $E=F\oplus F$ and F embeds diagonally, called the **split case**; or E is the unique quadratic extension of F, called the **anisotropic case**. Let the automorphism of E given by

$$x\mapsto\overline{x}:\begin{cases}\overline{(\xi,\eta)}=(\eta,\xi), & E=F\oplus F\\ \text{The non-trivial Galois automorphism}, & E\text{ is a field}\end{cases}.$$

Let $\mathrm{tr}(x)=x+\overline{x}, N(x)=x\overline{x}$. Let $E_1^*=\{x\in E^*|N(x)=1\}$.

There is an embedding ι of E into $GO(E)\subset GL(2,F)$: for $E=F\oplus F$, it embeds diagonally, and for E a field, E embeds by left action on itself. Notice $\overline{\iota(x)(\overline{y})}=\iota(\overline{x})(y)$, thus $GO(E)\cong E^*\rtimes\{\}$**?**.

Let ψ be a character of E^* that is non-trivial on E_1^*.

Prop. (16.5.4.6) [Howe Duality of Dihedral Representations]. Let ψ be a character of E^*, then by(15.1.1.12), ψ extends to a representation of $GO(E)$ iff $\psi(x)=\psi(\overline{x})$, which is equivalent to $\psi(x)=1$ on E_1^*, by Hilbert's theorem90 or direct inspection. Then by(15.1.1.12), in the other case, $\mathrm{ind}_{E^*}^{GO(E)}\psi$

is an irreducible representation of $GO(E)$, and Howe duality predicts an irreducible smooth representation of $GL(2,F)$. In case E is a field or F is finite, we can construct this representation directly, in(16.5.4.7) and(15.6.10.8).

Prop. (16.5.4.7) [Dihedral Representations]. Let E/F be a quadratic extension of non-Archimedean local fields, then E is a quadratic space over F by the norm form, and let ξ be a quasi-character of E^* that doesn't factor through the norm map $N: E^* \to F^*$. Let $U_{\xi,\psi}$ be the space of functions $\Phi \in C_c^\infty(E)$ that satisfy

$$\Phi(yv) = \xi(y)^{-1}\Phi(v), \quad \forall y \in E^*, N(y) = 1,$$

and let $\chi : F^* \to \{\pm 1\}$ be the quadratic character attached to the extension E/F(12.6.2.14), and let $GL(2,F)_+$ be the subgroup of $GL(2,F)$ that the determinants are norms from E, which is an open normal subgroup of index2, then there exists an irreducible admissible representation $\omega_{\xi,\psi}$ of $GL(2,F)_+$ on $U_{\xi,\psi}$ s.t.

$$(\omega_{\xi,\psi}(\begin{bmatrix} a & \\ & 1 \end{bmatrix})\Phi)(v) = |a|^{1/2}\xi(b)\Phi(bv), \quad \forall b \in E^*, N(b) = a \in F^*$$

$$(\omega_{\xi,\psi}(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix})\Phi)(v) = \psi(xN(v))\Phi(v)$$

$$(\omega_{\xi,\psi}(\begin{bmatrix} a & \\ & a^{-1} \end{bmatrix})\Phi)(v) = |a|\chi(a)\Phi(av)$$

$$(\omega_{\xi,\psi}(w_1)\Phi) = \gamma(N)\widehat{\Phi}.$$

Then the representation ω_ξ of $GL(2,F)$ induced from this representation of $GL(2,F)_+$ is irreducible and cuspidal.

Remark (16.5.4.8). For F with odd residue characteristic, this dihedral representation is the only cuspidal representation of $GL(2,F)$, by Tunnell 1978 or 1979.**?**

Proof: Notice in this case, the character χ defined in(16.5.4.3) is the same as the quadratic character corresponding to E/F: let $E = F(\sqrt{D})$, then $N_{E/F} = \langle 1, -D\rangle$, thus $(a,D)_F = 1$ iff $\langle a, D, -1\rangle$ is universal iff a is represented by $\langle 1, -D\rangle$, which is equivalent to $a \in N_{E/F}(E^*)$. Then by(16.5.4.3), we have an action of $SL(2,F)$ on $L^2(E)$, and we can extend it to $GL(2,F)_+$ satisfying all these equations(**?** by direct verification). And it can be verified $U_{\xi,\psi}$ is stable under this action.

We show this action is smooth: Every $\varphi \in U_{\xi,\psi}$ is stable under some $K(\mathfrak{p}^n)$ for n large: By(15.11.1.9), it suffices to prove it is stable under $N_-(\mathfrak{p}^n), T(\mathfrak{p}^n)$ and $N(\mathfrak{a})$. By action of w_1, it suffices to show it is stable under the latter two. But this is clear from the equations above.

Similarly, to show it is admissible, it suffices to show for any ideal $\mathfrak{a}$, the space of functions fixed by $N(\mathfrak{a})$ and $N_-(\mathfrak{a})$ is of f.d.: It is clear from equation2 that if φ is fixed by $N(\mathfrak{a})$, then there is a fractional ideal $\mathfrak{a}'$ that $\mathrm{Supp}(\varphi) \subset N^{-1}(\mathfrak{a}')$. Similarly for $\mathcal{F}(\varphi)$. These two conditions means φ has bounded support and fixed by some open subgroup, these functions are f.d..

To show $\omega_{\xi,\psi}$ and ω_ξ are irreducible: Let $B_1(F)_+$ be the subgroup of $B_1(F)$ consisting of matrices $\{\begin{bmatrix} a & b \\ & 1 \end{bmatrix} | a \in N_{E/F}(E^*)\}$, let $\mathcal{K}_+$ the restriction of $\omega_{\xi,\psi}$ to $B_1(F)_+$. Define a map

$$\Lambda : C_c^\infty(N(E^*)) \to \mathcal{K}_+ : (\Lambda\varphi)(v) = \xi(v)^{-1}|N(v)|^{-1/2}\varphi(N(v)),$$

then this is an isomorphism, and is $B_1(F)$-invariant, where $B_1(F)$ acts on $C_c^\infty(N(E^*))$ as in(15.11.3.15). Thus by Mackey decomposition(15.1.5.49),

$$\operatorname{res}_{B_1(F)} \operatorname{ind}_{GL(2,F)_+}^{GL(2,F)} \omega_{\xi,\psi} \cong \operatorname{ind}_{B_1(F)_+}^{B_1(F)} \omega_{\xi,\psi} \cong \operatorname{ind}_{N(F)}^{B_1(F)} \psi,$$

which is irreducible by(15.11.3.16). thus ω_ξ is irreducible, thus also does $\omega_{\xi,\psi}$.

A byproduct of the above argument is that ω_ξ is cuspidal. □

5 Gan-Gross-Prasad Conjecture

Main References are [Background on the Gan-Gross-Prasad Conjecture, David Schwein].

16.6 Trace Formulae

Main references are [Introductory notes on the trace formula, Lapid], [Trace formula, Whitehouse] and [Trace Formula, Arthur].

1 Introduction

Remark (16.6.1.1). Delete this subsection.

The trace formula was introduced by Selberg in his seminal work. Selberg mostly developed the trace formula for quotients of the hyperbolic plane by a Fuchsian group Γ of the first kind (both in the co-compact and the non co-compact case). One of his original motivations and applications was to show the existence of Maass forms with respect to $\Gamma = SL(2, Z)$. It was subsequently vastly generalized by Arthur in the context of adelic quotients $G(F)\backslash G(A)$ of a reductive group G over a number field F. Arthur's main driving force was the functoriality conjectures of Langlands.

Selberg's trace formula is a far-reaching non-commutative generalization of the Poisson summation formula. It underlines a duality between geometric and spectral objects.

2 Trace Formulae

Trace Formula for Compact Quotient

Prop. (16.6.2.1). Consider the right action of G on $L^2(\Gamma\backslash G,\chi)$(16.1.1.17), let $\varphi\in C_c^\infty(G)$, then φ can act on $L^2(\Gamma\backslash G,\chi)$ by(10.9.3.24), and:

- $\rho(\varphi)$ is an integration operator, in particular Hilbert-Schmidt and compact. And $\mathrm{Im}(\rho(\varphi))\subset C^\infty(\Gamma\backslash G,\chi)$.
- If $\varphi(g^{-1})=\overline{\varphi(g)}$, then $\rho(\varphi)$ is self-adjoint.
- If $\varphi(k_\theta g)=e^{-tk\theta}\varphi(g)$, then $\mathrm{Im}(\rho(\varphi))\subset C^\infty(\Gamma\backslash G,\chi,k)$.

Compare with(16.6.2.4).

Proof: These follows from(16.6.2.4). □

Cor. (16.6.2.2). Let H be a nonzero closed G-subrepresentation of $L^2(\Gamma\backslash G,\chi)$, then H decomposes as $\oplus_k H^k$ w.r.t. action of $SO(2,\mathbb{R})$. And if $H^k\neq 0$, then Δ has a nonzero eigenvector in $H^k\cap C^\infty(\Gamma\backslash G,\chi)$.

Proof: The decomposition is clear from(10.11.4.3). It's left to show Δ has an eigenvalue in $H_k\cap C^\infty(\Gamma\backslash G,\chi)$. By lemma(15.9.4.1) above, for $f_0\in H^k$, there is a $\varphi\in C_c^\infty(G)$ s.t. $\rho(\varphi)f_0\neq 0$, and $\varphi(k_\theta g)=e^{-ik\theta}\varphi(g)$. So(16.6.2.1) shows $\rho(\varphi)$ maps H into $H^k\cap C^\infty(\Gamma\backslash G,\chi)$ and induces a compact self-adjoint operator on H^k. So we can choose a f.d. eigenspace of it. Notice Δ commutes with the action $\rho(\varphi)$, so Δ fixes this eigenspace, thus it has an eigenvalue on $H_k\cap C^\infty(\Gamma\backslash G,\chi)$. □

Prop. (16.6.2.3)[$L^2(\Gamma\backslash G)$ Totally Decomposable]. Let G be a unimodular locally compact topological group and $\Gamma\subset G$ be a discrete subgroup that $\Gamma\backslash G$ is compact, $\chi\in\widehat{\Gamma}$, then the space $L^2(\Gamma\backslash G,\chi)$ decomposes as

$$L^2(\Gamma\backslash G,\chi)=\bigoplus_{\pi\in\widehat{G}} m_\pi V_\pi$$

that each m_π is finite.

Proof: Let Σ be the set of sums of irreducible invariant subspaces of $L^2(\Gamma\backslash G,\chi)$ that is mutually orthogonal. then choose by Zorn's lemma a maximal one in Σ, and we prove the orthogonal complement $H=0$ otherwise we construct an irreducible subspace of H.

Let $f\neq 0\in H$, choose by(15.9.4.1) and(16.6.2.1) a $\varphi\in C_c(G)$ that $\rho(\varphi)$ is compact self-adjoint and $\rho(\varphi)f\neq 0$. So $\rho(\varphi)$ has a non-zero eigenvalue and the eigenspace L is of f.d..

Let L_0 be a minimal nonzero subspace of L that is an intersection of L with a nonzero closed invariant subspace of $\mathcal{H}$, and let V be the intersection of all closed invariant subspaces W of H that $L_0=L\cap W$. We show V is irreducible, if not, then $V=V_1\cap V_2$, and if $0\neq f_0\in L_0$, then $f_0=f_1+f_2$ and both f_1,f_2 are eigenfunctions of $\rho(\varphi)$ of eigenvalue λ. Now if $f_1\neq 0$, then by minimality, $V_1\cap L=L_0$.

The finiteness of m_π follows from the fact that $\rho(f)$ is Hilbert-Schmidt for every $f\in C_c(G)$(16.6.2.4). □

Prop. (16.6.2.4). If $\Gamma\subset G$ is a discrete subgroup that $\Gamma\backslash G$ is compact, consider the right action of G on $L^2(\Gamma\backslash G)$(10.11.2.9), let $\varphi\in C_c(G)$, then φ can act on $L^2(\Gamma\backslash G,\chi)$ by(10.9.3.24), and:

- $\rho(\varphi)$ is an integration operator, in particular Hilbert-Schmidt and compact.
- If $\varphi(g^{-1})=\overline{\varphi(g)}$, then $\rho(\varphi)$ is self-adjoint.

Proof: 1:

$$(\rho(\varphi)f)(g)=\int_G f(h)\varphi(g^{-1}h)dh=\int_{\Gamma\backslash G_1}\sum_{\gamma\in\Gamma}f(\gamma h)\varphi(g^{-1}\gamma h)dh=\int_{\Gamma\backslash G_1}f(h)K_\varphi(g,h)dh$$

where

$$K_\varphi(g,h)=\sum_{\gamma\in\Gamma}\varphi(g^{-1}\gamma h).$$

Because φ is compactly supported, this is a smooth function in g and h, in particular square integrable on $\Gamma\backslash G$ compact. And $\rho(\varphi)(f)(g)$ is smooth in g because $f\in L_1(\Gamma\backslash G_1,\chi)$ as $\Gamma\backslash G_1$ is compact, and $K(g,h)$ is smooth in g.

2 is easy. □

Prop. (16.6.2.5) [Trace of $\rho(f)$]. If $\varphi=\varphi_1*\varphi_2$ where $\varphi_i\in C_c(\Gamma\backslash G)$, then $\rho(\varphi)=\rho(\varphi_1)\rho(\varphi_2)$(10.9.3.24) and hence a trace class(10.10.5.7). And its integral kernel is

$$K_\varphi(x,y)=\int_{\Gamma\backslash G}K_{\varphi_1}(x,z)K_{\varphi_2}(z,y)dz.$$

and

$$\operatorname{tr}\rho(f)=\int_{\Gamma\backslash G}K_\varphi(x,x)dx=\int_{\Gamma\backslash G}\int_{\Gamma\backslash G}K_{\varphi_1}(x,y)K_{\varphi_2}(y,x)dxdy.$$

Proof: This follows from(10.10.5.10). □

Cor. (16.6.2.6) [the Geometric Side of Trace Formula]. If G is unimodular, let $f=f_1*f_2$, $c(\gamma)$ be a representative for the conjugacy classes of Γ, then

$$\operatorname{tr}(\rho(f))=\sum_{\gamma\in c(\Gamma)}\int_{\Gamma_\gamma\backslash G}f(x^{-1}\gamma x)dx.$$

And if G_γ is unimodular for every $\gamma\in\Gamma$, then

$$\operatorname{tr}(\rho(f))=\sum_{\gamma\in c(\Gamma)}V(\Gamma_\gamma\backslash G_\gamma)\int_{G_\gamma\backslash G}f(x^{-1}\gamma x)dx.$$

Proof:
$$K_f(x,x)=\sum_{\gamma\in\Gamma}f(x^{-1}\gamma x)=\sum_{\gamma\in c(\Gamma)}\sum_{\delta\in\Gamma_\gamma\backslash\Gamma}f(x^{-1}\delta^{-1}\gamma\delta x),$$
so we have
$$\int_{\Gamma\backslash G}K_f(x,x)dx=\int_{\Gamma\backslash G}\sum_{\gamma\in c(\Gamma)}\sum_{\delta\in\Gamma_\gamma\backslash\Gamma}f(x^{-1}\delta^{-1}\gamma\delta x)=\sum_{\gamma\in c(\Gamma)}\int_{\Gamma_\gamma\backslash G}f(x^{-1}\gamma x)dx.$$
□

Cor. (16.6.2.7) [Trace Formula for $\Gamma\backslash G$ Compact]. Let G be a unimodular locally compact topological group and $f=f_1*f_2$ where $f_i\in C_c(G)$, and Γ be a discrete subgroup of G with $\Gamma\backslash G$ compact and G_γ is unimodular for every $\gamma\in\Gamma$, then $\rho(f)$ is a trace class with
$$\sum_{\pi\in\widehat{G}}m_\pi\operatorname{tr}(\pi(f))=\operatorname{tr}(\rho(f))=\sum_{\gamma\in c(\Gamma)}V(\Gamma_\gamma\backslash G_\gamma)\int_{G_\gamma\backslash G}f(x^{-1}\gamma x)dx.$$

Proof: Follows from(16.1.4.2) and(16.6.2.6). □

Lemma (16.6.2.8). Let $G=GL(2,\mathbb{R}),K=SL(2,\mathbb{R})$, $\Gamma\backslash G$ be compact, ρ be the principal series $P(\lambda,0)$(15.9.4.15) of G, and $s=\frac{1}{2}(s_1-s_2+1),\lambda=s(1-s),\mu=(s_1+s_2)$, then for any $f\in C_c^\infty(K\backslash G/K)$, $\rho(f)\in V_\rho^K$, which has dimension1, so f is a trace class and
$$\operatorname{tr}(\rho(f))=\int\int f(\begin{bmatrix}e^{u/2}&x\\0&e^{-u/2}\end{bmatrix})e^{\frac{us}{2}}dudx.$$

Proof: The trace of $\rho(f)$ is just the scalar by which $\rho(f)$ acts on a non-zero vector of ρ^K. Take $\varphi\in\rho^K\subset H(s_1,s_2,0)$ normalized that $\varphi(I)=1$, then
$$(\rho(f)\varphi)(I)=\int_G f(g)\varphi(g)dg=\int_K\int_A\int_N f(ank)\varphi(ank)dAdNd\theta=\int_A\int_N f(an)\varphi(an)dAdN$$
□

16.7 Modular Galois Representations

This section concerns automorphy and modularity of global Galois Representations.

Notation (16.7.0.1).

- Let $(F, \mathcal{O}_F) \in$ `NField`.

1 Galois Representation attached to Automorphic Forms

Prop. (16.7.1.1) [Representation Associated to a Cusp Form, Eichler-Shimura]. For any newform $f \in S_k(\Gamma_1(N))$, let $\mathcal{O}_f$ be the number field generated by the coefficients of f, then there exists a Galois representation

$$\rho_f : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \mathcal{O}_f).$$

Proof: □

Automorphic Galois Representations

Def. (16.7.1.2) [Automorphic Galois Representations]. An **automorphic Galois representation** is a Galois representation of $\mathrm{Gal}_{\mathbb{Q}}$ on a p-local field that is attached to an automorphic representation of $\mathrm{GL}(n, \mathbf{A}_F)$ for some $F \in$ `NField` via the global Langlands conjecture.

Def. (16.7.1.3) [Modular Galois Representations]. A continuous irreducible representation $\mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \overline{\mathbb{F}}_p)$ or $\mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, K)$, where $K \in p$-`NField` is called a **modular Galois representation** if it arises from a newform**?**.

Def. (16.7.1.4) [Modular Galois Representations]. Let A be a $\mathbb{Z}_p$-algebra and $\rho : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, A)$ be a representation, then ρ is called a **modular Galois representation** if there exists some $N > 0$ and a homomorphism $\mathrm{pr} : T'(N) \to A$(where $T'(N) = \mathbb{Z}[T_\ell, \langle d \rangle] \subset \mathrm{End}(S_2(\Gamma_1(N)))$, $\ell \in \mathbf{P} \backslash \{p\}, d \in (\mathbb{Z}/(N))^*$) s.t. ρ is unramified outside Np, and for $\ell \nmid pN$,

$$\mathrm{tr}(\rho(\mathrm{Frob}_\ell)) = \mathrm{pr}(T_\ell), \quad \det(\rho(\mathrm{Frob}_\ell)) = \mathrm{pr}(\langle \ell \rangle)\ell.$$

?

Conj. (16.7.1.5) [Langlands-Fontaine-Mazur]. Any geometric representation of Gal_F is automorphic(16.7.1.2).

Remark (16.7.1.6). This is very likely to imply Fontaine-Mazur conjecture(16.7.4.2).

Potential Modularity

Remark (16.7.1.7). A potential modularity result is a result that says certain representation of $\mathrm{Gal}_{\mathbb{Q}}$ comes from geometry when restricting to Gal_F for some $F \in$ `NField`. Cf.[Remarks on a Conjecture of Fontaine and Mazur, Taylor].

2 Serre's Modularity Conjecture

References are [K-W09b], [K-W09c] and [Diamond, F.: The Taylor-Wiles construction and multiplicity one. Invent. Math. 128(2), 379–391 (1997)], [Fujiwara, K.: Deformation rings and Hecke algebras in the totally real case], [Khare, C., Wintenberger, J.-P.: On Serre's conjecture for 2-dimensional mod p representations of $Gal(\overline{\mathbb{Q}}/\mathbb{Q})$], [Kisin, M.: Modularity of 2-adic Barsotti-Tate representations. Invent. Math. (2009)], [Kisin, M.: Moduli of finite flat group schemes, and modularity. Ann. Math].

Notation (16.7.2.1).
- For $N \in \mathbb{Z}_+$, let $Q(N)$ be a maximal prime factor of N.
- Let $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$, and $\overline{\rho} : \mathrm{Gal}_{\mathbb{Q}} \to GL(2, \mathbb{F}_q)$ be a continuous representation.

Def. (16.7.2.2) [Artin Conductor and Weights of $\overline{\rho}$]. ? $k(\overline{\rho}), N(\overline{\rho})$.

Thm. (16.7.2.3) [Serre's Modularity Conjecture, Khare-Kisin-Wintenberger]. If $\overline{\rho}$ be an odd smooth absolutely irreducible representation, (such a representation is said to be of **S-type**), then for any embedding $\iota : \overline{\mathbb{Q}} \hookrightarrow \overline{\mathbb{Q}}_p$, there exists a newform $f \in S_{k(\overline{\rho})}(\Gamma_1(N(\overline{\rho})))$(16.7.2.2) s.t. $\overline{\rho}_f = \overline{\rho}$(16.7.1.1).

Proof: Cf.[Khare-Wintenberger]Thm9.1? □

Lemma (16.7.2.4). Serre's modularity conjecture is true for
- $p \neq 2$ and $2 \nmid N(\overline{\rho})$.
- or $p = 2$ and $k(\overline{\rho}) = 2$.

Proof: (D_0)(16.7.2.8) follows from the truth of (L_r)(16.7.2.7) for each r. Then the assertion follows from(16.7.2.8) and (D_0). □

Lemma (16.7.2.5). Let $\rho : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \mathcal{O})$ be a continuous odd irreducible representation s.t.
- $\overline{\rho}$ has non-solvable image, and $\overline{\rho}$ is modular.
- ρ is of weight 2, a.e. unramified, and potentially crystalline at p.

Then ρ is modular.

Proof: Cf.[Khare-Wintenberger]Hypothesis H.? □

Def. (16.7.2.6) [Locally Good Dihedral Reoresentations]. $\ell \in \mathbf{P} \backslash \{p\}$ is called a **good dihedral prime** for $\overline{\rho}$ if
- $\overline{\rho}|_{I_\ell}$ is of the form $\begin{bmatrix} \psi & \\ & \psi^\ell \end{bmatrix}$, where ψ is a non-trivial character of I_ℓ of order a power of an odd prime t, s.t. $t | \ell + 1$, and $t > \max(Q(\frac{N(\overline{\rho})}{q^2}), 5, p)$.
- $q \equiv 1 \pmod 8$, and $q \equiv 1 \pmod r$ for any $r \leq \max(Q(\frac{N(\overline{\rho})}{q^2}), p) \in \mathbf{P}$.

If there exists a good dihedral prime q for $\overline{\rho}$, then $\overline{\rho}$ is called **locally good-dihedral** or q-dihedral.

Lemma (16.7.2.7). For $r \in \mathbb{Z}_+$, consider the following statements:

(L_r) : If $\overline{\rho}$ is of S-type(16.7.2.3) and satisfies
- $\overline{\rho}$ is locally good-dihedral,
- $k(\overline{\rho}) = 2$ if $p = 2$,
- $N(\overline{\rho})$ is odd and divisible by at most r primes.

Then $\overline{\rho}$ is modular.

(W_r) : If $\overline{\rho}$ is of S-type and satisfies

- $\overline{\rho}$ is locally good-dihedral,
- $k(\overline{\rho})=2$,
- $N(\overline{\rho})$ is odd and divisible by at most r primes.

Then $\overline{\rho}$ is modular.

Then

- (W_1) is true.
- (Killing ramification in weight 2)(L_r) implies (W_{r+1}).
- (Reduction to weight 2)(W_r) implies (L_r).

In particular, by induction spirally, all $(L_r),(W_r)$ are true.

Proof: Cf.[Khare-Wintenberger]Thm3.1, 3.2, 3.3.? □

Lemma (16.7.2.8) [Level-Rising]. For $r\in\mathbb{N}$, if the following is true:

(D_r) $\overline{\rho}$ is modular If $\overline{\rho}$ is of S-type and satisfies

- $\overline{\rho}$ is locally good-dihedral,
- $p\in\mathbf{P}\setminus\{2\}$,
- $2^{r+1}\nmid N(\overline{\rho})$.

Then the following is also true:

$\overline{\rho}$ is modular If $\overline{\rho}$ is of S-type and satisfies

- $k(\overline{\rho})=2$ if $p=2$ and $r=0$,
- $2^{r+1}\nmid N(\overline{\rho})$,

Proof: Cf.[Khare-Wintenberger]Thm3.4.? □

Def. (16.7.2.9) [Weights]. Let $K\in p$-`NField` and $\mathcal{O}=\mathcal{O}_K$, then a continuous representation $\rho:\mathrm{Gal}_{\mathbb{Q}}\to\mathrm{GL}(2,\mathcal{O})$ is said to be **of weight** $k\geq 2$ if it is Hodge-Tate with weights $(k-1,0)$.?

Thm. (16.7.2.10) [Modularity Lifting]. Assume $\overline{\rho}$ is modular, and

- $\mathrm{Im}(\overline{\rho})$ is non-solvable if $p=2$,
- $\overline{\rho}|_{\mathbb{Q}(\zeta_p)}$ is absolutely unramified if $p>2$,

Then

- (If $p=2$) and ρ is an odd lift of $\overline{\rho}$ to a 2-adic representation that is
  - a.e. unramified,
  - crystalline of weight 2 at 2, or semistable of weight 2 at 2 and $k(\overline{\rho})=4$,
- (Or if $p>2$) and ρ is a lift of $\overline{\rho}$ to a p-adic representation that is crystalline of weight $2\leq k\leq p+1$ at p, or potentially semistable of weight 2 at p,

Then ρ is also modular.

Proof: Cf.[Khare-Wintenberger 2].? □

Applications

Cor. (16.7.2.11) [Level-Lowering, Ribet]. Let $p, \ell \in \mathbf{P}, N \in \mathbb{Z}_+, \ell \nmid N$, and $f \in S_2(\Gamma_0(N\ell))$ is a newform. Suppose that $\overline{\rho}_{f,p}$ is irreducible and one of the following is true:

- $\overline{\rho}_{f,p}$ is unramified at ℓ,
- $\ell = p$ and $\overline{\rho}_{f,p}$ is flat at p.

Then there exists a $g \in S_2(\Gamma_0(N))$ s.t. $\overline{\rho}_{g,p} \cong \overline{\rho}_{f,p}$.

Proof: Cf.[Fermat's last theorem, Chap7]. □

3 Geometric Galois Representations

Def. (16.7.3.1) [Geometric Representations]. For $F \in \mathtt{NField}, p \in \mathbf{P}$, $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$ is called a **geometric representation** if it satisfies

- For a.e. $v \in \Sigma_F^{\mathrm{fin}}$, ρ_v is unramified.
- For any $v \in S(p)$, the representation ρ_v is deRham.

It is called a **genuine geometric representation** if it is isomorphic to the subquotient of some $\mathrm{H}^r_{\text{ét}}(X_{\overline{F}}, \mathbb{Q}_p)(m)$ where $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{rpr}/F$ and $m \in \mathbb{Z}$.

Prop. (16.7.3.2) [Change of Fields]. Let $E/F \in \mathtt{NField}$ be a field extension, then geometric representations are stable under res^L_K and Ind^L_K.

Proof: □

Compatible Systems

Prop. (16.7.3.3)[Weakly Compatible System of adic Representations]. A **weakly compatible system of adic representations** is a collection $\mathcal{R} = \{R_{\ell,\iota}\}$, where $\ell \in \mathbf{P}, \iota : \overline{\mathbb{Q}} \hookrightarrow \overline{\mathbb{Q}}_\ell$, and $R_{\ell,\iota}$ is a semisimple ℓ-adic representation

$$R_{\ell,\iota} : \mathrm{Gal}_{\mathbb{Q}} \to GL(V \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell),$$

which satisfies the following conditions:

1. There is a multiset of integers H-T($\mathcal{R}$) s.t. for any $\ell \in \mathbf{P}$ and each embedding $\iota : \overline{\mathbb{Q}} \hookrightarrow \overline{\mathbb{Q}}_\ell$, the restriction $R_{\ell,\iota}|_{\mathrm{Gal}_{\mathbb{Q}_\ell}}$ is deRham and H-T$(R_{\ell,\iota}|_{\mathrm{Gal}_{\mathbb{Q}_\ell}})$ = H-T($\mathcal{R}$).
2. There exists a finite set $S \subset \mathbf{P}$ s.t. if $p \notin S$, then $\mathfrak{wd}_p(R_{\ell,\iota})$ is unramified for all (ℓ, ι).
3. For a.e. $p \in \mathbf{P}$, there is an F-semisimple WD-representation $\mathfrak{wd}_p(\mathcal{R})$ of WD_p over $\overline{\mathbb{Q}}$ s.t. for all $\ell \in \mathbf{P} \setminus \{p\}$ and ι,
$$\mathfrak{wd}_p(R_{\ell,\iota}) \cong \mathfrak{wd}_p(\mathcal{R}) \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell.$$

Moreover,

- $\mathcal{R}$ is called **a strongly compatible system of adic representations** if condition3 holds for any $p \in \mathbf{P}$.
- $\mathcal{R}$ is called **irreducible** if each $R_{\ell,\iota}$ is irreducible.
- $\mathcal{R}$ is called **pure of weight** $w \in \mathbb{Z}$ if for a.e. $p \in \mathbf{P}$ and eigenvalues α_i of $\mathfrak{wd}_p(\mathcal{R})$, $|\alpha_i| \in \overline{\mathbb{Q}}$, and
$$|\iota(\alpha_i)|^2 = p^w.$$

- $\mathcal{R}$ is called a **genuinely geometric system** if there exists an $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{Q}$ and $i \in \mathbb{N}, j \in \mathbb{Z}$ and a subspace
$$W \subset H_{\mathrm{Betti}}(X, \overline{\mathbb{Q}}(j))$$
s.t. for any (ℓ, ι), $W \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell$ is $\mathrm{Gal}_{\mathbb{Q}}$-invariant and realizes $R_{\ell,\iota}$.

Conj. (16.7.3.4).

- If $\rho : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(n, \overline{\mathbb{Q}}_\ell)$ be a continuous semisimple representation unramified at a.e. places and deRham at p, then ρ is a part of a weakly compatible system.
- Any weakly compatible system is strongly compatible.
- Any irreducible strongly compatible system $\mathcal{R}$ is geometric and pure of weight $\frac{2}{\dim \mathcal{R}} \sum_{h \in \text{H-T}(\mathcal{R})} h$.

4 Conjectures

Prop. (16.7.4.1)[Properties of Étale Cohomologies]. Let $F \in \texttt{NField}$ and $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}^d/F, p \in \mathbf{P}$.

- (E5): If $v \notin \Sigma_F^p$ and X has good reduction at v, then $\mathrm{H}^i_{\text{ét}}(X, \mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}} \in \mathrm{Rep}^{\mathrm{ur}}_{\mathbb{Q}_p}(\mathrm{Gal}_{F_v})$, and
$$P_{v,X}(T) = \det(1 - \mathrm{Frob}_v\, T|\mathrm{H}^i_{\text{ét}}(X, \mathbb{Q}_p)) \in \mathbb{Z}[T]$$
is independent of p prime to v. And all roots of $P_{v,X}(T)$ in $\mathbb{C}$ has absolute value $q_v^{-i/2}$.
- (E6): Genuine geometric representations are geometric. And for $v \in \Sigma_F^p$, if X has good reduction at v, $\mathrm{H}^i_{\text{ét}}(X, \mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}}$ is even crystalline.
- (E7): There is a cycle map
$$\eta_\ell : \mathrm{CH}^i(X) \to (\mathrm{H}^{2i}_{\text{ét}}(X, \mathbb{Q}_\ell)(i))^{\mathrm{Gal}_K}.$$
and for $P \in X(K)$, $\eta_\ell(P) \neq 0 \in (\mathrm{H}^{2d}_{\text{ét}}(X, \mathbb{Q}_p)(d))^{\mathrm{Gal}_K}$.

And there are some open conjectures:

- (EC1)[Semisimplicity of Frobenius]: Suppose X has good reduction on v,
  - If $v \notin \Sigma_F^p$, then Frob_v acts semi-simply on $H^i(X, \mathbb{Q}_p)$.
  - if $v \in \Sigma_F^p$, then Frob_v acts semi-simply on $D_{\mathrm{crys}}(H^i(X, \mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}})$.
- (EC2)[Grothendieck-Serre]: $H^i(X, \mathbb{Q}_p)$ is a semisimple Gal_F-representation.
- (EC3)[Tate's Conjecture]: η_ℓ is surjective. There are variant of this conjecture:
There is a decomposition $H^i(X(\mathbb{C}), \overline{\mathbb{Q}}) = \oplus M_j$ as $\overline{\mathbb{Q}}$-vector spaces s.t.
  - For any $\ell \in \mathbf{P}$ and an embedding $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$, $M_j \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell$ is a minimal $\mathrm{Gal}_{G_{\mathbb{Q}_p}}$-stable $\overline{\mathbb{Q}}_\ell$-space.
  - There are Weil-Deligne representations $WD_p(W_j)$ over $\overline{\mathbb{Q}}$ s.t. for any $\ell \in \mathbf{P}$ and an embedding $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$,
$$WD_p(M_j) \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell \cong WD_p(M_j \otimes_{\overline{\mathbb{Q}},\iota}, \overline{\mathbb{Q}}_\ell).$$
  - There are motivic weights $\text{H-T}(M_j)$ s.t. for any $\ell \in \mathbf{P}$ and $\iota : \mathbb{Q} \hookrightarrow \mathbb{Q}_\ell$,
$$\text{H-T}(M_j \otimes_{\overline{\mathbb{Q}},\iota} \overline{\mathbb{Q}}_\ell) = \text{H-T}(M_j).$$

and for any $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{C}$,

$$\dim_{\mathbb{C}}(M_j \otimes_{\overline{\mathbb{Q}},\iota} \mathbb{C}) \cap H^{a,i-a}(X(\mathbb{C}),\mathbb{C})$$

equals the multiplicity of a in H-T(M_j).

Conj. (16.7.4.2) [Fontaine-Mazur]. For $F \in$ `NField`, any irreducible geometric representation is genuine geometric(16.7.3.1).

Proof: Emerton and Kisin proved the two-dimensional case, Cf.[The Fontaine-Mazur conjecture for GL(2), Kisin], [Emerton, Local-Global Compatibility in the p-adic Langlands Programme for $\mathrm{GL}(2)_{\mathbb{Q}}$]?. □

Remark (16.7.4.3). It follows from proper base change(7.4.3.1) and(7.4.7.33)(14.3.1.1) that any such cohomology group satisfies the requirement.

This conjecture is very strong, for example, the étale cohomology of smooth proper varieties are known to satisfy many good properties, like Weil conjecture, and Fontaine-Mazur conjecture implies that those properties can be derived via linear algebra data.

The local version of this conjecture is known to be false.

Def. (16.7.4.4) [Algebraic Representations]. $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$ is called an **algebraic representation** if

$$P_{v,X}(T) = \det(1 - \mathrm{Frob}_v\, T | H^i(X, \mathbb{Q}_p)) \in \overline{\mathbb{Q}}[T].$$

And it is moreover called **pure of weight** w if for a.e. $v \in \Sigma_F$, eigenvalues of $\rho(\mathrm{Frob}_v)$ are all Weil integers of weight w. And w is called the **motivic weight** of V.

Prop. (16.7.4.5). If $F_0 \subset F$ is a subfield, and $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K)$ is pure of weight w, then if $W = \mathrm{Ind}_{\mathrm{Gal}_F}^{\mathrm{Gal}_{F_0}}(V)$, W is also pure of weight w.

Proof: ? □

Prop. (16.7.4.6) [Total Hodge-Tate Weights]. For a geometric representation $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$, for each $v \in \Sigma_F^v$, there are Hodge-Tate weights associated to v. For $k \in \mathbb{Z}$, define

$$m_k(V) = \sum_{v \in \Sigma_F^p} [F_v : \mathbb{Q}_p] m_k(V|_{\mathrm{Gal}_{F_v}}),$$

called the **total Hodge-Tate weights** of V. Then it satisfies:

- $\sum_{k \in \mathbb{Z}} m_k(V) = [F : \mathbb{Q}] \dim V$.
- For a subfield $F_0 \subset F$, if $W = \mathrm{Ind}_{\mathrm{Gal}_F}^{\mathrm{Gal}_{F_0}}(V)$, then $m_k(V) = m_k(W)$.?
- If V is pure of weight w, then

$$w[F : \mathbb{Q}] \dim V = 2 \sum_{k \in \mathbb{Z}} m_k \cdot k.$$

Proof: 1 is clear.

2: ?

3: By item2 and(16.7.4.5), it suffices to show for $F = \mathbb{Q}$. Secondly, it suffices to show for $\det V$, it has motivic weight $w \dim V$ and for each $v \in \Sigma_F^p$ the unique Hodge-Tate weights equal to the sum of

Hodge-Tate weights of V. Then we may assume it has weight 0 by Tate twist because Hodge-tensoring by $\mathbb{Q}_p(k)$ increases both sides by $-2k$.

Then by Sen's theory, $V|_{\mathrm{Gal}_{\mathbb{Q}_p}}$ is potentially unramified. Let χ be the Hecke character attached to V, then its kernel contains an open subgroup $U_p \subset \mathbb{Z}_p^\times$, and also by small circle argument, it contains an open subgroup $U^p \subset \prod_{\ell\neq p}\mathbb{Z}_\ell^\times$, and it also contains $\mathbb{R}_+^\times$ by(12.6.3.27). But notice $\mathbf{I}_{\mathbb{Q}}^*/\mathbb{Q}^\times U_p U^p \mathbb{R}^\times$ is finite. Thus it is an Artin representation, and has motivic weight 0(16.7.4.4), □

Prop. (16.7.4.7)[Symmetry of Hodge-Tate Weights]. If the Tate conjecture(16.7.4.1) is true, then for any genuine geometric representation V pure of weight w,

- $m_k = m_{w-k}$.
- If $w \in 2\mathbb{Z}$, let $m_{w/2}^{\pm}(V)$ be defined by

$$m_{w/2}^{+}(V) + m_{w/2}^{-}(V) = m_{w/2}(V)$$

$$m_{w/2}^{+}(V) - m_{w/2}^{-}(V) = (-1)^{w/2}(\dim V^{\mathfrak{c}=\mathrm{id}} - \dim V^{\mathfrak{c}=-\mathrm{id}}).$$

  Then $m_{w/2}^{\pm}(V) \in \mathbb{N}$.
- For a subfield $F_0 \subset F$, $m_{w/2}^{\pm}(V) = m_{w/2}^{\pm}(\mathrm{Ind}_{\mathrm{Gal}_F}^{\mathrm{Gal}_{F_0}}(V))$.

Polarized Representations

Def. (16.7.4.8) [Polarized Representations]. V is called a **polarized Galois representation** if $V^\vee \cong V(w)$ for some $w \in \mathbb{Z}$. w is called the weight of the polarization. If V is polarized and pure, then the motivic weight equals the polarization weight, so there will be no confusion.

Prop. (16.7.4.9). If $F/\mathbb{Q}$ is Galois, and V, V' are two irreducible geometric representation of Gal_F s.t. $L(V;s) = L(V';s)$, then $V' \cong V$.

Proof: This is because $L(V;s)$ determines $WD_v(V)$ for all v that is unramified. Thus also determines V by Chebotarev density theorem**?**. □

Example (16.7.4.10) [Polarized Representations].

- Any 1-dimensional representation is polarized.
- $V_p(A)$ of an Abelian variety is polarized of weight 1.
- Representations attached to a classical modular eigenform in $S_{2k}(\Gamma_0(N))$ is polarized of weight $2k-1$.
- For an irreducible polarized representation of $\mathrm{Gal}_{\mathbb{Q}}$ of dimension 2, its weight is odd iff V is odd.

Proof: **?** □

16.8 Shimura-Taniyama-Weil Conjecture

References are [Ring-theoretic properties of certain Hecke algebras, Taylor-Wiles], [Henri Darmon, Fred Diamond, and Richard Taylor, Fermat's last theorem, Elliptic curves, modular forms & Fermat's last theorem (Hong Kong, 1993), Int. Press, Cambridge, MA, 1997, pp. 2 – 140.], http://virtualmath1.stanford.edu/~conrad/modseminar/.

1 Modularity

Thm. (16.8.1.1)[Eichler-Shimura]. If $f \in S_2(\Gamma_0(N))$ be a Hecke eigenform with integral coefficients, then there exists an elliptic curve $E/\mathbb{Q}$ s.t. $L(E,s) = L(f,s)$(19.1.7.5)(19.2.6.17).

Proof: □

Prop. (16.8.1.2) [Modular Elliptic Curves]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, the following are equivalent:

- there exists a normalized Hecke eigenform $f \in S_2(\Gamma_0(N_E))$ with integral coefficients s.t. $L(E,s) = L(f,s)$.
- For some(every) $p \in \mathbf{P}$, $\rho_{E,p}$ is modular.
- There is a non-constant map $X_0(N) \to E$ over $\mathbb{Q}$ for some $N \in \mathbb{Z}_+$.
- E is isogenous to the modular Abelian variety A_f associated to some newform $f \in S_2(\Gamma_0(N_E))$.

And E is called a **modular elliptic curve** if these hold.

Proof: □

Lemma (16.8.1.3). For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $N \in \mathbb{Z}_+$, there is a surjection $X_0(N_E) \to E$ iff there is a surjection $J_0(N) \to E$.

Proof: If $\varphi : X_0(N) \to E$ is non-zero, then $\varphi_* : J_0(N) \to \mathrm{Jac}(E) \cong E$ is nonzero, by(13.5.13.9). If $\Phi : J_0(N) \to E$ is surjective, then $X_0(N) \xrightarrow{\text{Abel}} J_0(N) \to E$ is also surjective, by looking at the Tate module**?**. □

Lemma (16.8.1.4) [Langland-Tunnell]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is semistable and $E[\ell]$ is irreducible for some odd prime ℓ, then $E[\ell]$ is modular.

Lemma (16.8.1.5) [Taylor-Wiles]. If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is semistable and ℓ is an odd prime s.t. $E[\ell]$ is irreducible and modular, then T_ℓ is modular.

Proof: □

Thm. (16.8.1.6) [Modularity Theorem(Shimura-Taniyama1955), Taylor-Wiles/Breuil-Conrad-Diamond-Taylor]. Any $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ is modular(16.8.1.2).

Proof: Cf.[On the modularity of elliptic curves over $\mathbb{Q}$: wild 3-adic exercises, C. Breuil, B. Conrad, F. Diamond, and R. Taylor]. □

Prop. (16.8.1.7) [Weil's Theorem]. modular deformation ring T is isomorphic to the Galois deformation ring $R_{\overline{\rho}}$.

2 L-Functions

Prop. (16.8.2.1) [Elliptic Curves and Modular Forms]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N and sign of functional equation w_E, and has L-function $L(E,s) = \sum c_n n^{-s}$. Let $f_E(\tau) = \sum c_n e^{2\pi i \tau}$ be the Mellin transform of $L(E,s)$, then

- f_E is a cuspidal modular form on $S_k(\Gamma_0(N))$.
- f_E is a normalized Hecke eigenfunction, and satisfies $f(-1/N\tau) = w_E f(\tau)$.
- Let ω be an invariant differential form on E, then there exists a finite morphism $\varphi : X_0(N) \to E$ over $\mathbb{Q}$ s.t. $\varphi^*(\omega)$ is a multiple of the differential form on $X_0(N)$ represented by $f(\tau)d\tau$.

Proof: □

Def. (16.8.2.2) [Manin Constant]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $\omega \in \mathcal{K}_{E/\mathbb{Q}}$, the **Manin constant** is defined to be the constant $c \in \mathbb{C}$ s.t. $f^*\omega = c \cdot 2\pi\,\mathrm{i}\, f_E dz$.

Fermat's Last Theorem

Def. (16.8.2.3) [Frey's Curve]. Let $a, b, c \in \mathbb{Z}$ satisfy $a^p + b^p = c^p, p \geq 3 \in \mathbf{P}, abc \neq 0$, the **Frey curve** for a, b, c is the elliptic curve $E_{a^p,b^p,c^p} \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ define by the Weierstrass equation

$$W_{a^p,b^p,c^p} : y^2 = x(x + a^p)(x - b^p).$$

Then it satisfies:

- $\mathfrak{D}_{W_{a^p,b^p,c^p}} = 16a^{2p}b^{2p}(a^p + b^p)^2 = 16(abc)^{2p}$.
- $\Delta^{\min}_{E_{a^p,b^p,c^p}/\mathbb{Q}}$ satisfies $\Delta^{\min}_{a^p,b^p,c^p} \geq \frac{|abc|^{2p}}{2^8}$ by(13.9.4.25).

Prop. (16.8.2.4) [Galois Representation of Frey's Curve]. Let $\rho_{a^p,b^p,c^p} : \mathrm{Gal}_{\mathbb{Q}} \to \mathrm{GL}(2, \mathbb{F}_p)$ be the mod p Galois representation of $\mathrm{Gal}_{\mathbb{Q}}$ corresponding to the Frey's curve E_{a^p,b^p,c^p}(16.8.2.3), and let $\overline{\rho}_{a^p,b^p,c^p}$ be its reduction modulo p. Suppose that $a \equiv -1 (\mathrm{mod}\ 4)$ and $2|b$, then

- $\overline{\rho}_{a^p,b^p,c^p}$ is absolutely irreducible.
- $\overline{\rho}_{a^p,b^p,c^p}$ is odd.
- $\overline{\rho}_{a^p,b^p,c^p}$ is unramified outside $2p$, flat at p, and semistable at 2**?**.

Proof: **?** □

Remark (16.8.2.5). One suspects that even such a Galois representation does't exist.

Thm. (16.8.2.6) [Fermat's Last Theorem, Ribet/Wiles-Taylor]. If $p \geq 5 \in \mathbf{P}$, then there are no integral solution to the equation $a^p + b^p = c^p$.

Proof: If there exists an integral solution s.t. $abc \neq 0$, consider the Frey's curve $E_{a^p[,b^p,c^p}$(16.8.2.3), then by(16.8.2.4), $\overline{\rho}_{a^p,b^p,c^p}$ is absolutely irreducible, odd and unramified outside $2p$, and flat at p.

Then it follows from modularity conjecture(16.8.1.6) that ρ_{a^p,b^p,c^p} is attached to some newform $f \in S_2(\Gamma_0(2p))$. Then it follows from Ribet's theorem(16.7.2.11) that $\overline{\rho}_{a^p,b^p,c^p} = \overline{\rho}_{g,p}$ for some newform $g \in S_2(\Gamma_0(2))$. But there is no cuspidal form of level $\Gamma_0(2)$ and weight 2 because $X_0(2) = \mathbb{P}^1$, and $H^0(\mathbb{P}^1, \Omega^1_{\mathbb{P}^1}) = 0$, contradiction. □

Remark (16.8.2.7) [Szpiro's Conjecture and Fermat's Last Theorem]. The Szpiro's conjecture(13.5.10.12) implies Fermat's last theorem for sufficiently large n(depending on the effectiveness of Szpiro's conjecture).

Proof: Let $a,b,c \in \mathbb{Z}$ satisfy $a^n + b^n = c^n, n \geq 2, abc \neq 0$, the conductor $N_{a,b,c}$ of the Frey's curve(16.8.2.3) $E_{a,b,c}$ satisfies $N_{a,b,c} \leq 2^8(abc)$ by(13.9.4.25). Szpiro's conjecture implies

$$\frac{|abc|^{2n}}{2^8} \leq |\Delta_{a,b,c}^{\min}| \leq \kappa_1 N_E^7 \leq 2^{56}\kappa_1|abc|^7,$$

so $|abc|^{2n-7} \leq 2^{64}\kappa$. As $|abc| \geq 2$, this gives an upper bound for n. □

16.9 Drinfeld Modules

References are [Elliptic Modules, Drinfeld] and [Introduction to Drinfeld Modules, Hayes].

17 Shimura Varieties

17.1 Shimura Varieties

Main references are [Lan20], [Mil17b], [Mil11], http://virtualmath1.stanford.edu/~conrad/shimsem/, [Canonical Models of Mixed Shimura Varieties and Automorphic Vector Bundles, Milne].

1 Connected Shimura Varieties

Def. (17.1.1.1)[Connected Shimura Data]. A **connected Shimura datum** is a pair (G, D) where $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/\mathbb{Q}$ is a semisimple algebraic group and D a $G^{\mathrm{ad}}(\mathbb{R})^0$-conjugacy classes of homomorphisms $u : \mathrm{U}(1) \to G^{\mathrm{ad}}_{\mathbb{R}}$ satisfying
SU1: Only $z, 1, z^{-1}$ appear in the character of the complex representation $\mathrm{Ad} \circ u : \mathrm{U}(1) \to \mathrm{Lie}(G^{\mathrm{ad}})_{\mathbb{C}}$.
SU2: $\mathrm{ad}(u(-1))$ is a Cartan involution on $G^{\mathrm{ad}}_{\mathbb{R}}$.?
SU3: G^{ad} has no $\mathbb{Q}$-factor H s.t. $H(\mathbb{R})$ is compact.

Prop. (17.1.1.2). Let H be an adjoint real Lie group and $u : U(1) \to H$ a homomorphism satisfying SU1, SU2, then the following are equivalent:

- $u(-1) = 1$.
- u is trivial.
- H is compact.

Proof: $1 \iff 2$: If $u(-1) = 1$, then u factors through $\mathrm{U}(1) \xrightarrow{2} \mathrm{U}(1)$, so the characters z, z^{-1} cannot occur in $\mathrm{Ad} \circ u$. The converse is trivial.

$1 \to 3$: by(8.3.6.19), H is compact iff $\mathrm{ad}(u(-1)) = 1$, which is equivalent to $u(-1) = 1$ as H is adjoint. □

Prop. (17.1.1.3) [Equivalent Characterization of Connected Shimura Data]. A connected Shimura datum is equivalent to the following data:

- $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/\mathbb{Q}$ semisimple of non-compact type.
- D a Hermitian symmetric domain.
- an action of $G(\mathbb{R})^+$ on D via a surjective homomorphism $G^{\mathrm{ad}}(\mathbb{R})^0 \to \mathrm{Hol}(D)^0$ with compact kernel.

Proof: Cf.[Mil17b]P45.? □

Prop. (17.1.1.4). Let (G, D) be a connected Shimura datum and X be the $G^{\mathrm{ad}}(\mathbb{R})$-conjugacy class of homomorphisms $\mathbb{S}^1 \to \mathbb{G}_{\mathbb{R}}$ containing D, and D is a connected component of X, with stabilizer $G^{\mathrm{ad}}(\mathbb{R})^0 \subset G^{\mathrm{ad}}(\mathbb{R})$.

Proof: Cf.[Mil17b]P45. □

Def. (17.1.1.5) [Connected Shimura Varieties]. Let (G, D) be a Shimura datum, then the map $G^{\mathrm{ad}}(\mathbb{R})^0 \to \mathrm{Hol}(D)^0$ as in(17.1.1.3) has compact kernel, so for any arithmetic $\Gamma \subset G^{\mathrm{ad}}(\mathbb{R})^0 \cap G^{\mathrm{ad}}(\mathbb{Q})$, the image $\overline{\Gamma}$ is an arithmetic subgroup of $\mathrm{Hol}(D)^0$, thus we can apply Baley-Borel compactification(11.11.7.4) to get an algebraic structure on $D(\Gamma) = \Gamma\backslash D = \overline{\Gamma}\backslash D$. Moreover, if $\Gamma' \subset \Gamma \subset G^{\mathrm{ad}}(\mathbb{R})^0 \cap G^{\mathrm{ad}}(\mathbb{Q})$ satisfy $\overline{\Gamma'}, \overline{\Gamma}$ are torsion-free, then by Borel-theorem(11.11.7.5) to get a morphism $D(\Gamma') \to D(\Gamma)$.

Then for any $\Gamma \in G^{\mathrm{ad}}(\mathbb{R})^0 \cap G^{\mathrm{ad}}(\mathbb{Q})$ s.t. $\overline{\Gamma}$ is torsion-free, $D(\Gamma)$ is called a **connected Shimura variety relative to** (G, D). And the inverse image of these Shimura varieties are called the **connected Shimura variety attached to** (G, D), denoted by $\mathrm{Sh}^0(G, D)$.

Prop. (17.1.1.6) [Galois Action on Shimura Varieties].

2 Shimura Varieties

Prop. (17.1.2.1) [Shimura Variety]. Let $K \subset G(\mathbf{A}^f)$ be a compact open subset, and

$$S_K(\mathbb{C}) = G(\mathbb{Q})\backslash X \times G(\mathbf{A}^f)/K.$$

Then when K is neat**?**(which is true when K is small enough), $S_K(\mathbb{C})$ has the structure of an algebraic variety over $\mathbb{C}$ by Baily-Borel**?**, and has a model $\mathcal{S}_K$ over the reflex field E, by[Milne].

Proof: □

3 Siegel Moduler Varieties

Prop. (17.1.3.1) [Siegel Modular Varieties]. For $k \in \mathtt{Field}$, consider the functor

$$\mathcal{M}^{g,d} : \mathcal{S}\mathrm{ch}/k \to \mathcal{S}\mathrm{et} : X \mapsto \{\text{Abelian schemes over } X \text{ with a polarization of degree } d\},$$

then its Zariski shifification $\mathcal{M}^{g,d}_{\text{ét}}$ is representable by an algebraic variety $\mathcal{M}^{g,d}/k$.

Proof: **?** □

Prop. (17.1.3.2) [Canonical Ample Divisor on $\mathcal{M}^{g,d}$]. There exists a canonical ample divisor on $\mathcal{M}^{g,d}$ given by the determinant of the sheaf of invariant differentials on $\mathcal{A}$, the universal Abelian variety.

Proof: □

Prop. (17.1.3.3). The j-invariant of Elliptic schemes define an isomorphism $\mathcal{M}^{1,1}_{\mathbb{Q}} \to \mathbb{A}^1_{\mathbb{Q}}$.

Proof: **?** □

Prop. (17.1.3.4). Let

$$(V, \psi) = (\mathbb{Q}^{2g}, \langle (a_i), (b_i) \rangle = \sum_{i=1}^{g} (a_i b_{g+i} - a_{g+i} b_i)),$$

and $\widetilde{G} = \mathrm{GSp}(V)$, then the Hermitian symmetric domain $\widetilde{X}$ is the Siegel double space, and for any neat compact open subgroup $\widetilde{K} \subset \widetilde{G}(\mathbf{A}^f)$, the corresponding Shimura variety $\widetilde{S}_{\widetilde{K}}$ is the moduli space of principally polarized g-dimensional Abelian varieties with level-$\widetilde{K}$-structure, which has a model over the reflex field $\mathbb{Q}$.

4 Hodge Type Shimura Varieties

A Shimura datum (G, X) is called of **Hodge Type** if it admits a closed embedding into some Siegel variety datum $(\widetilde{G}, \widetilde{X})$. Thus it carries a universal Abelian variety.

Prop. (17.1.4.1). If (G, X) is a Shimura datum of Hodge type with an embedding $(G, X) \hookrightarrow (\widetilde{G}, \widetilde{X})$, then there exists a neat subgroup $\widetilde{K} \subset \widetilde{G}(\mathbf{A}^f)$, $K = \widetilde{K} \cap G(\mathbf{A}^f)$ s.t. there is a closed embedding of Shimura varieties

$$S_K \hookrightarrow \widetilde{S}_{\hookrightarrow K} \otimes_{\mathbb{Q}} E.$$

Proof: [Deligne71, Prop1.15]. □

5 PEL Type Shimura Varieties

6 Complex Multiplication

7 Canonical Models

Remark (17.1.7.1). Delete this?. For a Shimura datum (G, X), attached to each compact open subgroup $K \subset G(\mathbb{A}^f)$, there is a map

$$f_K : \mathcal{S}\mathrm{h}_k(G, X) \to \pi_K$$

where π_K is a the theory of canonical model defines

- a reflex field $E = E(G, X)$, which is a number field.
- A canonical model $(f_K)_0 : \mathcal{S}\mathrm{h}_K(E, G)_0 \to (\pi_K)_0$ of f_K over E, which is uniquely characterized by the reciprocity law at the special points.

and also describes the action of $\mathrm{Aut}(\mathbb{C}/E)$ on π_K.

Remark (17.1.7.2). Delete this?. The method of constructing the canonical model is the following: When our Shimura variety arises naturally as a moduli space over $\mathbb{C}$, then we can use the action of $\mathrm{Gal}(\mathbb{C}/E)$ on the $\mathbb{C}$-points to define a model of the variety over a specific number field.

The theory of complex multiplication will give us an explicit description of the action on certain special points, called the **reciprocity law** at these points, which will determine the model uniquely.

Remark (17.1.7.3). Delete this?. A heuristic reason that a Shimura variety has a canonical model is that if it is defined only on a transcendental field, then it can be spread out to give a flat family of varieties. But there are only countably many arithmetic locally symmetric varieties up to isomorphism, so there cannot be a

André-Oort Conjecture

Def. (17.1.7.4) [Special Subvarieties].

Conj. (17.1.7.5) [André-Oort]. Let S be a Shimura variety. Let $V \subset S$ be a subvariety, then there are only f.m. maximal special subvarieties contained in V.

Proof: □

17.2 André-Oort Conjecture

References are [Canonical Heights on Shimura Varieties and the André-Oort Conjecture].

18 Arakelov Geometry

18.1 Arithmetic Intersection Theory

1 Arithmetic Riemann-Roch

18.2 Arakelov Geometry

1 Metrized Line Bundles

Def. (18.2.1.1)[Metrized Line Bundles]. Let F be a number field, a **metrized line bundle** $(\mathcal{L},|\cdot|)$ is a line bundle on $\mathcal{O}_F$ together with norms $||\cdot||_v$ on the free F_v-module $M\otimes_R F_v$ of rank 1 for $v\in\Sigma_F^\infty$.

Def. (18.2.1.2) [Heights and Degree of Metrized Line Bundles]. Let F be a number field and $(\mathcal{L},|\cdot|)$ be a metrized line bundle on $\mathcal{O}_F$(18.2.1.1), for each $v\in\Sigma_F^0$, $\mathcal{L}_v=\mathcal{O}_{F,v}m_v$ for some $m_v\in\mathcal{L}_v$, so we define $||m||_v=|m/m_v|_v$ for $m\in\mathcal{L}_v$, and define the **height of** $\mathcal{L}$ to be

$$H((\mathcal{L},|\cdot|))=\prod_{v\in\Sigma_F}||m||_v^{-1},\quad m\neq 0\in M$$

which is independent of m by product formula. Also we define

$$h(M)=\frac{1}{[F:\mathbb{Q}]}\log H(M),$$

called the **degree of** $\mathcal{L}$. $h((\mathcal{L},|\cdot|))$ is invariant under change of number fields.

19 L-Functions

19.1 L-Functions Attached to Motives

Main references are [Conjectures in Arithmetic Algebraic Geometry, Hulsbergen, 1992], [Galois Representations, ICM, Taylor].

Notation (19.1.0.1).
- Use notations defined in .

Remark (19.1.0.2). In short, nineteenth century number theory showed that much, if not all, of number theory is reflected by properties of L-functions.

1 Galois L-Functions

L-Factors of Weil Representations

Thm. (19.1.1.1) [Weil L-Factors]. For any local field K and a non-trivial additive character ψ of K, there exists a group homomorphism

$$\varepsilon(\cdot, \psi) : K_0(\mathfrak{wd}(W_K)) \to \mathbb{C}^\times$$

that satisfy
- For a quasi-character χ, $\varepsilon(\chi, \psi)$ agrees with local factor given by Tate thesis.
- If E/F is a finite extension, and ρ is a representation of W_E, then

$$\varepsilon(\mathrm{ind}_{W_E}^{W_F} \rho, \psi_F) = \lambda(E/F, \psi_F)^{\dim \rho} \varepsilon(\rho, \psi_F \circ \mathrm{tr}_{E/F}).$$

Proof: Cf.[Functional Equation for Artin L-Functions, Langlands] and [Tate, Number Theoretical Background]. □

Def. (19.1.1.2) [Weil-Deligne L-Factors]. Let $K \in p$-`NField` and $\rho = (\rho_0, N) \in \mathfrak{wd}(W_K)$, we define
- the conductor $\mathfrak{f}(\rho) = \mathfrak{f}(\rho_0) + \dim(V^{I_K} / \ker(N)^{I_K})$, where $\mathfrak{f}(\rho_0)$ is the Artin conductor(15.3.2.16).
- the local L-factor
$$L(\rho, s) = \det(1 - q^{-s}\,\mathrm{Frob}_\kappa \,|\, \ker(N)^{I_K})^{-1}.$$
- the local ε-factor

$$\varepsilon(\rho, s, \psi) = q^{-(c(\rho) + n(\psi) \dim V)s} \det(-\varphi | V^{I_K} / \ker(N)^{I_K}) \varepsilon(\rho', \psi).$$

Prop. (19.1.1.3). $\varepsilon(\rho \otimes \omega_s, \psi) = q^{-(c(\rho) + n(\psi) \dim V)s} \varepsilon(\rho, \psi)$.

Proof: □

Galois L-Functions

Def. (19.1.1.4) [L-Functions]. Given an isomorphism $\iota : \overline{\mathbb{Q}}_p \hookrightarrow \mathbb{C}$, for any $V \in \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_F)$, define the global L-function as

$$L(\iota V; s) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} L(\iota\, \mathrm{WD}_p(V); s).$$

Prop. (19.1.1.5). By Chebotarev density theorem, $L(\iota V; s)$ determines $\mathrm{WD}_p(V)$ and thus V up to F-semisimplification.

Proof: ? □

Prop. (19.1.1.6). Situation as in(19.1.1.4),

- $L(V(n); s) = L(V; s+n)$.
- If $F_0 \subset F$ is a subfield, $W = \mathrm{Ind}_{\mathrm{Gal}_K}^{\mathrm{Gal}_{K_0}}(V)$, then $L(V; s) = L(W; s)$.
- If V is S-pure of weight w, then $L_S(V; s)$ converges absolutely for $\mathrm{Re}\, s > w/2 + 1$.
- If V is pure of weight w, then $L(V; s)$ is meromorphic for $\mathrm{Re}\, s > w/2 + 1$ and has no zeros there.

Proof: 1 is easy.
2: ?
3: Compare with the Dedekind zeta function(19.2.2.1).
4: clear. □

Conj. (19.1.1.7)[Holomorphy]. Situation as in(19.1.1.4), if V is geometric and pure of weight w, then it is totally pure. In particular, it is holomorphic for $\mathrm{Re}\, s > w/2 + 1$. This should be a consequence of Fontaine-Mazur conjecture and Tate's conjecture.

Conj. (19.1.1.8) [Meromorphic Extension]. If V is geometric and pure of weight w, then

- $L(V; s)$ admits a meromorphic continuation to all $s \in \mathbb{C}$, and essentially bounded on vertical strips.
- $L(V; s) \neq 0$ for $\mathrm{Re}(s) > w/2 + 1$.
- If V is irreducible, then $L(V; s)$ has no poles, expect when $V \cong \mathbb{Q}_p(n)$, then it has a simple pole at $s = -n + 1$.
- $L(V; w/2 + 1) \neq 0$.

Proof: □

Remark (19.1.1.9). This is true when V is automorphic, by Jacquet-Shalika method.

Conj. (19.1.1.10) [Grand RH Hypothesis]. If V is geometric and pure of weight w, then $L(V; s)$ has no zeros on $\mathrm{Re}\, s > (w+1)/2$.

Proof: □

Def. (19.1.1.11) [Completed L-Functions]. If V is geometric and pure of weight w, define

$$L_\infty(V; s) = \Gamma_{\mathbb{R}}(s - w/2)^{m^+_{w/2}}.\Gamma_{\mathbb{R}}(s - w/2 + 1)^{m^-_{w/2}}.\prod_{k \in \mathbb{Z}, k < w/2} \Gamma_{\mathbb{C}}(s-k)^{m_k}.$$

and define the **root number at** ∞

$$w_\infty(\rho) = \mathrm{i}^{m^-_{w/2}} . \Big(\prod_{k<w/2} \mathrm{i}^{m_k}\Big)^{2w+1}$$

and the Artin conductor $\mathfrak{f}(\rho)$(15.3.2.16), and the completed L-function

$$\Lambda(V;s) = L(\iota V;s)L_\infty(V;s).$$

and the **root number**

$$w(\iota\rho) = w_\infty(\rho)\prod_{p\in\mathbf{P}} w(\mathrm{WD}_p(\rho);\psi_p)$$

where $\iota\psi_p(x) = e^{-2\pi\,\mathrm{i}\,x}$.

Prop. (19.1.1.12). If $V \in \mathrm{Rep}_{\overline{\mathbb{Q}}_\ell}(\mathrm{Gal}_\mathbb{Q})$ is geometric and pure of weight w, then

- $L_\infty(V(n);s) = L_\infty(V;s+n)$.
- $L_\infty(V(n);s)$ has a pole of order $\sum_{0\leq k<w/2} m_k + m^+_{w/2}$ at $s=0$.
- If Tate's conjecture(16.7.4.1) holds, then $m^\pm_{w/2}\geq 0$, so $L_\infty(V(n);s)$ has no zeros.

Proof: Only 1 deserves a proof: It suffices to prove for $n=1$. If $w\notin 2\mathbb{Z}$ this is clear. If $w\in 2\mathbb{Z}$, notice Tate twists change weights by 2, so it is also odd, and $(-1)w'/2 = -(-1)^{w/2}$. But also the twist changes the action of $\mathfrak{c}$ by -1 in(16.7.4.7), so the assertion follows. □

Conj. (19.1.1.13) [Functional Equations]. If V is geometric and pure of weight w, then

$$\Lambda(V;s) = w(V)N(V)^{(w+1)/2-s}\Lambda(V^\vee;1-s).$$

Proof: □

Remark (19.1.1.14). This is true for V automorphic, by Jacquet-Shalika method.?

Conj.Cor. (19.1.1.15). For a geometric representation polarized of weight w(16.7.4.8), there should be a functional equation

$$\Lambda(V;1+w-s) = \varepsilon(V;s)\Lambda(V;s).$$

Proof: □

2 Artin L-Functions

References are [On the Functional Equation of the Artin L-Functions, Langlands], [On Artin L-Functions, Cogdell], [Deligne's 1973 Paper]. [Neu99].

Def. (19.1.2.1) [Local Artin L-Factors]. For a Galois extension of global fields L/F and $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/F))$,

$$L_v(F,\rho;s) = \begin{cases} (\det(1-||v||^{-s}\rho(\varphi_{\mathfrak{P}/\mathfrak{p}})|V^{I_\mathfrak{P}}))^{-1} & ,v\in\Sigma_F^{\mathrm{fin}} \\ L_\mathbb{C}(s)^{\chi(1)} & ,v\in\Sigma_F^\mathbb{C} \\ L_\mathbb{R}(s)^{n_+}.L_\mathbb{R}(s+1)^{n_-} & ,v\in\Sigma_F^\mathbb{R}\text{(19.2.3.1)}\end{cases}$$

where in the case $v\in\Sigma_F^{\mathrm{fin}}$, $\mathfrak{P}$ is a prime over $\mathfrak{p}=\mathfrak{p}_v$, and in the case $v\in\Sigma_F^\mathbb{R}$, let $\mathfrak{p}=\mathfrak{p}_v,\mathfrak{P}$ be any place of L over $\mathfrak{p}$, and let $\mathfrak{c}_\mathfrak{P}$ be the generator of $\mathrm{Gal}(L_\mathfrak{P}/F_\mathfrak{p})$, then

$$n_+ = \frac{\chi(1)+\chi(\mathfrak{c}_\mathfrak{P})}{2},\quad n_- = \frac{\chi(1)-\chi(\mathfrak{c}_\mathfrak{P})}{2}.$$

Prop. (19.1.2.2)[Functoriality of Artin L-Factors]. For a Galois extension of global fields L/F and $(\rho, V) \in \mathrm{Rep}(\mathrm{Gal}(L/F)), v = v_{\mathfrak{p}} \in \Sigma_F$, The Artin L-factors(19.1.2.1) satisfy the following functorial properties:

- $L_v(F, \mathbb{1}; s) = L_v(\mathbb{1}; s)$**?**.
- For $\rho, \rho' \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, $L_v(F, \rho \oplus \rho'; s) = L_v(F, \rho; s) L_v(F, \rho'; s)$.
- For Galois extensions $L'/L/K$ and $\rho \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, $L(L'/F, \rho; s) = L(L/F, \rho; s)$.
- If $F \subset M \subset L$, $\rho \in \mathrm{Rep}(\mathrm{Gal}(L/M))$, then $L_{\mathfrak{p}}(F, \mathrm{Ind}_{\mathrm{Gal}(L/F)}^{\mathrm{Gal}(L/M)}(\rho); s) = \prod_{\mathfrak{q}|\mathfrak{p}} L_{\mathfrak{q}}(M, \rho; s)$.

Proof: **?**

1, 2, 3 are clear.

For 4: Let $G = \mathrm{Gal}(L/F), H = \mathrm{Gal}(L/M)$, for any $\mathfrak{p} \in \Sigma_F^{\mathrm{fin}}$, let $\{\mathfrak{q}_1, \ldots, \mathfrak{q}_r\} = S(\mathfrak{p}) \subset \Sigma_M^{\mathrm{fin}}$, and take $\mathfrak{P}_i \in \Sigma_L^{\mathrm{fin}}$ over $\mathfrak{q}_i$. Let G_i, I_i be the decomposition and inertia groups of $\mathfrak{P}_i/\mathfrak{p}$, then $H_i = G_i \cap H, I_i' = I_i \cap H$ are the decomposition and inertia groups of $\mathfrak{P}_i/\mathfrak{q}_i$. Denote f_i the inertia degree of $\mathfrak{q}_i/\mathfrak{p}$. Let $(\rho, W) \in \mathrm{Rep}(\mathrm{Gal}(L/M)), (\rho', V) = \mathrm{Ind}_{\mathrm{Gal}(L/F)}^{\mathrm{Gal}(L/M)}(\rho) \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, then it suffices to show that

$$\det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V^{I_1}) = \prod_{i=1}^r \det(1 - \varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i} T^{f_i} | W^{I_i'}).$$

If $\mathfrak{P}_i = \tau_i^{-1}(\mathfrak{P}_1)$, then we can take $\varphi_{\mathfrak{P}_i/\mathfrak{p}} = \tau_i^{-1} \varphi_{\mathfrak{P}/\mathfrak{p}} \tau_i, I_i = \tau_i^{-1} I \tau_i$, then

$$\det(1 - \varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i} T^{f_i} | W^{I_i'}) = \det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}}^{f_i} T^{f_i} | W^{I_1 \cap \tau_i H \tau_i^{-1}}),$$

and $f_i = (G_i : H_i I_i) = (G_1 : (G_1 \cap \tau_i H \tau_i^{-1}) I_1)$.

Let σ_{ij} be a representative of $G_1/(G_1 \cap \tau_i H \tau_i^{-1})$, then because $G/H = \cup_i G_i/H_i$, $\{\sigma_{ij}\tau_i\}_{ij}$ is a representative of G/H. Then

$$V = \oplus_i (\bigoplus_j \sigma_{ij} \tau_i W),$$

and $V_i = \bigoplus_j \sigma_{ij} \tau_i W = \mathrm{Ind}_{G_1 \cap \tau_i H \tau_i^{-1}}^{G_1}(\tau_i W)$ is a G_1-module. So

$$\det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V^{I_1}) = \prod_{i=1}^r \det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V_i^{I_1})$$

Then it suffices to prove for each i,

$$\det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V_i^{I_1}) = \det(1 - \varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i} T^{f_i} | W^{I_i'}).$$

Notice

$$V_i^{I_1} = \left(\mathrm{Ind}_{G_1 \cap \tau_i H \tau_i^{-1}}^{G_1}(\tau_i W)\right)^{I_1} = \mathrm{Ind}_{H_i}^{G_i} W^{I_i'} (15.1.5.47) = \bigoplus_{i=0}^{f_i - 1} \varphi_{\mathfrak{P}_i/\mathfrak{p}}^i W^{I_i'},$$

so the assertion follow easily from this. □

Def. (19.1.2.3) [Artin L-Functions]. For a Galois extension of global fields L/F and $(\rho, V) \in \mathrm{Rep}(\mathrm{Gal}(L/F))$, the **Artin L-function** of ρ is defined to be the Euler product

$$L(F, \rho; s) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} L_v(F, \rho; s).$$

This L-function also only depends on F but not L, as we will see in(19.1.2.4).

And also define the **completed Artin L-function** as the function

$$\Lambda(F,\rho;s)=\prod_{v\in\Sigma_F}L_v(F,\rho;s).$$

Prop. (19.1.2.4)[Functoriality of Artin L-Functions]. For a Galois extension of global fields L/F and $(\rho,V)\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, The L-functions satisfy the following functorial properties:

- $L(F,\mathbb{1};s)=\zeta(F;s)$(19.3.4.1).
- For $\rho,\rho'\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, $L(F,\rho\oplus\rho';s)=L(F,\rho;s)L(F,\rho';s)$.
- For Galois extensions $L'/L/K$ and $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, $L(L'/F,\rho;s)=L(L/F,\rho;s)$.
- If $F\subset M\subset L$, $\rho\in\mathrm{Rep}(\mathrm{Gal}(L/M))$, then $L(F,\mathrm{Ind}_{\mathrm{Gal}(L/F)}^{\mathrm{Gal}(L/M)}(\rho);s)=L(M,\rho;s)$.

Proof: These follow from(19.1.2.2). □

Cor. (19.1.2.5). For a finite Galois extension L/F,

$$\zeta(L;s)=\zeta(F;s)\cdot\Big(\prod_{\rho\neq\mathbb{1}\in\mathrm{Irr}(\mathrm{Gal}(L/F))}L(F,\rho;s)^{\chi_\rho(1)}\Big)$$

Prop. (19.1.2.6)[Artin L-Functions and Weber L-Functions]. For an Abelian extension of global fields L/F with conductor $\mathfrak{f}$ and a character $\chi:\mathrm{Gal}(L/F)\to\mathbb{C}^\times$, composing with the Artin symbols(12.6.4.26), we get a character $\widetilde{\chi}:C_F/C^{\mathfrak{f}}\cong J^{\mathfrak{f}}/P^{\mathfrak{f}}\to\mathrm{Gal}(L/F)\xrightarrow{\chi}\mathbb{C}^\times$, which is a Dirichlet character. Then we have

$$L(F,\chi;s)=\prod_{\mathfrak{p}\in S}\frac{1}{1-\chi(\varphi_{\mathfrak{P}/\mathfrak{p}})(N\mathfrak{p})^{-s}}L(F,\widetilde{\chi};s)\text{(19.3.3.3)},$$

where $S=\{\mathfrak{p}\in S_f(\mathfrak{f})|\chi(I_{\mathfrak{P}})=1\}$. Moreover, if χ is injective, then $S=\varnothing$.

Proof: S are the primes that are ramified in L/F and $\mathbb{C}(\chi)^{I_{\mathfrak{P}}}\neq 0$. □

Functional Equations

Prop. (19.1.2.7) [Functional Equations, Brauer]. By Brauer theorem(15.1.3.33) and(15.1.3.33), the Artin L-functions can be written as products and inverses of Weber L-functions(19.3.3.3) and f.m. L-factors. In particular, they can be extended meromorphically to all $s\in\mathbb{C}$ and satisfies a functional equation(19.3.3.5). But the ε-factor remains mysterious**?**.

More explicitly, for a Galois extension of global fields L/F and $(\rho,V)\in\mathrm{Rep}(\mathrm{Gal}(L/F))$, the completed Artin L-function satisfies a functional equation

$$\Lambda(F,\rho;s)=\varepsilon(\rho;s)\Lambda(\rho^\vee;1-s),$$

where

$$\varepsilon(\rho)=w(\rho)\Big(|d_F|^{\chi_\rho(1)}||\mathfrak{f}(F,\rho)||\Big)^{1/2-s}\text{(15.3.2.16)}$$

and $w(\rho)$ is a root number, which satisfies $|w(\rho)|=1$.

Proof: Cf.[Algebraic Number Theory, Neukirch].**?** □

Conj. (19.1.2.8) [Artin]. If F is a global field and $(\rho, V) \in \mathrm{Rep}(\mathrm{Gal}_F)$ satisfies $V^{\mathrm{Gal}_F} = 0$, then $L(F, \rho; s)$ is an entire function on $\mathbb{C}$.

Proof: □

Remark (19.1.2.9). The Artin conjecture is true for ρ factoring through a solvable quotient, as we can reduce to Abelian case, and use(19.1.2.6) and(19.3.3.5).

3 Artin-Weil L-Functions

Cf.[On the Functional Equation of the Artin L-Functions, Langlands].

4 Hasse-Weil L-Functions

over Finite Fields

Def. (19.1.4.1) [Zeta-Functions]. Let X be an algebraic scheme over a finite field $\mathbb{F}_q$, then its **Zeta function** is defined to be the power series

$$Z(X;T) = \exp(\sum_{n\geq 1} \#X(\mathbb{F}_{q^n})\frac{T^n}{n}) \in \mathbb{Q}[[T]].$$

Notice that we can get the information of number of rational points of X by the formula

$$\#X(\mathbb{F}_{q^n}) = \frac{1}{(n-1)!}\frac{d^n}{dT^n}\log Z(X;T)|_{T=0}.$$

Prop. (19.1.4.2) [Euler Product]. there is an Euler product formula for $Z(X;T)$ by(13.12.2.2)(13.12.2.3):

$$Z(X;T) = \prod_{x \text{ closed in } X} \frac{1}{1-T^{\deg(x)}}.$$

Thm. (19.1.4.3) [Weil Conjecture1949, Deligne1974]. Let X be a smooth proper variety over $\mathbb{F}_q$ of dimension n, then

1. (Rationality): $Z(X;T) \in \mathbb{Q}(T)$.
2. (Riemann Hypothesis): $Z(X;T)$ is of the form

$$Z(X;T) = \frac{P_1(X;T)P_3(X;T)\ldots P_{2n-1}(X;T)}{P_0(X;T)P_2(X;T)\ldots P_{2n}(X;T)}$$

s.t.

- $P_0(X;T) = 1-T$,
- $P_{2n}(X;T) = 1-q^nT$,
- For $0 \leq i \leq 2n$, $P_i(X;T) \in \mathbb{Z}[T]$,
- For $0 \leq i \leq 2n$, $P_i(X;T) = \prod_{j\leq k}(1-\alpha_{ij}T)$, where each α_{ij} is an algebraic integer s.t. $|\iota(\alpha_{ij})| = q^{i/2}$, where ι is any embedding $\mathbb{Z}[\alpha_{ij}] \to \mathbb{Z}$. In particular, α_{ij} appear in conjugate pairs.
- $\deg(P_i(X;T))$ is called the ***i*-th Betti number** of X, and $\deg P_i(X;T) = \deg P_{2n-i}(X;T)$.

3. (Functional Equation):
$$Z(X;\frac{1}{q^nT}) = \pm q^{n\chi/2}T^{\chi}Z(X;T),$$
where χ is a Euler character $\Delta\cdot\Delta = \sum_{i=0}^{2n}(-1)^i\deg P_i(X;T)$, where $n\chi/2\in\mathbb{Z}$.
4. If X lifts to some proper smooth scheme $\mathcal{X}$ over $\mathcal{O}_K$ where K is a global number field and $\mathfrak{p}$ is a prime of K with residue field $\mathbb{F}_q$, then $\deg(P_i(X;T))$ equals the i-th Betti number of $\mathcal{X}_{\mathbb{C}}$.
5. $\chi(X) = \Delta_X\cdot\Delta_X$.

Proof: 1, 2: It follows from trace formula(13.12.2.6) that
$$Z(X;T) = \frac{P_1(X;T)P_3(X;T)\dots P_{2n-1}(X;T)}{P_0(X;T)P_2(X;T)\dots P_{2n}(X;T)} = \frac{P(T)}{Q(T)},$$
where the roots α_{ij} of $P_i(X;T)$ are algebraic integers satisfying $|\iota(\alpha_{ij}^{-1})| = q^{-i/2}$ by Deligne's purity theorem(13.12.6.5). Thus $P_i(X;T)\in\mathbb{Q}[T]$ because it is in $\overline{\mathbb{Q}}[T]$ and also it is stable under $\mathrm{Gal}_{\mathbb{Q}}$, as their roots are distinguished by their ι-values.

Moreover, by Euler product(19.1.4.2), $Z(X;T)\in\mathbb{Z}[[T]]$, so it follows from(8.5.1.16) that $P(T), Q(T)\in\mathbb{Z}[T]$.

Notice by Poincaré duality(7.4.8.11), $\mathrm{H}^{2n}_{\text{ét}}(X;\mathbb{Q}_\ell(n))\cong\mathrm{H}^0_{\text{ét}}(X;\mathbb{Q}_\ell)^\vee$, thus F_X^* acts on $\mathrm{H}^0_{\text{ét}}(X;\mathbb{Q}_\ell)$ by id and acts on $\mathrm{H}^{2n}_{\text{ét}}(X,\mathbb{Q}_\ell)$ by q^n. Thus $P_0(X;T) = 1-T$, $P_{2n}(X;T) = 1-q^nT$.

3: Apply(2.3.12.1) to $H^i = \mathrm{H}^i_{\text{ét}}(X;\mathbb{Q}_\ell)$, trace map and perfect pairing given by Poincaré duality(7.4.8.11) and $\varphi_i = q^{-i/2}F_X^*$. Notice $\varphi_{2n} = \mathrm{id}$ by item2. Now(2.3.12.1) says $\varphi_i^{-1} = \varphi_{2d-i}^t$. Then
$$\{\frac{q^{i/2}}{\alpha_{ij}}\} = \{\frac{\alpha_{2n-i}}{q^{(2n-i)/2}}\}$$
where we are counting multiplicity. Thus for $i\neq d$, we can assume $\alpha_{ij}\alpha_{2n-i,j} = q^n$, and for $i = d$, suppose there are $N_\pm$ many $\alpha_{d,j} = \pm q^{n/2}$, and the other $\alpha_{d,j}$ comes in pair: $\alpha_{d,j}\alpha_{d,b_d-j} = 0$. Then
$$Z(X;\frac{1}{q^nT}) = \prod_i(1-\alpha_{ij}/(q^nT))^{(-1)^{i+1}} = \prod_i(1-\frac{1}{\alpha_{2n-i,j}T})^{(-1)^{i+1}} = Z(X;T)\cdot q^{n\chi/2}(-1)^{N_+}.$$

Moreover, if n is odd, then $b_i = b_{d-i}$, and χ is even, so $d\chi/2\in\mathbb{Z}$.

4: These follow from the trace formula(13.12.2.6) and(7.4.7.32). □

Cor. (19.1.4.4) [Invariance of Characteristic Polynomial with ℓ]. It follows from the proof above that P_i is determined by X, and it is also the characteristic polynomial of $\mathrm{Fr}_{\overline{X}}$ on $\mathrm{H}^i_{\text{ét}}(X,\mathbb{Q}_\ell)$ for any $\ell\in\mathbf{P}\backslash\operatorname{char}k$, so the latter is independent of ℓ chosen.

5: By(7.8.2.2),
$$\Delta_X\cdot\Delta_X = (\mathrm{cyl}_{X\times X}(\Delta_X), \mathrm{cyl}_{X\times X}(\Delta_X)) = \sum_{i=0}^{2d}\mathrm{tr}(\mathrm{id}\,|\mathrm{H}^i_{\text{ét}}(X)) = \chi(X).$$

Points Counting

Thm. (19.1.4.5) [Deligne's Estimate].

Proof: □

Cor. (19.1.4.6) [Weil Bound]. If X is a proper smooth curve over $\mathbb{F}_q$, then by Weil conjecture(19.1.4.3),

$$|\#X(\mathbb{F}_{q^n}) - q^n - 1| = |\sum_j \alpha_{1j}| \leq 2g(X)q^{n/2}.$$

Prop. (19.1.4.7) [Drinfeld-Vladut]. For $p \in \mathbf{P}, q = p^r$, let $A(q) = \overline{\lim}_{g(X)\to\infty} \frac{\#X(\mathbb{F}_q)}{g(X)}$, where the limit is taken over all smooth proper curves over $\mathbb{F}_q$. Then $A(q) \leq \sqrt{q} - 1$.

Proof: Let α_{1j} as in(19.1.4.3), $\omega_i = \alpha_{1i}q^{-1/2}$, then $|\omega_i| = 1$ and inversion induces an automorphism of $\{\omega_i\}$. Then by(19.1.4.6), for any $r \in \mathbb{Z}_+$,

$$N = \#X(\mathbb{F}_q) \leq \#X(\mathbb{F}_{q^r}) = q^r + 1 - q^{r/2}\sum_i \omega_i^r.$$

And notice

$$0 \leq |1 + \omega_i + \ldots + \omega_i^r|^2 = (r+1) + \sum_{j=1}^r (r+1-j)(\omega_i^j + \omega_i^{-j}),$$

So

$$\begin{aligned} 2g(X)(r+1) &\geq -\sum_i \sum_{j=1}^r (r+1-j)(\omega_i^j + \omega_i^{-j}) = -2\sum_{j=1}^r (r+1-j)(\sum_i \omega_i^j) \\ &\geq N\sum_{j=1}^r (r+1-j)q^{-j/2} - \sum_{j=1}^r (r+1-j)(\alpha^j + \alpha^{-j}) \end{aligned}$$

Thus

$$\frac{N}{g(X)} \leq (\sum_{j=1}^r \frac{r+1-j}{r+1} q^{-j/2})^{-1} \cdot (1 + \frac{1}{g}\sum_{j=1}^r \frac{r+1-j}{r+1}(\alpha^j + \alpha^{-j}))$$

Taking limit $g \to \infty$,

$$\frac{N}{g(X)} \leq (\sum_{j=1}^r \frac{r+1-j}{r+1} q^{-j/2})^{-1}.$$

And taking limit $r \to \infty$ gives

$$\frac{N}{g(X)} \leq (\sum_{j=1}^r q^{-j/2})^{-1} = \sqrt{q} - 1$$

□

Thm. (19.1.4.8) [Lang-Weil Estimate]. Cf.[Zeta function in algebraic geometry, Mustata].

Proof: □

Hasse-Weil L-Functions

Def. (19.1.4.9) [Hasse-Weil L-Functions]. For $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}/\mathbb{Q}, \ell \in \mathbf{P}$, there is some $N \in \mathbb{Z}_+, \ell | N$ s.t. X has a model $\mathcal{X}/\mathbb{Z}[\frac{1}{N}]$. Choose an embedding Then we can define a a partial zeta function

$$\zeta_N(X; s) = \prod_{p \nmid N} \Big(\prod_{x \in |X_p|_0} (1 - p^{-s\deg(x)})^{-1} \Big),$$

then by Grothendieck-Lefschetz formula,

$$\zeta_N(X;s) = \prod_{i=0}^{2\dim X} L_N(\iota H^i(X,\overline{\mathbb{Q}}_\ell);s)^{(-1)^i}.$$

Thus it is natural to define the **Hasse-Weil L-function**

$$\zeta(X;s) = \prod_{i=0}^{2\dim X} L(\iota H^i(X,\overline{\mathbb{Q}}_\ell);s)^{(-1)^i}.$$

and the completed L-function

$$\Lambda(X;s) = \prod_{i=0}^{2\dim X} \Lambda(\iota H^i(X,\overline{\mathbb{Q}}_\ell)l;s)^{(-1)^i}.$$

Example (19.1.4.10). If $X \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, then this will give

$$\zeta(X;s) = \frac{\zeta(s)\zeta(s-1)}{L(E;s)}.$$

Conj. (19.1.4.11). Motivated by Poincaré duality and(19.1.1.13), situation as in(19.1.4.9), $\zeta(X;s)$ should have a meromorphic extension to the whole plane, and satisfies a functional equation of the form

$$\Lambda(X;s) = \varepsilon(s)\Lambda(X, 1+\dim X - s).$$

Proof: □

Remark (19.1.4.12). This is true for elliptic curves, by [BCDT].

5 Motivic L-Functions

Main references are [Del79] and [Zag94].

Def. (19.1.5.1) [Motivic L-Functions]. Use the fact the Grothendieck motives over a finite field is a Tannakian category**?**, we can define L-functions for any motives over a number field. Such an L-function is called a **motivic L-function**.

Conj. (19.1.5.2) [Properties]. The motivic L-functions are conjectured to satisfy the following properties:

Algebraicity: There are Dirichlet series expansions: $L(s) = \sum_{n\geq 1} a_n n^{-s}$ for $\mathrm{Re}(s)$ large, where $\{a_n\} \in F$ for some number field F.

Euler Product: There are Euler product expansions: $L(s) = \prod_{p\in\mathbf{P}} \Phi_p(p^{-s})$ where $\max_{p\in\mathbf{P}}\{\deg\Phi_p\} < \infty$. In particular, $n \mapsto a_n$ is multiplicative.

Functional Equation: There is a γ-factor

$$\gamma(s) = A^s \cdot \prod_i \Gamma(\frac{1}{2}(s+m_i))$$

where $A \in \mathbb{C}^*, m_i \in \mathbb{Z}$, s.t. $\zeta(s) = \gamma(s)L(s)$ satisfies a functional equation

$$\zeta(s) = w\zeta(h-s)$$

where $w = \pm 1$ called the **sign of functional equation** and $h \in \mathbb{Z}_+$. And in this way, $L(s)$ extends to a meromorphic function on $\mathbb{C}$ with only f.m. poles.

Local Riemann Hypothesis: The zeros of $\Phi_p(p^{-s})$ lie on the line $\mathrm{Re}(s) = \frac{k-1}{2}$.

Riemann Hypothesis: The zeros of $L(s)$ are either integers or lie on the line $\mathrm{Re}(s) = \frac{k-1}{2}$.

Special Values: A **critical point for** $L(s)$ is an integer $m \in \mathbb{Z}$ s.t. neither m nor $h - m$ is a pole of $L(s)$. Then for a critical point m for $L(s)$, the **critical value** $L(m) = A(m)\Omega(m)$, where $A(m)$ is a reasonable algebraic number and $\Omega(m) \in \mathbb{P}$ is a reasonable period number.

Central Special Values: If $h = 2m, m \in \mathbb{Z}$, then m is called a **central value** of $L(s)$, and in this case, $A(m)$ is a square times a simple factor.

Proof: □

Conj. (19.1.5.3) [Big Automorphy Conjecture]. Every motivic L-function comes from a automorphism representation.

Proof: □

6 0-Dimensional Motives

7 Abelian Motives

Def. (19.1.7.1) [Motivic L-Function of Elliptic Curves]. Let F be a global field F and $A \in \mathcal{A}b\mathcal{V}ar/F$, the motivic h^1 L-function is defined to be

$$L(h^1 A, s) = \prod_{v \in \Sigma_F^0} L(h^1 A_v, s)$$

where $L(E_v, s)$ is defined to be

- $L(E_v, s) = (1 - a_v q_v^{-s} + q_v^{1-2s})^{-1}$ as in(19.1.7.4), where $a_v = q_v + 1 - \#\widetilde{E}_v(k_v)$, if E has good reduction at v.
- $(1 - q_v^{-s})^{-1}$ if E has split multiplicative reduction at v.
- $(1 + q_v^{-s})^{-1}$ if E has non-split multiplicative reduction at v.
- 1 if E has additive reduction at v.

Notice that in all cases we have $L(E_v, 1) = q_v / \#\widetilde{E}_{ns}(k_v)$.

Hasse-Weil L-Functions

Prop. (19.1.7.2)[Hasse-Weil L-Functions]. Let X be a smooth proper variety over a global field F, the ζ-function of X is defined to be

$$Z(X, s) = \prod_{v \in \Sigma_F^0} Z(\mathcal{X}_v, q^{-s}),$$

where for v s.t. $\mathcal{X}_v$ has good reduction, $Z(\mathcal{X}_v, T) = Z(\mathcal{X}_{k_v}, T)$ in(19.1.4.1), and for bad places v, it needs to be defined otherwise.?

Prop. (19.1.7.3). Let $l_1, \ldots, l_N$ be linear forms in r-variables with rational coefficients, then

$$\sum_{x \in \mathbb{Z}^r} \frac{1}{l_1(x) \ldots l_N(x)} \in \mathbb{Q}\pi^N$$

if it is convergent.

Proof: □

Elliptic Curves

Def. (19.1.7.4) [L-Factors].

Def. (19.1.7.5) [Motivic L-Function of Elliptic Curves]. Let F be a global field F and $E \in \mathcal{E}\mathrm{ll}/F$, the motivic h^1 L-function is defined to be

$$L(h^1 E, s) = \prod_{v \in \Sigma_F^0} L(h^1 E_v, s)$$

where $L(E_v, s)$ is defined to be

- $L(E_v, s) = (1 - a_v q_v^{-s} + q_v^{1-2s})^{-1}$ as in(19.1.7.4), where $a_v = q_v + 1 - \#\widetilde{E}_v(\kappa_v)$, if E has good reduction at v.
- $(1 - q_v^{-s})^{-1}$ if E has split multiplicative reduction at v.
- $(1 + q_v^{-s})^{-1}$ if E has non-split multiplicative reduction at v.
- 1 if E has additive reduction at v.

Notice that in all cases we have $L(E_v, 1) = q_v / \#\widetilde{E}_{\mathrm{sm}}(\kappa_v)$.

Prop. (19.1.7.6) [Tate-Faltings]. If $E, E' \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ s.t. $L_E(s) = L_{E'}(s)$, then E, E' are isogenous.

Proof: Cf.[Milne, Elliptic Curves, Thm5.4.1]. □

Invariants of Moduli Spaces

Prop. (19.1.9.1). Volumes and Euler characteristics of moduli spaces are often expressible by special values of ζ-functions.

Proof: □

Def. (19.1.9.2)[Witten ζ-Functions]. Because of the appearance in physics(Verlinde formula), people are interested in certain moduli spaces of vector bundles on curves.

Witten gave a formula expressing the volume of these moduli spaces in terms of special values of **Witten ζ-functions**:

Let $\mathfrak{g}$ be a semisimple f.d. Lie algebra, define

$$\zeta_g(s) = \sum_{\rho\in\mathrm{Rep}(\mathfrak{g})} \frac{\dim(\rho)^s}{}?$$

Prop. (19.1.9.3). A consequence of Witten's formula(19.1.9.2) is:

$$\zeta_{\mathfrak{g}}(2m) \in \mathbb{Q}\pi^{2rm}, m \in \mathbb{Z}_+$$

where r is the number of positive roots of $\mathfrak{g}$.

Multiple ζ-Values

Cf.[Zag94].

19.2 L-Functions Attached to Automorphic Representations

Main references are [Bum98], [Cog00] and [Gelbart-Shahidi, Analytic Properties of Automorphic L-Functions].

Notation (19.2.0.1).

- Use notations defined in Adelic Automorphic Representations.
- Use notations defined in Archimedean L-Factors.
- Fix a global field F.
- Fix an additive character $\psi = \otimes' \psi_v : \mathbf{A}_F / F \to \mathbb{C}^\times$.
- Fix a linear algebraic group $G \in \mathcal{A}\mathrm{lg}\mathcal{G}\mathrm{rp}/F$ with center Z, and let $\mathcal{K} \subset G(\mathbf{A}_F)$ be a hyperspecial compact subgroup(13.3.3.2).
- Fix a central character $\omega : Z(\mathbf{A}_F)/Z(F) \to \mathbb{C}^\times$. Notice if $G = \mathrm{GL}(2)$, ω is just a Hecke character.

1 Introduction

Remark (19.2.1.1) [Delete]. According to https://mathoverflow.net/questions/44657/principal-l-functions-on-gln, there are several ways to attach L-functions to a cusp form on $\mathrm{GL}(n)$ with functional equations:

1. Godement-Jacquet: In the spirit of Tate's thesis, take a cusp form f on $G = \mathrm{GL}(n)$ (and f' in the dual representation) and a Schwartz-Bruhat function Φ on $\mathrm{Mat}(n, \mathbf{A}_F)$ and integrate

$$\int_{Z(\mathbf{A}_F)G(F)\backslash G(\mathbf{A}_F)} \langle \pi(g)f, f'\rangle \Phi(g) |\det(g)|^s dg.$$

For this, Cf.[G-H11]Chap11.

2. Rankin-Selberg: Take a cusp form f on $G = \mathrm{PGL}(n)$ (and f' in the dual representation) and a specific Eisenstein series on $\mathrm{PGL}(n^2)$ and integrate

$$\int_{Z(\mathbf{A}_F)(G\times G)(F)\backslash (G\times G)(\mathbf{A}_F)} E(g_1, g_2) f(g_1) f'(g_2) \mathrm{d}g_1 \mathrm{d}g_2,$$

where Z is the center of $\mathrm{PGL}(n^2)$. For this, Cf.[Bum98] and [Goldfeld].

3. Explicit Eulerian integral(Jacquet-Shapiro-Shalika): Take a cusp form f on $\mathrm{GL}(n)$ and f' on $\mathrm{GL}(m)$ with $n > m$, integrate

$$\int_{GL(m,F)\backslash GL(m,\mathbf{A}_F)} Pf(g) f'(g) |\det(g)|^{s-1/2} \mathrm{d}g.$$

where P is the projection operator brilliantly designed s.t. this integral resolves to the product of Whittaker models for f and f'. For this, Cf.[Cog00] and [Analytic Theory of L-functions for $GL(n)$].

4. Eisenstein series(Langlands-Shahidi):

L-Functions for $\mathrm{GL}(n)$

Prop. (19.2.1.2). To $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n)/\mathbb{Q})$, we can associate:

-

2 Tate's thesis(Godement-Jacquet for $\mathrm{GL}(1)$)

Main references are [Poo15], [R-V99] and [Tat65].

Lemma (19.2.2.1) [Dedekind Zeta Function]. For a global field F, the **Dedekind zeta function** is defined by

$$\zeta(F;s) = \prod_{\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}} \frac{1}{1-||\mathfrak{p}||^{-s}}.$$

It converges absolutely for $\mathrm{Re}(s) > 1$. Notice if $F \in$ `FField`, then

$$\zeta(F;s) = \sum_{\mathfrak{a}\in\mathrm{Ideal}(\mathcal{O}_F)} \frac{1}{||\mathfrak{a}||^s}$$

Proof: It suffices to show $\prod_{\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}} \frac{1}{1-||\mathfrak{p}||^{-\sigma}} < +\infty$ for $\sigma > 1$.

If F is a number field, let $d = [F : \mathbb{Q}]$, this is bounded by

$$\prod_p (1-p^{-\sigma})^{-d} = (\sum_{n\geq 1} n^{-\sigma})^d < \infty.$$

If F is a function field, let the number of irreducible polynomial modulo p be N_n, then use the same method, it suffices to prove the convergence of

$$\prod_{\mathfrak{p}\in\Sigma_F^{\mathrm{fin}}} \frac{1}{1-\frac{1}{(N\mathfrak{p})^\sigma}} = \prod_{n\geq 1} (\frac{1}{1-q^{-n\sigma}})^{N_n}.$$

This is convergent iff $\sum_{n\geq 1} N_n q^{-n\sigma}$ is convergent(10.5.3.8), but the latter is bounded by

$$\sum_{n\geq 1} q^n q^{-n\sigma} = \sum_{n\geq 1} q^{-n(\sigma-1)} < \infty.$$

□

Def. (19.2.2.2) [Zeta Functions]. If $\Phi \in \mathcal{S}(F)$ and χ is a Hecke character of F, $s \in \mathbb{C}$, the **global zeta function** is defined to be

$$\zeta(\chi,\Phi;s) = \int_{\mathbf{I}_F} \Phi(\mathfrak{a})\chi(\mathfrak{a})|\mathfrak{a}|^s d^\times \mathfrak{a}.$$

When $\Phi = \otimes_v \Phi_v$ is a pure tensor,

$$\zeta(\chi,\Phi;s) = \prod_{v\in\Sigma_F} \zeta_v(s,\chi_v,\Phi_v) = \prod_{v\in\Sigma_F} \int_{F_v^\times} \Phi_v(x)\chi_v(x)|x|_v^s d^\times x$$

Where the **local zeta functions** $\zeta_v(\chi_v,\Phi_v;s)$ converge to a holomorphic function for $\mathrm{Re}(s) > 0$ and the integral is absolutely convergent for $\mathrm{Re}(s) > 1$.

Proof: For the local zeta function: Φ_v is rapidly decreasing, thus it suffices to integrate the part where $|x|_v < 1$. Then Φ_v is bounded on this compact region, thus it suffices to evaluate $\int_{|x|_v\leq 1}|x|_v^s \mathrm{d}^\times x<\infty$ for $\mathrm{Re}(s)>0$, which can be done case by case.

To show the global integral converges, notice the local integrals is the same as the local L-factors for a.e. $v\in\Sigma_F$ by(19.2.2.3), so we can use Fubini and notice that $\prod_v L(\chi_v;s)$ converges by comparison with the Dedekind zeta function(19.2.2.1). □

Prop. (19.2.2.3) [Unramified Factors]. For any place v that unramified in the sense of(12.4.6.19) and $\Phi_v=\mathbb{1}_{\mathcal{O}_v}$,

$$\zeta_v(\chi_v,\Phi_v;s)=L(\chi_v;s)=(1-\chi_v(\varpi)||\mathfrak{p}||^{-s})^{-1}\text{(19.2.3.1)}.$$

Proof: Notice the a.e. $v\in\Sigma_F$ satisfies v that unramified in the sense of(12.4.6.19) and $\Phi_v=\mathbb{1}_{\mathcal{O}_v}$, and for such a v,

$$\zeta_v(\chi_v,\Phi_v;s)=\sum_{k\in\mathbb{N}}\int_{v(x)=k}\chi_v(x)|x|_v^s d^\times x=\sum_{k\in\mathbb{N}}(\chi_v(\varpi_v)||v||^{-s})^k=(1-\chi_v(\varpi)||v||^{-s})^{-1}.$$

□

Prop. (19.2.2.4) [Global Functional Equation]. The global zeta function(19.2.2.2) can be extended to a meromorphic function for all s, and it has poles iff $\chi(x)=|x|^\lambda$ for some $\lambda\in\mathrm{i}\,\mathbb{R}$. In which case, it only has poles at

$$s=\begin{cases}-\lambda,1-\lambda & ,F\in\mathtt{NField}\\ -\lambda+\frac{2\pi n\,\mathrm{i}}{\log(\#F_0)},1-\lambda+\frac{2\pi n\,\mathrm{i}}{\log(\#F_0)} & ,F\in\mathtt{FField}\end{cases}$$

with respectively residue $-kf(0)$ and $kf^\vee(0)$, where $k=V(\mathbf{I}_F^1/F^\times)$(12.4.6.20), and essentially bounded on the vertical strips away from the poles. And we have functional equations

$$\zeta(\chi,\Phi;s)=\zeta(\chi^{-1},\Phi^\vee;1-s).$$

Proof: Consider the exact sequence

$$1\to\mathbf{I}_F^1\to\mathbf{I}_F\to|\,\mathbf{I}_F\,|\to 1.$$

Let $\mathbf{I}_F^t$ be the inverse image of $t\in|\,\mathbf{I}_F\,|$, where $|\,\mathbf{I}_F\,|=\mathbb{R}_+$ or $q^{\mathbb{Z}}$, with Haar measure dt/t or $\log q$ times the counting measure(also denoted dt/t), and choose Haar measure $d^\times x$ on each I_F^t compatible with $d^\times\mathfrak{a}$ and dt/t. In particular, if $|a_t|=t$,

$$\int_{|I_F|}\int_{I_F^1}\Phi(a_tx)\chi(a_tx)t^sd^\times x\frac{dt}{t}=\int_{I_F}\Phi(\mathfrak{a})\chi(\mathfrak{a})|\mathfrak{a}|^sd^\times\mathfrak{a}.$$

Then the measure $d^\times x$ and the counting measure on $F^\times$ induces a measure $d^\times x$ on $I_F^1/F^\times$, in particular, for any $f\in C(C_F)$, we have

$$\int_{I_F^t/F^\times}f(x)d^\times x=\int_{I_F^1/F^\times}f(a_tx)d^\times x=\int_{I_F^1/F^\times}f(\frac{a_t}{x})d^\times x=\int_{I_F^{1/t}/F^\times}f(\frac{1}{x})d^\times x.\qquad(\star)$$

Denote $\zeta_t(\chi,\Phi;s)=\int_{I_F^t}\Phi(x)\chi(x)|x|^sd^\times x$, then

$$\zeta(\chi,\Phi;s)=\int_0^1\zeta_t(\chi,\Phi;s)\frac{dt}{t}+\int_1^\infty\zeta_t(\chi,\Phi;s)\frac{dt}{t}=J+I$$

where if $|I_F| = q^{\mathbb{Z}}$ the value at 1 is counted half-half at this two part. Now for the I-part, if $\mathrm{Re}(s)$ is smaller, it is smaller, thus I extends to a holomorphic function to all $s \in \mathbb{C}$. For the J-part, by lemmas(19.2.2.6)(19.2.2.5),

$$\begin{aligned} J &= \int_0^1 \zeta_{1/t}(\widehat{\Phi}, \chi^{-1}; 1-s)\frac{dt}{t} + [\int_0^1 (k\widehat{\Phi}(0)(\frac{1}{t})^{1-s} - k\Phi(0)t^s)\frac{dt}{t}]\delta_{c,|\cdot|} \\ &= \int_1^\infty \zeta_t(\widehat{\Phi}, \chi^{-1}; 1-s)\frac{dt}{t} + [\int_0^1 (k\widehat{\Phi}(0)t^{s-1} - k\Phi(0)t^s)\frac{dt}{t}]\delta_{c,|\cdot|} \\ &= I(\chi, \Phi; s) + I(\chi^{-1}, \widehat{\Phi}; 1-s) + k\delta_{c,|\cdot|}[\int_0^1 (\widehat{\Phi}(0)t^{s-1} - \Phi(0)t^s)\frac{dt}{t}] \end{aligned}$$

So it can be extended, and the final part is

$$\frac{k\widehat{f}(0)}{s-1} - \frac{kf(0)}{s}$$

when F is number field, and when F is function field, it equals

$$k\log q[\widehat{f}(0)(-\frac{1}{2} + \sum_{n=0}^\infty (q^{-n})^{s-1}) - f(0)(-\frac{1}{2} + \sum_{n=0}^\infty (q^{-n})^s)] = \frac{k\log q}{2}(\widehat{f}(0)\frac{1+q^{1-s}}{1-q^{1-s}} + f(0)\frac{1+q^s}{1-q^s}).$$

Now clearly $\zeta(\chi, \Phi; s) = \zeta(\chi^{-1}, \widehat{\Phi}; 1-s)$, and it has the desired residues at 1 and $|\cdot|$. □

Lemma (19.2.2.5). $\int_{\mathbf{I}_F^t/F^\times} \chi(x)|x|^s d^\times x = kt^s$ if $\chi = \mathbb{1}$ and 0 otherwise.

Proof: $\int_{\mathbf{I}_F^t/F^\times} \chi(x)|x|^s d^\times x = \chi(a_t)t^s \int_{\mathbf{I}_F^1/F^\times} \chi(x) d^\times x$, $\mathbf{I}_F^t/F^\times$ is compact(12.4.5.21) and χ is trivial on $\mathbf{I}_F^1/F^\times$ iff $\chi = \mathbb{1}$, thus we can use(10.11.1.14). □

Lemma (19.2.2.6). $\zeta_t(\chi, \Phi; s) + \Phi(0)\int_{\mathbf{I}_F^t/F^\times} \chi(x)|x|^s d^\times x = \zeta_{1/t}(\widehat{\Phi}, \chi^{-1}; 1-s) + \widehat{\Phi}(0)\int_{I_F^{1/t}/F^\times} \chi(x)|x|^s d^\times x$.

Proof:

$$\begin{aligned} \zeta_t(\chi, \Phi; s) + \Phi(0)\int_{I_F^t/F^\times} \chi(x)|x|^s d^\times x &= \int_{\mathbf{I}_F^t/F^\times} (\sum_{a\in F^\times} \Phi(ax))\chi(ax)|ax|^s d^* x + \int_{\mathbf{I}_F^t/F^\times} \Phi(0)\chi(x)|x|^s d^\times x \\ &= \int_{\mathbf{I}_F^t/F^\times} (\sum_{a\in F} \Phi(ax))\chi(x)|x|^s d^* x \\ \text{(12.4.6.22)} &= \int_{\mathbf{I}_F^t/K^\times} \frac{1}{|x|}(\sum_{a\in K} \widehat{\Phi}(a/x))\chi(x)|x|^s d^* x \\ (\text{by } \star) &= \int_{\mathbf{I}_F^{1/t}/F^\times} (\sum_{a\in F} \widehat{\Phi}(ay))|y|\chi^{-1}(y)|y|^{-s} d^* y \\ &= \zeta_{1/t}(\widehat{\Phi}, \chi^{-1}; 1-s) + \widehat{f}(0)\int_{\mathbf{I}_F^{1/t}/F^\times} \chi(x)|x|^s d^\times x \end{aligned}$$

□

Local Functional Equations

Lemma (19.2.2.7). For any $\Phi_v, \Psi_v \in \mathcal{S}(F_v)$, $\chi_v \in (F_v^\times)^\vee$, $s \in \mathbb{C}$,

$$\frac{\zeta_v(\chi_v, \Phi_v; s)}{\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)} = \frac{\zeta_v(\chi_v, \Psi_v; s)}{\zeta_v(\chi_v^{-1}, \widehat{\Psi}_v; 1-s)}.$$

Proof: ?

$$\zeta(f,c)\zeta(\widehat{g},\overline{c}) = \int_{K^\times} f(\alpha)c(\alpha)\int_{K^\times} \widehat{g}(\beta)c^{-1}(\beta)|\beta|d\beta = \int\int f(\alpha)\widehat{g}(\beta)c(\alpha\beta^{-1})|\beta|d\alpha d\beta$$

by Fubini.

$$= \int\int f(\alpha)\widehat{g}(\alpha\beta)c(\beta^{-1})|\alpha\beta|d\alpha d\beta = \int(\int f(\alpha)\widehat{g}(\alpha\beta)|\alpha|d\alpha)|\beta|c(\beta^{-1})d\beta$$

And notice

$$\int_{K^\times} f(\alpha)\widehat{g}(\alpha\beta)|\alpha|d\alpha = C\cdot\int_{K^+\setminus\{0\}} f(\xi)\widehat{g}(\xi\beta)d\xi = C\cdot\int_{K^+}\int_{K^+} f(\xi)g(\eta)e^{-2\pi i\Lambda(\xi\beta\eta)}d\eta d\xi$$

which is clearly symmetric in f and g. So the conclusion follows. □

Prop. (19.2.2.8) [Local Functional Equations]. For any $\Phi_v \in \mathcal{S}(F_v), \chi_v \in (F_v^\times)^\vee$, the local zeta function $\zeta_v(\chi_v, \Phi_v; s)$(19.2.2.2) can be extended to a meromorphic function to all $s \in \mathbb{C}$ that is analytic for $\mathrm{Re}(s) > 0$, and there is a function $\gamma_v(\chi_v, \psi_v; s)$, meromorphic for s and independent of f, such that

$$\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s) = \gamma_v(\chi_v, \psi_s; s)\zeta_v(\chi_v, \Phi_v; s).$$

Proof: By(19.2.2.2), both $\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)$ and $\zeta_v(\chi_v, \Phi_v; s)$ are holomorphic in $0 < \mathrm{Re}(s) < 1$, so we define $\gamma(\chi_v, \psi_s; s)$ in this region, and try to extend it. Now(19.2.2.7) shows this is invariant of Φ_v, so we can take any Φ_v we want. Notice if $\Phi_v = 0$ on a nbhd of 0, then $\zeta_v(\chi, \Phi_v; s)$ is entire. Then because Fourier transform preserves $\mathcal{S}(F_v)$(12.4.6.11), we can take Φ_v to be 0 around 0 or $\widehat{\Phi}_v$ to be 0 around 0, then $\gamma_v(\chi_v, \psi_v; s)$ is analytic on both $\mathrm{Re}(s) > 0$ and $\mathrm{Re}(s) < 1$. □

Prop. (19.2.2.9). Let $v \in \Sigma_F^{\mathrm{fin}}$ and $\mathrm{Re}(s) < 1$, then for $N \in \mathbb{Z}_+$ sufficiently large,

$$\gamma_v(s, \chi_v, \psi_v) = \int_{\mathfrak{p}^{-N}} |x|^{-s}\chi_v^{-1}(x)\psi_v(x)dx.$$

Proof: In(19.2.2.8), take $\Phi_v = \mathbb{1}_{1+\mathfrak{p}^N}$, then $\widehat{\Phi}_v = \mathbb{1}_{\mathfrak{p}^{-N}}\cdot\psi_v$. □

Prop. (19.2.2.10).

- $\gamma(1-s, \chi^{-1}, \psi) = \chi(-1)/\gamma(s, \chi, \psi)$.
- $\rho(\overline{c}) = c(-1)\overline{\rho(c)}$

Proof: 1:

$$\zeta(f,c) = \rho(c)\zeta(\widehat{f},\widehat{c}) = \rho(c)\rho(\widehat{c})\zeta(\widehat{\widehat{f}},c) = \rho(c)\rho(\widehat{c})c(-1)\zeta(f,c)$$

2:

$$\zeta(f,c) = \rho(c)\zeta(\widehat{f},\widehat{c}), \quad \overline{\zeta(f,c)} = \zeta(\overline{f},\overline{c}) = \rho(\overline{c})\zeta(\widehat{\overline{f}},\widehat{c})$$

And

$$\overline{\widehat{\overline{f}}}(\xi) = \int \overline{f}(\eta) e^{-2\pi i \Lambda(\xi\eta)} d\eta = \overline{\int f(\eta) e^{2\pi i \Lambda(\xi\eta)} d\eta} = \overline{\widehat{f}}(-\xi)$$

so

$$\rho(\overline{c})\zeta(\widehat{\overline{f}}, \widehat{\overline{c}}) = \rho(\overline{c})c(-1)\zeta(\overline{\widehat{f}}, \overline{\widehat{c}}) = \rho(\overline{c})c(-1)\overline{\zeta(\widehat{f}, \widehat{c})}$$

Thus $\rho(\overline{c}) = c(-1)\overline{\rho(c)}$. □

Cor. (19.2.2.11). Because when $\sigma(c) = \frac{1}{2}$, $\widehat{c} = \overline{c}$**??**, we have $|\rho(c)| = 1$ in this case.

3 Weber L-Functions(GL(1) Case)

Def. (19.2.3.1) [Local L-Factors]. Given a Hecke character χ, for $v \in \Sigma_F$, the local L-factor for $v \in \Sigma_F$ and $s \in \mathbb{C}$ is defined to be

$$L(\chi_v; s) = \begin{cases} (1 - \chi_v(\varpi)||\mathfrak{p}||^{-s})^{-1} & v \in \Sigma_F^{\text{fin}}, \chi_v \text{ unramified} \\ 1 & v \in \Sigma_F^{\text{fin}}, \chi_v \text{ ramified} \\ L_{\mathbb{R}}(s + \nu + \varepsilon)(10.7.1.13) & v \in \Sigma_F^{\mathbb{R}}, \chi_v(x) = |x|^\nu \operatorname{sgn}(x)^\varepsilon, \nu \in \mathrm{i}\,\mathbb{R}, \varepsilon \in \{0,1\} \\ L_{\mathbb{C}}(s + \nu + \frac{|k|}{2})(10.7.1.13) & v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{\mathrm{i}\,k \arg(x)}, \nu \in \mathrm{i}\,\mathbb{R}, k \in \mathbb{Z} \end{cases}$$

Prop. (19.2.3.2)[Local L-Factors are the Common Divisors]. Situation as in(19.2.2.8), $\frac{\zeta_v(\chi_v, \Phi_v; s)}{L(\chi_v; s)}$ is entire for any $\Phi_v \in \mathcal{S}(F_v)$, and if $v \in \Sigma_F^{\text{fin}}$, it is a rational function of $||v||^{-s}$.

Moreover, if we take

$$\Phi_v(x) = \begin{cases} \mathbb{1}_{1+\mathfrak{c}(\chi_v)} & , v \in \Sigma_F^{\text{fin}} \\ x^\varepsilon e^{-\pi x^2} & , v \in \Sigma_F^{\mathbb{R}}, \chi_v(x) = |x|^\nu \operatorname{sgn}(x)^\varepsilon, \nu \in \mathrm{i}\,\mathbb{R}, \varepsilon \in \{0,1\} \\ \pi^{-1}\overline{x}^k e^{-2\pi|x|_v} & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{\mathrm{i}\,k \arg(x)}, \nu \in \mathrm{i}\,\mathbb{R}, k \in \mathbb{N} \\ \pi^{-1}x^{-k} e^{-2\pi|x|_v} & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{\mathrm{i}\,k \arg(x)}, \nu \in \mathrm{i}\,\mathbb{R}, k \in \mathbb{Z}_-. \end{cases}$$

then

$$\frac{\zeta_v(\chi_v, \Phi_v; s)}{L(\chi_v; s)} = \begin{cases} d^\times \alpha_v(\mathcal{O}^*) & , v \in \Sigma_F^{\text{fin}}, \chi_v \text{ unramified} \\ d^\times \alpha_v(1 + \mathfrak{c}(\chi_v)) & , v \in \Sigma_F^{\text{fin}}, \chi_v \text{ ramified} \\ 1 & , v \in \Sigma_F^\infty \end{cases}$$

In particular, they can all be non-zero constants.

Proof: For $v \in \Sigma_F^{\text{fin}}$,

$$\zeta_v(\chi_v, \Phi_v; s) = \sum_{k \in \mathbb{Z}} ||v||^{ks} \int_{v(x)=-k} \Phi_v(x)\chi_v(x) d^\times x$$

As $\Phi_v \in C_c^\infty(F_v)$, the summand is 0 for k large. And for k small, $\Phi_v(x)$ is constant. If χ_v is ramified, then these terms are 0, thus it is a polynomial in $||\mathfrak{p}||^{-s}$, and for χ_v unramified, the these terms are a geometric series, which is easily seen to be a rational function of $||\mathfrak{p}||^{-s}$, and has the same pole as $L(\chi_v; s)$(19.2.3.1).

For $v \in \Sigma_F^{\mathbb{R}}$, the poles of $\zeta_v(\chi_v, \Phi_v; s)$ are the same as poles of $\int_{|x|\le 1} \Phi_v(x)\chi_v(x)|x|^s dx$, because $\int_{|x|\ge 1} \Phi_v(x)\chi_v(x)|x|^s dx$ is convergent for any $s \in \mathbb{C}$. For the former, we can write Φ_v as a sum of an odd function and an even function. Only the part with the same parity of χ_v will be non-zero, and for that part, by(10.5.3.5), its poles are all simple and are poles of $L(\chi_v; s)$(19.2.3.1).

For $v\in\Sigma_F^{\mathbb{C}}$, if $\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{Z}$,

$$\zeta_v(\chi_v,\Phi_v;s)=\frac{1}{2\pi}\int_0^\infty\int_0^{2\pi}r^{2v+2s}e^{ik\theta}\Phi_v(re^{i\theta})d\theta\frac{dr}{r}=\int_0^\infty r^{2v+2s}\varphi(r)\frac{dr}{r},$$

where

$$\varphi(r)=\frac{1}{2\pi}\int_0^{2\pi}e^{ik\theta}\Phi_v(re^{i\theta})d\theta.$$

Suppose $\Phi_v(x)=\sum_{n,m\in\mathbb{N}}a(n,m)x^n\overline{x}^m$, then $\varphi(r)=\sum_{m-n=k}a(n,m)r^{m+n}$. Thus by(10.5.3.5), its pole are $\{s|2s+2v-(|k|+2l)\}$, which are all simple and are poles of $L(\chi_v;s)$(19.2.3.1).

For the last assertion, we need direct calculations, Cf.[Tate's Thesis]P320**?**. □

Prop. (19.2.3.3)[Local ε-Factors]. Situation as in(19.2.2.8), there exists a non-vanishing holomorphic function $\varepsilon_v(\chi_v,\psi_v)$ that

$$\frac{\zeta_v(\chi_v^{-1},\widehat{\Phi}_v;1-s)}{L(\chi_v^{-1};1-s)}=\varepsilon_v(\chi_v,\psi_v;s)\frac{\zeta_v(\chi_v,\Phi_v;s)}{L(\chi_v;s)}.$$

and $\frac{\zeta_v(\chi_v,\Phi_v)}{L_v(\chi_v;s)}$ is holomorphic. Moreover, $\varepsilon_v(\chi_v,\psi_v;s)$ is of the form ab^s for $a\in\mathbb{C}^*,b\in\mathbb{R}$. And $\varepsilon(\chi_v,\psi_v)=1$ if v is unramified in the sense of(12.4.6.19).

Proof: Such an $\varepsilon_v(\chi_v,\psi_v;s)$ exists by(19.2.2.8). It is holomorphic and non-vanishing by(19.2.3.2) as both $\frac{\zeta_v(\chi_v^{-1},\widehat{\Phi}_v;1-s)}{L(\chi_v^{-1};1-s)}$ and $\frac{\zeta_v(\chi_v,\Phi_v;s)}{L(\chi_v;s)}$ are holomorphic and for any $s_0\in\mathbb{C}$, Φ_v can be chosen to make either one of them non-vanishing at s_0.

To show it is of the form ab^s: If $v\in\Sigma_F^{\mathrm{fin}}$, it is a rational function in $||\mathfrak{p}||^{-s}$ with no zeros or poles, so it must be of the form ab^s. And if v is unramified, then we can take $\Phi_v=\mathbb{1}_{\mathcal{O}_{F,v}},\Phi_v^\vee=\mathbb{1}_{\mathcal{O}_{F,v}}$ by(12.4.6.5), and both sides are 1 by(19.2.2.3).

If $v\in\Sigma_F^\infty$, then we can take Φ_v defined in(19.2.3.2) to do the calculation to show it directly(**?**Cf.[Tate's Thesis]):

$$\Phi_v^\vee(x)=\begin{cases}||\mathfrak{c}(\psi_v)^{-1}\mathfrak{c}(\chi_v)||.d\mu_v(\mathcal{O}_{F_v}).\mathbb{1}_{\mathfrak{c}(\psi_v)\mathfrak{c}(\chi_v)^{-1}}.\psi_v^{-1} & ,v\in\Sigma_F^{\mathrm{fin}}\\ \mathrm{i}^\varepsilon\cdot x^\varepsilon e^{-\pi x^2} & ,v\in\Sigma_F^{\mathbb{R}},\chi_v(x)=\mathrm{sgn}(x)^\varepsilon,\varepsilon\in\{0,1\}\\ \mathrm{i}^k\cdot\pi^{-1}x^ke^{-2\pi|x|_v} & ,v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{N}\\ \mathrm{i}^{-k}\cdot\pi^{-1}\overline{x}^{-k}e^{-2\pi|x|_v} & ,v\in\Sigma_F^{\mathbb{C}},\chi_v(x)=|x|^\nu e^{\mathrm{i}\,k\arg(x)},\nu\in\mathrm{i}\,\mathbb{R},k\in\mathbb{Z}_-.\end{cases}$$

So it follows from(19.2.3.2) that

$$\varepsilon_v(\chi_v,\psi_v;s)=\begin{cases}\text{Cf.[Tate's Thesis]}\textbf{?} & ,v\in\Sigma_F^{\mathrm{fin}}\\ \mathrm{i}^\varepsilon & ,v\in\Sigma_F^{\mathbb{R}}\\ \mathrm{i}^{|n|} & ,v\in\Sigma_F^{C}\end{cases}$$

□

Remark (19.2.3.4). The local ε-factor is calculable using the special function Φ_v, theoretically.

Prop. (19.2.3.5) [Global Hecke L-Functions]. For a Hecke character $\chi=\prod_v\chi_v$ on F and $s\in\mathbb{C}$, we define the **global Hecke L-function** and **completed Hecke L-function** as

$$L(\chi;s)=\prod_{v\in\Sigma_F^{\mathrm{fin}}}L(\chi_v;s),\quad\Lambda(\chi;s)=\prod_vL(\chi_v;s)\text{(19.2.3.1)}$$

which converges for $\operatorname{Re} s > 1$ and has a meromorphic continuation to all $s \in \mathbb{C}$.

Also, we can define the **global ε-factor** for χ as

$$\varepsilon(\chi; s) = \prod_v \varepsilon_v(\chi_v, \psi_v; s).$$

All but f.m. of the product equals 1 by(19.2.3.3), and they are of the form ab^s, so $\varepsilon(s, \chi)$ is also of the form ab^s, where $a \in \mathbb{C}^*, b \in \mathbb{R}_+$. In particular, it is holomorphic and non-vanishing. The fact $\varepsilon(s, \chi)$ is independent of ψ can be seen from(19.2.3.6).

Prop. (19.2.3.6) [Meromorphic Extension of Hecke L-Functions]. For a Hecke character χ,

- $L(\chi; s)$ has meromorphic continuation to all s, and there is a functional equation

$$\Lambda(\chi; s) = \varepsilon(\chi; s)\Lambda(\chi^{-1}; 1 - s),$$

  where $\varepsilon(\chi; s)$ is of the form $ab^s, a \in \mathbb{C}^\times, b \in \mathbb{R}_+$.

- $L(\chi; s)$ has poles iff $\chi(x) = |x|^\lambda$ for some $\lambda \in \mathrm{i}\,\mathbb{R}$. In this case,
  - If $F \in$ `NField`, then it only has simple poles at $s = 1 - \lambda$, with residue $-k||\mathfrak{d}_F||^{1/2}$.
  - If $F \in$ `FField`, it has poles at $s = -\lambda + \frac{2\pi n\,\mathrm{i}}{\log(\#F_0)}, 1 - \lambda + \frac{2\pi n\,\mathrm{i}}{\log(\#F_0)}$, with respectively residue $-k||\mathfrak{d}_F||^{1/2}$ and k, where $k = V(\mathbf{I}_F^1/F^\times)$(12.4.6.20),
- $L(\chi; s)$ is essentially bounded on the vertical strips away from the poles.
- If $F \in$ `NField`, then $L(\mathbb{1}; s)$ has a zero of order $r_1 + r_2 - 1$ at $s = 0$.

Proof: The functional equation follows from the definition of local ε-factors(19.2.3.3) and(19.2.2.4). To show it is essentially bounded on vertical strips, use

$$\frac{\Lambda(\chi; s)}{\zeta(\chi, \Phi; s)} = \prod_{v \in \Sigma_F} \frac{L(\chi_v; s)}{\zeta_v(\chi_v, \Phi_v; s)}$$

where we can take Φ_v s.t. each fraction is of the form ab^s, and a.e. term is 1, by(19.2.3.3). Then $L(\chi; s)$ is essentially bounded on vertical strips because $\zeta(\chi, \Phi; s)$ does(19.2.2.4).

To find the poles and residues, choose Φ_v as in (19.2.3.2), then $\zeta(\chi, \Phi; s)$ is a constant multiple of $\Lambda(\chi; s)$, and the poles and residues of can be read from that of $\zeta(\chi, \Phi; s)$. Then we use(19.2.2.4), the assertion about poles follows.

Then it suffices to calculate for $\chi = 1$: we use the standard character on $\mathbf{A}_F$, then we calculate $\Phi_v(0) = \pi^{-r_2}$ and $\Phi_v^\vee(0) = ||\mathfrak{d}_v||^{-1/2}\pi^{-r_2}$, by(19.2.3.3) and(12.4.6.5). Thus we can use properties of the infinite L-factors(10.7.1.13). □

Def. (19.2.3.7) [Root Number]. The number $w(\chi) = \varepsilon(\chi; \frac{1}{2})$ is called the **root number** of χ. Then it satisfies $|w(\chi)| = 1$, and $w(\chi) \in \{\pm 1\}$ if χ is real.

4 Godement-Jacquet Theory

Main references are [G-J72].

5 Rankin-Selberg Methods on $\mathrm{GL}(2) \times \mathrm{GL}(2)$

References are [Automorphic Forms on GL(2), Jacquet, 1972].

Def. (19.2.5.1) [Intro, Rankin-Selberg Method]. Delete this**?**. Converse theorems like(19.2.6.18), shows that a possible method of proving the existence of an automorphic form is to prove by any method the functional equations of sufficiently many of the the L-series attached to it. One of the most powerful methods of doing this is the **Rankin-Selberg method**, which seeks to represent an L-function as an integral of one or more automorphic forms against an Eisenstein series, itself a type of automorphic form.

Conj. (19.2.5.2) [Rankin-Selberg L-function]. For a global field F, assume the Langlands functoriality, for any $\pi_1 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$ and $\pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(m)/F)$, their product $\pi_1 \times \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n) \times \mathrm{GL}(m)/F)$, and there is a tensor product map $\otimes : \mathrm{GL}(n) \times \mathrm{GL}(m) \to \mathrm{GL}(mn)$, which by functorial lifting(16.4.1.6) gives us an automorphic representation $\pi_1 \boxtimes \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(mn)/F)$, whose L-function is denoted by $L(s, \pi \times \pi')$ And for a finite set S of places of F large enough,

$$L_S(s, \pi_1 \times \pi_2) = \prod_{v \notin S} \prod_{i=1}^{n} \prod_{j=1}^{m} \frac{1}{1 - \alpha_i(\pi_{1,v})\beta(\pi_{2,v})q_v^{-s}}$$

called the (partial)**Rankin-Selberg L-function** of π_1, π_2. Here are some examples:

- $\pi_1 = \pi, \pi_2 = \widehat{\pi}$, then for some S, then

$$L_S(s, \pi \times \widehat{\pi}) = \prod_{v \notin S} \prod_{1 \le i,j \le n} \frac{1}{1 - \alpha_i(\pi_v)\alpha_j^{-1}(\pi_v)q_v^{-s}}.$$

  In this case, this is the functorial lifting of

$$\mathrm{GL}(n) \to \mathrm{GL}(n) \times \mathrm{GL}(n) \to \mathrm{GL}(2n) : g \mapsto (g, g^{-t}) \mapsto g \otimes g^{-t}$$

  by(16.3.2.7), which is isomorphic to the conjugation action of $\mathrm{GL}(n)$ on $\mathrm{Mat}(n)$. This action decomposes as a trivial action and a $n^2 - 1$-dimensional representation Ad^0. Thus there should be a decomposition

$$L_S(s, \pi \times \widehat{\pi}) = \zeta_{F,S}(s) L_S(s, \pi, \mathrm{Ad}^0)$$

  where $\zeta_{F,S}(s)$ is the partial zeta function on F.

- $\pi_1 = \pi = \pi_2$, then for some S, then

$$L_S(s, \pi \times \widehat{\pi}) = \prod_{v \notin S} \prod_{1 \le i,j \le n} \frac{1}{1 - \alpha_i(\pi_v)\alpha_j(\pi_v)q_v^{-s}}.$$

  In this case, this is the functorial lifting of

$$GL(n) \to GL(n) \times GL(n) \to GL(2n) : g \mapsto (g, g) \mapsto g \otimes g$$

  by(16.3.2.7), which decomposes as a $\frac{1}{2}n(n+1)$-dimensional symmetric square representation Sym^2, and a $\frac{1}{2}n(n-1)$-dimensional exterior square representation $\wedge^2$. Thus there should be a decomposition

$$L_S(s, \pi \times \widehat{\pi}) = L_S(s, \mathrm{Sym}^2 \pi) L_S(s, \wedge^2 \pi),$$

  where $L_S(s, \mathrm{Sym}^2 \pi)$ and $L_S(s, \wedge^2 \pi)$ are called the **symmetric square L-functions** and **exterior square L-functions** of π.

There are two Rankin-Selberg constructions of exterior square L-functions, which can be found in [Jacquet, H. and J. Shalika, Exterior square L-functions, in Automorphic Forms, Shimura Varieties and L-functions II, 1990] and [Bump, D. and S. Friedberg, The "exterior square" automorphic L-functions on GL(n), 47-65 in part 2 of Gelbart, Howe and Sarnak (1990)]. The construction of symmetric square L-functions can be found in [Bump, D. and D. Ginzburg, Symmetric square L-functions on GL(r), Annals of Math. 136 (1992)].

Prop. (19.2.5.3). For $\pi_1 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F, \omega_1), \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F, \omega_2)$, by tensor product theorem(16.3.1.4), we can fix a finite set $\Sigma_F^\infty \subset S \subset \Sigma_F$ that any $v \notin S$ is unramified for both π_1, π_2 in the sense of(19.2.6.1). Let $\alpha_i(v), \beta_i(v)$ be the Stake parameters of $\pi_{1,v}, \pi_{2,v}$, then $\pi_1 \cong \widehat{\pi}_2$ iff the Rankin-Selberg L-function(19.2.5.2)

$$L_S(s, \pi_1 \times \pi_2) = \prod_{v \notin S} \prod_{1 \le i,j \le 2} \frac{1}{1 - \alpha_i(v)\beta_i(v)}$$

has a pole at $s = 1$.

Proof: Cf.[Bump, Chap3.8]. □

Eisenstein Series

References are [Bump, Chap3].

Def. (19.2.5.4)[Non-Holomorphic Eisenstein Series]. The **non-holomorphic Eisenstein series** of weight s is defined to be

$$E^*(z, s) = \frac{1}{2} L_{\mathbb{R}}(2s) \sum_{(m,n) \neq 0 \in \mathbb{Z}^2} \frac{(\mathrm{Im}(z))^s}{|mz + n|^{2s}} = L_{\mathbb{R}}(2s) \sum_{\gamma \in \overline{\Gamma_\infty} \backslash \overline{\Gamma(1)}} (\mathrm{Im}(\gamma(z)))^s$$

It is absolutely convergent for $\mathrm{Re}(s) > 1$, and is automorphic for $\Gamma(1)$(16.1.1.11).

Prop. (19.2.5.5) [Fourier Expansion of $E(z, s)$]. The Fourier coefficients of $E(z, s)$ is of the form

$$E^*(z, s) = \sum_{n=-\infty}^{\infty} a_n(y, s) e^{2\pi i r x},$$

where

$$a_0(y, s) = \Lambda(2s) y^s + \Lambda(2 - 2s) y^{1-s}$$

and for $n \neq 0$,

$$a_n(y, s) = 2|n|^{-s+1/2} \sigma_{2s-1}(|n|) \sqrt{y} K_{s-1/2}(2\pi |n| y),$$

where $K_{s-1/2}(z)$ is the K-Bessel function(10.7.3.1). In particular,

$$E^*(z, s) = \Lambda(2s) y^s + \Lambda(2 - 2s) y^{1-s} + 4\sqrt{y} \sum_{n \in \mathbb{Z}_+} n^{\frac{1}{2} - s} \sigma_{2s-1}(n) K_{s - \frac{1}{2}}(2\pi n y) \cos(2\pi n x)$$

Proof:

$$a_r(y, s) = \int_0^1 E^*(x + iy, s) e^{-2\pi i r x} dx = \int_0^1 \frac{1}{2} \pi^{-s} \Gamma(s) \sum_{(m,n) \neq 0 \in \mathbb{Z}^2} \frac{y^s}{|mz + n|^{2s}} e^{-2\pi i r x} dx.$$

The term with $m = 0$ only contributes to a_0, and equals $\pi^{-s}\Gamma(s)\zeta(2s)y^s$. For the rest we may assume $m > 0$ by symmetry, then they contributes to

$$\begin{aligned}&\pi^{-s}\Gamma(s)y^s\sum_{m=1}^{\infty}\sum_{n=-\infty}^{\infty}\int_0^1[(mx+n)^2+m^2y^2]^{-s}e^{-2\pi irx}dx\\&=\pi^{-s}\Gamma(s)y^s\sum_{m=1}^{\infty}\sum_{n\mod m}\int_{-\infty}^{\infty}[(mx+n)^2+m^2y^2]^{-s}e^{-2\pi irx}dx\\&=\pi^{-s}\Gamma(s)y^s\sum_{m=1}^{\infty}m^{-2s}\sum_{n\mod m}e^{2\pi irn/m}\int_{-\infty}^{\infty}(x^2+y^2)^{-s}e^{-2\pi irx}dx\end{aligned}$$

Notice $\sum_{n\mod m}e^{2\pi irn/m}=\begin{cases}m & m|r\\ 0 & \text{otherwise}\end{cases}$, thus the calculation reduces to(10.7.3.5). □

Prop. (19.2.5.6) [Functional Equation]. $E^*(z,s)$ has meromorphic continuation to all $s\in\mathbb{C}$, and it is analytic except at $s=1$ or $s=0$, where the residue at $s=1$ is $1/2$ for any z, and it satisfies the functional equation

$$E^*(z,s)=E^*(z,1-s).$$

and $E(x+\mathrm{i}\,y,s)=O(y^\sigma)$ for $y\to\infty$, where $\sigma=\max(\mathrm{Re}(s),1-\mathrm{Re}(s))$.

Proof: This follows from the Fourier expansion of $E^*(z,s)$(19.2.5.5). Each term $a_r(y,s)$ has analytic extension to all s, except that a_0 has simple poles at $s=0$ and $s=1$ by(19.3.3.5)(the pole at $s=1/2$ was neutralized). And the functional equation and the convergence is clear from the properties of K-Bessel functions(10.7.3.2). For the residue, it suffices to show the residue of $\pi^{-s/2}\Gamma(s/2)\zeta(s)$ at 0 is -1(19.3.3.5). □

Prop. (19.2.5.7) [Kronecker's First Limit Formula].

$$2E^*(z,s)=\frac{1}{s-1}+\gamma_0-\log(4\pi y|\eta(z)|^4)+O(s-1).$$

And a similar formula is true for $s=0$, by the functional equation(19.2.5.6).

Proof: Cf.[Kronecker's First Limit Formula, Revisited]. □

Prop. (19.2.5.8) [Eisenstein Series of Mixed Type]. The **Eisenstein series of mixed type** is defined to be

$$E_{k,s}(z)=\sum_{(m,n)\in\mathbb{Z}^2\setminus(0,0)}\frac{y^s}{(mz+n)^k|mz+n|^{2s}},k\in\mathbb{Z},s\in\mathbb{C}.$$

Then

$$R_k(y^{k/2}E_{k,s}(z))=(k+s)y^{(k+2)/2}E_{k+2,s}(z).$$

and $y^{k/2}E_{k,s}(z)$ is a Maass form in (z) of weight k. Its better to consult the paper https://arxiv.org/abs/1803.08210 for the Fourier expansion of $E_{k,s}$.

Proof:

$$((z-\overline{z})\frac{\partial}{\partial z}+k/2)[\frac{(\frac{z-\overline{z}}{2i})^{s+k/2}}{(mz+n)^{s+k}(m\overline{z}+n)^s}]$$

$$= (z-\overline{z})\Big(\frac{\frac{s+k/2}{2i}(\frac{z-\overline{z}}{2i})^{s-1+k/2}(mz+n)^{s+k} - (\frac{z-\overline{z}}{2i})^{s+k/2}m(s+k)(mz+n)^{s+k-1}}{(m\overline{z}+n)^s(mz+n)^{2s+2k}}\Big) + \frac{k}{2}\frac{(\frac{z-\overline{z}}{2i})^{s+k/2}}{(mz+n)^{s+k}(m\overline{z}+n)^s}$$
$$= \frac{(\frac{z-\overline{z}}{2i})^{s+k/2}}{(mz+n)^{s+k+1}(m\overline{z}+n)^s}[(s+k/2)(mz+n) - (z-\overline{z})m(s+k) + \frac{k}{2}(mz+n)]$$
$$= (k+s)\frac{(\frac{z-\overline{z}}{2i})^{s-1+(k+2)/2}}{(mz+n)^{s+k+1}(m\overline{z}+n)^{s-1}}$$
$$= (k+s)y^{(k+2)/2}E_{k+2,s-1}(z)$$

□

Prop. (19.2.5.9) [Rankin-Selberg]. Let $\varphi \in C^\infty(\Gamma(1)\backslash\mathscr{H})$ be decreasing rapidly along $y \to \infty$ and $\varphi(z) = \sum_{n\in\mathbb{Z}} \varphi_n(y)e^{2\pi i n x}$ be its Fourier expansion. Call φ_0 the constant term of φ. Consider the Mellin transform

$$M(s,\varphi_0) = \int_0^\infty \varphi_0(y)y^s\frac{dy}{y}(10.12.2.16), \quad \Lambda(s,\varphi_0) = \Lambda(2s)M(s-1,\varphi_0).$$

As $\varphi(s,\varphi_0)$ is bounded as a function on y and decay rapidly, $M(s,\varphi)$ is absolutely convergent for $\mathrm{Re}(s) > 0$.

Then

$$\Lambda(s,\varphi_0) = \int_{\Gamma(1)\backslash\mathscr{H}} E^*(z,s)\varphi(z)\frac{dxdy}{y^2}$$

and thus has a meromorphic continuation to all s and satisfies a functional equation, with at most simple poles at $s=0$ or 1,

$$\mathrm{Res}_{s=1}\Lambda(s,\varphi_0) = \frac{1}{2}\int_{\Gamma(1)\backslash\mathscr{H}} \varphi(z)\frac{dxdy}{y^2}.$$

Proof: Using(19.2.5.4),

$$\int_{\Gamma(1)\backslash\mathcal{H}} \varphi(z)\frac{dxdy}{y^2} = \Lambda(2s)\sum_{\gamma\in\overline{\Gamma_\infty}\backslash\overline{\Gamma(1)}}\int_{\overline{\Gamma(1)}\backslash\mathcal{H}}(\mathrm{Im}(\gamma(z)))^s\varphi(\gamma(z))\frac{dxdy}{y^2}$$
$$= \Lambda(2s)\int_{\Gamma_\infty\backslash\mathcal{H}}\mathrm{Im}(z)^s\varphi(z)\frac{dxdy}{y^2}$$
$$= \Lambda(2s)\int_0^\infty y^{s-1}\int_0^1\varphi(x+\mathrm{i}\,y)dx\frac{dy}{y}$$
$$= \Lambda(2s)\int_0^\infty \varphi_0(y)y^{s-1}\frac{dy}{y}$$
$$= \Lambda(s,\varphi_0)$$

The assertion about the meromorphic continuation and the residue follows from the equation above and(19.2.5.6). □

<u>**Rankin-Selberg for Modular Forms**</u>

Prop. (19.2.5.10) [Convolution of Cusp Forms]. If $f(z) = \sum A(n)q^n \in S_k(\Gamma(1))$, $g(z) = \sum B(n)q^n \in M_k(\Gamma(1))$, define

$$L(f\times g;s) = \zeta(2s-2k+2)\sum A(n)B(n)n^{-s}, \quad \Lambda(f\times g;s) = (2\pi)^{-2s}\Gamma(s)\Gamma(s-k+1)L(f\times g;s),$$

then $L(s, f\times g)$ is absolutely convergent for s large, $\Lambda(s, f\times g)$ has a meromorphic continuation to all s, analytic except for at most simple poles at $s=k$ or $s=k-1$, and it satisfies a functional equation

$$\Lambda(s, f\times g) = \Lambda(2k-1-s, f\times g).$$

and the residue of Λ at $s=k$ is $\frac{1}{2}\pi^{1-k}(f,g)$(16.2.1.12).

Moreover, if f,g are Hecke eigenforms, let

$$1-A(p)X+p^{k-1}X^2 = (1-\alpha_1(p)X)(1-\alpha_2(p)X),$$
$$1-B(p)X+p^{k-1}X^2 = (1-\beta_1(p)X)(1-\beta_2(p)X),$$

then $L(s, f\times g)$ has an Euler product formula

$$L(s, f\times g) = \prod_p\prod_{i=1}^2\prod_{j=1}^2\frac{1}{1-\alpha_i(p)\beta_j(p)p^{-s}}.$$

Proof: We may assume f,g are Hecke eigenforms(16.2.3.12), so $A(n), B(n)$ are real. Let $\varphi(z)=f(z)\overline{g(z)}y^k$, then φ satisfies the condition of the Rankin-Selberg method(19.2.5.9), thus we calculate

$$\begin{aligned}\varphi_0(y) = \int_0^1 f(x+iy)\overline{g(x+iy)}y^k dx &= \sum_{n=0}^\infty\int_{m=0}^\infty\int_0^1 A(n)B(n)e^{2\pi i(n-m)x}e^{-2\pi(n+m)y}y^k dx\\ &= \sum_{n=0}^\infty A(n)B(n)e^{-4\pi ny}y^k\end{aligned}$$

and

$$M(s,\varphi_0) = \sum_{n=0}^\infty A(n)B(n)\int_0^\infty e^{-4\pi ny}y^{s+k}\frac{dy}{y} = (4\pi)^{-s-k}\Gamma(s+k)\sum_{n=0}^\infty A(n)B(n)n^{-s-k}$$

and

$$\Lambda(s,\varphi_0) = 4^{-s-k+1}\pi^{-2s-k+1}\Gamma(s)\Gamma(s+k-1)\zeta(2s)\sum_{n=1}^\infty A(n)B(n)n^{-s-k+1}.$$

Thus

$$\Lambda(s-k+1,\varphi_0) = \pi^{k-1}\Lambda(s, f\times g),$$

and the assertion follows from(19.2.5.9). The residue is also clear.

The Euler product formula follows from(8.5.2.3) applied to $z=p^{-s}$ for all $p\in\mathbf{P}$. □

Remark (19.2.5.11)[Averaged Ramanujan Conjecture]. By the Ramanujan conjecture(19.2.6.16), for any cuspidal form $f=\sum a(n)q^n$, $L(s,f)=\sum a_n n^{-s}$ is convergent for $\mathrm{Re}(s)>\frac{k+1}{2}$. But we can prove this directly: as $\sum a_n^2 n^{-s}$ is convergent for $\mathrm{Re}(s)>k$, and $|a(n)|\le\max(n^{\frac{k-1}{2}}, n^{-\frac{k-1}{2}}|a(n)|^2)$.

Waldspurger's Theorem

Cf.[Explicit application of Waldspurger's theorem].

Thm. (19.2.5.12) [Waldspurger]. Let χ be a character, $k\in 2\mathbb{Z}$ and $\varphi\in S_{k-1}(N,\chi^2)$, then there exists a function A_φ on $\mathbb{N}^{sc}$ s.t. for $t\in\mathbb{N}^{sc}$,

$$A_\varphi(t)^2 = L(\varphi\otimes\chi_0^{-1}\chi_t, \frac{k-1}{2})\varepsilon(\chi_0^{-1}\chi_t, \frac{1}{2}).$$

Proof: Cf.[Explicit application of Waldspurger's theorem]. □

6 Eulerian Integrals on GL(2) × GL(1)

Main references are [Cog00] and[Bum98].

Def. (19.2.6.1) [Unramified Places]. Let (π, V) be an irreducible cuspidal representation, given a pure cuspidal form $\varphi \in V$ and a Hecke character ξ of F, we call a place v of F **unramified** iff $v \in \Sigma_F^{\text{fin}}$, the conductor of ψ_v is $\mathcal{O}_v$ and the conductor of ξ_v is $\mathcal{O}_v^*$, π_v is a spherical principal series.

This condition is true for a.e. v by(16.3.3.2) and(16.3.3.3).

Def. (19.2.6.2) [Zeta Functions for GL(2) × GL(1)]. Given $(\pi, V) \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F, \omega), \xi$ a Hecke character, for any $\Phi \in V$, consider the zeta integral

$$\zeta(\Phi, \xi; s) = \int_{C_F} \Phi(\begin{bmatrix} y & \\ & 1 \end{bmatrix})|y|^{s-1/2}\xi(y)d^\times y$$

It is absolutely convergent by(16.3.3.5) and(12.4.5.21).

If $\Phi = \otimes \Phi_v$ is a pure tensor, the zeta integral equals

$$\int_{I_F} W_\Phi(\begin{bmatrix} y & \\ & 1 \end{bmatrix})|y|^{s-1/2}\xi(y)d^\times y = \prod_v \int_{F_v^\times} W_{v,\Phi_v}(\begin{bmatrix} y_v & \\ & 1 \end{bmatrix})|y_v|^{s-1/2}\xi_v(y_v)d^\times y_v = \prod_v \zeta_v(\Phi_v, \xi_v; s)$$

where each **local zeta functions** $\zeta_v(s, \Phi_v, \xi_v)$ converges absolutely to a holomorphic function for $\mathrm{Re}(s) > 1/2$, and the integral is absolutely convergent when $\mathrm{Re}(s) > 3/2$, using(10.11.1.38).

Proof: We analyze the integrand for the local zeta integrals:

For non-Archimedean case, the integrand is compactly supported on(15.11.3.19), and because π_v is unitary, use(15.11.4.23) and(15.11.6.10) to analyze the Kirillov model of π_v, we see the integral converges absolutely for $\mathrm{Re}(s) > 1/2$.

For Archimedean case, the W_φ decays rapidly for $|y| \to \infty$, and for $|y| \to 0$, by(16.1.3.2), it is bounded by $|y|^{-1/2}$, thus it also converges absolutely for $\mathrm{Re}(s) > 1/2$.

By(19.2.6.3), the local factor is the same as the local L-factor a.e. v, and $|\alpha_i| < ||v||^{1/2}$ by(15.11.6.10), thus it converges for $\mathrm{Re}(s) > 3/2$ by comparison with the Dedekind Zeta function(19.2.2.1). □

Prop. (19.2.6.3) [Unramified Factors]. If v is unramified in the sense of(19.2.6.1) and Φ_v is the spherical function in π_v normalized s.t. $W_{v,\Phi_v}(1) = 1$, then for $\mathrm{Re}(s) > 1/2$(thus all, as they are both meromorphic),

$$\zeta_v(\Phi_v, \xi_v; s) = L(\pi_v, \xi_v; s)\text{(19.2.6.10)}.$$

Proof: With the unramified hypothesis, there is an explicit formula for W_v in terms of the Satake parameters α_1, α_2(15.11.5.15): if $\mathrm{ord}_v(y) = m$, then

$$W_v(\begin{bmatrix} y & \\ & 1 \end{bmatrix}) = \begin{cases} ||v||^{-m/2}\frac{\alpha_1^{m+1}-\alpha_2^{m+1}}{\alpha_1-\alpha_2} & m \geq 0 \\ 0 & \text{otherwise} \end{cases}.$$

$$\begin{aligned}\zeta_v(W_v, \xi_v; s) &= \sum_{m=0}^{\infty} ||v||^{-m/2}\frac{\alpha_1^{m+1} - \alpha_2^{m+1}}{\alpha_1 - \alpha_2}||v||^{m/2-ms}\xi(\varpi_v)^m \\ &= \frac{1}{(1 - \alpha_1\xi(\varpi_v)||v||^{-s})(1 - \alpha_2\xi(\varpi_v)||v||^{-s})} = L(\pi_v, \chi_v; s)\end{aligned}$$

□

Prop. (19.2.6.4) [Global Functional Equation]. In spite of the convergence problem of the product of local zeta integrals, the global zeta integral is absolutely convergent for any s as W_Φ decay rapidly**?**. Moreover, because Φ is automorphic, we have

$$\begin{aligned}\zeta(\Phi,\xi;s) &= \int_{C(F)} \Phi(w_1 \begin{bmatrix} y & \\ & 1\end{bmatrix})|y|^{s-1/2}\xi(y)d^\times y \\ &= \int_{C(F)} \Phi(\begin{bmatrix} 1 & \\ & y\end{bmatrix} w_1)|y|^{s-1/2}\xi(y)d^\times y \\ &= \int_{C(F)} (\pi(w_1)\Phi)(\begin{bmatrix} y & \\ & 1\end{bmatrix})|y|^{-s+1/2}(\xi\omega)^{-1}(y)d^\times y \\ &= \zeta(\pi(w_1)\Phi,\xi^{-1}\omega^{-1};1-s)\end{aligned}$$

Local Functional Equation

Prop. (19.2.6.5) [Local Zeta Function]. Let K be a p-adic local field and $(\pi,V) \in \mathrm{Irr}^{\mathrm{adm},generic}(\mathrm{GL}(2,K))$, if we identify V with its Kirillov model, then for any $\varphi \in V$, quasi-character ξ of $K^\times$, the local Zeta integral $\zeta(\Phi,\xi;s)$(19.2.6.2) is absolutely convergent for $\mathrm{Re}(s)$ sufficiently large, and defines a holomorphic function there. And it has a meromorphic continuation to all s. In fact,

$$\zeta(\Phi,\xi;s) = p_{\varphi,\xi}(q^{-s})L(\pi,\xi;s), \quad p_{\Phi,\xi} \in \mathbb{C}[X,X^{-1}].$$

Moreover, Φ can be chosen s.t. $p_{\Phi,\xi} = 1$.

Proof: This is by direct calculation: If V is cuspidal, then $V = C_c^\infty(K^\times)$ by(15.11.3.20). If V is not cuspidal, then by(15.11.4.20) it is $\pi(\chi_1,\chi_2)$ or $\sigma(\chi_1,\chi_2)$, whose elements are known(15.11.4.22)(15.11.4.23). For $\mathrm{Re}(s)$ sufficiently large, the $|t| > \mathfrak{q}^{-k}$ part can contribute to any $p(q^{-s})$ for $p \in \mathbb{C}[q^s,q^{-s}]$ with degree$\leq k-1$, and the $|t| \leq q^{-k}$ part is of the form

$$\int_{\mathfrak{p}^k\backslash\{0\}} (\chi_i\xi)(y)|y|^s d^\times y = \sum_{n\geq k}((\chi\xi)(\varpi)q^{-s})^n \int_{\mathcal{O}^*}(\chi_i\xi)(y)d^\times y = C\frac{\alpha_i^k q^{-ks}}{1-\alpha_i q^{-s}},$$

where $C \neq 0$ iff $\chi_i\xi$ is unramified, or of the form

$$\int_{\mathfrak{p}^k\backslash\{0\}} v(y)(\chi_i\xi)(y)|y|^s d^\times y = \sum_{n\geq k}n((\chi\xi)(\varpi)q^{-s})^n \int_{\mathcal{O}^*}(\chi_i\xi)(y)d^\times y = C\frac{\alpha_i^k q^{-ks}}{(1-\alpha_i q^{-s})^2},$$

where $C \neq 0$ iff $\chi_i\xi$ is unramified.

Clearly $p_{\varphi,\xi}$ can be chosen to be 1 if we choose the compactly supported part of φ suitably. □

Prop. (19.2.6.6) [Local Functional Equations]. The local zeta integral $\zeta_v(\Phi_v,\xi_v;s)$, defined in(19.2.6.2) has a meromorphic continuation to all s, and there exists a meromorphic function $\gamma_v(x,\pi_v,\xi_v,\psi_v)$ s.t.

$$\zeta_v(\pi_v(w_1)\Phi_v,\xi_v^{-1}\omega_v^{-1};1-s) = \gamma_v(\pi_v,\xi_v,\psi_v;s)\zeta_v(\Phi_v,\xi_v;s).$$

Proof: This follows by similar method as the proof of(19.2.2.8) and by evaluating $\gamma_v(\pi_v,\xi_v,\psi_v;s)$ explicitly, using methods of Weil representation parallel to the proof of(19.2.6.8), Cf.[Jacquet-Langlands(1970), P37].**?**

There are easier way to prove this when $v\in\Sigma_F^{\text{fin}}$: We show that both sides are linear functionals on $\Phi\in V$ that satisfies

$$L(\pi(\begin{bmatrix}y&\\&1\end{bmatrix})\varphi)=\xi^{-1}(y)|y|^{-s+1/2}L(\varphi).$$

This is true for RHS by a change of variable and analytic continuation(19.2.6.5), and then also true for LHS.

Thus for general s, (15.11.3.22) shows two sides differ by a scalar $\gamma(s,\pi,\xi,\psi)$. By(19.2.6.5), for general s, both sides can be non-zero, thus $\gamma(s,\pi,\xi,\psi)$ is non-zero, and thus a meromorphic function of s. □

Prop. (19.2.6.7) [Gamma Factor Determines Representations]. For $(\pi_1,V_1),(\pi_2,V_2)\in \mathrm{Irr}^{\mathrm{adm},generic}(GL(2,K))$, if $\gamma(s,\pi_1,\xi,\psi)=\gamma(s,\pi_2,\xi,\psi)$ for any quasi-character ξ of $K^\times$, then $\pi_1\cong\pi_2$.

Proof: Identify V_i with their Kirillov models, and let $V_0=V_1\cap V_2$. Then it suffices to show that $\pi_1(w_1),\pi_2(w_1)$ acts the same on V_0: This is because V_0 contains $C_c^\infty(K^*)$, and $B(K)$ action on V_1,V_2 are the same by(15.11.3.15), and $GL(2,F)$ is generated by $B(F)$ and w_1. Then $V_0=V_1=V_2$ as they are irreducible representations.

For $\varphi\in V$, let $\varphi_i=\pi_i(w_1)\varphi$, then it suffices to show $\varphi_1(1)=\varphi_2(1)$: For other a,

$$\varphi_i(a)=(\pi_i(\begin{bmatrix}a&\\&1\end{bmatrix}\begin{bmatrix}&1\\-1&\end{bmatrix})\varphi)(1)=(\pi_i(\begin{bmatrix}&1\\-1&\end{bmatrix}\begin{bmatrix}1&\\&a\end{bmatrix})\varphi)(1)$$

and $\pi_1(\begin{bmatrix}1&\\&a\end{bmatrix})\varphi=\pi_2(\begin{bmatrix}1&\\&a\end{bmatrix})\varphi$.

For $n\in\mathbb{Z}$, let

$$F_\xi(n)=\int_{\mathfrak{q}^{-n}\backslash\mathfrak{q}^{-n+1}}(\varphi_1(y)-\varphi_2(y))\xi(y)d^\times y,$$

then $F_\xi(0)$ only depends on the restriction of ξ to $\mathcal{O}^*$, and $F_\xi(0)=0$ for all but f.m. characters ξ of $\mathcal{O}^*$: $\varphi_1-\varphi_2$ is a locally constant function that is fixed by $U\subset\mathcal{O}^*$, so in order $F_\xi(0)\neq 0$, at least ξ should be trivial on U, and there are f.m. such characters. Thus the hypothesis of Fourier transform on $\mathcal{O}^*$ is satisfied(10.11.3.24) and

$$\varphi_1(1)-\varphi_2(1)=\sum_{\xi\in(\mathcal{O}^*)^\wedge}F_\xi(0).$$

The hypothesis and the functional equation(19.2.6.6) shows $Z(s,\varphi_1,\xi)=Z(s,\varphi_2,\xi)$ for any quasi-character ξ of F^*, so

$$\sum_n F_\xi(n)q^{-sn}=Z(s,\varphi_1,\xi)-Z(s,\varphi_2,\xi)=0$$

and $F_\xi(n)=0$ for n sufficiently small, thus $F_\xi(n)=0$ for all n. In particular, $F_\xi(0)=0$, for any ξ. □

Prop. (19.2.6.8) [Gamma Factor Commutes with Parabolic Induction]. If $(\pi,V)=\mathcal{B}(\chi_1,\chi_2)$ is irreducible, then

$$\gamma(s,\mathcal{B}(\chi_1,\chi_2),\xi,\psi)=\gamma(s,\xi\chi_1,\psi)\gamma(s,\xi\chi_2,\psi).$$

Remark (19.2.6.9). For the compatibility of the gamma factor with parabolic inductions in the GL(n) case, Cf.[Jacquet, H., I. Piatetski-Shapiro and J. Shalika, Rankin-Selberg Convolutions, Am. J. Math., 105 (1981b), 367-464.] or [Jacquet, H. and J. Shalika, Rankin-Selberg Convolutions: Archimedean Theory].

Proof: Cf.[Bump, P548].**?** This uses the concrete realization of the Whittaker model of $\mathcal{B}(\chi_1,\chi_2)$ as a quotient of the Weil representation in the split case. □

Jacquet-Langlands L-Functions(GL(2) × GL(1) Case)

Def. (19.2.6.10) [Local L-Factors for GL(2)]. Given $\pi\in\mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F,\omega)$, for $v\in\Sigma_F^{\mathrm{fin}}$, the local L-factor is defined to be

$$L(\pi_v;s)=\begin{cases}1 & ,v\in S_{\mathrm{cusp}}(\pi)\\ \frac{1}{(1-\alpha_1q^{-s})(1-\alpha_2q^{-s})}\text{(15.11.5.2)} & ,\pi_v=\pi(\chi_1,\chi_2)\\ \frac{1}{1-\alpha_2q^{-s}} & ,\pi_v=\sigma(\chi_1,\chi_2),\quad \chi_1\chi_2^{-1}=|\cdot|^{-1}\end{cases}$$

It follows from(15.11.4.20) and(15.11.4.2) that any irreducible representation of $GL(2,F_v)$ is one of the form above. Also when ξ is a quasi-character of $F^\times$, define

$$L(\pi_v,\xi_v;s)=L(\pi_v(\xi_v);s).$$

Prop. (19.2.6.11) [L-Factors as the Common Divisors]. Situation as in(19.2.6.6), $\frac{\zeta_v(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)}$ is entire for any Φ_v,ξ_v, and if $v\in\Sigma_F^{\mathrm{fin}}$, then it is a rational function of $||v||^{-s}$.

Moreover, for each (π_v,V_v), we can take specific $\Phi_v\in V_v$**?** s.t. $\frac{\zeta_v(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)}$ is of the form ab^s for $a\in\mathbb{C}^\times,b\in\mathbb{R}_+$.

Proof: Cf.[Jacquet-Langlads, GL(2)]. □

Prop. (19.2.6.12) [Local ε-Factors]. Situation as in(19.2.6.6), there exists a non-vanishing holomorphic function $\varepsilon_v(\pi_v,\xi_v,\psi_v;s)$ s.t.

$$\frac{\zeta(\pi(w_1)\Phi_v,\xi_v^{-1};1-s)}{L_v(\widehat{\pi_v},\xi_v^{-1};s)}=\varepsilon_v(\pi_v,\xi_v,\psi_v;s)\frac{\zeta(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)},$$

and $\frac{Z(s,\Phi,\xi)}{L_v(s,\pi_v,\xi_v)}$ is holomorphic. Moreover, $\varepsilon_v(s,\pi_v,\xi_v,\psi_v)$ is of the form ab^s for $a\in\mathbb{C}^*,b\in\mathbb{R}$. And $\varepsilon_v(s,\pi_v,\xi_v,\psi_v)=1$ if v is unramified in the sense of(19.2.6.1).

Proof: Such a meromorphic $\varepsilon_v(\pi_v,\xi_v,\psi_v;s)$ exists by(19.2.6.6). It is holomorphic and non-vanishing by the same reason as in(19.2.3.3) as both $\frac{\zeta(\Phi_v,\xi_v;s)}{L_v(\pi_v,\xi_v;s)}$ and $\frac{\zeta(\pi(w_1)\Phi_v,\xi_v^{-1};1-s)}{L_v(\widehat{\pi_v},\xi_v^{-1};s)}$ are holomorphic by(19.2.6.11) and for any $s_0\in\mathbb{C}$, Φ_v can be chosen to make either one of them non-vanishing at s_0. To show it is of the form ab^s: If $v\in\Sigma_F^{\mathrm{fin}}$, it is a rational function in $||v||^{-s}$ with no zeros or poles, so it must be of the form ab^s. And if v is unramified, then we can let Φ_v be the spherical function in π_v normalized s.t. $W_{v,\varphi_v}(1)=1$, then $\pi(w_1)\Phi_v$ is the normalized spherical function of $\widehat{\pi}_v$. Then by(12.4.6.5), both sides are 1 by(19.2.6.3).

If $v\in\Sigma_F^\infty$, then we can take Φ_v as in(19.2.6.11) to do the calculation to show it directly, Cf.[Jacquet-Langlads, GL(2)].**?**. □

Prop. (19.2.6.13) [Global L-Functions for GL(2) × GL(1)]. Define

$$L(\pi,\xi;s)=\prod_{v\in\Sigma^{\mathrm{fin}}}L_v(\pi_v,\xi_v;s),\quad \Lambda(\pi,\xi;s)=\prod_v L_v(\pi_v,\xi_v;s)\quad \varepsilon(\pi,\xi;s)=\prod_v\varepsilon_v(\pi_v,\xi_v,\psi_v;s)$$

Then $\varepsilon(\pi,\xi;s)$ is independent of ψ, and $L(s,\pi,\xi)$ satisfies a functional equation

$$\Lambda(\pi,\xi;s)=\varepsilon(\pi,\xi;s)\Lambda(\widehat{\pi},\xi^{-1};s)$$

Proof: This follows from(19.2.6.12) and(19.2.6.4). □

Prop. (19.2.6.14) [Non-Vanishing on $\mathrm{Re}(s) = 1$]. For $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$, $L(\pi; s) \neq 0$ on the line $\mathrm{Re}(s) = 1$.

Proof: Cf.[A Non-Vanishing Theorem for Zeta Functions of GL(n), Jacquet-Shalika(1976)]. □

Modular Forms

Prop. (19.2.6.15) [Trivial Bound]. If $f \in S_k(\Gamma(N))$, suppose $f(z) = \sum_{n\geq 0} a_n e^{2\pi i n z/N}$, then $|a_n| = O(n^{k/2})$.

Proof: $a_n = \int_0^N f(x+iy)e^{-2\pi i n(x+iy)/N}dx$ for any y, so let $y = N/n$, then $a_n = \int_0^N f(x + iN/n)e^{-2\pi i n x/N}dx$. As f is a cusp modular form, $(\mathrm{Im}(z))^{k/2}|f(z)|$ is cuspidal automorphic function, thus bounded on $\mathcal{H}$, thus $|a_n| \leq C(N/n)^{\frac{k}{2}}$. □

Thm. (19.2.6.16) [Ramanujan-Petersson Conjecture]. Let f be a cuspidal Hecke eigenform of weight k for $\Gamma(1)$, then for any prime p, $|a_p(f)| \leq 2p^{(k-1)/2}$.

Proof: By(16.2.3.12) this means the eigenvalue λ_p of f w.r.t. T_p satisfies $|\lambda_p| \leq 2p^{1/2}$. This is a consequence of Weil conjecture and modularity**?**. □

Def. (19.2.6.17) [L-functions associated to Modular Forms]. Each $f \in M_k(\Gamma_1(N))$ has an associated L-functions: if $f = \sum_{n=0}^\infty a_n q^n$, define

$$L(s, f) = \sum_{n=1}^\infty a_n n^{-s}.$$

Prop. (19.2.6.18) [Functional Equations of Modular Forms, Hecke]. Let $a_0, a_1, \ldots$ be a sequence of complex numbers s.t. $a_n = O(n^M)$ for some integer M. Given $\lambda > 0, k > 0, C = \pm 1$, write

$$\varphi(s) = \sum_{n=1}^\infty a_n n^{-s}, \quad \Phi(s) = (\frac{2\pi}{\lambda})^{-s}\Gamma(s)\varphi(s), \quad f(z) = \sum_{n=0}^\infty a_n e^{2\pi i n z/\lambda}.$$

Then the following conditions are equivalent:

- The function $\Lambda(s) = \Phi(s) + \frac{a_0}{s} + \frac{Ca_0}{k-s}$ can be analytically continued to a holomorphic function of the whole plane which is bounded on vertical strips, and it satisfies the functional equation
$$\Phi(s) = C\Phi(k - s).$$
- In the upper half plane, f satisfies the functional equation
$$f(-1/z) = C(z/i)^k f(z).$$

Proof: Notice first

$$\int_0^\infty e^{-2\pi n t/\lambda} t^s \frac{dt}{t} = (\frac{2\pi}{n\lambda})^{-s} \int_0^\infty e^{-t} t^s \frac{dt}{t} = (\frac{2\pi}{n\lambda})^{-s}\Gamma(s).$$

Thus for $\mathrm{Re}(s)$ large,

$$\Phi(s) = \int_0^\infty (f(it) - a_0)t^s \frac{dt}{t} = \int_1^\infty (f(it) - a_0)t^s \frac{dt}{t} + \int_1^\infty (f(\frac{i}{t}) - a_0)t^{-s}\frac{dt}{t}.$$

If 2 holds, then $f(\frac{i}{t}) = Ct^k f(it)$, and

$$\begin{aligned}\Phi(s) &= \int_1^\infty (f(it)-a_0)t^s\frac{dt}{t} + \int_1^\infty (Ct^k f(it)-a_0)t^{-s}\frac{dt}{t}\\ &= \int_1^\infty (f(it)-a_0)t^s\frac{dt}{t} + C\int_1^\infty (f(it)-a_0)t^{k-s}\frac{dt}{t} + \int_1^\infty (Ct^{k-s}a_0 - t^{-s}a_0)\frac{dt}{t}.\end{aligned}$$

The first two integral is absolutely convergent for any s and then can be extended to an analytic function of the whole plane, and the final term equals

$$-(\frac{a_0}{s} + \frac{Ca_0}{k-s})$$

when $\mathrm{Re}(s)$ is large, so it can be extended to a meromorphic function on the whole plane. And $\Phi(s) = \Phi(k-s)$ follows easily from the equation above. Also it is bounded on vertical strips because it attain maximum at the real axis.

Conversely, first notice it suffices to prove for real $y > 0$,

$$f(\frac{\mathrm{i}}{y}) = Cy^k f(\mathrm{i}\,y)$$

because this implies these two holomorphic functions on $\mathcal{H}$ coincide on the imaginary axis, so they must be equal. Notice

$$\int_0^\infty (f(iy)-a_0)y^s\frac{dy}{y} = \Phi(s)$$

converges absolutely for $\mathrm{Re}(s)$ sufficiently large, so for $\sigma > 0$ sufficiently large, Mellin inversion formula(10.12.2.16) shows

$$\begin{aligned}f(iy)-a_0 &= \frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Phi(s)y^{-s}ds = \frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Phi(k-s)y^{-s}ds\\ &= \frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\Lambda(k-s) - \frac{Ca_0}{s} - \frac{a_0}{k-s})y^{-s}ds\end{aligned}$$

Notice $\Phi(\sigma+it)$ decays exponentially for fixed $\sigma = \alpha$ sufficiently large, because of the Stirling formula(10.7.1.12), and for $\sigma = \beta$ sufficiently small, $\Phi(s) = C\Phi(k-s)$ also shows $\Phi(\sigma+it)$ decays exponentially. And also $\frac{Ca_0}{\sigma+it} + \frac{a_0}{k-\sigma-it} = O(t^{-1})$ for $\sigma = \alpha$ or β, so $\Lambda(\sigma+it) = O(t^{-1})$ for σ large or small, and also the hypothesis shows Λ is bounded on the strip $\alpha < \mathrm{Re}(z) < \beta$, thus by(10.5.5.7), $\Lambda(\sigma+it)\to 0$ for $t\to 0$ and σ in any compact set. So we can move the integration of $\Lambda(s)$ to the left or to the right. Then

$$\begin{aligned}f(iy)-a_0 &= \frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\Lambda(k-s) - \frac{Ca_0}{s} - \frac{a_0}{k-s})y^{-s}ds\\ &= \frac{C}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}y^{-k}\Lambda(s)y^s ds - \frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\frac{a_0}{s}+\frac{Ca_0}{k-s})y^{-s}ds\\ &= \frac{Cy^{-k}}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Phi(s)y^s ds + \frac{Cy^{-k}}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(\frac{a_0}{s}+\frac{Ca_0}{k-s})y^s ds + \frac{1}{2\pi i}\int_{k-\sigma+i\infty}^{k-\sigma-i\infty}(\frac{a_0}{k-s}+\frac{Ca_0}{s})y^{s-k}ds\\ &= Cy^{-k}(f(\frac{i}{y})-a_0) + \frac{y^{-k}}{2\pi i}\int_\gamma(\frac{Ca_0}{s}+\frac{a_0}{k-s})y^s ds\\ &= Cy^{-k}f(\frac{i}{y}) - Ca_0y^{-k} + y^{-k}(Ca_0 - a_0y^k) = Cy^{-k}f(\frac{i}{y}) - a_0\end{aligned}$$

So we are done. □

Def. (19.2.6.19)[L-Functions of Modular Forms]. Let $a_1, a_2, \dots$ be a sequence of complex numbers such that $a_n = O(n^M)$ for some $M > 0$. Let

$$L(s) = \sum a_n n^{-s}, \quad \Lambda(s) = (2\pi)^{-s}\Gamma(s)L(s), \quad f(z) = \sum a_n e^{-2\pi i n z}.$$

More generally, let $m > 0$ and χ a primitive character mod m, then we define **twisted L-function** as

$$L(f, \chi; s) = \sum a_n \chi(n) n^{-s}, \quad \Lambda(f, \chi; s) = L_{\mathbb{C}}(s)L(f, \chi; s)$$

Notice if $f(x) =\in S_k(\Gamma(1))$, and $\pi_f \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/\mathbb{Q})$ corresponding to f via(16.3.2.12), then

$$L(f, \chi; s) = L(\pi_f, \chi; s).$$

Prop. (19.2.6.20) [Converse Theorem(Correspondence for $\Gamma(1)$)]. If $f \neq 0 \in S_k(\Gamma(1))$(so k is even), then $\Lambda(s, f) = (2\pi)^{-s}\Gamma(s)L(s, f)$ has analytic continuation to all s, is bounded on vertical strips, and satisfies a functional equation

$$\Lambda(s, f) = (-1)^{k/2}\Lambda(k - s, f).$$

Conversely, let $a_0, a_1, \dots$ be a sequence of complex numbers that $a_n = O(n^M)$ for some $M > 0$. Let $f(s), L(s), \Lambda(s)$ be defined in(19.2.6.19) and $\Lambda(s)$ has analytic continuation to all s and satisfies the above functional equation then $f(z) \in S_k(\Gamma(1))$.

Moreover, in this case, f is a normalized Hecke eigenform(16.2.3.12) iff $L(s, f)$ has as Euler product formula

$$L(s) = \prod_p (1 - a_p p^{-s} + p^{k-1-2s})^{-1}$$

for s sufficiently large, where $1 - a_s X + p^{k-1}X^2 = (1 - aX)(1 - \overline{a}X)$, where $|a| = p^{\frac{k-1}{2}}$.

Proof: The first part is a direct consequence of(19.2.6.18). Notice a_n is bounded by polynomials in n by(19.2.6.15).

When s is large, the Euler product is absolutely convergent, thus it suffices to compare the coefficients. By(16.2.3.12) and(16.2.3.10), f being a normalized Hecke eigenform is equivalent to

$$\begin{cases} c_m c_n = c_{mn}, & (m, n) = 1 \\ c_p c_{p^n} = c_{p^{n+1}} + p^{2k-1}c_{p^{k-1}} \end{cases}$$

which is equivalent to

$$(1 - a_p X + p^{k-1}X^2)(\sum_{r=0}^{\infty} a_{p^r} X^r) = 1.$$

□

Prop. (19.2.6.21) [Functional Equation associated to $S_k(N, \psi)$]. Notation as in(19.2.6.19). If $f(z) \in S_k(N, \psi)$(16.2.1.10). Denote $w_N = \begin{bmatrix} 0 & -1 \\ N & 0 \end{bmatrix}$, then w_N stablizes $\Gamma_0(N)$ because

$$w_N \begin{bmatrix} a & b \\ c & d \end{bmatrix} w_N^{-1} = \begin{bmatrix} d & -c/N \\ bN & a \end{bmatrix}$$

Also notice $\psi(a_\gamma) = \overline{\psi(d_\gamma)}$, so

$$f[w_N]_k[\gamma]_k = f[w_N\gamma w_N^{-1}]_k[w_N]_k = \overline{\psi(d)}f[w_N].$$

So $g = f[w_N]_k \in S_k(N, \overline{\psi})$.

Now if

$$f(z) = \sum a_n e^{2\pi i n z/N}, g(z) = \sum b_n e^{2\pi i n z/N},$$

and χ is a primitive character mod D, define $L(s, f, \chi), L(s, g, \overline{\chi}), \Lambda(s, f, \chi), \Lambda(s, g, \overline{\chi})$ as in(19.2.6.19), then $\Lambda(s, f, \chi)$ extends to an analytic function for all $s \in \mathbb{C}$, and there are functional equations

$$\Lambda(s, f, \chi) = i^k \chi(N)\psi(D)\frac{\tau(\chi)^2}{D}(D^2N)^{-s+k/2}\Lambda(k-s, g, \overline{\chi}), \tag{19.1}$$

where $\tau(\chi)$ is the Gauss sum of χ(19.3.2.2).

In particular, if $D = 1$, then

$$\Lambda(s, f) = i^k N^{-s+k/2}\Lambda(k-s, g). \tag{19.2}$$

Proof: Let

$$f_\chi(z) = \sum \chi(n) a_n q^n, \quad g_{\overline{\chi}}(z) = \sum \overline{\chi(n)} b_n q^n.$$

Use(19.3.2.6) on $f_\chi(z)$, we get

$$f_\chi = \frac{\chi(-1)\tau(\chi)}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\overline{\chi(m)}f[\begin{bmatrix} D & m \\ & D \end{bmatrix}]_k$$

Now

$$f_\chi[\begin{bmatrix} & -1 \\ D^2N & \end{bmatrix}]_k = f_\chi[\begin{bmatrix} & -1/DN \\ D & \end{bmatrix}]_k = \frac{\chi(-1)\tau(\chi)}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\overline{\chi(m)}g[w_N^{-1}]_k[\begin{bmatrix} D & m \\ & D \end{bmatrix}]_k[\begin{bmatrix} & -1/DN \\ D & \end{bmatrix}]_k$$
$$= \frac{\chi(-1)\tau(\chi)}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\overline{\chi(m)}g[\begin{bmatrix} D & -r \\ -Nm & s \end{bmatrix}\begin{bmatrix} D & r \\ & D \end{bmatrix}]_k$$

where (r, s) are integers chosen that $Ds - rNm = 1$. Thus $\overline{\chi(m)} = \chi(-N)\chi(r)$, and because $g \in M_k(N, \overline{\psi})$,

$$f_\chi[\begin{bmatrix} & -1 \\ D^2N & \end{bmatrix}]_k = \frac{\chi(N)\tau(\chi)}{D}\sum_{r\in(\mathbb{Z}/D\mathbb{Z})^*}\chi(r)\psi(D)g[\begin{bmatrix} D & r \\ & D \end{bmatrix}]_k.$$

Compare this with the formula

$$g_{\overline{\chi}} = \frac{\chi(-1)\tau(\overline{\chi})}{D}\sum_{m\in(\mathbb{Z}/D\mathbb{Z})^*}\chi(m)g[\begin{bmatrix} D & m \\ & D \end{bmatrix}]_k,$$

we get

$$f_\chi[\begin{bmatrix} & -1 \\ D^2N & \end{bmatrix}]_k = \chi(-N)\psi(D)\frac{\tau(\chi)}{\tau(\overline{\chi})}g_{\overline{\chi}} = \chi(N)\psi(D)\frac{\tau(\chi)^2}{D}g_{\overline{\chi}}\text{(19.3.2.3)(19.3.2.5)}. \tag{19.3}$$

Now similar to the proof of(19.2.6.18),

$$\Lambda(s,f,\chi)=\int_0^\infty f_\chi(iy)y^s\frac{dy}{y}.$$

So when Re(s) is large,

$$\begin{aligned}\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\Lambda(s,g,\overline{\chi})&=\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_0^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\\&=\int_0^{D\sqrt{N}}(D^2N)^{-k/2}(iy)^{-k}f_\chi(\frac{1}{-D^2Niy})y^s\frac{dy}{y}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\\&=\int_{D\sqrt{N}}^\infty(D^2N)^{k/2}t^ki^{-k}f_\chi(it)(D^2Nt)^{-s}\frac{dt}{t}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\\&=i^{-k}(D^2N)^{k/2-s}\int_{D\sqrt{N}}^\infty f_\chi(it)t^{k-s}\frac{dt}{t}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\end{aligned}$$

Both integral are absolutely convergent for any s. And similarly when Re(s) is small,

$$\begin{aligned}i^{-k}(D^2N)^{k/2-s}\Lambda(k-s,f,\chi)&=i^{-k}(D^2N)^{k/2-s}\int_0^\infty f_\chi(it)t^{k-s}\frac{dt}{t}\\&=i^{-k}(D^2N)^{k/2-s}\int_{D\sqrt{N}}^\infty f_\chi(it)t^{k-s}\frac{dt}{t}+\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy)y^s\frac{dy}{y}\end{aligned}$$

Thus we get the desired result. □

Cor. (19.2.6.22). As $f[w_N^2]_k=(-1)^kf$, if $f\in S_k(\Gamma_1(N))$ satisfies $f[w_N]_k=cf$, $c=\varepsilon i^k$, $\varepsilon=\pm1$, then

$$N^{s/2}\Lambda(s,f)=\varepsilon(-1)^k(N^{(k-s)/2}\Lambda(k-s,f)).$$

so $\mathrm{ord}_{1/2}(L(s,f))$ is even if $\varepsilon=(-1)^k$ and odd if $\varepsilon=(-1)^{k+1}$.

In particular, if $N=1$ and $k\equiv 2\mod 4$, $L(1/2,f)=0$.

It is conjectured that $L(1/2,f)\neq 0$ if $4|k$, Cf.[Modular Forms, Ribet] P148.?

Prop. (19.2.6.23) [Converse Theorem, Weil]. Let $N>0$ and ψ a character mod N. Suppose a_n,b_n are two sequence of complex numbers that $|a_n|,|b_n|=O(n^M)$ for some positive integer M. If $(D,N)=1$ and χ is a primitive character mod D, let

$$L_1(s,\chi)=\sum\chi(n)a_nn^{-s},\quad L_2(s,\overline{\chi})=\sum\overline{\chi(n)}b_nn^{-s}.$$

and $\Lambda_i(s,\chi_i)=(2\pi)^{-s}\Gamma(s)L_i(s,\chi_i)$.

Now if for D equals to a.e. p and any primitive character mod D, $\Lambda_i(s,\chi)$ has analytic continuation to all s, are bounded on vertical strips, and satisfy the functional equation

$$\Lambda_1(s,\chi)=i^k\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}(D^2N)^{-s+k/2}\Lambda_2(k-s,\overline{\chi}),$$

where $\tau(\chi)$ is the Gauss sum of χ(19.3.2.2), then $f(z)=\sum a_ne^{2\pi inz}\in M_k(N,\psi)$.

Proof: Let

$$f_\chi(z)=\sum \chi(n)a_nq^n, \quad g_{\overline{\chi}}(z)=\sum \overline{\chi(n)}b_nq^n.$$

We first show equation19.3 holds. As in the proof of(19.2.6.18), it suffices to show the functional equation it is true on the positive imaginary axis. If $\sigma=\mathrm{Re}(s)$ is sufficiently large, then

$$\int_0^\infty f_\chi(iy)y^s\frac{dy}{y}=\Lambda_1(s,\chi)$$

so by Mellin inversion formula

$$f_\chi(iy)=\frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Lambda_1(s,\chi)y^{-s}ds=i^k\chi(N)\psi(-D)\frac{\tau(\chi)^2}{D}\frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}(D^2N)^{-s+k/2}\Lambda_2(k-s,\overline{\chi})ds$$

Same argument of Phragmén-Lindelöf principle as in proof of(19.2.6.18) shows $\Lambda_2(\sigma+it,\overline{\chi})$ converges to 0 for $t\to\infty$, uniformly on any compact subset, so we can move the integral horizontally and make a change of variable $s\mapsto k-s$ to get

$$\begin{aligned}f_\chi(iy)&=i^k\chi(N)\psi(-D)\frac{\tau(\chi)^2}{D}(D^2N)^{-k/2}y^{-k}\frac{1}{2\pi i}\int_{\sigma-i\infty}^{\sigma+i\infty}\Lambda_2(k-s,\overline{\chi})(D^2Ny)^sds\\&=i^k\chi(N)\psi(-D)\frac{\tau(\chi)^2}{D}(D^2N)^{-k/2}y^{-k}g_{\overline{\chi}}(\frac{i}{D^2Ny})\end{aligned}$$

which is equivalent to19.3.

The rest is to manipulate 2×2 matrices and use(16.1.1.10) to show that $g\in M_k(N,\overline{\psi})$, Cf.[Bump, P62]?. □

Remark (19.2.6.24). For $\Gamma(1)$, the function only requires one functional equation, and we used the fact $\Gamma(1)$ is generated by S and T. But $\Gamma_0(N)$ is not generated by two elements, so we must assume functional equations for the twists $L(s,f,\chi)$ also.

19.3 Dirichlet L-Functions and Theory of Natural Primes

References are [Analytic Number Theory, Iwaniec-Kowaiski].

Notation (19.3.0.1).
- Let $F \in$ `NField`.

1 Representing Primes

Conj. (19.3.1.1) [Hardy-Littlewood]. There are infinitely many primes of the form $n^2+1, n \in \mathbb{Z}_+$.

Proof: □

Prop. (19.3.1.2). If $f(\underline{X}) \in \mathbb{C}[\underline{X}]$ only takes values in $\mathbf{P}$ at non-negative integer points, then f is constant.

Proof: □

Prop. (19.3.1.3). There is an integral polynomial of degree 25 in 26 variables that its only positive values at integer points are primes.

Proof: Cf.[J. P. Jones, D. Sato, H. Wada and D. Wiens, "Diophantine representation of the set of prime numbers," Amer. Math. Monthly, 83 (1976) 449-464.]. □

Prop. (19.3.1.4) [Landau]. For $n \in \mathbb{Z}_+$, let $f(n)$ be the cardinality of numbers in $[n]_+$ that can be written as the form x^2+y^2, then $f(n) = O(\frac{n}{\sqrt{\log n}})$.

Proof: ? □

2 Dirichlet Characters

Def. (19.3.2.1) [Dirichlet Character]. For $F \in$ `NField` and a modulus $\mathfrak{m}$ for F, a **Dirichlet character modulo $\mathfrak{m}$** is a functor $\mathrm{Cl}_{\mathfrak{m}}(F) = J^{\mathfrak{m}}/P^{\mathfrak{m}} \to \mathbb{C}^\times$.

A **primitive Dirichlet character** modulo $\mathfrak{m}$ is a Dirichlet character modulo $\mathfrak{m}$ that is injective.

Usually we consider the case $F = \mathbb{Q}$ and $\mathfrak{m} = m{\cdot}\infty$. In which case, a Dirichlet character is just a map $(\mathbb{Z}/(m))^\times \to \mathbb{C}^\times$.

Def. (19.3.2.2) [Gauss Sum]. Let χ be a primitive Dirichlet character mod N, then the **Gauss sum** of χ is defined to be

$$\tau(\chi) = \sum_{n \in \mathbb{Z}/(N)} \chi(n) e^{2\pi \mathrm{i}\, n/N}.$$

Prop. (19.3.2.3). $\tau(\overline{\chi}) = \chi(-1)\overline{\tau(\chi)}$.

Prop. (19.3.2.4). $\sum_{n \in \mathbb{Z}/(N)} \chi(n) e^{2\pi \mathrm{i}\, nm/N} = \overline{\chi(m)}\tau(\chi)$(19.3.2.2).

Proof: If $(m, N) = 1$, then this follows from

$$\tau(\chi) = \sum_{n (\mathrm{mod}\ N)} \chi(mn) e^{2\pi \mathrm{i}\, mn/N} = \chi(m) \sum_{n (\mathrm{mod}\ N)} \chi(n) e^{2\pi i mn/N}.$$

If $(m,N)\neq 1$, then we need to show the LHS is 0. Let $m=dM, N=dN_1$. Because χ is primitive character mod N, there is some $c\equiv 1 \mod N_1$ that $\chi(c)\neq 1$, otherwise χ is defined mod N_1. Notice

$$\sum_{n(\text{mod } N)}\chi(n)e^{2\pi inm/N}=\sum_{r(\text{mod } N_1)}\{\sum_{n(\text{mod } N),n\equiv r(\text{mod } N_1)}\chi(n)\}e^{2\pi irM/N_1}$$

But $r\mapsto cr$ is a permutation of $\{n(\text{mod } N), n\equiv r(\text{mod } N_1)\}$, thus

$$\sum_{n(\text{mod } N),n\equiv r \mod N_1}\chi(n)=\sum_{n \mod N,n\equiv r \mod N_1}\chi(cn)=\chi(c)\sum_{n(\text{mod } N),n\equiv r \mod N_1}\chi(n)$$

which means this sum vanishes. □

Prop. (19.3.2.5). $|\tau(\chi)|^2=N$.

Proof: For any m,

$$|\sum_{n \mod N}\chi(n)e^{2\pi inm/N}|^2=\sum_{(n_1n_2,N)=1}\chi(n_1)\overline{\chi(n_2)}e^{2\pi i(n_1-n_2)m/N},$$

summing over $m\in(\mathbb{Z}/N\mathbb{Z})^*$,

$$\varphi(N)|\tau(\chi)|^2=\sum_{m \mod N}\sum_{(n_1n_2,N)=1}\chi(n_1)\overline{\chi(n_2)}e^{2\pi i(n_1-n_2)m/N}=\sum_{n_1\equiv n_2 \mod N,(n_1n_2,N)=1}N=\varphi(N)N$$

□

Cor. (19.3.2.6). From this and(19.3.2.4) and also(19.3.2.3), we get that

$$\chi(n)=\frac{\chi(1)\tau(\chi)}{N}\sum_{m(\text{mod } N)}\overline{\chi(m)}e^{2\pi imn/N}.$$

Cor. (19.3.2.7). If χ is real(i.e. $\chi^2=1$), by(19.3.2.3), $\tau(\chi)^2=\chi(-1)N$.

Cor. (19.3.2.8). For $p\geq 3\in\mathbf{P}$,

$$\tau(\Big(\frac{-}{p}\Big))^2=\Big(\frac{-1}{p}\Big)p.$$

Prop. (19.3.2.9) [Finite Fourier Transform]. Let ψ be a non-trivial character on a finite field $\mathbb{F}_q$, then let $g_\psi=\sum_{x\in\mathbb{F}_q}\psi(x^2)$, then

- $|g_\psi|^2=q^{1/2}$.
- $g_\psi(a)=(\frac{a}{\mathbb{F}_q})g_\psi(1)$.

Proof: Use Fourier transform on $\mathbb{F}_q$**?**. □

Def. (19.3.2.10) [Theta Function]. Let χ be a primitive character modulo N s.t. $\chi(-1)=1$, define the **Theta function**

$$\theta_\chi(t)=\frac{1}{2}\sum_{n=-\infty}^{\infty}\chi(n)e^{-\pi n^2t}=\frac{1}{2}\chi(0)+\sum_{n=1}^{\infty}\chi(n)e^{-\pi n^2t}.$$

3 Dirichlet-Weber L-Functions

Cf.[Class Field Theory, Milne]

Def. (19.3.3.1)[Partial L-Functions]. If $\mathfrak{m}$ is a modulus for F, $\mathcal{R} \subset \mathrm{Cl}_{\mathfrak{m}}(F)$ be an ideal class. Define the **partial L-function**

$$\zeta(F, \mathcal{R}; s) = \sum_{\mathfrak{a} \in \mathcal{R}} \frac{1}{||N\mathfrak{a}||^s}.$$

Prop. (19.3.3.2). Situation as in(19.3.3.1), $\zeta(F, \mathcal{R}; s)$ is analytic for $\mathrm{Re}(s) > 1 - 1/N$ except a simple pole at $s = 1$, where it has residue $g_{\mathfrak{m}}$ depending only on $\mathfrak{m}$.

Proof: Cf.[Class Field Theory, Milne]. □

Prop. (19.3.3.3) [Weber L-Functions]. If $\mathfrak{m}$ is a modulus for F, $\chi : \mathrm{Cl}_{\mathfrak{m}}(F) \to \mathbb{C}^\times$ a Dirichlet character for F, then the **Weber L-function** attached to χ is defined to be the Euler product

$$L(F, \chi; s) = \prod_{\mathfrak{p} \nmid \mathfrak{m}} \frac{1}{1 - \chi(\mathfrak{p})||\mathfrak{p}||^{-s}} = \sum_{(\mathfrak{a}, \mathfrak{m})=1} \frac{\chi(\mathfrak{a})}{||N\mathfrak{a}||^s} = \sum_{\mathcal{R} \in \mathrm{Cl}_{\mathfrak{m}}(F)} \chi(\mathcal{R})\zeta(F, \mathcal{R}; s).$$

Thus by(19.3.3.2), $L(K, \chi; s)$ is analytic for $\mathrm{Re}(s) > 1 - 1/N$, except for possibly a simple pole at $s = 1$. And for $\chi \neq 1$, it is in fact analytic at $s = 1$, as the residues cancelled out.

Def. (19.3.3.4) [Dirichlet L-Functions]. For $F = \mathbb{Q}$, the characters of $\mathrm{Cl}_{\mathfrak{m}}(\mathbb{Q})$ are just Dirichlet characters χ(12.4.5.32), thus the Weber L-function is

$$L(s, \chi) = \sum_{n=1}^{\infty} \frac{\chi(n)}{n^s},$$

where $\mathrm{Re}\, s > 1$. Called the **Dirichlet L-function** attached to χ.

Prop. (19.3.3.5)[Functional Equation for Dirichlet L-Functions]. Let χ be a Dirichlet character with $\chi(-1) = (-1)^\varepsilon$ where $\varepsilon = 0$ or 1, then

$$\Lambda(\chi; s) = L_{\mathbb{R}}(s + \varepsilon)L(\chi; s),$$

is the Hecke L-function attached to the Hecke character corresponding to χ(12.4.5.32)(19.2.3.5). Thus $L(s, \chi)$ can be extended to a meromorphic function for all $s \in \mathbb{C}$, and it has simple poles at $s = 0, 1$ when $\chi = 1$, and analytic otherwise. When $\chi = 1$, by(19.3.4.2),

$$\mathrm{res}_{s=1} L(1; s) = 1.$$

Moreover, there are functional equations

$$\Lambda(\chi; s) = (-\mathrm{i})^\varepsilon \tau(\chi) N^{-s} \Lambda(\chi^{-1}; 1 - s)\text{(19.3.2.2)},$$

In other words,

$$\varepsilon(\chi; s) = (-\mathrm{i})^\varepsilon \tau(\chi) N^{-s}.$$

Proof: Cf.[Bum98]P10. □

Prop. (19.3.3.6). Let χ be a Dirichlet character modulo N, then

$$L(\chi;1)=\frac{-\tau(\chi)}{N}\sum_{n\in\mathbb{Z}/(N)}\chi^{-1}(n)\log(1-e^{-2\pi i n/N})=\begin{cases}\frac{\tau(\chi)}{N^2}\pi i\sum_{n\in\mathbb{Z}/(N)}\chi^{-1}(n)n & ,\chi(-1)=-1\\ \frac{-\tau(\chi)}{N}\sum_{n\in\mathbb{Z}/(N)}\chi^{-1}(a)\log|1-e^{-2\pi i n/N}| & ,\chi(-1)=1\end{cases}$$

Proof: Use Fourier transform**?**. □

Prop. (19.3.3.7). If $F\in\mathtt{NField}$ and $\chi\neq\mathbb{1}$ is a Hecke character on F, then $L(\chi;1+it)\neq 0$ for any $t\in\mathbb{R}$.

Proof: Cf.[GTM186, P289].**?**

We prove for $F=\mathbb{Q}$ and $\chi=1$: If ζ has a zero at $x+iy$ for $y\neq 0$, then by(19.3.3.5), $\zeta(s)$ has a simple pole at $s=1$ and holomorphic at $s=x+2iy$. But by(19.3.3.8)

$$\lim_{x\to 0^+}|\zeta(x)^3\zeta(x+iy)^4\zeta(x+2iy)|\geq 1,$$

contradiction. □

Lemma (19.3.3.8) [Mertens]. For $x,y\in\mathbb{R}$ with $x>1$, $|\zeta(x)^3\zeta(x+iy)^4\zeta(x+2iy)|\geq 1$.

Proof: Because for $\mathrm{Re}(s)>1$,

$$\log|\zeta(s)|=-\sum_{p\in\mathbf{P}}\log|1-p^{-s}|=-\sum_{p\in\mathbf{P}}\mathrm{Re}\log(1-p^{-s})=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{\mathrm{Re}(p^{-ns})}{n},$$

so

$$\log|\zeta(x+iy)=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{\cos(ny\log p)}{np^{nx}}.$$

So

$$\log|\zeta(x)^3\zeta(x+iy)^4\zeta(x+2iy)|=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{3+4\cos(ny\log p)+\cos(2ny\log p)}{np^{nx}}=\sum_{p\in\mathbf{P}}\sum_{n\in\mathbb{Z}_+}\frac{2(\cos(ny\log p)+1)^2}{np^{nx}}\geq 0.$$

□

Prop. (19.3.3.9). For any $\varepsilon>0$, there exists constant $C_\varepsilon>0$ s.t. $|\zeta(s)|^{-1}\leq C_\varepsilon|t|^\varepsilon$, where $s=\sigma+it,\sigma\geq 1,|t|\geq 1$.

Proof:

□

Estimates

Prop. (19.3.3.10) [Louboutin]. Let χ be a Dirichlet character modulo $N>1$, then

$$|L(\chi;1)|\leq\begin{cases}\frac{1}{2}\log N+0.009 & .\chi(-1)=1\\ \frac{1}{2}\log N+0.716 & ,\chi(-1)=-1\end{cases}.$$

Proof: Cf.[S. Louboutin, Majorations explicites de $|L(1,\chi)|$]. □

Remark (19.3.3.11). It is easy to show that $|L(\chi;1) \le \log(N)+C$:

$$\begin{aligned}|L(\chi;1)| &\le |\sum_{n\le N}\frac{\chi(n)}{n}| + |\sum_{n>N}\frac{\chi(n)}{n}|\\ &\le \sum_{n\le N}\frac{1}{n} + \Big|\int_N^\infty (\sum_{N<n\le t}\chi(n))\frac{\mathrm{d}t}{t^2}\Big|\\ &\le 1+\int_1^{N-1}\frac{\mathrm{d}t}{t}+\frac{1}{N}\max_X|\sum_{N<n\le t}\chi(n)|\\ &< \log N + 1 + \frac{\varphi(N)}{N}\end{aligned}$$

Thm. (19.3.3.12)[Zhang]. If χ is a real primitive Dirichlet character modulo $D>1$, then there exists an absolute effectively computable constant $c_1>0$ s.t.

$$L(\chi;1) > C(\log D)^{-2022}$$

Proof: Cf.[Yitang Zhang, Discrete mean estimates and the Landau-Siegel zero]. □

Cor. (19.3.3.13). If χ is a real primitive Dirichlet character modulo $D>1$, then there exists an absolute effectively computable constant $c_1>0$ s.t.

$$L(\sigma,\chi)\ne 0,\quad \sigma > 1-c_2(\log D)^{-2024}.$$

Proof: ? □

Cor. (19.3.3.14) [Siegel]. Let χ be a real primitive Dirichlet character modulo $N>1$, then for any $\varepsilon>0$, there exists $C(\varepsilon)>0$ s.t.

$$L(1,\chi)\ge\frac{C(\varepsilon)}{q^\varepsilon}.$$

Proof: There is a direct proof of this theorem in?? and [A simple proof of Siegel's theorem via Mellin's transform]. □

4 Riemann L-Functions

Def. (19.3.4.1)[Riemann L-Functions]. $\zeta(F;s)=L(F,\mathbb{1};s)$ is called the **Riemann L-function** for F. Also denote

$$\zeta(s)=\zeta(\mathbb{Q};s),\quad \Lambda(s)=\Lambda(\mathbb{Q},\mathbb{1};s)=L_{\mathbb{R}}(s)\zeta(s)(10.7.1.13).$$

By(19.3.3.5), $\zeta(s)$ extends to a meromorphic function for all $s\in\mathbb{C}$ with a simple pole at $s=1$. And there is a functional equation

$$\Lambda(s)=\Lambda(1-s).$$

Thm. (19.3.4.2) [Class Number Formula, Dirichlet]. By(19.2.3.6)(12.4.6.20),

$$\operatorname{res}_{s=1}\zeta(F;s)=\frac{2^{r_1}(2\pi)^{r_2}}{w(F)\sqrt{|d_F|}}\operatorname{cl}(F)\operatorname{Reg}(F)$$

where $w(F)=\#\mu(F)$, and $\operatorname{Reg}(F)$ is the regulator of F(12.4.2.26). In particular,

$$\operatorname{res}_{s=1}\zeta_{\mathbb{Q}}(s)=1.$$

Prop. (19.3.4.3) [Dirichlet's Class Number Formula for Quadratic Fields]. Let $\mathcal{K} = \mathbb{Q}(\sqrt{D})$ be a quadratic field with discriminant D, and χ_D the (real)Dirichlet character associated to K, and $\varepsilon = 0$(resp. 1) if $\mathcal{K}$ is real(resp. complex), then

- The root number of χ_D(19.2.3.7) is given by

$$W(\chi_D) = \frac{\tau(\chi)}{\sqrt{|D|}}(-1)^\varepsilon \in \{\pm 1\} \in \{-1, 1\},$$

- if $D < 0$, then

$$\mathrm{cl}(\mathcal{K}) = \frac{w(\mathcal{K})\sqrt{|D|}}{2\pi} L(\chi_D; 1) = \frac{w(\mathcal{K})\,\mathrm{i}}{2|D|} \cdot \frac{\tau(\chi_D)}{\sqrt{|D|}} \cdot \sum_{a \in \mathbb{Z}/(D)} \chi(a) = \frac{w(\mathcal{K})W(\chi_D)\,\mathrm{i}}{2D} \cdot \sum_{a \in \mathbb{Z}/(D)} \chi(a)a.$$

Proof: For 1: Cf. [GTM 218]P305-306, Ex.14-15.?

For 2, in this case $r_1 = 0, r_2 = 1$, so $\mathrm{Reg}(\mathcal{K}) = 1$, and the rest follows from(19.1.2.5)(19.3.3.5)(19.3.3.6) and item1. □

Prop. (19.3.4.4) [Kronecker's First Limit Formula].

$$\zeta(s) = \frac{1}{s-1} + \gamma_0 + O(s-1).$$

Proof: Cf.[Kronecker's First Limit Formula, Revisited]. This can be deduced from(19.2.5.7).? □

Remark (19.3.4.5). This is related to the the averaged Colmez's conjecture?.

Prop. (19.3.4.6). $\zeta(s) \neq 0$ for $\mathrm{Re}(s) \geq 1$, by(19.3.3.7).

5 Sieves

6 Characteristic Sums

7 Primes in Arithmetic Progressions

Def. (19.3.7.1) [Prime Counting Functions]. For $N \in \mathbb{Z}_+, a \in (\mathbb{Z}/(N))^*, X \in \mathbb{R}_+$, define

$$\pi(X; N, a) = \sum_{p \in \mathbf{P}, p \leq X, p \equiv a (\mathrm{mod}\ N)} 1.$$

And $\pi(X; 1, 1)$ is also denoted by $\pi(X)$.

Def. (19.3.7.2) [Log-Weighted Prime Counting Function]. For $X \in \mathbb{R}_+$, define

$$\vartheta(X) = \sum_{p \in \mathbf{P}, p \leq X} \log p.$$

Thm. (19.3.7.3) [Prime Number Theorem, Hadamard-Vallée-Poussin1896/Siegel-Walfisz]. then for any $A \in \mathbb{R}_+$,

$$\pi(X; N, a) = \frac{1}{\varphi(N)} \int_2^X \frac{\mathrm{d}t}{\log t} + O_A\left(\frac{X}{\exp(A\sqrt{\log X})}\right), X \to \infty$$

holds when $(a, N) = 1$ and $N \leq (\log X)^A$.

Proof: ?

We only prove that $\pi(X)\sim\frac{X}{\log X}, X\to\infty$: The function $H(t)=\vartheta(e^t)e^{-t}-1$ is piecewise continuous and bounded by(19.3.7.6), and $(\mathcal{L}H)(s)=\frac{\Phi(s+1)}{s+1}-\frac{1}{s}$(19.3.7.7) extends to a holomorphic function on $\mathrm{Re}(s)\geq 0$. Then by(10.12.2.18), the integral

$$\int_0^\infty H(t)\mathrm{d}t=\int_0^\infty(\vartheta(e^t)e^{-t}-1)\mathrm{d}t=\int_1^\infty\frac{\vartheta(x)-x}{x^2}\mathrm{d}x$$

converges. Then by(10.4.2.8), $\vartheta(X)\sim X$, and so $\pi(X)\sim\frac{X}{\log X}$ by(19.3.7.5). □

Remark (19.3.7.4). This is used by Vinogradov to prove the ternary Goldbach's conjecture: Any large odd integer is a sum of three primes.?

Prop. (19.3.7.5) [Chebyshev]. $\pi(X)\sim\frac{X}{\log X}$ iff $\vartheta(X)\sim X$.

Proof: As $0\leq\vartheta(X)\leq\pi(X)\log(X)$, $\frac{\vartheta(X)}{X}\leq\frac{\pi(X)\log(X)}{X}$. Also

$$\vartheta(X)\geq\sum_{X^{1-\varepsilon}<p\leq X}\log p\geq(1-\varepsilon)\log(X)(\pi(X)-\pi(X^{1-\varepsilon})),$$

so

$$\frac{\vartheta(X)}{X}\leq\frac{\pi(X)\log(X)}{X}\leq(\frac{1}{1-\varepsilon})\frac{\vartheta(X)}{X}+\frac{\log(X)}{X^\varepsilon}.$$

Thus the theorem follows. □

Lemma (19.3.7.6) [Chebyshev]. For $X\geq 1$, $\vartheta(X)\leq(4\log 2)X$.

Proof:

$$2^{2n}=(1+1)^{2n}\geq\binom{2n}{n}\geq\prod_{n<p<2n,p\in\mathbf{P}}p,$$

so

$$\vartheta(2n)-\vartheta(n)\leq 2n\log 2.$$

From this the assertion easily follows. □

Lemma (19.3.7.7). Define the function $\Phi(s)=\sum_{p\in\mathbf{P}}p^{-s}\log p$, then $(\mathcal{L}\vartheta(e^t))(s)=\Phi(s)/s$. Thus $\Phi(s)$ is holomorphic on $\mathrm{Re}(s)>1$ by(10.12.2.17) and(19.3.7.6), and $\Phi(s)-\frac{1}{s-1}$ extends to meromorphic functions on $\mathrm{Re}(s)>1/2$ and holomorphic on $\mathrm{Re}(s)\geq 1$.

Proof: It follows easily from Euler's method(taking divisors of $p_1\cdot\ldots\cdot p_n+1$ that there are infinitely many prime numbers. Let p_n be the n-th smallest prime number, then the function $\vartheta(e^t)$ is constant on $(\log p_n,\log p_{n+1})$, and

$$\int_{\log p_n}^{\log p_{n+1}}e^{-st}\vartheta(e^t)\mathrm{d}t=\vartheta(p_n)\int_{\log p_n}^{\log p_{n+1}}e^{-st}\mathrm{d}t=\vartheta(p_n)\frac{p_n^{-s}-p_{n+1}^{-s}}{s}.$$

Thus

$$(\mathcal{L}\vartheta(e^t))(s)=\int_0^\infty e^{-st}\vartheta(e^t)\mathrm{d}t=\frac{1}{s}\sum_{n\in\mathbb{Z}_+}\vartheta(p_n)(p_n^{-s}-p_{n+1}^{-s})=\frac{1}{s}\sum_{n\in\mathbb{Z}_+}p_n^{-s}\log p_n=\frac{\Phi(s)}{s}.$$

For the last assertion, notice

$$-\frac{\zeta^\backprime(s)}{\zeta(s)}=(-\log\zeta(s))^\backprime=(\sum_{p\in\mathbf{P}}\log(1-p^{-s}))^\backprime=\sum_{p\in\mathbf{P}}\frac{\log p}{p^s-1}=\Phi(s)+\sum_{p\in\mathbf{P}}\frac{\log p}{p^s(p^s-1)},$$

And $\sum_{p\in\mathbf{P}}\frac{\log p}{p^s(p^s-1)}$ is absolutely convergent and holomorphic for $\mathrm{Re}(s)>1/2$, and $\frac{\zeta^\backprime(s)}{\zeta(s)}$ has a simple pole with residue 1 by(19.3.4.1). So the assertion follows. □

Green-Tao Theorem

Thm. (19.3.7.8) [Green-Tao]. The primes contain arbitrarily long arithmetic progressions.

Proof: Cf.[Green-Tao]. □

Elliptic Curves

Thm. (19.5.1.1) [Analytic Continuation]. Let E be an elliptic curve over a global field K, the L-function $L(E,s)$ defined as in(19.1.7.5) has an analytic continuation an entire function on $s\in\mathbb{C}$, and satisfies a functional equation relating its value at s and $2-s$.

If $K=\mathbb{Q}$ and the zeta function $Z(E,s)=N_{E/\mathbb{Q}}^{s/2}(2\pi)^{-s}\Gamma(s)L(E,s)$, where $N_{E/\mathbb{Q}}$ is the conductor, the functional equation writes:

$$Z(E,s)=w_E Z(E,2-s)$$

where $w_E=\pm 1$ is called the **sign of functional equation of** E.

Proof: **?** This is a consequence of the Breuil-Conrad-Diamond-Taylor theorem(16.8.1.6), Cf.[Introduction to the Theory of Automorphic Forms, Shimura]. □

Conj. (19.5.1.2) [Birch-S.Dyer]. Let K be a number field, $E\in\mathcal{E}\mathrm{ll}/K$, let $L(E,s)$ be the L-function of E(19.1.7.5), then

- $\#\text{Ш}(E)<\infty$, $\mathrm{rank}(E/K)=\mathrm{rank}_{\mathrm{an}}(E/K)=r$, and
- $$L^\dagger(E;1)=\frac{2^{r_2}\Omega(\prod_{v\in\Sigma_K^0}c_v)(\prod_{v\in\Sigma_K^0}|\omega/\omega_{E,v}|_v)}{\sqrt{|d_K|}}\cdot\#\text{Ш}(E/K)\cdot\frac{\mathrm{Reg}(E/K)}{(\#E(K)_{\mathrm{tor}})^2},$$

where

- r_2 is the number of complex places of K,
- $\mathrm{Reg}(E/K)$ the regulator of $E(K)/E(K)_{\mathrm{tor}}$ w.r.t the Neron-Tate height pairing on $E(K)$(13.5.12.8),
- c_v the local Tamagawa numbers,
- ω a non-zero global exterior differential form,
- $\Omega=\prod_{v\in\Sigma_K^\infty}\int_{E(K_v)}|\omega|_v$,
- $\omega_{E,v}$ is a Néron differential on E_v.

Proof: □

Conj. (19.5.1.3) [p-Parts of the Birch-S.Dyer Conjecture].

Prop. (19.5.1.4) [Nekovar]. The parity conjecture holds for elliptic curves over a totally real number field K if $\text{Ш}(E/K)$ is finite.

Proof: □

Abelian Varieties

Conj. (19.5.1.5)[Functional Equation Conjecture]. Let F be a number field, $A \in \mathcal{A}b\mathcal{V}ar^g/F$, then

- the zeta function $Z(A,s)$**?** extends to an entire function on $s \in \mathbb{C}$, and satisfies the functional equation
$$Z(A,s) = w_A Z(A, 2-s),$$
where $w_A = \pm 1$ is called the **sign of functional equation of** A, and
- $w_A = w = \prod_{v\in\Sigma_F} w_v$, where w_v is the local root number of A/K at v.

Proof: □

Conj. (19.5.1.6)[Birch-S.Dyer-Tate]. Let $F \in \texttt{NField}$, $A \in \mathcal{A}b\mathcal{V}ar^g/K$, let $L(A,s)$ be the L-function of A(19.1.7.5), then

- $L(A,s)$ extends to an entire function on $s \in \mathbb{C}$, $\#Ш(A) < \infty$, $\mathrm{rank}(A/F) = \mathrm{rank}_{\mathrm{an}}(A/F) = r$,
- $$L^\dagger(A;1) = \frac{2^{gr_2}\Omega_A(\prod_{v\in\Sigma_K^0} c_v)(\prod_{v\in\Sigma_K^0}|\omega/\omega_{A,v}|_v)}{\sqrt{|d_K|}^g}\cdot \#Ш(A/K)\cdot\frac{\mathrm{Reg}(A/K)}{\#A(K)_{\mathrm{tor}}\#\widehat{A}(K)_{\mathrm{tor}}},$$

where

- r_2 is the number of complex places of F,
- $\mathrm{Reg}(A/F)$ the regulator of the Neron-Tate height pairing $A(K)/A(K)_{\mathrm{tor}} \times \widehat{A}(K)/\widehat{A}(K)_{\mathrm{tor}} \to \mathbb{R}$(13.5.12.8),
- c_v the local Tamagawa numbers,
- ω a non-zero global g-form,
- $\Omega_A = \prod_{v\in\Sigma_F^\infty}\int_{A(F_v)}|\omega|_v$,
- $\omega_{A,v}$ is a Néron differential on A_v.

Proof: □

Remark (19.5.1.7).

- The BSDT conjecture has been verified numerically for some elliptic curves over number fields, some Jacobians of genus 2 curves and (up to square) a few Jacobians of higher genus curves.
- BSDT conjecture implies BSD conjecture(19.5.1.2), as any $E \in \mathcal{E}ll/K$ is an Abelian variety of dimension 1, and $E \cong \widehat{E}$ canonically.

Prop. (19.5.1.8). If the BSDT conjecture holds for all Abelian varieties over $\mathbb{Q}$, then it holds for all Abelian varieties over any number fields.

Proof: Cf.[The Arithmetic of Abelian Varieties, Milne].**?** □

Conj. (19.5.1.9) [Parity Conjecture]. Let K be a number field and $A \in \mathcal{A}b\mathcal{V}ar/K$, then $\mathrm{rank}_{an}(A/K) \equiv \mathrm{rank}(A/K) \mod 2$. This is a consequence of BSDT conjecture(19.5.1.6).

2 Low Rank Cases

We use notations in11.

Thm. (19.5.2.1) [Rank 0 Case]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $\ell \in \mathbf{P}$, there are implications:

- $\mathrm{rank}(E/\mathbb{Q}) = 0, \#Ш[\ell^\infty] < \infty \Rightarrow \mathrm{rank}_\ell(E/\mathbb{Q}) = 0$.
- $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 0 \Rightarrow \mathrm{rank}(E/\mathbb{Q}) = 0, \#Ш[\ell^\infty] < \infty$.
- $\mathrm{rank}_\ell(E/\mathbb{Q}) = 0 \Rightarrow \mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 0$ if $\ell \geq 3$ is good ordinary for E and $\overline{\rho}_{E,\ell} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{Aut}(E[\ell])$ surjective.

Proof: 1 is trivial.

2 is the work of Gross-Zagier and Kolyvagin.?

3 is the work of Skinner-Urban(2000s)?. □

Prop. (19.5.2.2). If $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 0$, the p-part of the BSD formula(19.5.1.3) is know for $p \geq 3$ under similar hypothesis by work of Kato(2000s) and Skinner-Urban on the Iwasawa main conjecture for elliptic curves.?

Rank 1 Case

References are [Weil Zhang, Selmer groups and the divisibility of Heegner points (2013)] and [the Birch and Swinnerton-Dyer Formula for Elliptic Curves of Analytic Rank One].

Thm. (19.5.2.3) [Rank 1 Case]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $\ell \in \mathbf{P}$, there are implications:

- $\mathrm{rank}(E/\mathbb{Q}) = 1, \#Ш[\ell^\infty] < \infty \Rightarrow \mathrm{rank}_\ell(E/\mathbb{Q}) = 1$.
- $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 1 \Rightarrow \mathrm{rank}(E/\mathbb{Q}) = 1, \#Ш[\ell^\infty] < \infty$.
- $\mathrm{rank}_\ell(E/\mathbb{Q}) = 1 \Rightarrow \mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 1$ if $\ell \geq 5$ is good ordinary for E and $\overline{\rho}_{E,\ell} : \mathrm{Gal}_\mathbb{Q} \to \mathrm{Aut}(E[\ell])$ surjective with some mild ramification conditions.

Proof: 1 is trivial.

2 is the work of Gross-Zagier(19.7.2.2) and Kolyvagin(19.7.3.10).

3 follows from(19.7.3.14). □

Cor. (19.5.2.4). As a corollary of(19.5.2.1) and(19.5.2.3), [Bhargava-Skinner-Zhang] proved that at least 66% of Elliptic curves over $\mathbb{Q}$ satisfy the rank part of the BSD conjecture(19.5.1.2)?

Prop. (19.5.2.5). Under the hypothesis of(19.7.3.12), if $\mathrm{rank}_p(E/\mathbb{Q}) = 1$, then the p-part of the

Prop. (19.5.2.6). If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N satisfies $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) = 1$, $p \in \mathbf{P}\backslash\{2,3\}$ and $\overline{r}ho_{E,p}$ is surjective and ramifies at any $\ell \in \mathbf{P}$ s.t. $v_\ell(N) = 1$, then the p-part of the BSD formula(19.5.1.3) holds.

Proof: Cf, [Weil Zhang, Selmer groups and the divisibility of Heegner points (2013)]. or http://www.math.columbia.edu/~chaoli/docs/KolyvaginConjecture.html. □

3 over Function Fields

Prop. (19.5.3.1) [Artin-Tate]. The BSD conjecture hold for an elliptic curve over a function field F iff $Ш(E/F)$ is finite.

Proof: □

4 Motivic BSD Conjectures

Prop. (19.5.4.1) [Motivic BSD conjectures]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, consider the motive $h^1(E)$, then

$$L(E,s) = Z(h^1(E), s).$$

More generally, if we consider L-functions of the form

$$L_3(E,s) = \prod_p L(E_{\mathbb{F}_{p^3}}, s).$$

Then there exists a motive $M \in M_{\mathrm{num}}(\mathbb{Q})$ s.t.

$$h^1(E) \otimes h^1(E) \otimes h^1(E) = 3h^1E(-1) \oplus M,$$

and

$$L_3(E,s) = Z(M,s).$$

Proof: □

19.6 Special Values of L-Functions

Main references are[Del79], [Conrad BSD notes], [Remarks on special values of L-functions, Scholl], [nLab].

1 Deligne Conjecture

Prop. (19.6.1.1). If $X \in \mathcal{S}\mathrm{m}\mathcal{P}\mathrm{roj}\,/\mathbb{Q}$ and $M = h^i(X)(m)$, then $M^\vee \cong h^i(X)(i-m)$, i.e. it is polarized of weight $i - 2m$**?**.

Proof: **?** Let $\eta \in h^2$ be a hyperplane section, then

$$H^{2d}(X)(d) \cong H^{2d}(\mathbb{P}^N)(d) = (\eta(1))^{\otimes d} \cong 1.$$

There is a pairing

$$h^i(X)(m) \times h^{2d-i}(X)(d-m) \to h^{2d}(X)(d),$$

and also an isomorphism

$$h^i(X)(i-m) \xrightarrow{\cup \eta^{d-i}} h^{2d-i}(X)(d-m).$$

□

Def. (19.6.1.2)[Critical Values]. For $M \in \mathrm{Mot}(\mathbb{Q})$, $m \in \mathbb{Z}$ is called a **critical value** for M if neither $L_\infty(M;s)$ nor $L_\infty(M^\vee;1-s)$ has a pole at $s = m$. M is called a **critical motive** if 0 is critical for M.

Prop. (19.6.1.3). M is critical iff the Betti realization satisfies

- $\mathrm{Real}_{\mathrm{Betti}}(M)^{p,q} = 0$ unless $p = q$ or $p < 0 \le q$ or $q < 0 \le p$.
- $\mathfrak{c}$ acts on $\mathrm{Real}_{\mathrm{Betti}}(M)^{p,p}$ by -1 if $p \ge 0$, and 1 if $p < 0$.

Deligne's Periods

Prop. (19.6.1.4)[Deligne's Periods]. We assume that $M \in \mathrm{Mot}(\mathbb{Q})$ is pure of weight w, and $\mathfrak{c} = \pm 1$ on $M^{w/2,w/2}$ if $w \in 2\mathbb{Z}$. Notice these hypothesis are satisfied when M is critical.

Define

$$d(M) = \dim_{\mathbb{Q}} \mathrm{Real}_{\mathrm{Betti}}(M), \quad d^\pm(M) = \dim_{\mathbb{Q}} \mathrm{Real}_{\mathrm{Betti}}(M)^{\mathfrak{c}=\pm 1},$$

And also the eigenvalue decomposition of $\mathfrak{c}^*$ on $\mathrm{Real}_{\mathrm{Betti}}(M)$:

$$\mathrm{Real}_{\mathrm{Betti}}(M) = \mathrm{Real}_{\mathrm{Betti}}(M)^+ \oplus \mathrm{Real}_{\mathrm{Betti}}(M)^-.$$

Then it follows from(7.8.3.16) that

$$I_{\mathrm{dR}}(\mathrm{Real}_{\mathrm{Betti}}(M)^+ \otimes \mathbb{R}) \subset \mathrm{Real}_{\mathrm{dR}}(M), \quad I_{\mathrm{dR}}(\mathrm{Real}_{\mathrm{Betti}}(M)^- \otimes \mathbb{R}) \subset \mathrm{i}\,.\,\mathrm{Real}_{\mathrm{dR}}(M).$$

There are filtration steps $\mathrm{Fil}^\pm \subset \mathrm{Real}_{\mathrm{dR}}(M)$ of the deRham filtration s.t.

$$\mathrm{Fil}^\pm \mathrm{Real}_{\mathrm{dR}}(M) \otimes \mathbb{C} = I_{\mathrm{dR}}(\oplus_{p>q} \mathrm{Real}_{\mathrm{Betti}}(M)^{p,q} \oplus (\mathrm{Real}_{\mathrm{Betti}}(M)^{w/2,w/2})^{\mathfrak{c}=\pm 1}).$$

Then we can define

$$\mathrm{Real}_{\mathrm{dR}}(M)^\pm = \mathrm{Real}_{\mathrm{dR}}(M)/\,\mathrm{Fil}^\mp \mathrm{Real}_{\mathrm{dR}}(M).$$

Since $\mathrm{Real}_{\mathrm{Betti}}(M)^{p,q} = \overline{\mathrm{Real}_{\mathrm{Betti}}(M)^{q,p}}$, the space $\mathrm{Real}_{\mathrm{Betti}}(M)^{\pm}$ lies (anti)diagonally, so the following maps

$$I^{\pm} : \mathrm{Real}_{\mathrm{dR}}(M)^{\pm} \otimes \mathbb{C} \subset \mathrm{Real}_{\mathrm{dR}}(M) \otimes \mathbb{C} \xrightarrow{I_{\mathrm{dR}}} \mathrm{Real}_{\mathrm{dR}}(M) \otimes \mathbb{C} \twoheadrightarrow \mathrm{Real}_{\mathrm{dR}}(M)^{\pm} \otimes \mathbb{C}$$

are isomorphisms.

Then because of the $\mathbb{Q}$-structure on $\mathrm{Real}_{\mathrm{dR}}(M)^{\pm}$ and $\mathrm{Real}_{\mathrm{dR}}(M)^{\pm}$, we have that

$$c^{\pm}_{\mathrm{Del}}(M) = \det(I^{\pm}) \in \mathbb{C}^{\times}/\mathbb{Q}^{\times}$$

are well-defined, called the **Deligne periods** of M(if both sides are $\{0\}$, let $c^{\pm}_{\mathrm{Del}}(M) = 1$). In fact, from the argument above, we see that $I^{\pm}$ are real, so in fact $c^{\pm}_{\mathrm{Del}} \in \mathbb{R}^{\times}/\mathbb{Q}^{\times}$.

Conj. (19.6.1.5) [Deligne]. Let $M \in \mathrm{Mot}(\mathbb{Q})$ be critical, then

$$L(M; s) \sim_{\mathbb{Q}} c^{+}_{\mathrm{Del}}(M) \in \widehat{\mathbb{P}}(19.6.1.4).$$

Proof: Cf.[Deligne, Values of L-functions] for the assertion that $c^{+}_{\mathrm{Del}}(M) \in \widehat{\mathbb{P}}$. □

Example (19.6.1.6) [Tate Modules]. For the Tate module $\mathbb{Q}(r)$, $\mathfrak{c}^* = (-1)^r$ on $\mathrm{Real}_{\mathrm{Betti}}(\mathbb{Q}(n))$, so it follows from(7.8.3.15) that

$$c^{\varepsilon}(\mathbb{Q}(r)) = \begin{cases} (2\pi\,\mathrm{i})^r & , \varepsilon = (-1)^r \\ 1 & , \varepsilon = (-1)^{r-1} \end{cases}.$$

And $\mathbb{Q}(r)$ is critical iff $L_{\infty}(\mathbb{Q}) = \Gamma_{\mathbb{R}}(s)$ is holomorphic at both $r, 1-r$, and this is the case when $r \in 2\mathbb{Z}_{+}$ or $r \in 1 - 2\mathbb{Z}_{+}$. The Deligne's conjecture is true in this case, by(19.6.4.1).

General Coefficients

2 Beilinson-Bloch Conjecture

References are [Blo00], [Beilinsen, Higher regulators of modular curves, Applications of algebraic K-theory to algebraic geometry and number theory, Part I, II], [Iwasawa theory for the symmetric square of an elliptic curve], [Nekovar, Beilinson's Conjecture, in Motives, 537-570], [Algebraic K-Theory and Special Values of L-Functions: Beilinson's Conjecture], [Higher Regulators And Values Of L-Functions, Beilinson].

Notation (19.6.2.1).

- Denote $m = i + 1 - n$.
- We assume that
  - the Euler product for $L(h^i(X); s)$ converges absolutely for $\mathrm{Re}(s) > i/2 + 1$.
  - $L(h^i(X); s)$ meromorphically extends to the whole plane, and possible poles can occur only when i is even and $s = i/2 + 1$.
  - $L(h^i(X); i/2 + 1) \neq 0$.
  - $\Lambda(h^i(X); s)$ has a functional equation

$$\Lambda(h^i(X); i + 1 - s) = \varepsilon(h^i(X); s)\Lambda(h^i(X); s).$$

Prop. (19.6.2.2). By(11.10.3.8), if $m < \frac{i+1}{2}$, there is an exact sequence

$$0 \to \mathrm{Fil}^n H^i_{\mathrm{Betti}}(X, \mathbb{R}) \to H^i_{\mathrm{Betti}}(X, \mathbb{R}(n-1))^{\mathfrak{e}^*=(-1)^{n-1}} \to H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n)) \to 0.$$

Prop. (19.6.2.3). If the functional equation and

$$\dim_{\mathbb{R}} H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n)) = \begin{cases} \mathrm{ord}_{s=m} L(h^i(X), s) & , m < \frac{i}{2} \\ \mathrm{ord}_{s=m} L(h^i(X), s) - \mathrm{ord}_{s=m+1} L(h^i(X), s) & , m = \frac{i}{2} \end{cases}.$$

Notice if $m < i/2$, $H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n)) = \{0\}$ iff $h^i(X)(m)$ is critical(19.6.1.2).

Proof: Cf.[Schneider's notes, P5].**?** □

Prop. (19.6.2.4) [Beilinson's version of Periods]. If m is critical for $h^i(X)$, then $H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n)) = 0$, and the determinant c_{Bei} of the isomorphism

$$\mathrm{Fil}^n H^i_{\mathrm{Betti}}(X, \mathbb{R}) \to H^i_{\mathrm{Betti}}(X, \mathbb{R}(n-1))^{\mathfrak{e}^*=(-1)^{n-1}}$$

satisfies $c_{\mathrm{Bei}}(h^i(X)(m)) = c_{\mathrm{Del}}(h^i(X)(m)) \in \mathbb{R}^\times/\mathbb{Q}^\times$.

Proof: Cf.[Deligne's conjecture, in Rapoports' notes, P42]**?**. □

<u>**Beilinson's Regulator Maps**</u>

Remark (19.6.2.5) [Beilinson't Regulator]. If $m < (i+1)/2$, then by(19.6.2.2), there is an isomorphism

$$\det \mathrm{Fil}^n H^i_{\mathrm{Betti}}(X, \mathbb{R}) \otimes_{\mathbb{R}} \det H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n)) \to \det H^i_{\mathrm{Betti}}(X, \mathbb{R}(n-1))^{\mathfrak{e}^*=(-1)^{n-1}},$$

then if $\det H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n))$ has a $\mathbb{Q}$-structure, then we can construct a $c_{\mathrm{Bei}}(h^i(X)(m)) \in \mathbb{R}^\times/\mathbb{Q}^\times$.

Def. (19.6.2.6) [Beilinson's Regulator]. There is a regulator

$$r : H^{i+1}_M(X, \mathbb{Q}(n))_{\mathbb{Z}} = (K_{2n-i-1}(X)_{\mathbb{Q}})^{(n)} \to H^{i+1}_M(X, \mathbb{Q}(n))_{\mathbb{Z}} = (K_{2n-i-1}(X_{\mathbb{R}})_{\mathbb{Q}})^{(n)} \xrightarrow{\mathrm{ch}_{2n-i-1}} H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n))(7.9.$$

Conj. (19.6.2.7) [Beilinson].

- If $w < -2$, then
  - $r_{\mathbb{R}} : H^{i+1}_{\mathrm{Mot}}(X, \mathbb{Q}(n))_{\mathbb{Z}} \otimes \mathbb{R} \to H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n))$(19.6.2.6) is an isomorphism.
  - the determinant of the map

$$\begin{aligned} &\det \mathrm{Fil}^n H^i_{\mathrm{Betti}}(X, \mathbb{R}) \otimes_{\mathbb{R}} \det(H^{i+1}_{\mathrm{Mot}}(X, \mathbb{Q}(n))_{\mathbb{Z}} \otimes \mathbb{R}) \xrightarrow{\mathrm{id} \otimes \det(r_{\mathbb{R}})} \\ &\det \mathrm{Fil}^n H^i_{\mathrm{Betti}}(X, \mathbb{R}) \otimes_{\mathbb{R}} \det H^{i+1}_{\mathrm{Del}}(X/\mathbb{R}, \mathbb{R}(n)) \to \\ &\det H^i_{\mathrm{Betti}}(X, \mathbb{R}(n-1))^{\mathfrak{e}^*=(-1)^{n-1}} \end{aligned}$$

    equals $L^\dagger(M; 0) \in \mathbb{R}^\times/\mathbb{Q}^\times$.

- If $w=-2$, then $s=0$ may be a pole, and Tate conjecture predicts**?** that

$$-\operatorname{ord}_{s=0} L(M;0)=\dim_{\mathbb{Q}} N^{n-1}(X),$$

where $N^{n-1}(X)=\mathrm{CH}^{n-1}(X)/\mathrm{CH}^{n-1}(X)_0$, and $\mathrm{CH}^{n-1}(X)_0$ is the subgroup of homologically trivial cycle. In this case, there is also a cycle class map

$$r': N^{n-1}(X)\to H^{i+1}_{M_\infty}(X_{\mathbb{R}},\mathbb{R}(n))\textbf{?},$$

and

  - $(r\otimes r')\otimes\mathbb{R}: C_1\otimes\mathbb{R}\oplus N^{n-1}(X)\otimes\mathbb{R}\to H^{i+1}_{M_\infty}(X_{\mathbb{R}},\mathbb{R}(n))$ is an isomorphism.
  - $L^\dagger(M,0)=\det(r\otimes r')\in\mathbb{R}^\times/\mathbb{Q}^\times$.

Def. (19.6.2.8) [Polylogarithm]. For $s\in\mathbb{Z}_+$, the power series

$$\mathrm{Li}_s(z)=\sum_{n\geq 1}\frac{z^n}{n^s}$$

converges absolutely for $|z|<1$ and can be analytically continued to a multi-valued function on $\mathbb{C}\backslash\{1\}$, called the **Polylogarithm function**.

Proof: In fact, $\mathrm{Li}_1(z)=-\log(1-z)$, and $\mathrm{Li}_{s+1}(z)=\int_0^z\mathrm{Li}_s(t)\frac{dt}{t}$. □

Def. (19.6.2.9) [Bloch-Wigner Dilogarithm]. The function

$$D(z)=\mathrm{Im}\Big(\mathrm{Li}_2(z)+\log|z|\log(1-z)\Big),\quad z\in\mathbb{C}(19.6.2.8)$$

is a real-valued function on $\mathbb{C}$, called the **Bloch-Wigner dilogarithm**.

Proof: Cf.[Blo00]P44. □

Height Pairings

Conj. (19.6.2.10) [Beilinson]. If $w=-1$, then M must be critical by drawing diagram, and

- There is a non-degenerate **Beilinson height paring**

$$h:\mathrm{CH}^n(X)_0\otimes\mathrm{CH}_0^{\dim X+1-n}\to\mathbb{R},$$

- and $\operatorname{ord}_{s=0}L(M;s)=\dim_{\mathbb{Q}}\mathrm{CH}^n(X)_0$.
- $L^\dagger(M;0)=c^+_{\mathrm{Del}}(M)\det(h)\in\mathbb{R}^\times/\mathbb{Q}^\times$.

Proof: □

3 Fontaine-Perrion.Riou Conjecture

Cf.[Fontaine-Perrion.Riou]**?**.

4 Examples

$\mathbb{A}^1$ Case

Prop. (19.6.4.1). For $k \in \mathbb{Z}_+$, $\zeta(2k) = \frac{B_{2k}}{(2k)!}(2\pi)^{2k}$.

Proof: Because

$$\cot(z) = i + \frac{2i}{e^{2iz}-1},$$

$$z\cot(z) = 1 - \sum_{k=1}^{\infty} B_{2k}\frac{2^{2k}z^{2k}}{(2k)!}$$

where B_k are Bernoulli numbers(8.5.1.12). But also

$$z\cot(z) = 1 - 2\sum_{k=1}^{\infty}\zeta(2k)\frac{z^{2k}}{\pi^{2k}}.$$

by(10.5.3.11), thus the assertion follows. □

Cor. (19.6.4.2). For $k \in \mathbb{Z}_+$, $\zeta(1-2k) = (-1)^k\frac{B_{2k}}{2k}$.

Proof: ? □

Prop. (19.6.4.3) [Leibniz Formula for π].

$$1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \ldots = \frac{\pi}{4}.$$

Proof: Use the arctan integration formula. □

Thm. (19.6.4.4) [Borel1972]. For $F \in \texttt{NField}$ and $m \in \mathbb{Z}_{>1}$, let

$$d_m = \operatorname{ord}_{s=1-m}\zeta_F(s) = \begin{cases} r_2 & ,m \in 2\mathbb{Z} \\ r_1 + r_2. & ,m \in 2\mathbb{Z}+1 \end{cases}.$$

Then

$$\dim_{\mathbb{Q}} K_{2m-1}(\mathcal{O}_F)_{\mathbb{Q}} = d_m$$

Proof: □

Prop. (19.6.4.5) [Comparison of Beilinson and Bloch's Regulator Maps]. Cf.[Rapoport, Comparison].

Conj. (19.6.4.6) [Bloch Conjecture for Fields]. For a number field F, mapping the higher K-groups $K_{2i-1}(F)$ to a lattice with covolume $\zeta_F(m)$ via higher regulator maps. And the regular maps are made from m-th polylogarithm functions(19.6.2.8), so $\zeta_F(m)$ can be expressed by combinations of m-th polylogarithm functions of elements in F.

For example:

$$\zeta_{\mathbb{Q}(\sqrt{5})}(3) = \frac{24}{25\sqrt{5}}\operatorname{Li}_3(1)[\operatorname{Li}_3(\alpha) + \operatorname{Li}_3(-\alpha) + \frac{1}{2}(\log(\alpha))^3 - \frac{\pi^2}{6}\log(\alpha)], \alpha = \frac{\sqrt{5}-1}{2}.$$

This makes the numerical calculation of higher K-groups possible.

Proof: ? □

Remark (19.6.4.7). $m = 2$ case is proved by Bloch-Suslin-Merkuriev, $m = 3$ case is proved by Goncharov.

Elliptic Curve Case

Def. (19.6.4.8) [Elliptic Dilogarithm]. Let $E \in \mathcal{E}ll/\mathbb{C}$ with complex parametrization $\mathbb{C}^\times/q^{\mathbb{Z}}$, define the **elliptic dilogarithm**:

$$D_q : \mathbb{C}^\times/q^{\mathbb{Z}} \to \mathbb{R} : z \mapsto \sum_{n\in\mathbb{Z}} D(q^n z)(19.6.2.9).$$

And it extends linearly to a map $Z_1(E) \to \mathbb{R}$.

Prop. (19.6.4.9) [Bloch]. Let $E \in \mathcal{E}ll/\mathbb{C}$, define

$$F : R(E)^\times \otimes R(E)^\times \to \mathbb{R} : f \otimes g \mapsto D_q(\sum m_i n_j [b_j - a_i]),$$

where $f, g \in R(E)^*$ with divisor $(f) = \sum m_i a_i, (g) = \sum n_j b_j$. Then F is additive, and

$$D(f \otimes (1-f)) = 0.$$

In particular, F factors through $R(E)^* \otimes R(E)^*/\{f \otimes (1-f)\} = K_2(R(E))$.

Thus, there is a composition $r_E : K_2(E) \to K_2(R(E)) \to \mathbb{R}$, called the (higher)**regulator map**.

Proof: □

Thm. (19.6.4.10) [Beilinson-Bloch]. Le $E \in \mathcal{E}ll/\mathbb{Q}$ with complex parametrization $E(\mathbb{C}) \cong \mathbb{C}^\times/q^{\mathbb{Z}}$, then there exists a $\mathrm{Gal}_{\mathbb{Q}}$-invariant divisor P on E s.t. $D_q(P) \sim_{\mathbb{Q}^\times} L(E,2)/\pi$(19.6.4.8).

Proof: Cf.[Beilinson, Higher regulators of modular curves]. □

19.7 Heegner Points

References are [Gross−Zagier formula and arithmetic fundamental lemma, Wei Zhang], [Gross-Zagier Formula notes], [Heegner Points and Representation Theory, Gross], [Gross–Zagier Revisited, Conrad]. [Moduli of Elliptic Curves, James Parson], [Heegner points and derivatives of L-series, Gross/Zagier]. http://math.columbia.edu/~yihang/GZSeminar.html.

1 Heegner Points

Def. (19.7.1.1) [Heegner Conditions]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $F/\mathbb{Q}$ an imaginary quadratic extension with $(d_F, N) = 1$ and associated quadratic character $\eta_F : (\mathbb{Z}/d_F)^\times \to \{\pm 1\}$. Then the **Heegner condition** is the hypothesis that every prime factor of N splits in F.

Prop. (19.7.1.2). In the Heegner situation(19.7.1.1), the sign of functional equation for E(19.5.1.1) $w_E = -1$?, thus $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q})$ is odd and the BSD conjecture(19.5.1.2) predicts $\mathrm{rank}(E/\mathbb{Q})$ is odd, so at least it has a non-torsion rational point.

Def. (19.7.1.3) [Heegner Points]. In the Heegner situation(19.7.1.1), there exists an ideal $\mathcal{N} \subset \mathcal{O}_F$ of conductor N. Then for any $n \in \mathbb{Z}_+$, $\mathcal{O}_n = \mathbb{Z} + n\mathcal{O}_F$ is an order of $\mathcal{O}_F$ of conductor n. Thus for $(n, N) = 1$,

$$\mathbb{C}/\mathcal{O}_F \to \mathbb{C}/(\mathcal{O}_F \cap \mathcal{N})^{-1}$$

is an isogeny of degree N, thus defines a point $x_n \in X_0(N)$, by moduli characterization?, called a **Heegner point**. Then by theory of complex multiplication?, x_n is defined over the ring class field F_n corresponding to the open compact subgroup $(\mathcal{O}_n \otimes \widehat{\mathbb{Z}})^\times \subset A_F^\times$.

Proof:

□

Def. (19.7.1.4)[Heegner Points]. In the Heegner situation(19.7.1.1), using the modular parametrization $\varphi_E : X_0(N) \to E$ over $\mathbb{Q}$(16.8.1.6), $y_n = \varphi_E(x_n) \in E(K_n)$. In particular, define $y_F = \mathrm{tr}_{F_1/F}(y_1) \in E(F)$, called the (principal)**Heegner point of** E.

Prop. (19.7.1.5). The Heegner point $y_F \in E(F)$ is uniquely defined up to sign and torsion.

Proof: □

2 Gross-Zagier Formula

Thm. (19.7.2.1) [Gross-Zagier]. In the Heegner situation(19.7.1.1),

$$L^{`}(E/F;1) = \frac{\int_{E(\mathbb{C})} \omega \wedge \overline{\omega}}{|d_F|^{1/2}} \cdot \frac{1}{c^2} \cdot \langle y_F, y_F \rangle_{\text{N-T}}$$

Proof: □

Cor. (19.7.2.2). If $\mathrm{rank}_{\mathrm{an}}(E/F) = 1$, then the Heegner point y_F is non-torsion, by(13.5.12.6). And if $\mathrm{rank}_{\mathrm{an}}(E/F) = 1$, y_F is torsion.

3 Kolyvagin's Work

Main references are [Gro89], [Finiteness of $E(\mathbb{Q})$ and Ш$(E/\mathbb{Q})$ for a subclass of Weil curves, Kolyvagin], [Finiteness of the Shafarevich-Tate group and the group of rational points for some modular abelian varieties, Kolyvagin-Yu] and [Euler Systems, Kolyvagin].

Def. (19.7.3.1) [Kolyvagin Primes]. In the Heegner situation(19.7.1.1), let $p \in \mathbf{P}$, a **Kolyvagin prime** ℓ for E is a prime $\ell \in \mathbf{P}\backslash S(Npd_F)$ s.t. ℓ is inert in F and $p|\ell+1, p|a_{\ell,E}$. Equivalently, Frob_ℓ is in the conjugacy class of $\mathsf{c} \in \mathrm{Gal}(F(E[p])/F)$**?**. So by Chebotarev density theorem, the set of Kolyvagin primes has positive Dirichlet density.

For a Kolyvagin prime ℓ, $M(\ell) = \min\{v_p(\ell+1), v_p(a_{\ell,E})\}$ is called the **Kolyvagin index** of ℓ.

A product of distinct Kolyvagin primes is called a **Kolyvagin number** for E. The set of Kolyvagin numbers is denoted by Λ_E. For a Kolyvagin number n, define the **Kolyvagin index** of n as $M(n) = \min_{\ell|n}\{M(\ell)\}$.

Prop. (19.7.3.2). In the Heegner situation(19.7.1.1), let ℓ be a Kolyvagin prime for E, then

$$\mathrm{Gal}(F_\ell/F_1) \cong \mathrm{Pic}(\mathcal{O}_\ell)/\,\mathrm{Pic}(\mathcal{O}_F) \cong \mathbb{Z}/(\ell+1) = \langle\sigma\rangle.$$

Proof: □

Def. (19.7.3.3) [Kolyvagin Derivative]. In the situation(19.7.3.1), let ℓ be a Kolyvagin prime for E, define the **Kolyvagin derivative** $D_\ell = \sum_{i=1}^{\ell} i\sigma^i \in \mathbb{Z}[\mathrm{Gal}(F_\ell/F_1)]$. Then $(\sigma-1)D_\ell = \ell+1-\mathrm{tr}_\ell$.

Prop. (19.7.3.4). In the situation(19.7.3.1), for $\ell \in \Lambda_E \cap \mathbf{P}$ and Heegner point $y_\ell \in E(F_\ell)$, $D_\ell y_\ell \in E(F_\ell)/p^M E(F_\ell) \subset H^1(F_\ell, E[p^M])$ is invariant under the action of $\mathrm{Gal}(F_\ell/F_1)$.

Thus for any $n \in \Lambda_E$ and $M \le M(n)$, $D_n y_n \in H^1(F_n, E[p^M])$ is invariant under the action of $\mathrm{Gal}(F_\ell/F_1) \cong \prod_{\ell|n} G_\ell$, thus descends to an element in $H^1(F_1, E[p^M]) \cong H^1(F_n, E[p^M])^{\mathrm{Gal}(F_n,F_1)}$ by Hochschild-Serre spectral sequence(10.1.1.13) and the fact $E[p^M](K_n) = 0$**?**

Proof: By(19.7.3.3), it suffices to show that $(\sigma-1)D_\ell y_\ell = (\ell+1-\mathrm{tr}_\ell)y_\ell \in p^M E(F_1)$: This follows from the definition(19.7.3.1) and the fact $\mathrm{tr}_\ell\, y_\ell$ is just the Hecke operator action T_ℓ on y_1, which maps to $a_\ell y_1 \in E(F_1)$**?** □

Def. (19.7.3.5) [Kolyvagin Systems]. In the situation(19.7.3.1), for $n \in \Lambda_E$, define the **Kolyvagin cohomology classes**

$$c_M(n) = \sum_{s\in\mathrm{Gal}(F_1/F)} sD_n y_n \in H^1(F, E[p^M]), \quad M \le M(n).$$

The collection of cohomology classes

$$\kappa = \{c_M(n) \in H^1(F, E[p^M]) | n \in \Lambda_E, M \in \mathbb{Z}_+, M \le M(n)\}$$

is called a **Kolyvagin system** of E.

Def. (19.7.3.6) [p-Divisibility]. In the situation(19.7.3.1), for $r \in \mathbb{N}$, denote Λ_r to be the subset of Λ_E consisting of numbers with exactly r prime factors, and define $\mathcal{M}_r \in [0,\infty]$ to be the maximal integer s.t. $p^{\mathcal{M}_r}|c_M(n)$ for any $n \in \Lambda_r, M \le M(n)$.

Prop. (19.7.3.7) [Order of Kolyvagin Systems]. In the situation(19.7.3.1), $\mathcal{M}_0 \geq \mathcal{M}_1 \geq \ldots \geq 0$.

In particular, we can define $\mathcal{M}_\infty = \lim_{r\to\infty} \mathcal{M}_r$. Clearly, $\mathcal{M}_\infty = \infty$ iff $\kappa = 0$. The **vanishing order of** κ is the minimal r s.t. $\mathcal{M}_r \neq \infty$, denoted by $\operatorname{ord}\kappa$.

Proof: □

Prop. (19.7.3.8). $\mathcal{M}_0$ is just the p-divisibility of the Heegner point y_F. In particular, $\mathcal{M}_0 < \infty$ iff y_F is non-torsion?.

Thm. (19.7.3.9) [Kolyvagin]. Let $\operatorname{ord}\kappa < \infty$, then

- $\mathrm{Sel}^{p^\infty}(E/F)$ is contained in the subgroup of $H^1(F, E[p^\infty])$ generated by κ.
- $\mathrm{rank}_p^{w_E(-1)^{\operatorname{ord}\kappa+1}}(E/F) = \operatorname{ord}\kappa + 1, \mathrm{rank}_p^{w_E(-1)^{\operatorname{ord}\kappa}}(E/F) = \operatorname{ord}\kappa - d$ and $d \in 2\mathbb{N}$.
- Let
$$\widetilde{Ш}(E/F)[p^\infty]^{\operatorname{ord}\kappa+1} = (\bigoplus_{i\geq 1}\mathbb{Z}/(p^{a_i}))^2, \quad \widetilde{Ш}(E/F)[p^\infty]^{\operatorname{ord}\kappa} = (\bigoplus_{i\geq 1}\mathbb{Z}/(p^{b_i}))^2,$$
where $(a_i), (b_i)$ is non-increasing, then
$$a_i = \mathcal{M}_{\operatorname{ord}\kappa+2i-1} - \mathcal{M}_{\operatorname{ord}\kappa+2i}, \quad b_{d+i} = \mathcal{M}_{\operatorname{ord}\kappa+2i-2} - \mathcal{M}_{\operatorname{ord}\kappa+2i-1}.$$

In particular, $\#\widetilde{Ш}(E/F)[p^\infty]^{\operatorname{ord}\kappa+1} \geq p^{\mathcal{M}_{\operatorname{ord}\kappa}-\mathcal{M}_\infty}$, with equality iff $d = 0$.

Proof: □

Cor. (19.7.3.10). If $\operatorname{ord}\kappa = 0$, i.e. y_F is non-torsion(19.7.3.8), then $d = 0$, and $r(E/\mathbb{Q}) = 1, \#Ш(E/K) < \infty$.

<u>**Kolyvagin's Conjecture**</u>

Conj. (19.7.3.11) [Kolyvagin]. Let $p \in \mathbf{P}\backslash\{2\}$ s.t. $\overline{\rho}_{E,p}$ is surjective, then $\kappa \neq \{0\}$. Equivalently, $\mathcal{M}_\infty < \infty$.

Thm. (19.7.3.12) [Zhang]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N and $p \geq 5$ is good ordinary and $\overline{\rho}_{E,p}$ is surjective and ramifies at every prime $\ell \in \mathbf{P}$ s.t. $v_\ell(N) = 1$, then $\mathcal{M}_\infty = 0$. In particular, Kolyvagin's conjecture(19.7.3.11) is true.

Remark (19.7.3.13). There are results that generalize this.

Cor. (19.7.3.14). Under the hypothesis of(19.7.3.12), if $\mathrm{rank}_p(E/\mathbb{Q}) = 1$, then $r_{\mathrm{an}}(E/\mathbb{Q}) = r(E/\mathbb{Q}) = 1$, and $\#Ш(E/\mathbb{Q}) < \infty$.

Proof: Cf.[Wei Zhang]. □

4 p-adic Gross-Zagier Formula

References are [Heegner points and a p-adic Gross-Zagier formula].

5 Waldspurger's Period Formula

6 Higher Gross-Zagier over Function Fields, Yun-Zhang

Remark (19.7.6.1). The formula relates arbitrary order central derivative of the base change L-function of an unramified automorphic representation of $PGL(2)$ over a function field to the self-intersection number of a certain algebraic cycle on the moduli stack of Shtukas.

19.8 Gan-Gross-Prasad Conjecture

References are [Wei, More Arithmetic Fundamental Lemma Conjectures: The Case Of Bessel Subgroups].

1 Introduction

The GGP conjecture is a generalization of the the Gross-Zagier formula to higher dimensional varieties. It concerns the central derivative of the L-function and special cycles of Shimura varieties.

AGGP conjecture has applications to the Beilinson-Bloch conjecture, which is a generalization of the BSD conjecture.

2 restriction Problems

Conj. (19.8.2.1) [Local Restriction Problems]. Let K be a local field with an involution σ, $K_0 = K^\sigma$. Let $V \in \mathcal{V}\mathrm{ect}\,/K$ with a non-degenerate sesqui-linear form. Let $G(V)$ be the identity component of the subgroup of $GL(V_{k_0})$ preserving this form.

There are natural non-degenerate subspace $W \subset V$, there will be a subgroup $H \subset G(W) \times G(V)$ containing the diagonally embedded subgroup $G(W)$, and a unitary representation ν of H**?**.

The **local restriction problem** is to determine for each $\pi \in \mathrm{Irr}(G)$, the number

$$d(\pi) = \dim \mathrm{Hom}_H(\pi|_H \otimes \overline{\nu}, \mathbb{1}).$$

Def. (19.8.2.2)[Arithmetic Periods]. Let F be a global field and G a reductive group over F, $H \subset G$ an algebraic subgroup, $Z = Z(G) \cap H$. Denote $[H] = Z(A_F)H(F)\backslash H(A_F)$. For $\chi \in \widehat{H(A_F)}$, denote the (twisted)**automorphic L-period map**:

$$l_{H,\chi} : \mathcal{A}_0(G/F) \to \mathbb{C} : \varphi \mapsto \int_{[H]} \chi(h)\varphi(h)dh.$$

(**?** Convergence).

3 Statements

References are [Symplectic Local Root Numbers, Central Critical L-Values, And Restriction Problems In The Representation Theory Of Classical Groups, Gan-Gross-Prasad].

Conj. (19.8.3.1).

4 Arithmetic Fundamental Lemma

Jacquet−Rallis proposed an approach using relative trace formula to attack the unitary case of Gan−Gross−Prasad conjecture. The fundamental lemma is proved by Yun.

Later Wei Zhang proposed an analogous approach using the arithmetic fundamental lemma, equality between certain intersection numbers and the first derivatives of some relative orbital integrals, and is not proved yet.

Notation (20.1.0.1).

- Fix $p \in \mathbf{P}$, $F \in \texttt{NField}$.
- For each modulus $\mathfrak{m}$ of F, let $F(\mathfrak{m})$ be the maximal p-extension of F inside the ray class field $F_{\mathfrak{m}}$, and $\Gamma_{\mathfrak{m}} = \mathrm{Gal}(F(\mathfrak{m})/F(1))$.
- Fix $T \in \mathrm{Rep}_{\mathbb{Z}_p}(\mathrm{Gal}_F), V = T \otimes_{\mathbb{Z}_p} \mathbb{Q}_p, W = V/T = T \otimes_{\mathbb{Z}_p} (\mathbb{Q}_p/\mathbb{Z}_p)$.
- Suppose T is unramified outside f.m. places of F.
- WARNING: the notations in this section may subject to change.?

1 Local Cohomologies

This subsection should be moved to somewhere else.

Prop. (20.1.1.1). If $p \in \mathbf{P}, K \in \texttt{p-Field}, \ell \in \mathbf{P} \setminus \{p\}$, and $V \in \mathrm{Rep}^{\mathrm{fd}}_{\mathbb{Q}_\ell}(\mathrm{Gal}_K)$, then

$$\dim H^1_{\mathrm{ur}}(K, V) = V^{\mathrm{Gal}_K}, \quad \dim \left(H^1(K,V)/H^1_{\mathrm{ur}}(K,V)\right) = \dim H^2(K,V).$$

Proof: Cf.[Rubin, P5]. □

Prop. (20.1.1.2). Suppose $K \in \texttt{Field}$ and K_∞/K is an infinite p-extension, $T \in \mathrm{Rep}^{\mathrm{fg}}_{\mathbb{Z}_p}(\mathrm{Gal}_K)$, then

$$\varprojlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} T^{\mathrm{Gal}_L} = 0,$$

where the transition maps are norm maps.

Proof: Define $T_0 = \varinjlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} T^{\mathrm{Gal}_L} \subset T$, so T_0 is also f.g. over $\mathbb{Z}_p$. Then $T_0 = T^{\mathrm{Gal}_{L_0}}$ for some $K \subset_{\mathrm{fin}} L_0$. Then

$$\varprojlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} T^{\mathrm{Gal}_L} = \varprojlim_{L_0 \subset_{\mathrm{fin}} L \subset K_\infty} T_0 = 0.$$

□

Prop. (20.1.1.3). If $\ell \in \mathbf{P} \setminus \{p\}$, $\mathbb{Q}_\ell \subset_{\mathrm{fin}} K$, and K_∞ is the unique $\mathbb{Z}_p$-extension of K. Suppose $\{c_L\} \in \varprojlim_{K \subset_{\mathrm{fin}} L \subset K_\infty} H^1(L,T)$, then for any L, $c_L \in H^1_{\mathrm{ur}}(L,T)$.

Proof: K_∞/K is unramified**?**, so for any $K\subset_{\text{fin}} L\subset K_\infty$, there is an exact sequence

$$0\to H^1_{\text{ur}}(L,T)\to H^1(L,T)\to H^1(I_K,T)^{\text{Gal}_K}.$$

But $H^1(I_K,T)$ is f.g. over $\mathbb{Z}_p$ by [Rubin, B.2.7]**?**, so taking limit of these exact sequences, we get

$$\varprojlim_{K\subset_{\text{fin}} L\subset K_\infty} H^1_{\text{ur}}(L,T)=\varprojlim_{K\subset_{\text{fin}} L\subset K_\infty} H^1(L,T)$$

by(20.1.1.2). □

Cor. (20.1.1.4). Let F_∞ be an $\mathbb{Z}_p^d$-extension of F, $F\subset_{\text{fin}} L\subset F_\infty$, and $v\in\Sigma_L^p$ has infinite decomposition group in $\text{Gal}(F_\infty/F)$. Suppose

$$\{c_L\}\in\varprojlim_{F\subset_{\text{fin}} L\subset F_\infty} H^1(L,T),$$

then $(c_L)_v\in H^1_{\text{ur}}(F_\lambda,T)$. In particular, this applies to $L=F$.

Proof: Cf.[Rubin, P155]. □

2 Selmer Groups

Def. (20.1.2.1) [Selmer Local Conditions]. For $F\in\texttt{NField}, v\in\Sigma_F^p$, denote

$$H^1_f(F_v,V)=H^1_{\text{ur}}(F_v,V)=\ker\Big(H^1(F_v,V)\to H^1(F_v^{\text{ur}},V)\Big)=H^1(F_v^{\text{ur}}/F_v,V^{I_v})\text{(10.1.1.13)}$$

And for places of F over p, fix a choice of invariant subspaces $H^1_s(F,V)\subset H^1(F_v,V)$.

Then we can define for any $v\in\Sigma_{\text{cycl}_{p,n}(\mathbb{Q})}$,

$$H^1_f(F_v,W)\subset H^1(F_v,W),\quad H^1_f(F_v,T)\subset H^1(F_v,T)$$

the image and inverse image of $H^1_f(F_v,V)$ under the maps on cohomologies induced by the exact sequence

$$0\to T\to V\to W\to 0.$$

Next, for any $v\in\Sigma_F$, denote

$$H^1_s(F_v,T)=H^1(F_v,T)/H^1_f(F_v,T)$$

$$\text{loc}^s_v(T):H^1(F,T)\to H^1_s(F_v,T)$$

and similarly for W.

Prop. (20.1.2.2). For $v\in\Sigma_F^p$,

- $H^1_f(F_v,W)=H^1_{\text{ur}}(F_v,W)_{\text{div}}$.
- $H^1_{\text{ur}}(F_v,T)\subset H^1_f(F_v,T)$ has finite index, and $H^1_s(F_v,T)$ is torsion-free.
- Let $\mathcal{W}=W^{I_v}/(W^{I_v})_{\text{div}}$ be finite, then there are natural isomorphisms

$$H^1_f(F_v,W)/H^1_{\text{ur}}(F_v,W)\cong\mathcal{W}/(\text{Frob}_v-1)W,\quad H^1_{\text{ur}}(F_v,T)/H^1_f(F_v,T)\cong\mathcal{W}^{\text{Frob}_v=1}.$$

- If T is unramified at v, then

$$H^1_f(F_v,W)=H^1_{\mathrm{ur}}(F_v,W),\quad H^1_{\mathrm{ur}}(F_v,T)=H^1_f(F_v,T)$$

Proof: 1, 2, 4 follow from 3. For 3, Cf.[Rubin, P6]**?**. □

Def. (20.1.2.3) [Selmer Groups]. Situation as in(20.1.2.1), define

$$\mathrm{Sel}(F,W)=\ker\Big(H^1(F,W)\xrightarrow{\mathrm{loc}^s(W)}\bigoplus_{v\in\Sigma_F}H^1_s(F_v,W)\Big).$$

Moreover, if Σ is a finite set of places, then we can define

$$\mathrm{Sel}^{\Sigma}(F,W)=\ker\Big(H^1(F,W)\to\bigoplus_{v\notin\Sigma}H^1_s(F_v,W)\Big).$$

$$\mathrm{Sel}_{\Sigma}(F,W)=\ker\Big(\mathrm{Sel}^{\Sigma}(F,W)\to\bigoplus_{v\in\Sigma}H^1(F_v,W)\Big).$$

Def. (20.1.2.4) [Hypothesis]. Situation as in(20.1.2.1), assume for all the time that the choices $H^1_f(F_p,V)$ and $H^1_f(F_p,V^D)$ satisfy:

- $H^1_f(\mathrm{cycl}_{p,n}(\mathbb{Q}_p),V)$ and $H^1_f(\mathrm{cycl}_{p,n}(\mathbb{Q}_p),V^D)$ are orthogonal complements under the cup product pairing

$$H^1(\mathrm{cycl}_{p,n}(\mathbb{Q}_p),V)\times H^1(\mathrm{cycl}_{p,n}(\mathbb{Q}_p),V^D)\to H^2(\mathrm{cycl}_{p,n}(\mathbb{Q}_p),\mathbb{Q}_p(1))=\mathbb{Q}_p.\textbf{?}$$

- For $m\geq n$,

$$\mathrm{cor}^{\mathrm{cycl}_{p,m}(\mathbb{Q}_p)}_{\mathrm{cycl}_{p,n}(\mathbb{Q})}H^1_f(\mathrm{cycl}_{p,m}(\mathbb{Q}),V)\subset H^1_f(\mathrm{cycl}_{p,n}(\mathbb{Q}_p),V).$$

$$\mathrm{res}^{\mathrm{cycl}_{p,n}(\mathbb{Q}_p)}_{\mathrm{cycl}_{p,m}(\mathbb{Q})}H^1_f(\mathrm{cycl}_{p,n}(\mathbb{Q}),V)\subset H^1_f(\mathrm{cycl}_{p,m}(\mathbb{Q}_p),V).$$

Prop. (20.1.2.5) [Selmer Group of Elliptic Curves]. If $T=T_p(E),W=E[p^\infty]$ where $E\in\mathcal{E}\mathrm{ll}/\mathbb{Q}$, and define

$$H^1_f(\mathbb{Q}_{n,p},V)=\mathrm{Im}\Big(E(\mathbb{Q}_{n,p})\otimes\mathbb{Q}_p\hookrightarrow H^1(\mathbb{Q}_{n,p},V)\Big),$$

then $\mathrm{Sel}(\mathbb{Q}_n,W)=\mathrm{Sel}^{p^\infty}(E/\mathbb{Q}_n)$(13.5.11.9)(13.5.11.4) is the classical Selmer group.

Proof: For $v\in\Sigma^p_{\mathbb{Q}_n}$, by(13.9.4.17), $\#E(\mathbb{Q}_{n,v})[p^\infty]<\infty$, so $E(\mathbb{Q}_{n,v})\otimes(\mathbb{Q}_p/\mathbb{Z}_p)=0$. And also by(20.1.1.1),

$$\dim H^1_f(\mathbb{Q}_{n,v},V_p(E))=\dim V_p(E)^{\mathrm{Gal}_{\mathbb{Q}_{n,v}}}=0,$$

because $E(\mathbb{Q}_{n,v})[p^\infty]=0$. So

$$H^1_f(\mathbb{Q}_{n,v},W)=\mathrm{Im}\Big(E(\mathbb{Q}_{n,v})\otimes(\mathbb{Q}_p/\mathbb{Z}_p)\to H^1(\mathbb{Q}_{n,v},W)\Big)$$

for any place v. Thus the assertion follows from the definitions(20.1.2.1)(13.5.11.4). □

Selmer Groups over F_∞

Def. (20.1.2.6). Define Λ_p-modules20.2

$$\mathrm{Sel}(F_\infty,W)=\varinjlim_{F\subset_{\mathrm{fin}}F'\subset F_\infty}\mathrm{Sel}(F',W),\quad X_\infty=\mathrm{Hom}(\mathrm{Sel}(F_\infty,W^D),\mathbb{Q}_p/\mathbb{Z}_p),$$

$$H^1_\infty(F,T)=\varprojlim_{F\subset_{\mathrm{fin}}F'\subset F_\infty}H^1(F',T),\quad H^1_{\infty,s}(F_p,T)=\varprojlim_{F\subset_{\mathrm{fin}}F'\subset F_\infty}H^1_s(F',T).$$

where the transition maps are induced by restriction and corestriction maps(20.1.2.4). Then they are f.g. Λ_p-modules**?**.

Similarly define

$$\mathrm{Sel}_{S(p)}(F_\infty,W)=\varinjlim_{F\subset_{\mathrm{fin}}F'\subset F_\infty}\mathrm{Sel}_{S(p)}(F',W),\quad X_{\infty,S(p)}=\mathrm{Hom}(\mathrm{Sel}_{S(p)}(F_\infty,W^D),\mathbb{Q}_p/\mathbb{Z}_p).$$

Prop. (20.1.2.7). There is an exact sequence

$$0\to H^1_{\infty,s}(F_p,T)/\operatorname{loc}^s_{\infty,S(p)}(H^1_\infty(F,T))\to X_\infty\to X_{\infty,S(p)}\to 0.$$

Proof: Cf.[Rubin, P29].**?** □

Poitou-Tate Duality

Prop. (20.1.2.8) [Poitou-Tate Duality]. Let $m\in\mathbb{Z}^\times,\Sigma_0\subset\Sigma\subset\Sigma_F$ be two finite set of places, then

- There are exact sequences

$$0\to\mathrm{Sel}^{\Sigma_0}(F,W[m])\to S^\Sigma(F,W[m])\xrightarrow{\operatorname{loc}^s_{\Sigma,\Sigma_0}}\bigoplus_{v\in\Sigma\setminus\Sigma_0}H^1_s(F_v,W[m])$$

$$0\to\mathrm{Sel}_\Sigma(F,W[m])\to S^{\Sigma_0}(F,W[m])\xrightarrow{\operatorname{loc}^f_{\Sigma,\Sigma_0}}\bigoplus_{v\in\Sigma\setminus\Sigma_0}H^1_f(F_v,W[m])$$

- $\mathrm{Im}(\operatorname{loc}^s_{\Sigma,\Sigma_0})$ and $\mathrm{Im}(\operatorname{loc}^f_{\Sigma,\Sigma_0})$ are orthogonal w.r.t. the pairing $\sum_{v\in\Sigma\setminus\Sigma_0}\langle-,-\rangle_v$.
- There is an isomorphism

$$\mathrm{Sel}_{\Sigma_0}(F,W^D[m])/\mathrm{Sel}_\Sigma(F,W^D[m])\cong\mathrm{Hom}_{\mathbb{Z}_p}(\mathrm{Coker}(\operatorname{loc}^s_{\Sigma,\Sigma_0}),\mathbb{Z}_p/(m)).$$

Proof: 1 is clear, and 3 follows from 2. For 2, Cf.[Rubin, P17].**?** □

Remark (20.1.2.9). When Σ is large, we can make $\mathrm{Sel}_\Sigma(F,W^D[m])=0$, then $\#\mathrm{Sel}_{\Sigma_0}(F,W^D[m])=\#\mathrm{Coker}(\operatorname{loc}^s_{\Sigma,\Sigma_0})$. So if we can construct enough element in $S^\Sigma(F,W[m])$, then we bound $\mathrm{Sel}_{\Sigma_0}(F,W^D[m])$. And this can be done by Kolyvagin's derivative construction4 applied to Euler classes.

Cor. (20.1.2.10). There is an isomorphism

$$\mathrm{Sel}(F,W^D)/\mathrm{Sel}_{S(p)}(F,W^D)\cong\mathrm{Hom}_{\mathbb{Z}_p}(\mathrm{Coker}(\operatorname{loc}^s_{S(p)}),\mathbb{Q}_p/\mathbb{Z}_p).$$

3 Euler Systems

Def. (20.1.3.1) [Euler Systems]. Suppose $F \in \texttt{NField}, p \in \mathbf{P}$ and F_∞/F is an $\mathbb{Z}_p^d$-extension s.t. no finite place of F splits completely(This is satisfies if F_∞ contains the cyclotomic $\mathbb{Z}_p$-extension of F**?**). Suppose

- $\mathcal{K}$ is an Abelian extension of F containing F_∞ and $F(\mathfrak{p})$ for any $\mathfrak{p} \in \Sigma_F^{\text{fin}}$,
- $\mathcal{N}$ is an ideal of F divisible by p and all finite places that T is ramified(20.1.0.1).

Then an **Euler system** for $(T, \mathcal{K}, \mathcal{N})$ is a collection of cohomology classes

$$\mathbf{c} = \{\mathbf{c}_{F'} \in H^1(F', T) : F \subset_{\text{fin}} F' \subset \mathcal{K}\}$$

satisfying

$$\operatorname{cor}_{F''/F'}(\mathbf{c}_{F''}) = \Big(\prod_{\mathfrak{q} \in \Sigma(F''/F')} P_{\mathfrak{q}}(||\mathfrak{q}||^{-1} \operatorname{Frob}_{\mathfrak{q}}^{-1})\Big)(\mathbf{c}_{F'}),$$

where $\Sigma(F''/F')$ is the set of finite places of F not dividing $\mathcal{N}$ that is ramified in F'' but not in F'.

And an Euler system for (T, F_∞) is any Euler system for such $(T, \mathcal{K}, \mathcal{N})$.

Example (20.1.3.2) [Euler Systems for $\mathbb{Q}$]. For $N \in \mathbb{Z}_+$, let $\mathcal{R}(N)$ be the set of square-free integers r s.t. $(r, N) = 1$, and $\mathbb{Q}_\infty$ be the cyclotomic $\mathbb{Z}_p$-extension of $\mathbb{Q}$, then an Euler system $\mathbf{c}$ for $(T, \mathbb{Q}_\infty)$ is a collection of cohomology classes

$$\mathbf{c}_{\mathbb{Q}_n(\mu_r)} \in H^1(\mathbb{Q}_n(\mu_r); T)$$

s.t. for any $r \in \mathcal{R}(N), \ell \in \mathbf{P}, r\ell \in \mathcal{R}(N)$ and $m \geq n \in \mathbb{N}$,

$$\operatorname{cor}_{\mathbb{Q}_n(\mu_{r\ell})/\mathbb{Q}_n(\mu_r)}(\mathbf{c}_{\mathbb{Q}_n(\mu_{r\ell})}) = P_\ell(\ell^{-1} \operatorname{Frob}_\ell^{-1})(\mathbf{c}_{\mathbb{Q}_n(\mu_r)}).$$

Def. (20.1.3.3). If $\mathbf{c}$ is an Euler system, denote $\mathbf{c}_{F,\infty}$ the corresponding element in $H^1_\infty(F, T)$, and the ideal

$$\operatorname{ind}_{\Lambda_p}(\mathbf{c}) = \{\varphi(\mathbf{c}_{F,\infty}) : \varphi \in \operatorname{Hom}_{\Lambda_p}(H^1_\infty(F, T), \Lambda_p)\} \subset \Lambda_p.$$

and also

$$\operatorname{ind}_{\mathbb{Z}_p}(\mathbf{c}) = \sup\{n : \mathbf{c}_F \in p^n H^1(F, T) + H^1(F, T)_{\text{tor}}\}.$$

Twisting by Characters

Prop. (20.1.3.4) [Twisting Cohomology Groups]. For any extension of number fields $L/F \in \texttt{NField}$, denote $H^1_\infty(L, T) = \varprojlim_{F \subset_{\text{fin}} F' \subset F_\infty} H^1(F'L, T)$, $L_\infty = LK_\infty$. Then for any character $\rho : \operatorname{Gal}(L_\infty/K) \to \mathbb{Z}_p^*$ and $S(p) \subset \Sigma \subset \Sigma_F$, then there are Gal_K-isomorphisms

$$H^1_\infty(L, T)(\rho) \cong H^1_\infty(L, T(\rho)), \quad \operatorname{Sel}_\Sigma(L_\infty, W)(\rho) \cong \operatorname{Sel}_\Sigma(L_\infty, W(\rho)).$$

Proof: Cf.[Rubin, P91].**?** □

Prop. (20.1.3.5). Suppose $\mathbf{c}$ is an Euler system for $(T, \mathcal{K}, \mathcal{N})$, and $\rho : \operatorname{Gal}(F_\infty/F) \to \mathbb{Z}_p^*$ is a character with fixed field L and conductor $\mathfrak{f}$, then for any field $F \subset_{\text{fin}} F' \subset \mathcal{K}$, denote by $\mathbf{c}^\rho_{F'} \in H^1(F, T(\chi))$ the image of $\mathbf{c}_{F'L}(\rho)$ under the map

$$H^1(F'L, T)(\rho) \xrightarrow{\operatorname{cor}} H^1(F', T(\rho)).$$

Then $\{\mathbf{c}^\rho_{F'}\}$ form an Euler system for $(T(\rho), \mathcal{K}, \mathfrak{f}^{p\infty}\mathcal{N})$.

Proof: Cf.[Rubin, P30, 93].**?** □

4 Kolyvagin Derivatives

Def. (20.1.4.1) [Kolyvagin Primes]. Suppose $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+$, define $\mathcal{R}_{F',m} \subset \mathcal{R}(\mathcal{N})$ to be the set of products of primes $\mathfrak{q}$ of F s.t.

- $m | [F(\mathfrak{q}) : F(1)]$,
- $P_\mathfrak{q}(||\mathfrak{q}||^{-1})/m \in \mathbb{Z}_p$,
- $\mathfrak{q}$ splits completely in $F'(1)/F$.

Def. (20.1.4.2) [Kolyvagin Derivatives]. For any $\mathfrak{q} \in \Sigma_F^p$, $\Gamma_\mathfrak{q} = \mathrm{Gal}(F(\mathfrak{q})/F(1))$ is canonical isomorphic to a cyclic group with generator $\sigma_\mathfrak{q}$(?, [Rubin, P62]). Define

$$D_\mathfrak{q} = \sum_{i=0}^{\#\Gamma_\mathfrak{q}-1} i\sigma_\mathfrak{q}^i \in \mathbb{Z}[\Gamma_\mathfrak{q}],$$

and for any $\mathfrak{r} \in \mathcal{R}(\mathcal{N})$, define

$$D_\mathfrak{r} = \prod_{\mathfrak{q}|\mathfrak{r}} D_\mathfrak{q} \in \mathbb{Z}[\Gamma_\mathfrak{r}].$$

And if $F \subset_{\text{fin}} L \subset F_\infty$, fix an element $N_{L(1)/L} \in \mathbb{Z}[\mathrm{Gal}(L(\mathfrak{r})/L)]$ whose restriction to $\mathrm{Gal}(F(1)/F)$ is $\sum_{\gamma \in \mathrm{Gal}(F(1)/F)} \gamma$, then define

$$D_{\mathfrak{r},L} = N_{L(1)/L} D_\mathfrak{r}.$$

Def. (20.1.4.3) [Kolyvagin Systems]. Suppose $\mathbf{c}$ is an Euler system, $F \subset_{\text{fin}} L \subset F_\infty, m \in \mathbb{Z}_+$, and $\mathfrak{r} \in \mathcal{R}_{L,m}$, define

$$\kappa_{L,\mathfrak{r},M} = \delta_L(\mathbf{d}(D_{\mathfrak{r},L} x_{F(\mathfrak{r})}) \in H^1(F, W[m]).$$

Proof: ?. Cf.[Rubin, P66]. □

Cor. (20.1.4.4) [Properties of $\kappa_{L,\mathfrak{r},m}$].

- $\kappa_{L,1,m}$ is the image of $\mathbf{c}_L$ in $H^1(L, W[m])$.
- The restriction of $\kappa_{L,\mathfrak{r},m}$ to $L(\mathfrak{r})$ is the image of $D_{\mathfrak{r},L}\mathbf{c}_{L(\mathfrak{r})}$ in $H^1(L(\mathfrak{r}), W[m])$.
- $\kappa_{L,1,m}$ is compatible with m.

Proof: Cf.[Rubin, P67]?. □

Local Properties

Thm. (20.1.4.5). Suppose $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+$, and $\mathfrak{r} \in \mathcal{R}_{F',m}$, then

$$\kappa_{F,\mathfrak{r},m} \in \mathrm{Sel}^{S(p\mathfrak{r})}(F', W).$$

Proof: Cf.[Rubin, P67]. □

Thm. (20.1.4.6) [Ramification of Kolyvagin Systems]. Suppose $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+$, and $\mathfrak{r}\mathfrak{q} \in \mathcal{R}_{F,m}$, then

$$\mathrm{loc}_\mathfrak{q}^s(\kappa_{F,\mathfrak{r}\mathfrak{q},m}) = \phi_\mathfrak{q}^{fs}(\kappa_{F,\mathfrak{r},m}).$$

Proof: Cf.[Rubin, P68]. □

5 p-adic L-Function for Elliptic Curves

Thm. (20.1.5.1) [p-adic L-Functions]. Let $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}, p \in \mathbf{P}$. Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has good ordinary reduction or multiplicative reduction at p. Let $\alpha \in \mathbb{Z}_p^*, \beta = p/\alpha \in p\mathbb{Z}_p^*$ be the eigenvalues of Frob_p on $T_p(E)$ if E has good ordinary reduction at p, or $(\alpha, \beta) = (1, p)$ or $(-1, -p)$ if E has split or non-split multiplicative reduction.

Then there exists $c_E \in \mathbb{Z}_+$ independent of p and a **p-adic L-function** $\mathcal{L}_E \subset c_E^{-1}\Lambda_p$ s.t. for any character χ of $\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})$ of finite order,

$$\chi(\mathcal{L}_E) = \begin{cases} (1-\alpha^{-1})^2 L(E;1)/\Omega_E & , \chi = 1 \& E \text{ has good reduction at } p. \\ (1-\alpha^{-1}) L(E;1)/\Omega_E & , \chi = 1 \& E \text{ has multiplicative reduction at } p. \\ \alpha^{-n}\tau(\chi) L(E, \chi^{-1}; 1)/\Omega_E & , \mathfrak{c}(\chi) = p^n > 1 \end{cases}.$$

And for any $N \in \mathbb{Z}_+$, we can define

$$\mathcal{L}_{E,N} = \prod_{q|N, q\neq p} P_\ell(\ell^{-1}\,\mathrm{Frob}_\ell^{-1})\mathcal{L}_E \in \Lambda_p.$$

Proof: Cf.[Mazur-Tate-T]**?**. □

Coleman Map

Def. (20.1.5.2) [Coleman Map]. Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ has good ordinary reduction or multiplicative reduction at p, then there is an injective Λ_p-module map

$$\mathrm{Col}_\infty : H^1_{\infty,s}(\mathbb{Q}_p, T_p(E)) \hookrightarrow \Lambda_p$$

s.t.

- For any element $z = \{z_n\} \in H^1_{\infty,s}(\mathbb{Q}_p, T_p(E))$ and any non-trivial character χ of $G_n = \mathrm{Gal}(\mathrm{cycl}_{p,n}(\mathbb{Q})/\mathbb{Q})$ of conductor p^m,

$$\chi(\mathrm{Col}_\infty(z)) = \alpha^{-m}\tau(\chi)\sum_{\gamma\in G_n}\chi^{-1}(\gamma)\exp^*_{\omega_E}(z_n^\gamma).$$

- If χ_0 is the trivial character, then

$$\chi_0(\mathrm{Col}_\infty(z)) = (1-\alpha^{-1})(1-\beta^{-1})^{-1}\exp^*_{\omega_E}(z).$$

- If E has split multiplicative reduction at p, then the image of Col_∞ is contained in the augmentation ideal $\mathcal{J}_p$ of Λ_p.

Proof: Cf.[Rubin short, Appendix]**?**. □

Local Cohomology Groups

Prop. (20.1.5.3). Let $K \in$ `p-Field` and $E \in \mathcal{E}\mathrm{ll}/K$ with a Neron differential ω_E, then $\mathrm{Tgt}^*(E/K) = K\omega_E$, and $\mathrm{Tgt}(E/K) = K\omega_E^*$. There exists an exponential map

$$\exp_E : \mathrm{Tgt}(E/K) \cong E(K)\otimes\mathbb{Q}_p$$

and the following diagram is commutative:

$$\begin{array}{ccccc}
\mathrm{Tgt}(E/K) & & \xrightarrow{\exp_E} & & E(K)\otimes\mathbb{Q}_p \\
{\scriptstyle .\omega_E^*}\uparrow & & & & \uparrow{\scriptstyle =} \\
K & \xleftarrow[\log_E]{} & \widehat{E}(\mathfrak{m}_K)\otimes\mathbb{Q}_p & \xrightarrow{\cong} & E_1(K)\otimes\mathbb{Q}_p
\end{array}$$

where all the maps are isomorphisms.

Proof: ? □

Prop. (20.1.5.4). By the definition and local Tate pairing,

$$\mathrm{Hom}(E(\mathbb{Q}_{n,p}),\mathbb{Q}_p)=\mathrm{Hom}(H^1_f(\mathbb{Q}_{n,p},V_p(E)))\cong H^1_s(\mathbb{Q}_{n,p},V_p(E)).$$

So we can define a dual exponential map

$$\exp_E^*:H^1_s(\mathbb{Q}_{n,p},V)\to\mathrm{Tgt}^*(E/\mathbb{Q}_{n,p})$$

and its composite with ω_E^*:

$$\exp_{\omega_E}^*:H^1_s(\mathbb{Q}_{n,p},V)\to\mathrm{Tgt}^*(E/\mathbb{Q}_{n,p})/\omega_E\cong\mathbb{Q}_{n,p}.$$

More explicitly, for $z\in H^1_s(\mathbb{Q}_{n,p},V_p(E)),x\in E(\mathbb{Q}_{n,p})$,

$$\mathrm{tr}_{\mathbb{Q}_{n,p}/\mathbb{Q}_p}(\lambda_E(x)\exp_{\omega_E}^*(z))=\langle x,z\rangle_{\mathbb{Q}_{n,p}}.$$

Prop. (20.1.5.5).

$$\exp_{\omega_E}^*(H^1_s(\mathbb{Q}_p,T))=\frac{1}{p}[E(\mathbb{Q}_p):E_1(\mathbb{Q}_p)+E(\mathbb{Q}_p)_{\mathrm{tor}}]\mathbb{Z}_p.$$

Proof: By duality, if $\lambda_E(\mathbb{Q}_p)=p^{-a}\mathbb{Z}_p$, then $\exp_{\omega_E}^*(H^1_s(\mathbb{Q}_p,T))=p^a\mathbb{Z}_p$. But $\lambda_E(E_1(\mathbb{Q}_p))=p\mathbb{Z}_p$, so the assertion follows. □

6 Bounding Selmer Groups

Notation (20.1.6.1).

- Fix an Euler system $\mathbf{c}$ for (T,F_∞)(20.1.3.2). $\mathbf{c}_F\in\mathrm{Sel}^{S(p)}(F,T)$ by(20.1.1.4) and(20.1.2.2).
- Suppose the choices of Selmer local conditions satisfy hypothesis(20.1.2.4).

Hypothesis on Representations

Def. (20.1.6.2) [Hypothesis]. T satisfies the hypothesis

Hypothesis $\mathrm{Hyp}(F_\infty;T)$ if:

- There exists $\tau\in\mathrm{Gal}_{F(1)F(\mu_{p^\infty})}$ s.t. $T/(\tau-1)T$ is free of rank 1 over $\mathbb{Z}_p$, and
- $T/(p)\in\mathrm{Irr}_{\mathbb{F}_p}(\mathrm{Gal}_{F_\infty})$.

Hypothesis $\mathrm{Hyp}(F_\infty;V)$ if:

- There exists $\tau\in\mathrm{Gal}_{F(1)F(\mu_{p^\infty})}$ s.t. $\dim_{\mathbb{Q}_p}V/(\tau-1)V=1$, and
- $V\in\mathrm{Irr}_{\mathbb{Q}_p}(F_\infty)$.

Hypothesis $\mathrm{Hyp}(F_\infty/F)$ if:

- $\text{rank}_{\mathbb{Z}_p}(\text{Gal}_{F_\infty/F}) > 1$ or
- neither T nor $T(-1)$ is trivial, or
- F is imaginary quadratic, or
- F is totally real and leopoldt's conjecture holds for F.

Prop. (20.1.6.3). Suppose $E \in \mathcal{E}\text{ll}/\mathbb{Q}$ without CM, then

- $T = T_p(E)$ satisfies the hypothesis $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); V)$(20.1.6.2), and $\#H^1(\mathbb{Q}(E[p^\infty])/\mathbb{Q}, E[p^\infty]) < \infty$.
- If $\rho_{E,p} : \text{Gal}_{\mathbb{Q}} \to \text{Aut}(T_p)$ is surjective, then $T_p(E)$ satisfies the hypothesis $\text{Hyp}(\text{cycl}_p(\mathbb{Q}), T)$(20.1.6.2), and $H^1(\mathbb{Q}(E[p^\infty])/\mathbb{Q}, E[p^\infty]) = 0$.

Proof: By Weil pairing,

$$\rho_{E,p}(\text{Gal}_{\mathbb{Q}(\mu_{p^\infty})}) = \rho_{E,p}(\text{Gal}_{\mathbb{Q}}) \cap \text{SL}(2, \mathbb{Z}_p).$$

When $\rho_{E,p} : \text{Gal}_{\mathbb{Q}} \to \text{Aut}(T_p)$ is surjective, then $\overline{\rho_{E,p}}$ is surjective thus irreducible, and also we can take $\rho_{E,p}(\tau) = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$. So $T_p(E)$ satisfies the hypothesis $\text{Hyp}(\text{cycl}_p(\mathbb{Q}), T)$.

And because E has no CM, by [Serre, Galois Property Points Elliptiques, (1972) Cor1 of Thm3], $\rho_{E,p}(\text{Gal}_{\mathbb{Q}}) \subset \text{GL}(2, \mathbb{Z}_p)$ is open. So $\rho_{E,p}|_{\text{Gal}_{\mathbb{Q}(\mu_{p^\infty})}}$ is irreducible, and we can take $\rho_{E,p}(\tau) = \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}$ for some $x \neq 0$. So $T_p(E)$ satisfies the hypothesis $\text{Hyp}(\text{cycl}_p(\mathbb{Q}), V)$.

Finally, the cohomology group can be calculated directly?. □

Bounding Selmer Groups over F

Thm. (20.1.6.4). Suppose V satisfies $\text{Hyp}(F; V)$(20.1.6.2), and V is not the trivial representation.

- If $\mathbf{c}_F \notin H^1(F, T)_{\text{tor}}$, then $\#\,\text{Sel}_{S(p)}(F, W^D) < \infty$.
- If $\text{loc}_p^s(\mathbf{c}_{\mathbb{Q}}) \neq 0$ and $[H^1_s(\mathbb{Q}_p, T) : \mathbb{Z}_p \,\text{loc}_p^s(\mathbf{c}_{\mathbb{Q}})] < \infty$, then $\#\,\text{Sel}(\mathbb{Q}, W^D) < \infty$.

(If V is trivial, this is true iff the Leopodlt's conjecture holds).

Proof: Cf.[Rubin, P24].?

2: It follows from(20.1.2.10) that

$$[\text{Sel}(\mathbb{Q}, W^D) : \text{Sel}_p(\mathbb{Q}, W^D)] = [H^1_s(\mathbb{Q}_p, T) : \mathbb{Z}_p \,\text{loc}_p^s(\text{Sel}^p(\mathbb{Q}, T))] \leq [H^1_s(\mathbb{Q}_p, T) : \mathbb{Z}_p \,\text{loc}_p^s(\mathbf{c}_{\mathbb{Q}})].$$

So the assertion follows from item1. □

Cor. (20.1.6.5). Suppose V satisfies $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); V)$(20.1.6.2), $\text{loc}_p^s \mathbf{c}_{\mathbb{Q}} \neq 0$, and $\text{rank}_{\mathbb{Z}_p} H^1_s(\mathbb{Q}_p, T) = 1$, then $\#\,\text{Sel}^{p^\infty}(\mathbb{Q}, W^D) < \infty$.

Proof: This is because $H^1_s(\mathbb{Q}_p, T)$ is torsion-free. □

Thm. (20.1.6.6). Suppose T satisfies $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); T)$(20.1.6.2), $p > 2$. Let $\Omega = \mathbb{Q}(W)\mathbb{Q}((\mathbb{Z}_p^*)^{1/p^\infty})$, where $\mathbb{Q}(W)$ is the minimal extension of $\mathbb{Q}$ that $\text{Gal}_{\mathbb{Q}(W)}$ acts trivially on W.

- Then

$$\#\,\text{Sel}_p(\mathbb{Q}, W^D) \leq p^{\text{ind}_{\mathbb{Z}_p}(\mathbf{c})} \#\Big(H^1(\Omega/\mathbb{Q}, W) \cap \text{Sel}^p(\mathbb{Q}, W)\Big) \#\Big(H^1(\Omega/\mathbb{Q}, W) \cap \text{Sel}_p(\mathbb{Q}, W^D)\Big)$$

- If $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \neq 0$(20.1.2.1), then

$$\#\,\mathrm{Sel}(\mathbb{Q}, W^D) \leq [H^1_s(\mathbb{Q}_p, T) : \mathbb{Z}_p \,\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q})]\#\Big(H^1(\Omega/\mathbb{Q}, W)\cap \mathrm{Sel}^p(\mathbb{Q}, W)\Big)\#\Big(H^1(\Omega/\mathbb{Q}, W^D)\cap \mathrm{Sel}_p(\mathbb{Q}, W^D)\Big).$$

Notice $\#H^1(\Omega/\mathbb{Q}, W)\#H^1(\Omega/\mathbb{Q}, W^D) < \infty$ when V is irreducible and $\dim V > 2$, by [Rubin, P162].?

Proof: Cf.[Rubin, P24].?

2: Notice $H^1(\mathbb{Q}, T)/\,\mathrm{Sel}^p(\mathbb{Q}, T) \hookrightarrow \oplus_{v\in\Sigma_\mathbb{Q}^p} H^1_s(\mathbb{Q}_v, T)$ is torsion-free, so $\mathbf{c}_\mathbb{Q} \in p^n H^1(\mathbb{Q}, T) + H^1(\mathbb{Q}, T)_{\mathrm{tor}}$ implies $\mathbf{c}_\mathbb{Q} \in p^n\,\mathrm{Sel}^p(\mathbb{Q}, T) + H^1(\mathbb{Q}, T)_{\mathrm{tor}}$, which implies $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \in p^n\,\mathrm{loc}_p^s(\mathrm{Sel}^p(\mathbb{Q}, T))$. Then the assertion follows from(20.1.2.10) and item1. □

Bounding Selmer Groups over F_∞

Prop. (20.1.6.7). Suppose V satisfies $\mathrm{Hyp}(F_\infty, V)$ with τ. Define Z(resp. Z^D) to be the maximal Gal_{F_∞}-stable submodule of $(\tau-1)W$(resp. W^D), and

$$a_\tau = [W^\tau : (W^\tau)_{\mathrm{div}}].\max(\#Z, \#Z^D).$$

Then $a_\tau < \infty$. And if T satisfies $\mathrm{Hyp}(F_\infty, T)$, then $a_\tau = 1$.

Proof: Cf.[Rubin, P98].? □

Thm. (20.1.6.8). Suppose V satisfies $\mathrm{Hyp}(F_\infty; V)$ and $\mathrm{Hyp}(F_\infty/F)$(20.1.6.2), $\mathbf{c}_{F,\infty} \notin H^1_\infty(F, T)_{\Lambda_p-\mathrm{tor}}$, then

- (Weak Leopoldt Conjecture) $X_{\infty,S(p)}$ is a torsion Λ_p-module.
- There exists $t \in \mathbb{N}$ s.t. $\mathrm{char}(X_{\infty,S(p)})|p^t\,\mathrm{ind}_{\Lambda_p}(\mathbf{c})$.
- If moreover T satisfies $\mathrm{Hyp}(F_\infty; T)$(20.1.6.2), then $\mathrm{char}(X_{\infty,S(p)})|\,\mathrm{ind}_{\Lambda_p}(\mathbf{c})$.

Proof: 1: [Rubin, Thm2.3.2].?

2,3: Cf.[Rubin, P101]?. Given item1, there exists an injective pseudo-isomorphism

$$\bigoplus_{i=1}^r \Lambda_p/(f_i) \to X_{\infty,S(p)},$$

where $f_{i+1}|f_i$. Then by(20.1.6.7), it suffices to show that $\mathrm{char}(X_{\infty,S(p)})|a_\tau^{5r}\,\mathrm{ind}_{\Lambda_p}(\mathbf{c})$.

Suppose $h \in \Lambda_p$ satisfies(20.1.6.14), and a finite set of places $\Sigma_F^\infty \cup S(p) \cup \mathrm{Ram}(T) \subset \Sigma \subset \Sigma_F$, then by?,

$$h^r a_\tau^{5r}\mathbf{c}_L \in \mathrm{char}(X_{\infty,S(p)}).H^1(F_\Sigma/L, T)_{\mathrm{lf}}.$$

Then by? and taking limit,

$$h^r a_\tau^{5r}\mathbf{c}_{F,\infty} \in \mathrm{char}(X_{\infty,S(p)}).H^1(F, T)_{\mathrm{lf}}.$$

Then by the definition of $\mathrm{ind}_{\Lambda_p}(\mathbf{c})$ and the fact h is prime to $\mathrm{char}(X_{\infty,S(p)})$(20.1.6.14), we get $\mathrm{char}(X_{\infty,S(p)})|a_\tau^{5r}\,\mathrm{ind}_{\Lambda_p}(\mathbf{c})$. □

Cor. (20.1.6.9). Suppose V satisfies $\mathrm{Hyp}(\mathrm{cycl}_p(\mathbb{Q});V)$(20.1.6.2), $\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})$ is non-torsion over Λ_p, and $H^1_{\infty,s}(F_p,T)/\Lambda_p.\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})$ is torsion, define

$$\mathcal{L}=\mathrm{char}\left(H^1_{\infty,s}(F_p,T)/\Lambda_p.\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})\right),$$

then

- (Weak Leopoldt Conjecture) X_∞ is a torsion Λ_p-module.
- There exists $t\in\mathbb{N}$ s.t. $\mathrm{char}(X_\infty)|(p^t\mathcal{L})$.
- If T satisfies $\mathrm{Hyp}(F_\infty;T)$(20.1.6.2), then $\mathrm{char}(X_\infty)|\mathcal{L}$.

Proof: By(20.1.6.8), $X_{\infty,S(p)}$ is torsion over Λ_p, so by(20.1.2.7) and the hypothesis, X_∞ is also torsion over Λ_p, and

$$\mathrm{char}(X_\infty)=\mathrm{char}(X_{\infty,S(p)})\,\mathrm{char}\left(H^1_{\infty,s}(F_p,T)/\mathrm{loc}^s_{p,\infty}(H^1_\infty(F,T))\right).$$

Notice the hypothesis also implies $\mathrm{loc}^s_{p,\infty}(H^1_\infty(F,T))$ has rank 1 over Λ_p, so by the definition of $\mathrm{ind}_{\Lambda_p}(\mathbf{c})$,

$$\mathrm{ind}_{\Lambda_p}(\mathbf{c})|\,\mathrm{char}\left(\mathrm{loc}^s_{p,\infty}(H^1_\infty(F,T))/\Lambda_p.\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{F,\infty})\right).$$

Thus the assertion follows. □

Proof over F_∞

Lemma (20.1.6.10). Let $\rho:\mathrm{Gal}(F_\infty/F)\to\Lambda_p$ be a character, then theorem(20.1.6.8) for T and $\mathbf{c}$ are equivalent to the theorem for $T(\rho)$ and $\mathbf{c}^\rho$.

Proof: The hypothesis $\mathrm{Hyp}(F_\infty;V),\mathrm{Hyp}(F_\infty/F)$ and $\mathrm{Hyp}(F_\infty;T)$ depends only on T as a Gal_{F_∞}-module, so they are not affected. And the rest follows from the fact everything is twisted by ρ, by(20.1.3.4). □

Prop. (20.1.6.11). [Rubin, P99]?

Def. (20.1.6.12) [Selmer Sequences and Kolyvagin Sequences]. Fix a sequence $(z_1,\dots,z_r)$ for $X_{\infty,S(p)}$ as in(20.1.6.11), and let $Z_\infty\subset X_{\infty,S(p)}$ be the submodule they generate. Then for $0\le k\le r$, $F\subset_{\text{fin}}L\subset F_\infty$, then

- A **Selmer sequence** of length k is a sequence $(\sigma_1,\dots,\sigma_k)$ s.t. Cf.[Rubin, P99].?
- A **Kolyvagin sequence** of length k for L and M is a sequence $(\mathfrak{Q}_1,\dots,\mathfrak{Q}_k)$ of primes of L? Cf.[Rubin, P99].

Let $\Pi(k,L,M)$ be the set of Kolyvagin sequences of length k for F and M, and define

$$\Psi(k,L,M)=\sum_{\pi\in\Pi(k,L,M)}\sum_{\psi\in\mathrm{Hom}(\Lambda_p\kappa_{L,\mathfrak{r}(\pi),M},\Lambda_{L,M})}\psi(\kappa_{L,\mathfrak{r}(\pi),M})\subset\Lambda_{L,M}$$

Lemma (20.1.6.13). Suppose $G\in\mathcal{A}\mathrm{b}^{\mathrm{fin}}$, $R\in\mathcal{CR}\mathrm{ing}$ is a PID, and B is a f.g. $R[G]$-module without R-torsion. Suppose $f\in R[G]$ is a non-zerodivisor, $b\in B$, and

$$\{\psi(b):\psi\in\mathrm{Hom}_{R[G]}(B,R[G])\}\subset fR[G],$$

then $b\in fB$.

Proof: Cf.[Rubin, P101]. □

Prop. (20.1.6.14). Situation as in(20.1.6.8), there exists $h \in \Lambda_p$ relatively prime to $\mathrm{char}(X_{\infty,S(p)})$, and for each $F \subset_{\text{fin}} L \subset F_\infty$ a number $N_L \in p^{\mathbb{Z}_+}$, s.t. if $M \in p^{\mathbb{Z}_+}, N_L | M, 0 \leq k \leq r$, then

$$h a_\tau^5 \Psi(k, L, M N_L) \subset f_{k+1} \Psi(k+1, L, M)(20.1.6.12).$$

Proof: Cf.[Rubin, P100]**?**. □

Cor. (20.1.6.15). Situation and notation as in(20.1.6.14), if $F \subset_{\text{fin}} L \subset F_\infty$ and finite set of places $\Sigma_F^\infty \cup S(p) \cup \mathrm{Ram}(T) \subset \Sigma \subset \Sigma_F$, then

$$h^r a_\tau^{5r} \mathbf{c}_L \in \mathrm{char}(X_{\infty,S(p)}).H^1(F_\Sigma/L, T)_{\mathrm{lf}}.$$

Proof: It follows from(20.1.6.14) and induction that

$$h^r a_\tau^5 \Psi(0, L, M N_L^r) \subset (\prod_{i=1}^r f_i) \Psi(r, L, M) \subset \mathrm{char}(X_{\infty,S(p)}) \Lambda_{L,M}.$$

By(20.1.6.13), it suffices to show that for any $\psi \in \mathrm{Hom}(H^1(F_\Sigma/L, T), \Lambda_L)$, $h^r a_\tau^{5r} \psi(\mathbf{c}_L) \in \mathrm{char}(X_{\infty,S(p)})\Lambda_L$. For this, notice $\overline{\psi}(\kappa_{L,1,MN_L^r}) \equiv \psi(\mathbf{c}_L)(\mathrm{mod}\ M)$(**?**, Cf.[Rubin, P100]), and by definition $\overline{\psi}(\kappa_{L,1,MN_L^r}) \in \Psi(0, L, MN_L^r)\Lambda_{L,M}$. Then we get the desired assertion by noticing M can arbitrarily large. □

7 Euler System for Elliptic Curves(Kato)

Thm. (20.1.7.1)[Kato]. Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ with conductor N, and $p \in \mathbf{P}$. Then there exists $D, D \not\equiv 1 \mod p, (DD', 6pN) = 1$, and $r_E \in \mathbb{Z}_+$ independent of p, and an Euler system $\overline{\mathbf{c}} = \overline{\mathbf{c}}(D, D')$ for $T_p(E)$(20.1.3.2):

$$\{\overline{\mathbf{c}}_{\mathbb{Q}_n(\mu_r)} \in H^1(\mathbb{Q}_n(\mu_r), T_p(E))\}_{r \in \mathcal{R}(NpDD'), n \in \mathbb{N}},$$

s.t. for any character $\chi \in \mathrm{Gal}(\mathbb{Q}_n/\mathbb{Q})^\vee$,

$$\sum_{\gamma \in \mathrm{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi(\gamma) \exp^*_{\omega_E}(\mathrm{loc}_p^s(\overline{\mathbf{c}}_{\mathbb{Q}_n}^\gamma)) = r_E DD'(D - \chi^{-1}(D))(D' - \chi^{-1}(D')) L_{Np}(E, \chi; 1)/\Omega_E.$$

Proof: Cf.[Scholl, Thm5.2.7.]**?** □

Cor. (20.1.7.2). Situation as in(20.1.7.1), suppose that E has good ordinary reduction or multiplicative reduction at p, then there is an Euler system $\mathbf{c}$ for $T_p(E)$ s.t.

- $\exp^*_{\omega_E}(\mathrm{loc}_p^s(\mathbf{c}_{\mathbb{Q}})) = r_E L_{Np}(E; 1)/\Omega_E$.
- $\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q},\infty})) = r_E \mathcal{L}_{E,N}$(20.1.5.1).

Proof: Let $\sigma_D, \sigma_{D'} \in \mathrm{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q})$ denote the automorphism $\zeta \mapsto \zeta^D, \zeta \in \mu_{p^\infty}$, then since $D, D' \nmid 1(\mathrm{mod}\ p)$, $(D - \sigma_D)(D' - \sigma_{D'}) \in \Lambda_p$ is invertible. Let $\rho_{D,D'} \in \mathbb{Z}_p[[\mathrm{Gal}_{\mathbb{Q}}]]$ be any element that restricts to $(D - \sigma_D)^{-1}(D' - \sigma_{D'})^{-1}$, then we can define

$$\mathbf{c}_{\mathbb{Q}_n(\mu_r)} = (DD')^{-1} \rho_{D,D'} \overline{\mathbf{c}}_{\mathbb{Q}_n(\mu_r)},$$

which is also an Euler system, and by(20.1.7.1) and a change of variable, we get

$$\sum_{\gamma\in \mathrm{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi(\gamma)\exp^*_{\omega_E}(\mathrm{loc}^s_p(\mathbf{c}^\gamma_{\mathbb{Q}_n})) = r_E L_{Np}(E,\chi;1)/\Omega_E.$$

Then if χ is the trivial character, this gives equation1. And for any $\chi\in \mathrm{Gal}(\mathbb{Q}_\infty/\mathbb{Q})^\vee$,

$$\chi\Big[\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q},\infty}))\Big] =$$

$$\begin{cases}(1-\alpha^{-1})(1-\beta^{-1})^{-1}\exp^*_{\omega_E}(\mathrm{loc}^s_p(\mathbf{c}_{\mathbb{Q}})) = r_E L_{Np}(E;1)/\Omega_E & ,\chi=1\\ \alpha^{-n}\tau(\chi)\sum_{\gamma\in\mathrm{Gal}(\mathbb{Q}_n/\mathbb{Q})}\chi^{-1}(\gamma)\exp^*_{\omega_E}(\mathrm{loc}^s_p(\overline{\mathbf{c}}^\gamma_{\mathbb{Q}_n})) = r_E L_{Np}(E;\chi^{-1},1)/\Omega_E & \mathfrak{c}(\chi)=p^n>1\end{cases}$$

$$= \chi(r_E\mathcal{L}_{E,N}).$$

Thus $\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q},\infty})) = r_E\mathcal{L}_{E,N}$. □

Bounding Selmer Groups

Prop. (20.1.7.3). Suppose $E\in\mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM. Notation as in(20.1.7.1),

- If E has good ordinary reduction or non-split multiplicative reduction at p, then $X_\infty(E[p^\infty])$ is f.g. torsion over Λ_p, and there exists $t\in\mathbb{N}$ s.t. $\mathrm{char}(X_\infty)|(p^t\mathcal{L}_{E,N})$. And if $\rho_{E,p}$ is surjective with $p\nmid r_E\prod_{q|N,q\neq p}\ell_q(q^{-1})$, then $\mathrm{char}(X_\infty)|(\mathcal{L}_E)$.
- If E has split multiplicative reduction at p, then similar results hold with $\mathrm{char}(X_\infty)$ replaced by $\mathcal{J}\,\mathrm{char}(X_\infty)$.

Proof: Because Col_∞ is injective(20.1.5.2), by(20.1.7.2),

$$\mathcal{L} = \mathrm{char}\left(H^1_{\infty,/\,\mathrm{Sel}}(\mathbb{Q}_p,T)/\Lambda_p.\,\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q}})\right)\Big|\,\mathrm{char}\left(\mathrm{Im}(\mathrm{Col}_\infty)/(\mathrm{Col}_\infty(\mathrm{loc}^s_{p,\infty}(\mathbf{c}_{\mathbb{Q}})))\right)\Big|(r_E\mathcal{L}_{E,N})$$

So item1 follows from(20.1.6.9). Notice the hypothesis are satisfied by(20.1.6.3). Item2 also follows, by noticing that $\mathrm{Im}(\mathrm{Col}_\infty)\subset\mathcal{J}_p$(20.1.5.2). □

Cor. (20.1.7.4) [Greenberg]. Let $E\in\mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, then there exists $M_E\in\mathbb{Z}_+$ s.t. if $p\in\mathbf{P}$ is good ordinary for E and $p\nmid M_E$, then $X_\infty(E)$(20.1.2.6) has no non-zero finite submodules.

Proof: Cf.[Rubin short, P363] and [Greenberg, Iwasawa theory for p-adic Representations]**?**. □

Cor. (20.1.7.5). Let $E\in\mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, $p\in\mathbf{P}$ is a good place for E and $p\nmid 2r_EM_E\prod_{q|N}\ell_q(q^{-1})$(20.1.7.1)(20.1.7.4), and $\rho_{E,p}$ is surjective, then

$$\#\text{Ш}(E)[p^\infty]\Big|\frac{L(E;1)}{\Omega_E}.$$

Proof: If p is good supersingular for E, then $p\nmid\#\widetilde{E}(\mathbb{F}_p)$, and Cf.[Rubin short, P362]**?**

If p is good ordinary for E, then by(20.1.7.4), we may assume $X_\infty(E)\subset\prod_i\Lambda_p/(f_i^{n_{ij}})$, and then

$$\mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}),E[p^\infty])^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})} = (X_\infty(E))_{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})}\subset\chi_0(\prod_i\Lambda_p/(f_i^{n_{ij}}))$$

and the RHS has cardinality $\chi_0(\mathrm{char}(X_\infty(E)))$, which by(20.1.7.3) divides

$$\chi_0(\mathcal{L}_E) = (1-\alpha^{-1})^2 \prod_{q|N} \ell_q(q^{-1}) L(E;1)/\Omega_E(20.1.5.1).$$

Also, one show by proof of Mazur control theorem that

$$\mathrm{Sel}(\mathbb{Q}, E[p^\infty]) \to \mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})}.$$

is injective with cokernel of order divisible by $(1-\alpha^{-1})^2$**?**. Thus the assertion follows. □

Cor. (20.1.7.6). Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ without CM, and $L(E;1) \neq 0$, then $\#E(\mathbb{Q}) < \infty, \#\text{Ш}(E) < \infty$.

Proof: This is proven by Kolyvagin before, but Kato proved it again as follows:

For each $q|N, \ell_q(q^{-1}) \neq 0$, so $L_{Np}(E;1) \neq 0$, and then by(20.1.7.2), $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \neq 0$, then it follows from(20.1.6.5) that $\mathrm{Sel}^{p^\infty}(E/\mathbb{Q}) < \infty$. Notice the hypothesis is satisfied by(20.1.5.5).

But then by Serre's theorem, $\rho_{E,p}$ is surjective for a.e. p, so by(20.1.7.5), $\text{Ш}(E)[p^\infty] = 0$ for a.e. e. Thus the assertion follows. □

Thm. (20.1.7.7) [Kato]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$, if $F/\mathbb{Q}$ is an Abelian extension and $\chi \in \mathrm{Gal}(F/\mathbb{Q})^\vee$, and $L(E,\chi;1) \neq 0$, then $\#E(F)^\chi < \infty, \#\text{Ш}(E_L)^\chi < \infty$.

Proof: We only prove for the case E without CM. For the CM case, Cf.[Coates-Wiles77], [Rubin, The Iwasawa Main conjecture for Imaginary Quadratic Fields] or [Rubin-Wiles, Mordell-Weil Groups of Elliptic Curves over Cyclotomic Fields].**?**

The proof is similar to that of(20.1.7.6): $\chi(\mathrm{char}(X_\infty(E)))$ is a non-zero multiple of $L(E,\chi;1)$, so $\#\,\mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^\chi < \infty$. Then use a variant of(20.1.7.5) to bound $\#\text{Ш}(E)$. □

Cor. (20.1.7.8) [Kato]. For $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $F/\mathbb{Q}$ an Abelian extension, $p \in \mathbf{P}$, $E(\mathbb{Q}(\mu_{p^\infty}))$ is a f.g. Abelian group.

Proof: It follows from [Roh84]**?** that $L(E,\chi,1) \neq 0$ for a.e. character χ of finite order of $\mathrm{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q})$. **?** □

Def. (20.1.7.9) $[r_p(E/F)]$**.** For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, define

$$r_p(E/F) = \sum_{v\in S(p), E \text{ has potential supersingular reduction at } v} [F_v : \mathbb{Q}_p].$$

Conj. (20.1.7.10). For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, let $\Gamma = \mathrm{Gal}(\mathrm{cycl}_p(F)/F) \cong \mathbb{Z}_p$, then

$$\mathrm{rank}_{\mathrm{Frac}(\mathbb{Z}_p(\Gamma))}[\mathrm{Sel}(E/\mathrm{cycl}_p(F)) \otimes_{\mathbb{Z}_p(\Gamma)} \mathrm{Frac}(\mathbb{Z}_p(\Gamma))] = r_p(E/F)(20.1.7.9)$$

Proof: □

Conj.Cor. (20.1.7.11). For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$,

$$\mathrm{rank}_{\mathrm{Frac}(\Lambda_p)}[\mathrm{Sel}(E/\mathrm{cycl}_p(F)) \otimes_{\Lambda_p} \mathrm{Frac}(\Lambda_p)] \geq r_p(E/F)(20.1.7.9)$$

Proof: Cf.[Coates, Galois of Elliptic Curves, P19]. □

Cor. (20.1.7.12). For $F \in \mathtt{NField}, E \in \mathcal{E}\mathrm{ll}/F, p \in \mathbf{P}$, if E has potential good ordinary reduction at all places dividing p, and $\mathrm{Sel}(E/F)$ is finite, then $\mathrm{Sel}(E/\mathrm{cycl}_p(F))^\vee$ is $\mathbb{Z}_p(\Gamma)$-torsion.

Proof: □

Cor. (20.1.7.13). If $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $\mathrm{rank}_{\mathrm{an}}(E) = 0$, then $\mathrm{Sel}(E/\mathrm{cycl}_p(\mathbb{Q}))^\vee$ is Λ_p-torsion.

Proof: This follows from(19.5.2.1) and(20.1.7.12). □

Cor. (20.1.7.14). Suppose $E \in \mathcal{E}\mathrm{ll}/\mathbb{Q}$ and $p \in \mathbf{P}$ is of good ordinary reduction for E, then

$$\mathrm{Sel}(\mathbb{Q}(\mu_{p^\infty}), E)^\vee$$

is torsion over Λ_p.

Proof: Cf.[Kato]. □

Prop. (20.1.7.15) [Euler Characteristic of $\mathrm{Sel}(E/\mathrm{cycl}_p(F))$]. Let $p \in \mathbf{P} \setminus \{2\}, F \in \mathtt{NField}$, and $E \in \mathcal{E}\mathrm{ll}/F$ with good ordinary reduction over all places $v \in S(p)$. Suppose $\mathrm{Sel}(E/F)$ is finite, then $\mathrm{Sel}(E/F)$ has finite Γ-Euler characteristic, and

$$\chi(\Gamma, \mathrm{Sel}(E/\mathrm{cycl}_p(F))) = \rho_p(E/F) = \Big|\frac{\#\text{Ш}(E/F)[p^\infty]}{(\#E(F)[p^\infty])^2} \cdot \prod_{v \in \Sigma_F^{\mathrm{fin}}} c_v \cdot \prod_{v \in S(p)} (\#\widetilde{E}_v(\kappa_v))^2\Big|_p^{-1}$$

Proof: Cf.[Coates, Galois cohomology of Elliptic Curves, P28]. □

8 Examples

Example (20.1.8.1). There are three elliptic curves of conductor 11 over $\mathbb{Q}$, namely

$$A_0 : y^2 + y = x^3 - x^2 - 10x - 20$$

$$A_1 : y^2 + y = x^3 - x^2$$

$$A_2 : y^2 + y = x^3 - x^2 - 7820x - 263580.$$

And they are all isogenous.

Proof: □

20.2 Iwasawa Theory

1 Iwasawa Theory for Fields

Def. (20.2.1.1)[Iwasawa Algebra]. Let $\Gamma \cong \mathbb{Z}_p$, the **Iwasawa algebra** Λ_p is defined to be

$$\Lambda_p = \mathbb{Z}_p[\Gamma].$$

And it is non-canonically isomorphic to $\mathbb{Z}_p[[T]]$.

Proof: ? □

Def. (20.2.1.2)[Pseudo-Isomorphisms]. A homomorphism between Λ_p-modules are called a **pseudo-isomorphism** if its kernel and cokernel are all finite.

Prop. (20.2.1.3). For $M \in \mathcal{M}\mathrm{od}^{\mathrm{fg}}_{\Lambda_p}$, there exists $r, s, t, n_i, m_j \in \mathbb{N}$ and f_j distinguished and irreducible, s.t. M is pseudo-isomorphic to

$$\Lambda_p^{\oplus r} \oplus (\bigoplus_{i=1}^{s} \Lambda_p/(p^{n_i})) \oplus (\bigoplus_{j=1}^{t} \Lambda_p/(f_j(T)^{m_j})).$$

Proof: Cf.[Washington, P272]. □

Prop. (20.2.1.4). If $B \in \mathcal{M}\mathrm{od}^{\mathrm{tor,fg}}_{\Lambda_p}$, then there exists $f_i \in \Lambda_p^*$ and a pseudo-isomorphism(20.2.1.2)

$$B \to \bigoplus_i \Lambda_p/(f_i).$$

Moreover, the ideal $(\prod_i f_i) \subset \Lambda_p$ is well-defined, called the **characteristic ideal of** B, denoted by $\mathrm{char}(B)$.

Proof: □

Prop. (20.2.1.5). If $X \in \mathcal{M}\mathrm{od}^{\mathrm{fg}}_{\Lambda_p}$ and $\#X_\Gamma < \infty$, then X is torsion over Λ_p.

Proof: Cf.[Washington]. □

20.3 p-adic L-Functions

1 p-Adic L-Functions

Main references are [Fontaine's rings and p-adic L-functions, Colmez], and [Mazur, B.; Tate, J.; Teitelbaum, J. On p-adic analogues of the conjectures of Birch and Swinnerton-Dyer. Invent. Math. 84 (1986), no. 1, 1–48.]

Prop. (20.3.1.1) [Kummer's Theorem]. Let $a \geq$ be coprime to p and $k \geq 1$. If $n_1, n_2 \geq k$ that $n_1 \equiv n_2 \mod \varphi(p)$, then

$$(1-a^{n_1})\frac{B_{n_1}}{n_1} \equiv (1-a^{n_2})\frac{B_{n_2}}{n_2} \mod p^k.$$

Proof: Cf.[p-adic L-functions, Colmez]P5. □

Remark (20.3.1.2). This has vast generalizations in Iwasawa theory, Cf.[Iwasawa, On p-adic L-functions].

2 Iwasawa Main Conjectures

[Wiles, A. The Iwasawa conjecture for totally real fields. Ann. of Math. (2) 131 (1990), no. 3, 493–540], [Rubin, Karl The "main conjectures" of Iwasawa theory for imaginary quadratic fields. Invent. Math. 103 (1991), no. 1, 25–68.].

Thm. (20.3.2.1)[Herbrand]. Let $p \in \mathbf{P}$, $Y = \mathrm{Cl}(\mathbb{Q}(\mu_p))[p]$, then $\mathrm{Gal}(\mathbb{Q}(\mu_p)/\mathbb{Q}) = (\mathbb{Z}/(p))^\times$ acts on Y as a $\mathbb{F}_p$-space by conjugation. Let Y^j be the subspace of Y that $(\mathbb{Z}/(p))^\times$ acts by character $a \mapsto a^j$. Then for $1 < j < p-1$ an odd integer, if $Y^j \neq 1$, then the Bernoulli number B_{p-j} has numerator divisible by p.

Proof: Cf.[Eisenstein Ideals, Mazur, P52]. □

3 Iwasawa Main Conjectures for $\mathrm{GL}(2)$

Main references are [the Iwasawa Main Conjectures for GL(2), Skinner-Urban].

21 Computational Number Theory and Complexity

21.1 Computational Number Theory

References are [Princeton Companion] and [Pi and the AGM. A study in Analytic Number theory and computational complexity].

21.2 Theoretical Computer Science

Def. (21.2.0.1) [Protocols]. A **protocol** is a multi−party algorithm, defined by a sequence of steps, specifying the actions required of two or more parties in order to achieve a specified objective

1 Cryptography

References are [Arithmetic aspects of cryptography, GTM], and [AAG99].

Def. (21.2.1.1) [Key Establishment Protocols]. A **key establishment protocol** is a protocol whereby a shared secret becomes available to two or more parties, for subsequent cryptographic applications.

Prop. (21.2.1.2) [An Algebraic Key Establish Protocol, Anshel-Andhel-Goldfeld]. Let U, V be monoids and

$$\beta : U \times U \to V, \gamma_0, \gamma_1 : U \times V \to V$$

be feasibly computable functions satisfying the following properties:

- $\beta(x, y_1 y_2) = \beta(x, y_1)\beta(x, y_2)$.
- $\gamma_1(x, \beta(y, x)) = \gamma_2(y, \beta(x, y))$.
- Given $y_1, y_2, \ldots, y_k \in U$ and $\beta(x, y_1), \ldots, \beta(x, y_k)$, it is in general infeasible to determine the element x.

Then there is a key establish protocol as follows:

1. Publicly assign users A, B elements $S = \{s_1, \ldots, s_m\}$ and $T = \{t_1, \ldots, t_n\}$.
2. User A choose some $a \in S$ and transmit the elements $\beta(a, t_i)$ to user B.
3. User B chose some $b \in T$ and transmit the elements $\beta(b, t_i)$ to user A.
4. Then item1 guarantees that user A can calculate $\beta(b, a)$ and thus $\gamma_1(a, \beta(b, a))$. Similarly user B can calculate $\beta(a, b)$ and thus $\gamma_2(b, \beta(a, b))$. Then notice

$$\kappa = \gamma_1(a, \beta(b, a)) = \gamma_2(b, \beta(a, b))$$

is an established key.
But to extract an identical element, there are two cases: If there isa. feasible algorithm to put every word in U in canonical form, then they get a identical element. Otherwise there are no canonical form algorithm but has a fast word identifying algorithm, then user A can choose a random word τ other than κ and then choose either send τ or κ to user A. Then user A can determine if this is κ or not, and receives a bit in this way.

Remark (21.2.1.3). An example is given by $U = V = G \in \mathcal{G}\mathrm{rp}$ and

$$\beta(x, y) = x^{-1}yx, \quad \gamma_1(u, v) = u^{-1}v, \quad \gamma_2(u, v) = v^{-1}u.$$

Then

$$\kappa(a, b) = [a, b].$$

Def. (21.2.1.4) [Factoring Integers].

Def. (21.2.1.5) [ECDHE Key Exchange].

Def. (21.2.1.6) [SIDH Key Exchange]. Using a supersingular elliptic curve $E/\mathbb{F}_{p^2}$.

22 Theoretical Physics

22.1 Quantum Mechanics

Basic References are [Nap].

1 Basics

Axiom (22.1.1.1) [Axioms for Quantum Machanics]. The Schrodinger equation can be derived from the Dirac-von Neumann axioms:

The **states of particles** is a countable dimensional Hilbert space, and

- The **observables** of a quantum system are defined to be the (possibly unbounded)Hermitian operators A on $\mathbb{H}$. Then any continuous observable is unitarily diagonalizable, with real eigenvalues by Hilbert-Schimidt(10.10.4.16).
- The **state** φ of the quantum system is a unit vector of $\mathbb{H}$, up to scalar multiples.
- The expectation value of an observable A for a system in a state φ is given by the inner product $(\varphi, A\varphi)$.
- (Unitarity)The time evolution of a quantum state according to the Schrodinger equation is mathematically represented by a unitary operator $U(t)$ (depends only on the state an relative time)(one-parameter subgroup).

Now that $\varphi(t) = \widehat{U}(t)\varphi(t_0)$, so $\widehat{U}(t)\varphi(t_0) = e^{-i\widehat{\mathcal{H}}t}$, $\widehat{\mathcal{H}}$ hermitian.

So now take derivative w.r.t t, we get $i\frac{d\varphi}{dt} = \widehat{\mathcal{H}}\varphi$. By **quantum correspondence principle**, it is possible to derive the expression of $\widehat{\mathcal{H}}$ by classical methods.

Def. (22.1.1.2) [Qubits]. A **qubit** is a state that is complex combination of 0 and 1, i.e. $|\varphi) = \alpha|0) + \beta|1)$. Notice I very dislike the 'bra-ket' notation, I prefer to think of state just as an element in the Hilbert space, and use any notation I like.

Def. (22.1.1.3)[Pauli Observables]. The observables on a two dimensional Hilbert space, i.e. a qubit state space, are all combinations of **Pauli Observables** or Pauli matrixes plus I:

$$\sigma_z = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \quad \sigma_x = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \quad \sigma_y = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$$

Their corresponding eigenvalues are denoted by

$$\uparrow = \begin{bmatrix} 0 \\ 1 \end{bmatrix} \quad \downarrow = \begin{bmatrix} 1 \\ 0 \end{bmatrix}, \quad \rightarrow = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \leftarrow = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ -1 \end{bmatrix}, \quad \otimes = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ i \end{bmatrix} \quad \odot = \frac{1}{\sqrt{2}}\begin{bmatrix} 1 \\ -i \end{bmatrix}$$

Remark (22.1.1.4). The solution of a Schrodinger equation for a non Relativistic particle is assumed to be a Schwartz function (Vanish fast enough at infinity). The coefficients is assumed smooth enough to guarantee at least uniqueness and existence locally.

Prop. (22.1.1.5). The wave function on the (p,t) coordinates is the Fourier Transform of the wave function on the (x,t) coordinates, because the eigenstate of the p-operator $i\hbar\frac{\partial}{\partial x}$ is e^{ikx}, the coefficients of which is the value (probability) of the wave function of the (p,t) coordinates.

Prop. (22.1.1.6) [Schrödinger Uncertainty Principle]. Set $\sigma_A = \sqrt{\langle\widehat{A}^2\rangle - \langle\widehat{A}\rangle^2}$, then:

$$\sigma_A^2 2\sigma_B^2 \geq \left|\frac{1}{2}\langle\widehat{A}\widehat{B} + \widehat{B}\widehat{A}\rangle - \langle\widehat{A}\rangle\langle\widehat{B}\rangle\right|^2 + \left|\frac{1}{2i}\langle[\widehat{A},]\widehat{B}]\rangle\right|^2.$$

Proof: Derived from definition and Schwarz inequality, Cf.[Wiki]. □

Cor. (22.1.1.7) [Heisenberg Uncertainty Principle]. $\sigma_x\sigma_p \geq \frac{\hbar}{2}$.

Proof:

$$[x, i\hbar\frac{\partial}{\partial x}] = i\hbar.$$

□

Prop. (22.1.1.8) [Spectral Decomposition]. In Quantum physics, one need to use spectral decomposition of the Hamiltonian operator. But at most cases, there are only countably many eigenstate and the eigenvalue has a lower bound and tends to infinity. In this case, $(\widehat{H} + A)^{-1}$ is a compact operator thus by spectral theorem(10.10.4.15) the eigenstate of $\widehat{H}$ forms a set of complete basis.

Prop. (22.1.1.9) [No-Cloning Theorem].

Calculations

Prop. (22.1.1.10) [Virial Theorem]. For a system that $V(r) \sim r^n$, the average kinetic energy and the average potential energy has the relation :

$$2\langle T\rangle = n\langle V\rangle.$$

Spin

2 Quantum Computations

Classical Logic Gates

Def. (22.1.2.1) [Boolean Functions]. A **Boolean function** is a function $f : \mathbb{F}_2^n \to \mathbb{F}_2$.

Def. (22.1.2.2) [Classical Logic Gates]. There are four classical logic gates, if we let $0, 1 \in \mathbb{F}_2$, then:

- **AND gate**: $(a, b) \mapsto ab$.
- **OR gate**: $(a, b) \mapsto ab + a + b$.
- **NOT gate**: $a \mapsto a + 1$.
- **COPY gate**: $a \mapsto (a, a)$.

Def. (22.1.2.3) [Reversible Gates]. A gate is called **reversible** iff it is a bijection from $\mathbb{F}_2^n$ to $\mathbb{F}_2^n$.

Def. (22.1.2.4) [Stimulation]. A set of gates is said to be able to **stimulate** a boolean function f iff there is a composition of these gates that maps:

$$(x_1, \ldots, x_{m+n}) \to (g_1(x_1, \ldots, x_{m+n}), \ldots, g_k(x_1, \ldots, x_{m+n}))$$

that if we let $x_{i_1} = a_1, x_{i_2} = a_2, \ldots, x_{i_m} = a_m$ be fixed, where $\{0, 1 \ldots, m+n\} - \{i_1, \ldots, i_m\} = \{j_1, \ldots, j_n\}$(in some order), then $g_1(x_1, \ldots, x_{m+n}) = f(x_{j_1}, \ldots, x_{j_n})$.

A set of gates is called **universal** iff they can stimulates all Boolean function $f : \mathbb{F}_2^n \mapsto \mathbb{F}_2$.

Prop. (22.1.2.5) [Classical Gates Universal]. The four classical gates are universal. In fact, $AND(x, y) = OR(NOT(x), NOT(y))$, so even AND is disposable, and COPY is not used as well.

Proof: Just use OR gate to juxtapose all possible combinations that are mapped to 1. □

Example (22.1.2.6) [Reversible Gates].

- The **CNOT gate** is defined to be $CNOT : (a, b) \mapsto (a, a + b)$.
- The **Toffoli gate** is defined to be $CCNOT : (a, b, c) \mapsto (a, b, c + ab)$.

Prop. (22.1.2.7). CNOT gate cannot stimulate AND. In particular, CNOT is not universal.

Proof: It can be shown that any Boolean function that can be stimulated by CNOT gate is of the form $(x_1, \ldots, x_n) \mapsto \sum a_i x_i + b$. But AND is of the form $(a, b) \mapsto ab$, which is not of the form, so it is not stimulated by CNOT. □

Prop. (22.1.2.8). The Toffoli gate(22.1.2.6) is universal(22.1.2.4).

Proof: It suffices to show it can stimulate AND and NOT, then it can stimulate OR because $OR(x, y) = NOT(NOT(x), NOT(y))$.

AND is outputted in the third bit with $c = 0, a = x, b = y$, NOT is outputted in the third bit with $a = 1 = c, b = x$. □

Quantum Logic Gates

Def. (22.1.2.9) [Quantum Logic Gates]. A **quantum logic gate** is a unitary matrix. So a quantum logic gate is always reversible.

Prop. (22.1.2.10) [Examples of Quantum Gates].

- The **Hadamard gate** H is a rotation on one single qubit given by the matrix $\begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$.
- If a classical gate is reversible and its matrix is unitary, then the same matrix will give out a quantum gate with all entries 0 and 1, called the **quantization** of the classical gate.
- The **Fredkin gate** or CSWAP gate is a three-bit gate defined as the quantization of the gate given by:$(a, b, c) \mapsto (a, a(b + c) + b, a(b + c) + c)$.

3 Quantum Algorithms

Deutsch-Jozsa Algorithm

Prop. (22.1.3.1) [Deutsch-Jozsa Algorithm]. The **Deutsch-Jozsa problem** is that: given a function $f : \mathbb{F}_2^n \to \mathbb{F}_2$, which is either a constant function or a function that takes half value 0 and half value 1, If we have a box that maps:$(x_1, \ldots, x_n, x) \mapsto (x_1, \ldots, x_n, x + f(x_1, \ldots, x_n))$.

Now there is a **Deutsch-Jozsa algorithm** that can determine if f is a constant function just using the box one time.

Proof: Cf.[Napkin P270]. The circuit is

$$\begin{aligned}(0,0,\ldots,0,1) &\mapsto (H(0),H(0),\ldots,H(0),H(1)) \mapsto (H(0),H(0),\ldots,H(0),H(1)+f(H(0),H(0),\ldots,H(0)))\\ &\mapsto (H(H(0)),H(H(0)),\ldots,H(H(0)),H(1)+f(H(0),H(0),\ldots,H(0))).\end{aligned}$$

Then we measure all the first n bits in the $|0)/|1)$-basis.

Notice if f is constant, then the first n bits must be all $\pm|00\ldots0)$, so the measure is all 0. And if f is not constant, then the first n bits are entangled, equals the image of

$$\frac{1}{\sqrt{2}^n}\sum_{(a_1,\ldots,a_n)\in\mathbb{F}_2^n}(-1)^{f(a_1\ldots a_n)}|a_1\ldots a_n).$$

after the action of $H^{\otimes n}$, then its coefficient of $|0\ldots0)$ is just 0, so the measure cannot be all 0. □

Quantum Fourier Transform

Def. (22.1.3.2) [Discrete Fourier Transform]. The **inverse Fourier transform** is defined to be:$(x_0,\ldots,x_{n-1})\mapsto(y_0,\ldots,y_{n-1})$, where

$$y_k=\frac{1}{N}\sum_{j=0}^{N-1}\omega_N^{jk}x_k.$$

This is in fact represented by a van der Waerden matrix of ω_N times $\frac{1}{N}$.

Prop. (22.1.3.3) [Fast Fourier Transform]. There is a **fast Fourier transform algorithm** that can calculate the Fourier transform in $O(N\log N)$ time.

Proof: □

Def. (22.1.3.4) [Quantum Fourier Transform]. The **quantum Fourier transform** is a gate represented by a matrix U_{QFT} which is the van der Waerden matrix of ω_N times $\frac{1}{\sqrt{N}}$.

Proof: It suffices to prove this matrix is truly unitary. □

Prop. (22.1.3.5) [Tensor Representation]. The trick of the quantum Fourier transform lies in its connection with the 2-adic decimal representation:

$$\begin{aligned}U_{QFT}(|x_nx_{n-1}\ldots x_1)) = \frac{1}{\sqrt{N}}&(|0)+\exp(2\pi i\cdot 0.x_1)|1))\\ &\otimes(|0)+\exp(2\pi i\cdot 0.x_2x_1)|1))\\ &\otimes\ldots\\ &\otimes(|0)+\exp(2\pi i\cdot 0.x_nx_{n-1}\ldots x_1)|1))\end{aligned}$$

Proof: Direct calculation.? □

Prop. (22.1.3.6). Now by the above tensor representation, the thing seems to be beautiful, and it seems the Fourier transform for 2^n data can be done in n^2 steps. And this is true, QFT_n is inductively define, Cf.[Napkin P273].

Shor's Algorithm

Def. (22.1.3.7). For a number $M = pq$, where p, q are different odd prime numbers. Then an $x \mod M$ is called **good** iff: $(x, M) = 1$, $r = \text{ord}(x)$ is even, and neither of $x^{r/2} \pm 1$ is divisible by M.

Then at least half of $(\mathbb{Z}/M\mathbb{Z})^*$ is good.

Proof: It suffices to consider a fixed order $2a$, and this is additive in $\mathbb{Z}/(2a, p-1)\mathbb{Z} \times \mathbb{Z}/(2a, q-1)\mathbb{Z}$.?. □

Remark (22.1.3.8). If we find a good x for M, then $x^{r/2} \pm 1$ contains separately a prime p or q, so we can use Euclidean algorithm to extract a prime of M. This is just the idea of Shor's algorithm(22.1.3.9).

Prop. (22.1.3.9) [Shor's Algorithm]. For $M = pq$, we can factor p, q out in $O((\log M)^2)$ time.

Proof: Cf.[Napkin P274]. □

Grover's Algorithm

Prop. (22.1.3.10).

Prop. (22.1.3.11) [Grover's Algorithm]. If there are n items labeled $\{0, \dots, n-1\}$, and there is a marked item w. then there is a quantum algorithm that find w in $O(\sqrt{n})$ times.

Proof: Cf.[Quantum Algorithm MIT P33,35]. □

22.2 Quantum Field Theory

Main references are [Witten, Super-symmetry and Morse Theory]. [Witten, Topological Quantum Field Theory, 1988]. [Witten, Elliptic Genera and Quantum Field Theory], [Quantum Field Theory and the Jones Polynomial, Witten], [Supersymmetry and Morse Theory, Witten].

1 Supersymmetric Quantum Field Theory

Main references are [Supersymmetry and Morse Theory, Witten].

2 Topological Quantum Field Theory

Main references are [Ati88], [On the Classification of Topological Field Theories, Lurie].

Remark (22.2.2.1). It now seems clear that the way to investigate the subtleties of low-dimensional manifolds is to associate to them suitable infinite-dimensional manifolds (e.g. spaces of connections) and to study these by standard linear methods (homology, etc.). In other words we use quantum field theory as a refined tool to study low-dimensional manifolds. ——Atiyah.

Def. (22.2.2.2) [Topological Quantum Field Theory]. A **topological quantum field theory** or TQFT in dimension d defined over a ground ring $\Lambda\in\mathcal{CA}\mathrm{lg}$ consists of the following data:

- For any $\Sigma\in\mathcal{D}\mathrm{iff}^d_{\mathrm{orntd,cpct}}$, there is a finite Λ-module $Z(\Sigma)$, called the **states of particles of** Σ.
- For any $M\in\mathcal{D}\mathrm{iff}^{d+1}_{\mathrm{orntd},\partial}$, there is an element $Z(M)\in Z(\partial M)$, called the **vacuum state defined by** M.

s.t.

- Z are functorial in orientation-preserving diffeomorphisms of Σ or M.
- Z are involutary, i.e. $Z(\Sigma^*)=Z(\Sigma)^*$, where Σ^* is Σ with the dual orientation and $Z(\Sigma)^*$ is the dual module of $Z(\Sigma)$.
- Z is multiplicative, i.e. $Z(\Sigma_1\coprod\Sigma_2)=Z(\Sigma_1)\otimes Z(\Sigma_2)$, and if $\partial M_1=\Sigma_1\coprod\Sigma_3,\partial M_2=\Sigma_3*\coprod\Sigma_2, M=M_1\coprod_{\Sigma_3}M_2$, then
$$Z(M)=\langle Z(M_1),Z(M_2)\rangle$$
where the pairing is the natural pairing $Z(\Sigma_3)\times Z(\Sigma_3)^*\to\Lambda$.
- $Z(\varnothing^d)=\Lambda$, and $Z(\varnothing^{d+1})=1\subset\Lambda=Z(\varnothing^d)$.

Prop. (22.2.2.3) [Cobordisms]. If For $M\in\mathcal{D}\mathrm{iff}^{d+1}_{\mathrm{orntd},\partial}$, if $\partial M=\Sigma_1^*\coprod\Sigma_2$, then $Z(M)\in Z(\Sigma_1)^*\otimes Z(\Sigma_2)$ can be regarded as a homomorphism $Z(M):Z(\Sigma_1)\to Z(\Sigma_2)$, and this is compatible with composition of cobordisms. In particular, if $\Sigma\in\mathcal{D}\mathrm{iff}^d_{\mathrm{orntd,cpct}}, M=\Sigma\times[0,1]$, then $Z(M)=\mathrm{id}\in\mathrm{End}(Z(\Sigma))$.

In particular, the states of particles and vacuum states can be calculated by cut-and-paste.

Def. (22.2.2.4) [Vacuum-Vacuum Expectation Values]. For $M\in\mathcal{D}\mathrm{iff}^{d+1}_{\mathrm{orntd,cpct}}$, $Z(M)\in Z(\partial M=\varnothing)=\Lambda$ is an element, called the **vacuum-vacuum expectation value** of M.

Prop. (22.2.2.5) [Homotopy Invariance]. Let $\Sigma,\Sigma'\in\mathcal{D}\mathrm{iff}^d_{\mathrm{orntd,cpct}}, M=\Sigma\times[0,1], M'=\Sigma'\times[0,1]$, and $F:M\to M'$ is a homotopy of morphisms between $f_1,f_2:\Sigma\to\Sigma'$, then $Z(f)=Z(f'):Z(\Sigma')\to Z(\Sigma)$, by(22.2.2.3).

Examples of Topological Quantum Field Theory

Remark (22.2.2.6). For $d = 1$, there are Floer/Gromov theory and holomorphic conformal field theories.

Remark (22.2.2.7). For $d = 2$, there are Jones/Witten theory, Casson theory, Johnson theory, and "Thurston" theory.

Remark (22.2.2.8). For $d = 3$, there are Floer/Donaldson theory.

3 Vector Operator Algebras

Cf.[Princeton Companion].

22.3 Mirror Symmetry

Cf.[Princeton Companions].

22.4 General Relativity

1 Basics

Prop. (22.4.1.1) [Maxwell's Equation]. Normal Maxwell's equation reads:

$$\begin{cases} \mathrm{div}E = q & \text{(Coulomb's law)} \\ \mathrm{div}H = 0 & \text{(Gaussian law)} \\ \mathrm{curl}E = -\frac{1}{c}\frac{\partial H}{\partial t} & \text{(Faraday's law)} \\ \mathrm{curl}H = j + \frac{1}{c}\frac{\partial E}{\partial t} & \text{(Ampère-Maxwell law)} \end{cases}$$

where E is the magnetic field, H is the electric field, q the charge density, j the electric current.

In Minkowski space, we define the electromagnetic 2-form

$$F = \frac{1}{2}F_{\alpha\beta}dx^\alpha \wedge dx^\beta,$$

where $F_{i0} = E_i, \quad Fij = H_k$, and electric current J, $J^i = -j^i, J^0 = q$.

Maxwell's equation can be re-written as:

$$d^*F = J \qquad dF = 0.$$

Where $d^* = *d*$.

Proof: The Minkowski space is flat, the equivalence can be seen by direct calculation. □

23 Combinatorics

23.1 Combinatorics

1 Graph Theory

Def. (23.1.1.1) [Graphs]. A **graph** X is a CW-complex of dimension≤ 1 with a given presentation $(X^0, X^1 = X)$(3.12.3.1). the elements in the set of X^0 are called **vertices** of X, and the 1-cells are called **edges** of X.

For a graph X, a **subgraph** is a sub CW-complex of X.

Def. (23.1.1.2) [Trees]. A **tree** is a graph T s.t. $H_1(T) = 0$. A tree in a graph X is called a **maximal tree** if it contains all vertices of X. A **forest** is a graph that is a disjoint union of trees.

Prop. (23.1.1.3). Any tree T is contractible, and any vertex v is a deformation retract of T.

Proof: □

Prop. (23.1.1.4) [Maximal Trees]. Every connected graph contains a maximal tree, and any tree in such a graph is contained in a maximal tree.

A tree T in a graph X is maximal iff $X^0 \subset T$.

Proof: Cf.[Hat02]P84. □

Prop. (23.1.1.5) [π_1 of Graphs]. For a connected graph X with a maximal tree T, $\pi_1(X)$ is a free group with basis the classes $[f_\alpha]$ corresponding to the edges $e_\alpha \in X\backslash T$.

Proof: The quotient map $X \to X/T$ is a homotopy equivalence by(3.12.6.7). And the quotient space X/T has only one vertex, thus is a wedge sum of circles corresponding to $e_\alpha \in X\backslash T$. So we are done by(3.12.4.28). □

Prop. (23.1.1.6) [Covering Spaces of Graphs]. Every covering space $\pi : \widetilde{X} \to X$ of a graph is also a graph, with vertices and edges lifts of vertices and edges of X.

Proof: Let the sets $\pi^{-1}(v)$ be vertices of $\widetilde{X}$, where v are vertices of X. And if we write X as a quotient space of $X^0 \cup_\alpha I_\alpha$, each I_α can be lifted to maps to $\widetilde{X}$, and we let these be edges of $\widetilde{X}$. The topology of $\widetilde{X}$ coming from quotient topology of this is the same as the original topology, because they has the same basis open sets, because π is a local homeomorphism. □

Prop. (23.1.1.7) [Spencer's Lemma]. If there is a triangulation of a plane polygon P, for arbitrary 3-color numbering($\{0, 1, 2\}$) of the vertices, if the number of edges on the boundary with color $(0, 1)$ is odd, then there is a triangle with vertices of pairwise different colors.

Proof: In fact the number of those triangles with vertices of pairwise different colors is odd. In fact, the number of $(0, 1)$-edges on a triangle is odd iff its vertices has pairwise different colors. But the sum of numbers of $(0, 1)$-edges on the triangles are odd, by hypothesis, thus the result. □

Connectedness

Def. (23.1.1.8) [s-Connected Graphs]. For $s \in \mathbb{Z}_+$, a graph is called **k-connected** if it is connected after deleting any $k-1$ vertices.

Def. (23.1.1.9) [(x, y)-Cuts]. For a finite graph G and $x, y \in V(G)$ with $d(x, y) \geq 2$, an **(x, y)-cut** in G is a set $S \in V(G) \setminus \{x, y\}$ s.t. $G \setminus S$ has no (x, y)-paths.

Def. (23.1.1.10) [Independent Sets]. An independent set in a graph is a set of vertices that any two of them is not connected.

Thm. (23.1.1.11) [Menger]. Let G be a finite graph and $x, y \in V(G)$ s.t. $d(x, y) \geq 2$. Denote $\kappa_G(x, y)$ the minimum size of an (x, y)-cut in G and $\lambda_G(x, y)$ a maximum number of internally-disjoint (x, y)-paths in G, then $\kappa_G(x, y) = \lambda_G(x, y)$.

Proof: □

Def. (23.1.1.12) [(x, U)-Fans]. For a finite graph G and a subset $U \subset V(G)$ and $x \in V(G) \setminus U$, an **(x, U)-fan** of size k is a set of k-paths from x to U s.t. any two of them shear only x.

Prop. (23.1.1.13) [Fan Lemma, Dirac]. For $k \in \mathbb{Z}_+$, a graph is k-connected iff it has at least $k+1$ vertices, and for any subset U of vertices G with $|U| \geq k$ and each vertex $x \notin U$, G has an (x, U)-fan of size k.

Proof: If G has at least $k+1$ vertices and for any subset $U \subset V(G)$ with $|U| \geq k$ and each vertex $x \notin U$, G has an (x, U)-fan of size k, we show G is k-connected: If there is a $(k-1)$-vertex cut S, let A be a connected component of $G \setminus S$, and $U = V(G) \setminus A$. Then $\#U \geq k$, and for any $x \in A$, there are no (x, U)-cut of size k, because each path from x to U must intersect with S.

Conversely, if G is k-connected and $U \subset V(G), \#U \geq k$. Let $G' = G *_U \{y\}$, then G' is also k-connected. Then by Menger's theorem(23.1.1.11), $\lambda_G(x, y) = \kappa_G(x, y) \geq k$. Let $P_1, \ldots, P_k$ be internally-disjoint (x, y)-paths in G', then after deleting y, they form an (x, U)-fan of size k. □

Def. (23.1.1.14) [Hamiltonian Circuits]. Let G be a finite graph, then an **Hamiltonian circuit** is an loop in G s.t. each vertices appear exactly once. An **Hamiltonian path** is a path in G s.t. each vertices appear exactly once.

G is called **Hamiltonian connected** if each pair of vertices $x \neq y \in G$ is the endpoint of a Hamiltonian path in G.

Thm. (23.1.1.15) [Chvátal-Erdös]. If G is a finite graph with at least 3 vertices, and for some $k \in \mathbb{Z}_+$, G is s-connected and contains no independent set of cardinality$> k$, then G has a Hamiltonian circuit.

Proof: The hypothesis implies that G is not a tree thus contains a circuit. Take a longest circuit C, if there exists $x \notin C$, then by Fan lemma(23.1.1.13), there exists an (x, U)-fan of size k, with vertices $x_1, \ldots, x_k$. Take any ordering of C and let y_i be the successor of x_i, then for the set $\{x, y_1, \ldots, y_k\}$, either there is a path xy_i or there is a path y_iy_j. In each case, we can find a circuit of larger size, contradiction. □

Cor. (23.1.1.16). If G is an k-connected finite graph with no independent set of cardinality$> k+1$, then G has an Hamiltonian path.

Proof: The graph $G * \mathrm{pt}$ satisfies the hypothesis of(23.1.1.15) and has a Hamiltonian circuit. Thus G has an Hamiltonian path. □

Cor. (23.1.1.17). If G is a finite graph with at least 3 vertices, and for some $s \in \mathbb{Z}_+$, G is k-connected and contains no independent set of cardinality$> k$, then G is Hamiltonian-connected.

Proof: The proof is similar to that of(23.1.1.15): For any vertices $x \neq y \in G$, just choose the longest path from x to y. □

Complete Graphs

Prop. (23.1.1.18). For any $k, l \in \mathbb{Z}_+$ and a graph G of size $(k-1)(l-1)+1$, then either G contains a complete k-graph, or any no-circuits ordering of the complement graph G' contains a directed path of l-vertices.

Proof: Consider any ordering on G'. then we can put the vertices in a matrix by the following rule: The first row are vertices with no inward order, and for any $k \geq 1$, the row k are vertices not in the first k row and has an inward edge from some vertex in the row k.

Then there are no edges between vertices in the same row, and we are done if some row has k vertices. If each row has less than k vertices, then there are at least l row, which will give us a directed path of l-vertices, by our rule of construction. □

Cor. (23.1.1.19). For any $k, l \in \mathbb{Z}_+$ and $a_1 < a_2 < \ldots < a_{(k-1)(l-1)+1} \in \mathbb{Z}_+$, there either exists k of them no one dividing the other, or there exists l of them each of a multiple of the previous one.

Planer Graphs

Prop. (23.1.1.20) [Plane Graphs]. When can a graph be embedded in $\mathbb{R}^2$.**?**

Proof: □

Prop. (23.1.1.21) [Euler]. A simple finite planer graph G satisfies $E(G) < 3V(G) - 6$.

Proof: □

Extremal Graph Theory

Prop. (23.1.1.22) [Rademacher]. For any $n \in \mathbb{Z}_+$, any graph G with $V(G) = 2n, E(G) = n^2 + 1$ contains at least n triangles.

Proof:

□

Applications

Thm. (23.1.1.23) [Monsky]. A square cannot be divided into m triangles of the same area, where m is odd.

Proof: Choose a 3-coloring on $\mathbb{R}^2$: By(12.2.1.28) there can be an extended 2-adic valuation $|\cdot|_2$ on $\mathbb{R}$ that extends the 2-adic valuation on $\mathbb{Q}$, then color a point (x, y)

- 0 if $|x|_2 < 1, |y|_2 < 1$,
- 1 if $|x|_2 \geq 1$ and $|x|_2 \geq |y|_2$.
- 2 if $|y|_2 \geq 1$ and $|y|_2 > |x|_2$.

Then there are two things:

1. The coloring is invariant under translation by vectors represented by a point of color 0.
2. The valuation of the area of a triangle with vertices of 3 different colors is bigger than 1, because we can assume one vertex is the origin, and then its area is $\frac{1}{2}|x_1y_2 - x_2y_1|$, which, because the coloring, must have 2-adic valuation bigger than 1.

Now back to the question, let the square be placed as a unit square, then its area is 1, and it has exactly one $(0,1)$-edge, so by Spencer's lemma(23.1.1.7), it has a triangle with vertices of pairwise different colors, so its area A has valuation>1, but the total area is $mA = 1$ that has valuation 1, so $|m| < 1$, which means that m is even. □

Prop. (23.1.1.24) [Hindman's Theorem]. Whenever $\mathbb{N}$ is colored with f.m. colors, one can find an infinite subset $A \subset \mathbb{N}$ and a color c that whenever $F \subset A$ is finite, the color of the sum of numbers in F is colored c.

Proof: Cf.[W. W. Comfort, Ultrafilters: some old and some new results, Bull. Amer. Math. Soc. 83 (1977) 417–455.] □

2 Spander Graphs

3 Polytopes

Def. (23.1.3.1) [Polytopes]. A n-**polytope** is a compact subset of $\mathbb{R}^n$ for some $n \in \mathbb{Z}$ with boundaries given by polytopes of smaller dimensions. A **polygon** is a 2-polytope. A **polyhedron** is a 3-polytope.

Def. (23.1.3.2) [Tetrahedra]. A **tetrahedron** is an 3-simplex in $\mathbb{R}^3$.

Def. (23.1.3.3) [Orthohedra]. An **orthohedron** is a tetrahedron isomorphic to the convex hull of the four points

$$\{(0,0,0),(x,0,0),(x,y,0),(x,y,z)\} \in \mathbb{R}^3.$$

Prop. (23.1.3.4) [Dihedral Angles of Orthohedra].

- Each orthohedron has dihedral angles $(\alpha, \beta, \gamma, \pi/2, \pi/2, \pi/2)$.
- A rectangular solid can be cut into 6 orthohedra sharing a common diagonal. And for any $\alpha, \beta, \gamma \in (0, \pi), \alpha + \beta + \gamma = \pi$, there is a rectangular solid that can be cut into 6 orthohedra s.t. the dihedral angles along the diagonal are $(\alpha, \beta, \gamma, \alpha, \beta, \gamma)$.

Proof: Only 2 needs a proof, and this is verified by brutal force calculations. □

4 Hilbert's 3rd Problem

Cf.[Sch13b].

Def. (23.1.4.1) [Scissors Congruence]. A **dissection of a polytope** P is an expression $P = \cup_i^n P_i$ s.t. the interiors of P_i are disjoint.

Two polytopes P, Q are called **scissors-congruent** if there are dissections $P = \cup_i^n P_i, Q = \cup_i^n Q_i$ s.t. $P_i \cong Q_i$ for $1 \le i \le n$. Scissors congruence relations are denoted by $\sim_s$.

Thm. (23.1.4.2) [Wallace-Bolyai-Gerwien]. Any two polygons P, Q in $\mathbb{R}^2$ are scissors-congruent.

Proof: Find a line l that is not parallel to any line generated by vertices of P and Q, cut P,Q through lines parallel to l and passing through some vertices of O,Q. Then we get some trapezoids. Then we cut them into right triangles.

Now we transform any right triangle P with vertices $\{A=(-0,0),B=(0,2b),C=(0,c)\}$ to a triangle triangle of height 2: Now consider another right triangle with vertices $\{A=(-0,0),X=(0,2),Y=(0,bc)\}$. Then $BY//CX$, thus BYC and BYX are triangles of the same base and height.

Then $BYC\sim_s BYX$: cut them into parallelograms with the same base and height, then it is easy to see any two such parallelograms are scissor-congruent.

Now all the triangles has a side of length2, we can transform them into rectangles with a side of length1. Then clearly P,Q are transformed together. ☐

Thm. (23.1.4.3) [Zylev]. If P,A,B are polytopes, $A\subset P, B\subset P$, $P\backslash A\sim_s P\backslash B$, then $A\sim_s B$.

Proof: Let

$$F=A\coprod\coprod_{k=1}^n P_k=B\coprod\coprod_{k=1}^n Q_k, P_k\sim_s Q_k$$

We can dissect them even further s.t. $\mathrm{Vol}(P_k)<\frac{1}{2}\mathrm{Vol}(A)$. Then we use induction on n to show that $A\sim_s B$: $n=0$ is trivial. For $n>0$, because of the volume bound, $\mathrm{Vol}(A\backslash Q_n)>\mathrm{Vol}(Q_n)$, thus we can find disjoint $T_1,\dots,T_n\subset A\backslash Q_n$ s.t. $T_k\sim_s P_k\cap Q_n$. Now define

$$F'=F\backslash Q, P_k'=(P_k\backslash Q_n)\cup T_k\sim_s P_k,\quad A'=F'\backslash\bigcup_{k=1}^{n-1}P_k'=(A\backslash\bigcup_{k=1}^{n-1}T_k)\bigcup_{k=1}^{n-1}Q_k$$

Then by induction, $A'\sim_s B'=B$. But $A'\sim_s A$ by changing T_k with Q_k. ☐

<u>**Dehn-Sydler Theorem**</u>

Prop. (23.1.4.4) [Tetrahedra]. Any polyhedron has a dissection into tetrahedra.

Proof: By choose a sufficiently small lattice dissection of $\mathbb{R}^3$, it suffices to consider three cases:
- A cube.
- A cube cut by one hypersurfaces.
- A cube cut by two hypersurfaces.
- A cube containing a single vertex.

All cases are straightforward. ☐

Def. (23.1.4.5) [Dehn Invariants]. For a polyhedron P, define the **Dehn invariant** of P as

$$\Delta(P)=\sum_i l_i[\alpha_i]\in\mathbb{R}\otimes(\mathbb{R}/\mathbb{Z}\pi)$$

where the sum is over all edges e_i, of P, $l_i=l(e_i)$, and α_i is the dihedral angles of e_i.

Thm. (23.1.4.6) [Dehn]. If two polyhedra in $\mathbb{R}^3$ are scissors-congruent, then they have the same volume and Dehn invariants.

Proof: The volumes are the same by the invariance properties of Lebesgue measure. To show the Dehn invariants are the same, notice the dissections of a polytope P may create new edges, but the sum of angles around a new edge is 2π for if it is contained in the interior of P, or π if it is in the surface of P. ☐

Def. (23.1.4.7) [Simple Prisms]. A **simple prism** is a polyhedron that is isomorphic to an affine translate of $T \times I \subset \mathbb{R}^2 \times \mathbb{R}$, where $T \subset \mathbb{R}^2$ is a triangle.

Prop. (23.1.4.8). A simple prism P is scissors-congruent to $[0,1]^2 \times [0, \mathrm{Vol}(P)]$.

Proof: Place the three edges P_1Q_1, P_2Q_1, P_3Q_3 that is the image of Vertices$(T) \times I$ vertically, and they have length l. Then we can talk about the **heights** of P_i, Q_i. Suppose $h(P_1) \geq h(P_2) \geq h(P_3)$. If $h(P_3) \geq h(Q_1)$, then we can cut P along height $h(Q_1)$ make P scissors-congruent to a perfect simple prism $P' = T' \times I'$. If $h(P_3) < h(Q_1)$, then we can cut P along the plane $P_2P_3Q_1$ to make $P \sim_s P'$, where for P', $h(P_3') - h(Q_1')$ is larger. And if this process goes on, every 2 transform makes $h(P_3) - h(Q_1)$ bigger by at least l, so eventually $h(P_3) \geq h(Q_1)$, and we can transform it to a perfect simple prism.

Now if $P = T \times I$ is a perfect simple prism, (23.1.4.2) shows T is scissors equivalent to $[0,1] \times [0, \mathrm{Vol}(T)]$, and then it suffices to show $[0, \mathrm{Vol}(T)] \times I$ is scissors equivalent to $[0, \mathrm{Vol}(P)]$, which is by(23.1.4.2) again. □

Def. (23.1.4.9) [pseudo-prisms]. A **pseudo-prisms** is a convex polyhedra $(OPQRS)$, where

- OPQ is is an isosceles with $OP = PQ$,
- PR, QS is orthogonal to the plane OPQ,
- $l(QS) = 2l(PR)$.

Notice a pseudo-prism $(OPQRS)$ is scissors-congruent to the perfect simple prism $OPQ \times PR$.

Def. (23.1.4.10). Denote

- $\mathcal{P}$ the free Abelian group generated by isomorphism classes of all polyhedra.
- $\mathcal{E}$ the subgroup of $\mathcal{P}$ generated by the dissection relations.
- $\mathcal{F}$ is the subgroup of $\mathcal{P}$ generated by $\mathcal{E}$ and all the simple prisms(23.1.4.7).
- $\mathcal{V} = \mathcal{P}/\mathcal{F}$.

Then clearly two polyhedra P, Q are scissors-congruent iff $[P] = [Q] \in \mathcal{P}/\mathcal{E}$.

Prop. (23.1.4.11)[$\mathbb{R}$-Structures]. $\mathbb{R}$ acts on the set of polyhedra by scaling, and this action is additive and multiplicative, and stablizes $\mathcal{F}$, thus inducing an $\mathbb{R}$-structure on $\mathcal{V}$.

Proof: By(23.1.4.4), $\mathcal{P}$ is generated by tetrahedra. So it suffices to show that for $\lambda_1, \lambda_2 \in \mathbb{R}_+$ and a tetrahedron T, $[\lambda_1 T] + [\lambda_2 T] - [(\lambda_1 + \lambda_2)T] \in \mathcal{F}$. For this, use geometry, notice $(\lambda_1 + \lambda_2)T \backslash (\lambda_1 T \cup \lambda_2 T)$ consists of two simple prisms, where these two smaller tetrahedra aligned along an edge of T. □

Prop. (23.1.4.12) [Orthohedra]. $\mathcal{V}$ is generated by orthohedra(23.1.3.3).

Proof: By(23.1.4.4), it suffices to show that for any tetrahedron T, $[T]$ is a linear combinations of orthohedra. For this, take the center I of the inscribed circle of T, and take its projections I_1, I_2, I_3, I_4 to the faces of T, then they form 24 orthohedra(may be degenerate ones). Thus T is a linear combinations of those non-degenerate orthohedra. □

Prop. (23.1.4.13). A simple primes P has Dehn invariant $\Delta(P) = 0$(23.1.4.14) and(23.1.4.8), so by(23.1.4.8) again, Δ factors through $\Delta : \mathcal{V} \to \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi)$, which is $\mathbb{R}$-linear with $\mathbb{R}$-structure on $\mathcal{V}$ given in(23.1.4.11).

Thm. (23.1.4.14) [Dehn-Sydler]. Two polyhedra in $\mathbb{R}^3$ are scissors-congruent iff they have the same volume and Dehn invariants.

Proof: One direction is shown in(23.1.4.6). For the other, it suffices to show this map $\Delta : \mathcal{V} = \mathcal{P}/\mathcal{F} \to \mathbb{R}\otimes(\mathbb{R}/\mathbb{Z}\pi)$(23.1.4.13) is injective, because in this way, if two polyhedra has the same volume and Dehn invariants, then they are scissors equivalent to two prisms with the same volume, hence scissors-congruent, by(23.1.4.8).

Take a good function $\varphi : \mathbb{R} \to \mathcal{V}$(23.1.4.24). φ vanishes on $\mathbb{Z}\pi$, thus extends to an $\mathbb{R}$-linear map $\Phi : \mathbb{R}\otimes(\mathbb{R}/\mathbb{Z}\pi) \to \mathcal{V}$, and for an orthohedron T, $\Phi(\Delta([T])) = [T]$ by(23.1.4.15), and orthohedra generate $\mathcal{V}$ by(23.1.4.12), so $\Phi\circ\Delta = \mathrm{id}_{\mathcal{V}}$. Thus Δ is injective. □

Homological Arguments

Def. (23.1.4.15) [Good Functions]. A map $\varphi : \mathbb{R} \to \mathcal{V}$ is called a **good function** if

- φ is additive and $\varphi(\pi) = 0$.
- For any orthohedron T, $[T] = \sum_{i=1}^{6} l_i\varphi(\alpha_i)$, where the notation is the same as in(23.1.4.5).

Def. (23.1.4.16) [$T(a, b)$]. For $a, b \in (0, 1)$, define $a' = \sqrt{a^{-1} - 1}, b' = \sqrt{b^{-1} - 1}$, and define $T(a, b)$ to be the orthohedron with vertices

$$\{(0, 0, 0), (a', 0, 0), (a', a'b', 0), (a', a'b', b')\} \in \mathbb{R}^3.$$

Notice $T(a, b) \cong T(b, a)$.

The order of the vertices is also important. It is always assumed to be written in this order.

Prop. (23.1.4.17). For $\alpha, \beta \in \mathbb{R}$, $T(\sin^2(\alpha), \sin^2(\beta))$ has three edges with dihedral angle $\pi/2$, and three edges with lengths $\cot(\alpha), \cot(\beta), \cot(\gamma)$ and dihedral angles $(\alpha, \beta, \pi/2 - \gamma)$ resp., where $\sin^2(\gamma) = ab, \gamma \in (0, \pi/2)$. In particular,

$$\Delta(T(\sin^2(\alpha), \sin^2(\beta))) = \cot(\alpha)\otimes\alpha + \cot(\beta)\otimes\beta + \cot(\gamma)\otimes(\pi/2 - \gamma).$$

Proof: Brutal force calculation. □

Prop. (23.1.4.18). For $a, b, c \in \mathbb{R}_+$,

$$a[T(\frac{a+b}{a+b+c}, \frac{a}{a+b})] + b[T(\frac{a+b}{a+b+c}, \frac{b}{a+b})] = a[T(\frac{a+c}{a+b+c}, \frac{a}{a+c})] + c[T(\frac{a+c}{a+b+c}, \frac{c}{a+c})]$$

Proof: This follows from the different ways of cutting the tetrahedron with vertices

$$\{O = (0, 0, 0), X = (\sqrt{bc}, 0, 0), Y = (0, \sqrt{ac}, 0), Z = (0, 0, \sqrt{ab})\} \in \mathbb{R}^3.$$

In fact, for this tetrahedron, the plane orthogonal to YZ passing through X cut this to two orthohedra, and similar does the plane orthogonal to XZ passing through Y. These two cutting give the assertion above. □

Def. (23.1.4.19) [Homological Functions]. A **homological function** is a function $h : (0, 1) \to \mathcal{V}$ s.t.

- For $a, b \in (0, 1), [T(a, b)] = h(a) + h(b) - h(ab)$.
- If $a, b \in (0, 1), a + b = 1$, then $ah(a) + bh(b) = 0$.

Prop. (23.1.4.20). For $V \in \mathcal{V}\mathrm{ect}/\mathbb{R}$, if $g : \mathbb{R}_+ \to V$, define $\delta(g)(a, b) = g(a) + g(b) - g(ab)$. And if $F : \mathbb{R}_+^2 \to V$, define $\delta(F)(a, b, c) = F(a, b) - F(a, c) + F(ab, c) - F(ac, b)$.

Then if $F : (0, 1) \to V$ is symmetric and $\delta(F) = 0$, then $F = \delta(f)$ for some $f : (0, 1) \to V$.

Proof: Cf.[Sch13b]. □

Prop. (23.1.4.21). Let $G : \mathbb{R}_+^2 \to V$ be a symmetric function satisfying

- $G(\lambda a, \lambda b) = \lambda G(a, b), \lambda, a, b \in \mathbb{R}_+$,
- $G(a, b) + G(a + b, c) = G(a, c) + G(a + c, b)$.

Then there exists a homomorphism $g : \mathbb{R}_+^\times \to V$ s.t. when $a + b = 1$,

$$G(a, b) = ag(a) + bg(b).$$

Proof: Cf.[Sch13b]. □

Prop. (23.1.4.22)[Sydler]. Let $F : (0, 1)^2 \to \mathcal{V} : (a, b) \mapsto [T(a, b)]$, then F is symmetric, and $\delta(F) = 0$.

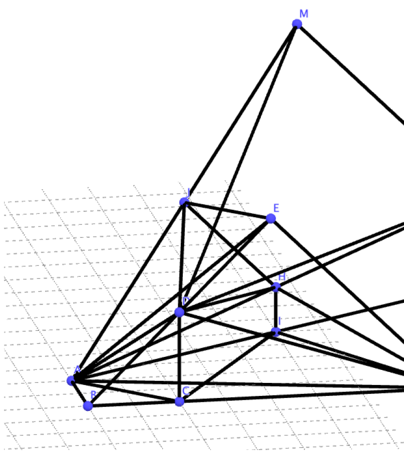
Proof: We check that $[T(a, b)] + [T(ab, c)] = [T(a, c)] + [T(ac, b)]$. This is done by geometry:

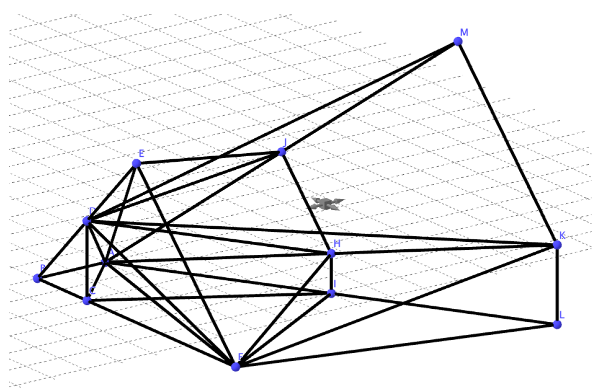
Put $T(a, b), T(a, c)$ together: $T(a, b) \cong ABCD, T(a, c) \cong ABEF$, where BDE is collinear. Let H be the center of the sphere S passing through $ACDEF$, and the projection of H on the planes ABC, ABD is denoted by I, J resp. Let K, L, M be the intersection of AH, AI, AJ with the sphere S resp.

Then it can be verified that $T(ab, c) \cong ANMK, T(ac, b) \cong AFLK$. Let $P = ABDFHI+ADHJ$, then

$$P - (AICHD) - (FICHD) + (DJMHK) = T(a, b) + T(ab, c).$$
$$P + (DJEHF) - (AJEHF) + (FILHK) = T(a, c) + T(ac, b).$$

□





Cor. (23.1.4.23). Homological functions(23.1.4.19) exist.

Proof: By(23.1.4.20), there exists $f : (0, 1) \to \mathcal{V}$ s.t. $F(a, b) = [T(a, b)] = f(a) + f(b) - f(ab)$. Then we want to find $h = f - g$, where $g : (0, 1) \to \mathcal{V}$ is a homomorphism s.t. when $a + b = 1$, $ah(a) + bh(b) = 1$, which is equivalent to

$$ag(a) + bg(b) = af(a) + bf(b).$$

Let

$$G : \mathbb{R}_+^2 \to \mathcal{V} : (a, b) \mapsto af(\frac{a}{a+b}) + bf(\frac{b}{a+b}),$$

then $G(\lambda a, \lambda b) = \lambda G(a, b), \lambda, a, b \in \mathbb{R}_+$, and $G(a, b) + G(a + b, c) = G(a, c) + G(a + c, b)$. In fact, this boils down to(23.1.4.18). Thus by(23.1.4.21), we truly can find such a function g. □

Prop. (23.1.4.24). Good functions(23.1.4.15) exist.

Proof: Take a homological function h(23.1.4.23), define $\varphi:\mathbb{R}\to\mathcal{V}$:

$$\varphi(\frac{n\pi}{2})=0,\quad n\in\mathbb{Z},\quad \varphi(\alpha)=\tan(\alpha)h(\sin^2(\alpha)).$$

We show this is a good function:

Firstly we show:

Lemma (23.1.4.25). $\varphi(\pi/2-\alpha)=-\varphi(\alpha),\varphi(\alpha+\pi/2)=\varphi(\alpha)$.

Proof: If $\alpha=n\pi/2$, the assertion holds. So we assume $\alpha\neq n\pi/2$ and let $\beta=\pi/2-\alpha, a=\sin^2(\alpha), b=\sin^2(\beta)$, then $a+b=1$, so by definition(23.1.4.19),

$$\begin{aligned}0&=2ah(a)+abh(b)=2\sin^2(\alpha)\cot(\alpha)\varphi(\alpha)+2\sin^2(\beta)\cot(\beta)\varphi(\beta)\\&=\sin(2\alpha)\varphi(\alpha)+\sin(2\beta)\varphi(\beta)=\sin(2\alpha)(\varphi(\alpha)+\varphi(\beta))\end{aligned}$$

So the assertion holds as $\sin(2\alpha)\neq 0$.

The second equality follows from the first. □

Next, we show $[T]=\sum_{i=1}^6 l_i\varphi(\alpha_i)$ for a orthohedron T: By scaling, it suffices to prove for T of the form $T(\sin^2(\alpha),\sin^2(\beta))$(23.1.4.16). Thus by(23.1.4.19) and(23.1.4.17),

$$\begin{aligned}[T(\sin^2(\alpha),\sin^2(\beta))]&=h(\sin^2(\alpha))+h(\sin^2(\beta))-h(\sin^2(\alpha)\sin^2(\beta))\\&=\cot(\alpha)\varphi(\alpha)+\cot(\beta)\varphi(\beta)+\cot(\gamma)\varphi(\pi/2-\gamma)=\sum_{i=1}^6 l_i\varphi_i(\alpha_i)\end{aligned}$$

Finally, to show additivity of φ, notice by the lemma above, it suffices to show $\varphi(\alpha)+\varphi(\beta)=\varphi(\alpha+\beta)$ for $\alpha,\beta\in(0,\pi/2)$. In this case, let $\gamma=\pi-\alpha-\beta\in(0,2\pi)$, then use(23.1.3.4) to find a rectangular solid that cuts along a diagonal to 6 orthohedra T_i s.t. the dihedral angles along the diagonals are $(\alpha,\beta,\gamma,\alpha,\beta,\gamma)$. Then

$$0=[R]=\sum_{k=1}^6[T_i]=2l(\varphi(\alpha)+\varphi(\beta)+\varphi(\gamma))+\sum_{k=1}^6 l_k(\varphi(\theta_{k1})+\varphi(\theta_{k2}))$$

where l is the length of the diagonal, θ_{k_i} are the dihedral angles along the edges of the rectangular solid that is connected to the diagonal, and $\theta_{k_1}+\theta_{k_2}=\pi/2$. Thus by the lemma above, $\varphi(\alpha)+\varphi(\beta)=-\varphi(\gamma)=\varphi(\alpha+\beta)$. □

5 Additive Combinatorics

Zero-Sum Sets of Prescribed Size

Prop. (23.1.5.1) [Cauchy-Davenport]. If A,B are two nonempty subsets of $\mathbb{F}_p$, then $|A+B|\geq\min\{p,|A|+|B|-1\}$.

Proof: If $|A|+|B|>p$, then this is trivial, because $A\cap(B-x)\neq\varnothing$ for all x.

Now if $|A|+|B|\leq p$, and if $A+B\subset C$ with $|C|=|A|+|B|-2$, define $f=\prod_{c\in C}(x+y-c)$, then $f(a,b)=0$ for all $a\in A,b\in B$, but the coefficient of the highest degree term $x^{|A|-1}y^{|B|-1}$ is $C_{|A|+|B|-2}^{|A|-1}\neq 0$, so this contradicts combinatorial Nullstellensatz(2.2.2.6). □

Cor. (23.1.5.2). Any element of $\mathbb{F}_p$ is a sum of two squares, as there are $\frac{p+1}{2}$ squares.

Cor. (23.1.5.3) [Erdös-Ginzburg-Ziv]. For any $2n-1$ elements (a_i) in $\mathbb{Z}/(n)$, there exists $I \subset \{1, 2, \ldots, 2n-1\}$ with $\#I = n$ and $\sum_{i \in I} a_i = 0$.

Proof: We use induction on n. If $n \in \mathbf{P}$, then this follows from Cauchy-Davenport(23.1.5.1). If this is true for m, then for $p \in \mathbf{P}$ and $n = mp$, given any $2n-1$ numbers, we can find pairwise disjoint subsets $I_1, \ldots, I_{2m-1}$ of $\{1, \ldots, 2pm-1\}$ where $\#I_i = p$ and $\sum_{j \in I_i} a_j \equiv 0 (\mathrm{mod}\ p)$ for any $1 \le i \le 2m-1$. Define

$$A_i = (\sum_{j \in I_i} a_j)/p,$$

then we can use the induction hypothesis for m and A_i to get the desired assertion. □

Roth's Theorem

Thm. (23.1.5.4). For $X \in \mathbb{Z}_+$, let $A(X)$ be the maximal set of a subset of $[X]_+$ that avoids three-term arithmetic sequences, then

$$\frac{A(X)}{X} = O(\frac{1}{\log \log X}).$$

Proof: Let $b(X) = A(2^{4^X})/2^{4^X}$, then $b(X)$ is decreasing by(23.1.5.5), and(23.1.5.6) applied to $m = 2^{4^X}$ implies that if $\delta = \frac{1}{2^{4^{X+1}}\eta}$ where $0 < \eta < 1/2$, then

$$b(X)^2 < C[b(X)\delta + b(X)^2\delta^2 + (\delta^{-1}b(X) + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}})].$$

Then notice for X large, we can choose $\delta = \delta(X) = \frac{b(X)}{2C_1} < \frac{1}{2}$ where $C_1 > \min(C, 1)$ is a constant: it suffices to verify that $\frac{1}{2^{4^{X+1}} \cdot \frac{1}{2}} < \frac{b(X)}{2C}$, or equivalently $C < 2^{3 \cdot 4^X - 2} A(2^{4^X})$, which is clearly true for X large.

Thus by the fact $b(X) < 1$,

$$\begin{aligned} b(X)^2 &< C_1[b(X)\delta + b(X)^2\delta^2 + (\delta^{-1}b(X) + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}})] \\ &\le b(X)^2(\frac{1}{2} + \frac{1}{4C_1}) + C_1(\delta^{-1}b(X) + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}}) \\ &< \frac{3}{4}b(X)^2 + C_1(2C_1 + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}}) \end{aligned}$$

Thus there exists a constant C_2 s.t. for X large,

$$b(X)^2 < C_2(b(X) - b(X+1) + \frac{1}{2^{4^x}}).$$

which implies there exists a constant $C_3 > C_2$ that for X large,

$$Xb(2X)^2 \le \sum_{k=X}^{2X-1} b(X)^2 < C_3(b(X) - b(2X) + \frac{2C_3}{X}).$$

Hence whenever $2Xb(2X) > 4C_3$,

$$2Xb(2X) < \frac{1}{4C_3} 4X^2 b(2X)^2 < (Xb(X) - Xb(2X) + 2C_3) < Xb(X).$$

From this that the fact $b(X)$ is decreasing(23.1.5.5) it is clear that $Xb(X)$ is bounded, i.e. $b(X) = O(\frac{1}{X})$. And clearly this together with(23.1.5.5) implies the desired assertion. □

Lemma (23.1.5.5). For any $X, Y \in \mathbb{Z}_+$, $A(X)$ equals the maximal number of elements without three-term arithmetic sequences that can be selected from any X-term arithmetic sequence. $\frac{A(XY)}{XY} \leq \frac{A(X)}{X}$, and $\frac{A(X)}{X} \leq \frac{X+Y}{X}\frac{A(Y)}{Y}$.

Proof: The first assertion is easy. Thus $A(X+Y) \leq A(X) + A(Y)$, and

$$A(X) \leq A(\Big[1 + \lfloor \frac{X}{Y} \rfloor\Big]Y) \leq \frac{X+Y}{X} A(Y).$$

□

Lemma (23.1.5.6) [Hardy-Littlewood Method]. For $X \in \mathbb{Z}_+$, let $a(X) = \frac{A(X)}{X}$, then for any $m \in 2\mathbb{Z}_+$, if $\delta = \frac{1}{m^4\eta}$ where $0 < \eta < 1/2$, there exists constant $C > 0$

$$a(m)^2 < C[a(m)\delta + a(m)^2\delta^2 + (\delta^{-1}a(m) + 1)(a(m) - a(m^4) + m^{-1})].$$

Proof: Let $\{u_1, \ldots, u_{A(m^4)}\}$ be a maximal subset of $\{m^4\}$ without three-term arithmetic sequences, and let $\{2v_1, \ldots, 2v_V\}$ be the set of even integers among u_k. Then by(23.1.5.5),

$$A(m^4) \leq m^4 a(m), \quad V \leq A(\frac{m^4}{2}) \leq \frac{m^4}{2}a(m), \quad V \geq A(m^4) - A(\frac{m^4}{2}) \geq m^4 a(m^4) - \frac{m^4}{2}a(m).(\star)$$

Define

$$f_1(\alpha) = \sum_{k=1}^{A(m^4)} e^{2\pi \mathrm{i}\alpha u_k}, \quad f_2(\alpha) = \sum_{k=1}^{V} e^{2\pi \mathrm{i}\alpha v_k},$$

$$F_1(\alpha) = a(m)\sum_{n=1}^{m^4} e^{2\pi \mathrm{i}\alpha n}, \quad F_2(\alpha) = a(m)\sum_{n=1}^{m^4/2} e^{2\pi \mathrm{i}\alpha n},$$

then by the above, $|f_i(\alpha)| \leq m^4 a(m)$, $\quad |F_i(\alpha)| \leq m^4 a(m)$. And

$$f_i(\alpha) - F_i(\alpha) = O\Big(m^4[a(m) - a(m^4)] + m^3\Big)(\star\star):$$

Using(23.1.5.7), if $q = 1$, this is true for $i = 1$, and for $i = 2$, use the lower bound for V above. On the other hand, if q cannot be chosen to be 1, then $S' = 0$, and it suffices to show that $F_r(\alpha) = O(m^3)$, which is true by(12.1.1.1) and the fact $\{\{\alpha\}\} \geq 1/\sqrt{2N}$(because q cannot be chosen to be 1).

Thus

$$\begin{aligned} f_1(\alpha)f_2(-\alpha)^2 - F_1(\alpha)F_2(-\alpha)^2 &= f_1(\alpha)(f_2(-\alpha) + F_2(-\alpha))(f_2(-\alpha) - F_2(-\alpha)) + F_2(-\alpha)^2(f_1(\alpha) - F_1(\alpha)) \\ &= O\Big([m^4 a(m)]^2(m^4[a(m) - a(m^4)] + m^3)\Big). \end{aligned}$$

and by(12.1.1.1), if $0 < \eta < \{\{\alpha\}\} < 1/2$, then

$$f_1(\alpha) = O\Big(a(m)\eta^{-1} + m^4[a(m) - a(m^4)] + m^3\Big).(\star\star\star)$$

Then for any $0 < \eta < 1/2$,

- The hypothesis implies that $u_h = v_k + v_l$ iff $k = l$ and $u_h = 2v_k$, so by $(\star)$

$$\int_{-\eta}^{1-\eta} f_1(\alpha)f_2^2(-\alpha)\mathrm{d}\alpha = V = O(m^4 a(m)).$$

- By $(\star\star\star)$,

$$\int_{\eta}^{1-\eta} f_1(\alpha)f_2(-\alpha)^2\mathrm{d}\alpha < [\max_{\eta<\alpha<1-\eta} f_1(\alpha)]\int_0^1 f_2(-\alpha)^2\mathrm{d}\alpha = O\Big(\Big[a(m)\eta^{-1}+m^4[a(m)-a(m^4)]+m^3\Big]m^4a(m)\Big).$$

- By $(\star\star)$ and(12.1.1.1),

$$\begin{aligned}\int_{-\eta}^{\eta} f_1(\alpha)f_2^2(-\alpha)\mathrm{d}\alpha &= \int_{-\eta}^{\eta} F_1(\alpha)F_2^2(-\alpha)\mathrm{d}\alpha + O\Big(\eta[m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big)\\ &= \int_{-1/2}^{1/2} F_1(\alpha)F_2^2(-\alpha)\mathrm{d}\alpha + O(a(m)^3\eta^{-2}) + O\Big(\eta[m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big)\\ &= a(m)^3m^8/4 + O(a(m)^3\eta^{-2}) + O\Big(\eta[m^4a(m)]^2(m^4[a(m)-a(m^4)]+m^3)\Big)\end{aligned}$$

And these three estimates give the desired assertion. □

Lemma (23.1.5.7). Let $M \in \mathbb{Z}_+$ and $A = \{u_1,\dots,u_U\}$ be a subset of $[M]_+$ without three-term arithmetic sequences. For any $\alpha \in \mathbb{R}$, by Dirichlet's box principle, there exists $h,q \in \mathbb{Z}$ s.t.

$$\alpha = \frac{h}{q} + \beta, \quad (h,q) = 1, 1 \le q \le \sqrt{M}, \quad q|\beta| < 1/\sqrt{M}.$$

Thus for any $m \in \mathbb{Z}_+, m < M$, we can define

$$S = S(\alpha) = \sum_{k=1}^{U} e^{2\pi\,\mathrm{i}\,\alpha u_k}, \quad S' = S'(\alpha,q,h,m) = \frac{A(m)}{m}\frac{1}{q}(\sum_{r=1}^{q} e^{2\pi\,\mathrm{i}\,\frac{rh}{q}})(\sum_{n=1}^{M} e^{2\pi\,\mathrm{i}\,\beta n}).$$

Then

$$|S - S'| = M\frac{A(m)}{m} - U + O(m\sqrt{M}),$$

and $S' = 0$ unless $q = 1$.

Proof: Firstly, notice

$$S = \frac{1}{mq}\sum_{r=1}^{q}\sum_{n=1}^{M}\sum_{n\le u_k\le n+mq, u_k\equiv r (\mathrm{mod}\ q)} e^{2\pi\,\mathrm{i}\,\alpha u_k} + O(mq),$$

because the coefficient for $e^{2\pi\,\mathrm{i}\,\alpha u_k}$ is 1 unless $u_k \le mq$, which is compensated by the error term.

Then notice

$$e^{2\pi\,\mathrm{i}\,\alpha u_k} = e^{2\pi\,\mathrm{i}\,\frac{rh}{q}}e^{2\pi\,\mathrm{i}\,\beta u_k} = e^{2\pi\,\mathrm{i}\,\frac{rh}{q}}e^{2\pi\,\mathrm{i}\,\beta n} + O(mq|\beta|),$$

and the number of k s.t. $u_k \equiv r (\mathrm{mod}\ q)$ and $n \le u_k \le n + mq$ is at most $A(m)$ for each n,r, by(23.1.5.5), which we denote by $A(m) - D(n,m,q,r) \le A(m)$, then

$$S = S' - \frac{1}{mq}\sum_{r=1}^{q} e^{2\pi\,\mathrm{i}\,\frac{rh}{q}}\sum_{n=1}^{M} e^{2\pi\,\mathrm{i}\,\beta n}D(n,m,q,r) + O(Mmq|\beta|) + O(mq).$$

But this estimate is also true for $\alpha \in \mathbb{Z}$, so

$$U = M\frac{A(m)}{m} - \frac{1}{mq}\sum_{r=1}^{q}\sum_{n=1}^{M} D(n,m,q,r) + O(mq),$$

then combining these two estimates and the facts $q \le \sqrt{M}, q|\beta| \le 1/\sqrt{M}$, the assertion follows. □

Littlewood-Offord Problem

Prop. (23.1.5.8) [Littlewood-Offord Problem, Erdös].

- If $\{x_i\}_{1\leq i\leq n}$ is a set of real numbers with $|x_i|\geq 1$, then for any $r\in\mathbb{Z}_+$, the number of sums $\sum\pm x_k$ which lies in the interior of any interval of length $2r$ doens't exceed $r\binom{n}{\lfloor n/2\rfloor}$.
- If $\{x_i\}_{1\leq i\leq n}$ is a set of complex numbers with $|x_i|\geq 1$, then for any $r\in\mathbb{Z}_+$, the number of sums $\sum\pm x_k$ which lies in the interior of an arbitrary circle of radius r is $O(r\binom{n}{\lfloor n/2\rfloor})\leq O(r2^n/\sqrt{n})$.

Proof: Cf.[Erdös, On a lemma of Littlewood and Offord. Bull. Amer. Math. Soc. 51 (1945), 898–902.] □

Sidon's Problem

Prop. (23.1.5.9) [Erdös-Turán]. For $n\in\mathbb{Z}_+$, let $\Phi(n)$ be the maximal number of subset $\{a_1,\ldots,a_X\}$ of $[n]_+$ s.t. $\{a_i+a_j\}_{i\leq j}$ are pairwise different. Then

$$\frac{1}{\sqrt{2}}\leq\varliminf_{n\to\infty}\frac{\Phi(n)}{\sqrt{n}}\leq\varlimsup_{n\to\infty}\frac{\Phi(n)}{\sqrt{n}}\leq 1.$$

Proof: Let $p\in\mathbf{P}\setminus\{2\}$ and $a_k=2pk+u(k),k=1,2,\ldots,p-1$, where $1\leq u(k)\leq p-1,u(k)\equiv k^2(\mathrm{mod}\ p)$. Then $a_k<2p^2$ for each k, and

$$a_i+a_j=a_k+a_l\iff(i,j)=(k,l),$$

because in this case

$$i+j=k+l,\quad i^2+j^2\equiv k^2+l^2\equiv q.$$

Thus $\Phi(2p^2)\geq p-1$, and because there are infinitely primes, $\varliminf_{n\to\infty}\frac{\Phi(n)}{\sqrt{n}}\geq\frac{1}{\sqrt{2}}$.

For the other direction, for any such set $S=\{a_1,\ldots,a_X\}$ of $[n]_+$ s.t. $\{a_i+a_j\}_{i\leq j}$ are pairwise different. Choose $1\leq m<n$, then for each $u\in\mathbb{Z}$, let $A_u=\#[u-m,u)\cap S$, then

$$\sum_{u=1}^{m+n}A_u=mx,$$

and the number of triples (i,j,n) s.t. $a_i,a_j\in A_u,a_j>a_i$ is

$$\sum_{u=1}^{m+n}\frac{1}{2}A_u(A_u-1)\geq\frac{1}{2}(m+n)\frac{mx}{m+n}(\frac{mx}{m+n}-1).$$

But by the hypothesis, there are at most

$$\sum_{r=1}^{m-1}(m-r)=\frac{1}{2}m(m-1)$$

such triples. Thus

$$\frac{1}{2}mx(mx-m-n)\leq\frac{1}{2}m(m-1)(m+n),$$

and whence

$$x<\frac{n}{m}+\sqrt{n+m+\frac{n^2}{m^2}}.$$

Taking $m=\lfloor\sqrt{n}\rfloor$, we get $x=\sqrt{n}+O(n^{\frac{1}{4}})$, thus $\varlimsup_{n\to\infty}\frac{\Phi(n)}{\sqrt{n}}\leq 1$. □

6 Combinatorial Geometry

Convex Polygons

Prop. (23.1.6.1). For $n \in \mathbb{Z}_{\geq 4}$ and any n points in $\mathbb{R}^2$ in general position, they form a convex n-gon iff any 4 points of them form a convex quadrilateral.

Proof: We use induction on n. $n = 4$ is trivial. For $n \geq 5$, let the points by $\{P_1, \ldots, P_n\}$, then by induction hypothesis, any $n-1$ points of them form a convex $(n-1)$-gon. So for any $1 \leq k \leq n$, $\{X_1, \ldots, \widehat{X_k}, \ldots X_n\}$ is a convex $(n-1)$-gon, and X_k is not contained in any sub-$(n-2)$-gon of $X_1 \ldots \widehat{X_k} \ldots X_{n-1}$. But any convex $(n-1)$ is a sum of its sub-$(n-2)$-gons, because we can use equations of the form $a_1 P_1 + a_2 P_2 = a_3 P_3 + a_4 P_4, a_i > 0$ to eliminate some P_i. Because k is arbitrary, this means $P_1 \ldots P_n$ is convex. □

Thm. (23.1.6.2) [Erdös-Szekeres]. For any $n \in \mathbb{Z}_{\geq 2}$, there exists a minimal positive integer $N(n)$ s.t. for any $ES(n)$ points in $\mathbb{R}^2$ in general position, there exists a subset of n points forming a convex n-gon. Moreover,

$$2^{n-2} + 1 \leq ES(n) \leq \binom{2n-4}{n-2} + 1.$$

Proof: We first prove that $ES(4) = 5$: Given 5 points in $\mathbb{R}^2$ in general position, we need to find 4 points that form a convex quadrilateral. If the convex hull of these 5 points is a quadrilateral or a pentagon, we are done, and if the convex hull is a triangle ABC, and D, E are inside ABC, then suppose BC lies in the same side of the line $\overline{DE}$, then $BDEC$ form a convex quadrilateral.

For general n, in fact $ES(n) \leq R(4, 2; 5, n)$(1.3.1.2), because for $R(4, 2; 5, n)$ many points $X \subset \mathbb{R}^2$, divide the 4-subsets of X into two classes depending on either they form a convex quadrilateral or not, then either there exists a 5-subset whose 4-subsets are all non-convex, or there exists an n-subset whose 4-subsets are all convex. The first case is not possible by the fact $ES(4) = 5$, so the second case is true. Thus we get a convex n-gon by(23.1.6.1).

For the lower bound, it suffices to construct 2^{n-2} points with no n points forming a convex n-gon: Cf.[Art of Counting, Erdös]P680.?

For the upper bound for $ES(n)$, Cf. [Erdös-Szekers](or [Holmsen-Mojarrad-Pach-Tardos], where they proved that $ES(n) \leq 2^{n+O(\sqrt{n \log n})}$). □

Conj. (23.1.6.3) [Erdös-Szekeres]. For any $n \in \mathbb{Z}_{\geq 2}$, $ES(n) = 2^{n-2} + 1$.

Proof: □

Remark (23.1.6.4). This conjecture has been proven for $n \leq 6$.

Distance Problems

Prop. (23.1.6.5) [Erdös/Guth-Katz]. For $n \in \mathbb{Z}_{\geq 2}$, let $P(n)$ be the minimal number of distinct distances determined by n distinct points in $\mathbb{R}^2$, then there exists constants C_1, C_2 s.t.

$$f(n) = \Theta(\frac{n}{\log n}).$$

Proof: Consider the points (x, y) where $1 \leq x, y \leq \sqrt{n}$, then the distances between them are all of the form $\sqrt{a^2 + b^2}$, where $1 \leq a^2 + b^2 < 2n$. Then by(19.3.1.4), there are $O(\frac{n}{\log n})$ many points.

Conversely, Cf.[Guth-Katz]? □

Conj. (23.1.6.6) [Erdös]. For $n \in \mathbb{Z}_{\geq 2}$, the number of distinct distances determined by the vertices of a convex n-gon in $\mathbb{R}^2$ is at least $\lfloor \frac{n}{2} \rfloor$, with equality iff this is a regular n-gon.

Prop. (23.1.6.7). For $n \in \mathbb{Z}_{\geq 3}$ and $r \in \mathbb{R}_+$, let $g(n, r)$ be the maximal number of times the distance r occur among n points in $\mathbb{R}^2$, then there exists $C > 0$ s.t.

$$n^{1+c/\log\log n} < g(n, r) < n^{3/2}.$$

Proof: This is clearly true for $n \leq 3$, so we assume $n \geq 4$. Given n points $\{P_1, \ldots, P_n\}$, and for $1 \leq i \leq n$, suppose there are x_i points with distance r from P_i. We may assume that $x_1 \geq x_2 \geq \ldots \geq x_n$. Then for any $i \neq j$, the x_i points at distance r from P_i can contain at most two points with distance r from P_j, so for each $1 \leq j \leq n$,

$$\sum_{i=1}^{j} (x_i - 2i + 2) \leq n.$$

Denote $\lfloor \sqrt{n} \rfloor = a, \{\sqrt{n}\} = \varepsilon$, then

$$x_1 + x_2 + \ldots + x_a \leq n + a(a-1) = 2n - 2\varepsilon\sqrt{n} + \varepsilon^2 - \sqrt{n} + \varepsilon < 2n - 2\varepsilon\sqrt{n}.$$

Thus $x_a < \frac{1}{a}(2n - 2\varepsilon\sqrt{n}) = 2\sqrt{n}$, and

$$\sum x_i < 2n - 2\varepsilon\sqrt{n} + (n-a)2\sqrt{n} = 2n^{3/2}.$$

For the lower bound, consider the set of points $(x, y), 0 \leq x, y \leq \sqrt{n}$.**?** □

Prop. (23.1.6.8). For $n \geq 3$, let $a_{\min}(n)$ and $a_{\max}(n)$ be the maximal number of times the minimal and maximal distance of distinct n points in $\mathbb{R}^2$ can be achieved, then

$$a_{\min}(n) = n, \quad a_{\max}(n) = 3n - \Theta(\sqrt{n}).$$

Proof: For $a_{\max}(n)$, notice $a_{\max}(n) \geq n$ because it can easily achieve n times. To prove $a_{\max}(n) \leq n$, we use induction on n: if the given points are $\{P_1, \ldots, P_n\}$, and $d(P_1, P_2)$ and $d(P_3, P_4)$ are both maximal, then by an easy argument, $P_1P_2 \cap P_3P_4 \neq \varnothing$. Now connect any two points with maximal distance, and consider two cases: if each point is connected to at most 2 points, then there are at most n edges; and if some point P_1 is connected to 3 points P_2, P_3, P_4, where $\angle P_2P_1P_4$ is acute, and P_3 are between P_2, P_4, then it is clear P_3 cannot connect to any other P_i, so we can omit P_3 and use induction on n.

For $a_{\min}(n)$, we only prove that $a_{\min}(n) \leq 3n - 6$**?**: Connect two points if they has minimal distance, then clearly these edges don't intersect. Thus the resulting graph is planer, and then has at most $3n - 6$ edges by Euler's theorem(23.1.1.21). □

Conj. (23.1.6.9) [Borsuk]. For $k \in \mathbb{Z}_+$, each subset $S \subset \mathbb{R}^k$ of diameter 1 can be decomposed into $k + 1$ subsets s.t. each subset has diameter< 1.

Proof:

□

7 Probabilistic Methods

References are [The probabilistic method, Alon-Spencer].

23.2 Partition Theory

References are [The Theory of Partitions, Andrews].

24 Others

24.1 Elementary Mathematics

1 Algebra

Prop. (24.1.1.1). If $(a_n)_{n\geq n_0, n\in\mathbb{N}}$ is a series of real numbers and $C\in\mathbb{R}$ s.t. $a_{m+n}\geq a_m+a_n+C$ for any $m,n\geq n_0\in\mathbb{N}$, then a_m/m converges to $\overline{\lim}\, a_n/n\in(-\infty,\infty]$.

Notice by taking $b_n=-a_n$, the $\leq$ case is also true. In particular, if $|a_{m+n}-a_m-a_n|\leq C$ for any $m,n\geq n_0\in\mathbb{N}$, then a_m/m converges in $\mathbb{R}$.

Proof: Let $\lambda=\overline{\lim}\, a_n/n$. By induction, for any $N\geq n_0\in\mathbb{N}$, $a_{2^kN}\geq 2^ka_N+(2^k-1)C$ for any $k\in\mathbb{N}$, so $a_{2^kN}/2^kN\geq a_N/N+\min\{C,0\}$, so $\lambda>-\infty$.

If $\lambda=+\infty$, then for any $M\in\mathbb{R}$, there exists $n>|C|/\varepsilon$ s.t. $a_n/n\geq M$. For any N large, $N=kn+m$ for some k,m and $n_0\leq m<n_0+n$, so $a_N\geq ka_n+a_m+(k+1)C$, so $\underline{\lim}\, a_N/N\geq a_n/n-\varepsilon\geq M-\varepsilon$ for N large, so $\underline{\lim}\, a_n/n=\overline{\lim}\, a_n/n$.

If $\lambda<\infty$, for any $\varepsilon>0$, there exists $n>|C|/\varepsilon$ s.t. $\lambda-a_n/n<\varepsilon$. For any N large, $N=kn+m$ for some k,m and $n_0\leq m<n_0+n$, so $a_N\geq ka_n+a_m+(k+1)C$, so $\underline{\lim}\, a_N/N\geq a_n/n\geq\lambda-2\varepsilon$ for N large, so $\underline{\lim}\, a_n/n=\overline{\lim}\, a_n/n$. □

2 Analysis

Lemma (24.1.2.1). If $P(x)=a_nx^n+a_{n-1}x^{n-1}+\ldots+a_0$ satisfies $a_n\geq 1, a_{n-1}\geq 0$, and $|a_i|\leq H$ for $i\leq n-2$, then for any root α of P, either $\operatorname{Re}\alpha\leq 0$, or $|\alpha|<\frac{1+\sqrt{1+4H}}{2}$.

Proof: □

3 Number Theory

Def. (24.1.3.1) [Prime Numbers]. $p\in\mathbb{Z}_+$ is called a (rational)**prime number** if for any $d\in\mathbb{Z}_+$, $d|p$ implies $d=1$ or $d=p$. The set of prime numbers is denoted by $\mathbf{P}$.

Def. (24.1.3.2) [Integral Part]. For any number $\alpha\in\mathbb{R}$, let $[\alpha]$ be the maximal integer n that $n\leq\alpha$, called the **integral part of** α and $\{\alpha\}=\alpha-[\alpha]$, called the **fractional part of** α.

Prop. (24.1.3.3) [Approximation of Irrational Numbers]. Let α be an irrational number, then for any integer N, there exists an integer $n\in N$ that $\{n\alpha\}<1/N$ or $\{n\alpha\}>1-1/N$.

Proof: Consider the sequence

$$\{\{\alpha\},\{2\alpha\},\ldots,\{(N+1)\alpha\}\},$$

where $\{x\}$ is the fractional part of x, then this sequence sits in the N intervals

$$\{(0,1/N),(1/N,2/N),\dots,((N-1)/N,1)\},$$

thus there are two that are in the same interval. if $v_1 < v_2$ satisfies $\{v_1\alpha\}$ and $\{v_2\alpha\}$ are in the same interval, then $n = v_2 - v_1$ satisfies the desired property. □

Thm. (24.1.3.4) [Power Lifting]. If $p \in \mathbf{P}, a, b \in \mathbb{Z}\setminus(p)$, and $v_p(a-b) = k \geq 1$, then $v_p(a^{p^n} - b^{p^n}) = k + n$ for $n \in \mathbb{Z}_+$, except for $p = 2$ and $k = 1$, in which case $v_p(a^{p^n} - b^{p^n}) = k + n + 1$ for $n \in \mathbb{Z}_+$.

Proof: Use induction on n: If $a^{p^n} = b^{p^n} + p^{n+k}c$ for some c s.t. $p \nmid c$, then

$$a^{p^{n+1}} = b^{p^{n+1}} + p^{n+k+1}b^{p^n(p-1)}c \dots + p^{(n+k)p}c^p,$$

and the assertion follows. □

Lemma (24.1.3.5). $\sum_{x=0}^{p-1} x^k \equiv -1 \mod p$ iff $p-1|k$, and $\equiv 0 \bmod p$ otherwise.

Proof: Choose a a that $a^k - 1$ is not divisible by p, this is doable iff k is not divisible by $p-1$, then it is clear. □

Prop. (24.1.3.6) [Quadratic Legendre Symbol Sum]. For add prime p,

$$\sum \left(\frac{x^2+1}{p}\right) = -1.$$

Proof: The sum is equivalent modulo p to $\sum_{x=0}^{p-1}(x^2+ax+b)^{\frac{p-1}{2}}$, which by the lemma(24.1.3.5) above equivalent to -1 modulo p. Now it can not be $p-1$, because otherwise there is a solution for $p|x^2+1$, and then it can be calculated directly. □

Prop. (24.1.3.7). For $n \geq 2$, the multiplicative group of $(\mathbb{Z}/(2^n))^* \cong \mathbb{Z}/(2) \times Z/(2^{n-2})$.

Proof: it suffices to show $3^{2^{n-3}} \not\equiv \pm 1 \mod 2^n$, and $3^{2^{n-2}} \equiv 1 \mod 2^n$. □

Prop. (24.1.3.8) [b-adic Decompositions and Irreducibility]. If $b > 2$ and p is a prime, consider the b-adic expansion $p = \sum a_n b^n$, then the polynomial

$$\sum a_n X^n$$

is irreducible over $\mathbb{Z}$.

Proof: If $p(x) = h(x)r(x)$, use the lemma(24.1.2.1) to show that $r(b)$ and $h(b)$ cannot be 1, thus $h(b)r(b) = p$ cannot happen. □

Thm. (24.1.3.9) [Zsigmondy]. If $a, n \in \mathbb{Z}_{>1}$, then there exists a prime divisor of $a^n - 1$ not dividing $a^j - 1$ for any $0 < j < n$, except in the following cases:

- $n = 2, a = 2^s - 1, s \geq 2$.
- $n = 6, a = 2$.

Proof: By(2.2.2.21), it suffices to find a prime ideal of $\Psi_n(a)$ not dividing n. If $n=2$, then any prime divisor of $a+1$ not dividing $a-1$ suffices, as long as a is not of the form 2^s-1.

For $n\geq 3$, if all prime divisors of $\Psi_n(a)$ divides n, we prove that $\Psi_n(a)\in\mathbf{P}$: Take $p|\Psi_n(a)$, and let $k=\mathrm{ord}(a,\mathbb{F}_p^\times)|(p-1)<n$, then $p|\Psi_k(a)$, and $n/k=p^t$ for some $t\in\mathbb{Z}_+$. Then if $p\neq 2$, by power-lifting(24.1.3.4),

$$v_p(a^n-1)=v_p(a^{n/p}-1)+1,$$

so $v_p(\Psi_n(a))=1$. And if $p=2$, then clearly $k=1$, and $n\in 2^{\mathbb{Z}_+}$, and $\Psi_n(a)=a^{n/2}+1\equiv 2(\mathrm{mod}\ 4)$ as $n\neq 2$, so it is still true that $v_2(\Psi_n(a))=1$.

And if $\ell\in\mathbf{P}\setminus\{p\}$ is another prime dividing $\Psi_n(a)$, then $n/p^t=k|(p-1),n/\ell^{t'}=k'|\ell-1$, so $p\leq\ell-1<\ell\leq p-1$, contradiction. So $\Psi_n(a)=p$ is a prime.

Then suppose $n=p^kr$ where $(r,p)=1$, we prove that $p>(b^{p-2}(b-1))^{\varphi(r)}$ where $b=a^{q^{k-1}}$: By(2.2.2.18),

$$\Psi_n(a)=\Psi_r(b^p)/\Psi_r(b)\geq\Big(\frac{b^p-1}{b+1}\Big)^{\varphi(r)}\geq\Big(\frac{b^{p-2}(b^2-1)}{b+1}\Big)^{\varphi(r)}=(b^{p-2}(b-1))^{\varphi(r)}.$$

If $p\geq 5$, then we have $b^{p-2}>p$, so only possible cases are $p=2$ or 3. The case $p=2$ is not possible, because then $a=2$, and $2=\Psi_n(2)\equiv 1(\mathrm{mod}\ 2)$. So $p=3,a=2,k=1$ and $r=1$ or 2. But $\Psi_n(2)\neq 3$, contradiction. □

Def. (24.1.3.10) [Numerical Polynomials]. A function $f:\mathbb{Z}\to\mathbb{Z}$ is called a **numerical polynomial** if it there exists $a_1,\dots,a_r\in\mathbb{Z}$ that

$$f(n)=\sum_{i=0}^r a_i\binom{n}{i}.$$

for n sufficiently large.

Prop. (24.1.3.11). Suppose that $f:\mathbb{Z}\to\mathbb{Z}$ is defined for n sufficiently large and $g(n)=f(n)-f(n-1)$ is a numerical polynomial, then f is a numerical polynomial.

Proof: Suppose $f(n)-f(n-1)=\sum_{i=0}^r a_i\binom{n}{i}$ for all $n>0$. If we set $g(n)=f(n)-\sum_{i=0}^r a_i\binom{n+1}{i+1}$, then $g(n)-g(n-1)=0$ for n sufficiently large, so it is eventually constant, which is equal to a_{-1}. Then $f(n)=\sum_{i=0}^r a_i\binom{n+1}{i+1}+a_{-1}$ is a numerical polynomial. □

Cor. (24.1.3.12). Any polynomial function with coefficients in $\mathbb{Q}$ maps any integer sufficiently large into $\mathbb{Z}$ iff it is a numerical function.

Useful Functions

Def. (24.1.3.13) [Euler Function]. The **Euler function** is defined to be

$$\varphi:\mathbb{Z}_+\to\mathbb{Z}_+:n\mapsto\sum_{d|n}d.$$

Def. (24.1.3.14) [Möbius Function]. The **Möbius function** is defined to be the multiplicative function

$$\mu:\mathbb{Z}_+\to\{0,1,-1\}:n\mapsto\begin{cases}(-1)^k & n=\prod_{i=1}^k p_i, p_i\neq p_j\in\mathbf{P}\\ 0 & \text{otherwise}\end{cases}.$$

Prop. (24.1.3.15) [Möbius Identities]. For $n \in \mathbb{Z}_+$,

- If $m \in \mathbb{Z}_+$ is prime to n, then $\mu(mn) = \mu(m)\mu(n)$.
- $$\sum_{d|n} \mu(d) = \begin{cases} 1 & n = 1 \\ 0 & n > 1 \end{cases}.$$
- If $p \in \mathbf{P}$,
$$\sum_{d|n, p\nmid d} \mu(d) = \begin{cases} 1 & n \in p^{\mathbb{Z}_+} \\ 0 & \text{otherwise} \end{cases}.$$

Proof: 1: This is clear.
2: By item1, it suffices to prove for $d = p^k$ for some $p \in \mathbf{P}$, then this is clear.
3: By item1, it suffices to prove for $d = p^k$ for some $p \in \mathbf{P}$, then this is clear. □

Cor. (24.1.3.16) [Möbius Inversion].

Proof: □

Congruences of Binomial Coefficients

References arehttp://www.cecm.sfu.ca/organics/papers/granville/paper/binomial/html/binomial.html.

Prop. (24.1.3.17) [p-Power in Product]. $v_p(n!) = \frac{n-c(n)}{p-1}$, where $c(n)$ is the sum of the presentation of n in the p-adic base.

Cor. (24.1.3.18) [Kummer]. $v_p(\binom{a+b}{a})$ equals the number of carries when adding a and b in base p.

Prop. (24.1.3.19) [Wilson]. $(p-1)! \equiv -1 (\text{mod } p)$.

Proof: Consider the two polynomials
$$g(X) = \prod_{k=1}^{p-1} (X - k), \quad h(X) = X^{p-1} - 1,$$
then
$$f(X) = g(X) - h(X)$$
are identically zero on $\mathbb{F}_q$ but has degree$\leq p - 2$, so it must be identically 0. Thus the assertion follows. □

Cor. (24.1.3.20). For any $n \in \mathbb{Z}$,
$$\binom{np-1}{p-1} \equiv 1 (\text{mod } p).$$
And
$$\binom{2p-1}{p-1} \equiv 1 (\text{mod } p^r)$$
where $r = \min(3, p-1)$.

Proof: □

Prop. (24.1.3.21) [Lucas]. For $m, r \in \mathbb{Z}_+, n = m + r$, let n_i, m_i, r_i be their i-th term in base-p, then if $k = v_p(\binom{n}{m})$, then

$$\frac{(-1)^k}{p^k}\binom{n}{m} \equiv \prod_k \frac{n_k!}{m_k! r_k!} (\text{mod } p).$$

Proof: Denote $(n!)_p = \prod_{1\leq m\leq n, p\nmid m} m$, then by some argument, it suffices to prove that

$$(-1)^{\lfloor n/p \rfloor}(n!)_p \equiv n_0! (\text{mod } p).$$

And this follows easily from Wilson's theorem(24.1.3.19). □

Prop. (24.1.3.22) [Glaisher]. If $p \in \mathbf{P}, 1 \leq j, k \leq p-1$ and $n \in \mathbb{Z}$ s.t. $n \equiv k (\text{mod } p-1)$, then

$$\sum_{1\leq m\leq n, m\equiv j (\text{mod } p-1)} \binom{n}{m} \equiv \binom{k}{j} (\text{mod } p).$$

Proof: Notice if the i-th term of n, m in the base p are n_i, m_i, then $p \nmid \binom{n}{m}$ iff $m_i < n_i$ for each i. And then

$$\sum_{1\leq m\leq n-1, m\equiv j (\text{mod } p-1)} \binom{n}{m} = \sum_{(m_0,\ldots,m_d)} \binom{n_0}{m_0} \cdots \binom{n_d}{m_d}.$$

But the RHS equals the sum of coefficients of $X^j, X^{j+(p-1)}, X^{j+2(p-1)}, \ldots$ in $(X+1)^{n_0}(X+1)^{n_1} \cdot (X+1)^{n_d} = (X+1)^{\sum n_i}$, which is also equal to

$$\sum_{1\leq m\leq \sum n_i, m\equiv j (\text{mod } p-1)} \binom{\sum n_i}{m}$$

And also $n \equiv \sum n_i (\text{mod } p-1)$, so we can use induction on n, and notice that the assertion is trivial for $n \leq p-1$. □

Cor. (24.1.3.23) [Hermite]. If $n \in \mathbb{Z}_+, p \in \mathbf{P}$, then

$$\sum_{1\leq m\leq n-1, (p-1)|m} \binom{n}{m} \equiv 0 (\text{mod } p)$$

Prop. (24.1.3.24) [Carlitz]. If $n \in \mathbb{Z}_+, p \in \mathbf{P}, r \in \mathbb{Z}_+$ and $p^{r-1}|n$, then

$$p + (p-1)\sum_{1\leq m\leq n-1, (p-1)|m} \binom{n}{m} \equiv 0 (\text{mod } p^r).$$

Proof: □

Prop. (24.1.3.25) [Morley]. For $p \in \mathbf{P}$ and $p \geq 5$,

$$(-1)^{\frac{p-1}{2}}\binom{p-1}{(p-1)/2} \equiv 4^{p-1} (\text{mod } p)^3.$$

Proof: □

Continued Fractions

Def. (24.1.3.26)[Continued Fractions]. A **finite continued fraction** $[a_1,\dots,a_n]$ is an abbreviation of

$$\frac{1}{a_1+\frac{1}{a_2+\dots\frac{1}{a_n}}},\quad a_i\in\mathbb{Z}_+.$$

A **continued fraction** $[a_1,a_2,\dots]$ is an abbreviation of

$$\frac{1}{a_1+\frac{1}{a_2+\dots}},\quad a_i\in\mathbb{Z}_+.$$

Def. (24.1.3.27) [Gauss Transformation]. The **Gauss transformation** is the function $\varphi:\mathbb{R}\to[0,1]$:

$$\varphi(x)=\begin{cases}1/x-[1/x] & x\neq 0\\ 0 & x=0\end{cases}.$$

Prop. (24.1.3.28). For any sequence of positive numbers $\{a_1,\dots,a_n,\dots\}$, $[a_1,\dots,a_n]$ converges. In particular, $\lim_{n\to\infty}[\varphi(x),\varphi^2(x),\dots,\varphi^n(x)]=\{x\}$ for $x\in\mathbb{R}$.

Proof: We may assume the sequence is infinite. Then we notice for any $a\in\mathbb{Z}_+$ and t varying in an interval in $(0,1]$ of length l, the value of $\frac{1}{a+t}$ is in an interval of length$l/a(a+l)\le l/(l+1)$. So clearly the length of possible values of $[a_1,\dots,a_n,t]$ for t in an interval of length l is in an interval of length l_n that $\lim_{n\to\infty}l_n=0$.

Then we conclude $[a_1,\dots,a_n]$ is a Cauchy sequence for n, thus it converges. □

Prop. (24.1.3.29). $x\in\mathbb{R}$ is a rational number iff $\varphi^m(x)=0$ for some $m>0$.

Proof: If x is rational then this is Euclid division. If $\varphi^m(x)=0$, then notice $x=[x]+[\varphi(x),\varphi^2(x),\dots,\varphi^{m-1}(x)]$ is rational. □

Prop. (24.1.3.30). $x\in\mathbb{R}$ has eventually periodic continued fractions $[\varphi(x),\varphi^2(x),\dots,\varphi^n(x),\dots]$ iff $[\mathbb{Q}(x):\mathbb{Q}]\le 2$.

Proof: If the fraction is finite, then $\mathbb{Q}(x)=\mathbb{Q}$, by(24.1.3.29). If the fraction has periodic part $[a_1,\dots,a_n]$, let $t=[a_1,\dots,a_n,a_1,\dots,a_n,\dots,\dots]$, then

$$\frac{at+b}{ct+d}=t$$

for some $a,b,c,d\in\mathbb{Z}$, so $[\mathbb{Q}[t]:\mathbb{Q}]=2$, and hence $[\mathbb{Q}(x):\mathbb{Q}]=2$.

For the converse, ?. □

Notations

This chapter is a collection of definitions used often. These notations will be used without throughout this book without referring, so if you are confused about some notation, maybe you can find it here.

Chapter/Section/Subsection/... are called classes. Sometimes in the beginning of a class, there are notation assignments. They influence only the propositions contained in the same smallest class.

In any proposition, for any symbol appeared, there will only be two cases:

1. This symbol appear without assigned meanings. Then its meaning is defined in this chapter.
2. This symbol has been assigned meanings. Then its meaning may be different from the notations here(which I will try to avoid it from happening).

When they contradict(which I will try to avoid from happening), they have ascending priorities(e.g. notations assigned in the beginning of a chapter can be overrode by the notation assigned in the beginning of a section in this chapter), and have higher priorities than notation assignments in this chapter.

27 General

Notation (24.2.27.1).

- $\in$ is an abbreviation for "in" or "be/is/are in", depending on the syntax. So I will use this symbol more casually than usual.
- i is a chosen square root of -1 in $\mathbb{C}$.
- a.e. is an abbreviation for "all but finitely many".
- e.g. is an abbreviation for "for example".
- f.m. is an abbreviation for "finitely many".
- i.e. is an abbreviation for "which means".
- resp. is an abbreviation for "respectively".
- s.t. is an abbreviation for "such that".
- "Sufficiently large" means "is an integer greater than a given integer N_0 that only depends on the parameters defined before".

28 Set Theory

Notation (24.2.28.1) [Sets]. For $X \in \mathcal{S}\mathrm{et}$,

- Use $\#X$ instead of $|X|$ to denote the cardinality of a set X.
- $\mathscr{P}(X)$ is the power set of X.

- To avoid confusion with other structures on sets, use bijection of sets instead of isomorphism of sets to indicate an isomorphism in $\mathcal{S}$et.
- Use $U \subset X$ to indicate U is a subset of X. Use $U \subsetneq X$ ot indicate U is a proper subset of X.
- Use `\dutchcal` capital to represent a property on a set.
- If $\mathcal{P}$ is a property on X, then use $\{x \in X : \mathcal{P}(x)\}$ or $\{x \in X|\mathcal{P}(x)\}$ to indicate the subset of X defined by the property $\mathcal{P}$, depending on which avoids confusion better.
- If $S \subset \mathscr{P}(X)$, we say a property $\mathcal{P}$ holds for elements of Y sufficiently large if it holds for all elements of Y containing a fixed subset $S_0 \subset X$. Notice this definition is compatible with the definition of numbers being sufficiently large, by taking $X = \aleph_0$ and $Y = \mathbb{N} \subset \mathscr{P}(\aleph_0)$.
- Use `\mathtt` capital to represent a set that is doesn't form a category with good properties. For example, `GField` represents the set of global fields.
- If $f : X \to X$ is a self-map and $S \subset X$, then f is said to fix S or stablizes S if $f(S) \subset S$.
- For $n \in \mathbb{Z}_+$, use $\underline{a}^n$ to denote an n-tuple of elements $(a_1, \ldots, a_n)$. And the superscript n can be omitted sometimes.

Notation (24.2.28.2) [Common Sets].

- For $n \in \mathbb{N}$, $[n]$ is the set $\{0, 1, \ldots, n\}$.
- For $n \in \mathbb{Z}_+$, $[n]_+$ is the set $\{1, \ldots, n\}$.
- $\mathbb{Z}$ is the ring of integers.
- $\mathbb{Z}_+ \subset \mathbb{Z}$ is the commutative multiplicative monoid of positive integers.
- $\mathbb{Z}_- \subset \mathbb{Z}$ is the commutative multiplicative monoid of negative integers.
- $\mathbb{N} \subset \mathbb{Z}$ is the commutative multiplicative monoid of non-negative integers.
- $\mathbb{Q}$ is the field of rational numbers.
- $\mathbb{R}$ is the ordered valued field of real numbers.
- $\mathbb{R}_+$ is the ordered commutative multiplicative monoid of positive real numbers.
- $\mathbb{C}$ is the complete valued field of complex numbers.

29 Categories

Notation (24.2.29.1) [Categories].

- Use `\mathscr` capital for symbols representing a category.
- Use pr for morphisms that look like projections.

Notation (24.2.29.2) [Common Categories]. To avoid the set-theoretical issue that the class of all sets is not a set, we fix a cardinal κ, which will be given in prior in each situation, and define

- $\mathcal{S}$et to be the category of sets with cardinality$< \kappa$.
- $\mathcal{G}$rp to be the category of groups with cardinality$< \kappa$.
- $\mathcal{A}$b to be the category of Abelian groups with cardinality$< \kappa$.
- $\mathcal{G}\text{rp}^{\text{fin}}$ to be the category of finite groups. $\mathcal{A}\text{b}^{\text{fin}}$ to be the category of finite Abelian groups.
- $\mathcal{C}\mathcal{A}$lg to be the category of commutative unital rings with cardinality$< \kappa$.

- For $p \in \mathbf{P}$, $\mathcal{CAlg}^p$ to be the category of commutative unital rings of characteristic p with cardinality $< \kappa$.
- `Field` to be the category of fields(2.2.1.3) with cardinality $< \kappa$.
- $\texttt{Field}^p$ to be the category of fields of characteristic p**??** with cardinality $< \kappa$, where $p \in \mathbf{P} \cup \{0\}$.
- $\mathcal{Top}$ to be the category of topological spaces with cardinality $< \kappa$.
- $\mathcal{Top}\,\mathcal{Grp}$ to be the category of topological groups with cardinality $< \kappa$.
- $\mathcal{Cat}$ to be the category of categories with cardinality $< \kappa$.
- In generally, whenever we define the category of some objects, we mean the category of objects with cardinality $< \kappa$. This applies to the whole book.

Remark (24.2.29.3). If the cardinal κ in(24.2.29.2) is chosen to be too small, some construction in the categories won't be possible. For example, if you take $\kappa = 2$, then $\{\varnothing\} \coprod \{\varnothing\}$ is not definable in $\mathcal{Set}$. If you take $\kappa = \aleph$, then $\coprod_{\aleph} \{\varnothing\}$ is not definable in $\mathcal{Set}$.

So usually κ is taken to be a large enough strongly inaccessible cardinal (whose existence depends on the large cardinal axiom). But in specific cases we can take κ to be smaller to show some proposition is invariant of the axiom of large cardinals, for example the Weil conjecture(Deligne's theorem).

Notation (24.2.29.4) [Categories]. For $\mathcal{C}, \mathcal{D} \in \mathcal{Cat}$, $A \in \mathcal{C}$,

- $\mathcal{C}/A$ or $\mathcal{C}_{/A}$ is the slice category of objects over A, $\mathcal{C}_{A/}$ is the slice category of objects under A.
- $\mathrm{Func}(\mathcal{C}, \mathcal{D})$ is the category of functors from $\mathcal{C}$ to $\mathcal{D}$.
- $\mathcal{C}^{\mathrm{op}}$ is the category with the arrows reversed.

Notation (24.2.29.5) [Monoidal Categories]. For a monoidal category $(\mathcal{C}, \otimes)$

- $\mathcal{C}^{opp}$ is the monoidal category with the same underlying category and the tensor product $\otimes$ reversed.

Homological Algebra

Notation (24.2.29.6) [Homological Algebras].

- Use `^\bullet` capital for symbols representing a complex over an Abelian category.
- Use K-groups instead of K-groups.

30 Topology

Notation (24.2.30.1) [Topological Spaces].

- cntd is an abbreviation for "connected".
- For a metric space X and $x \in X, \delta \in \mathbb{R}_+$, denote $U(x, \delta) = \{y \in X : d(x, y) < \delta\}, \mathbb{D}(x, \delta) = \{y \in X : d(x, y) \leq \delta\}$.

Notation (24.2.30.2) [Common Spaces].

- For $n \in \mathbb{Z}_+$, $\mathbb{S}^n$ is the unit sphere $\{x \in \mathbb{R}^n | ||x|| = 1\}$.
- For $n \in \mathbb{Z}_+$, $\mathbb{D}^n$ is the unit disk $\{x \in \mathbb{R}^n | ||x|| \leq 1\}$. $\mathbb{D}^2$ is also denoted by $\mathbb{D}$.
- For $n \in \mathbb{Z}_+$, $\mathbb{I}^n$ is the unit cube $\{x = (x_i) \in \mathbb{R}^n | |x_i| \leq 1\}$. $\mathbb{I}^1$ is also denoted by $\mathbb{I}$.

- For $n \in \mathbb{Z}_+, a < b \in \mathbb{R}_{\geq 0}$, $\mathbb{D}^n(a,b)$ is the annulus $\{x \in \mathbb{R}^n | a < ||x|| < b\}$. Similarly, we can define $\mathbb{D}^n[a,b), \mathbb{D}^n(a,b], \mathbb{D}^n[a,b]$.
- For $K \in \{\mathbb{R}, \mathbb{C}, \mathbb{H}\}$, $\mathbb{S}^\infty_{\mathbb{K}}$ is the unit sphere in $\mathbb{K}^\infty$.

31 Algebras

Notation (24.2.31.1) [Groups]. For $G \in \mathcal{G}\mathrm{rp}$,

- G_{ab} is the abelianization of G.
- Use $H \leq G$ to indicate that H is a subgroup of G.
- Use $H \trianglelefteq G$ to indicate that H is a normal subgroup of G.

Notation (24.2.31.2) [Free Groups].

- For $n \in \mathbb{Z}_+$, F_n is the free group generated by $[n-1]$.

Notation (24.2.31.3) [Abelian Groups]. For $G \in \mathcal{A}\mathrm{b}$,

- $G^\vee = \mathrm{Hom}(G, \mathbb{C}^\times)$ is the dual group of G. This applies to topological groups. Try not to use $\widehat{G}$, because this may be confused with the Langlands dual group or the completion.
-

Notation (24.2.31.4) [Linear Algebras]. For $R \in \mathcal{CA}\mathrm{lg}, m, n \in \mathbb{Z}_+$,

- For $V \in \mathcal{V}\mathrm{ect}/R$, V^* is the dual space of R.
- $\mathrm{Mat}(m \times n; R)$ is the group of $m \times n$-matrices with coefficients in R. $\mathrm{Mat}(m \times n; R)$ is also denoted by $\mathrm{Mat}(n, R)$.
- $GL(n, R)$ is the group of invertible elements in $\mathrm{Mat}(n; R)$.
- For $A \in \mathrm{Mat}(m, n; R)$, $A^t \in \mathrm{Mat}(n \times m; R)$ is the transpose of A.
- For $A \in GL(n, R)$, $A^{-1} \in GL(n, R)$ is the inverse of A. A^{-t} denotes $(A^{-1})^t = (A^t)^{-1}$.

Prop. (24.2.31.5) [Algebras]. For $R \in \mathcal{R}\mathrm{ing}$,

- $\mathcal{M}\mathrm{od}_R$ is the category of left R-modules.
- $\mathcal{A}\mathrm{lg}_R$ is the the category of R-algebras.
- $\mathcal{R}\mathrm{ing}_R$ is the category of associative unital R-algebras.
- $\mathcal{CR}\mathrm{ing}_R$ is the category of commutative unital R-algebras.

Notation (24.2.31.6) [Lie Algebras].

- Use `\mathfrak` lowercase for symbols representing a Lie algebra.

32 Commutative Algebras

Notation (24.2.32.1) [Fields]. For $k \in$ `Field`,

- $\mathrm{char}\, k$ is the characteristic of k.
- $\overline{k}$ is a fixed algebraic closure of k.
- k^{sep} is the separable closure of k in $\overline{k}$.
- k^{perf} is the perfect closure of k in $\overline{k}$.

- For a Galois extension k'/k, use $\mathrm{Gal}(k'/k)$ instead of $\mathrm{Gal}_{k'/k}$ or $G(k'/k)$ or $G_{k'/k}$ to denote the Galois group of k'/k.
- $\mathrm{Gal}_k = \mathrm{Gal}(k^s/k)$.
- $\mathfrak{c} \in \mathrm{Gal}(\mathbb{C}/\mathbb{R})$ is the complex conjugation. For $a \in \mathbb{C}$, $\mathfrak{c}(a)$ is also denoted by $\overline{a}$.
- For $p \in \mathbf{P}$, $\mathbb{F}_p$ is the a fixed finite field of order p.
- For $p \in \mathbf{P}$, $\mathbb{F}_{p^r}$ is the fixed finite field of order p^r contained in $\overline{\mathbb{F}}_p$.
- $\mu(k)$ is the group of roots of unity in k.

Notation (24.2.32.2) [Commutative Algebras].
- Use `\mathfrak` lowercase for a first prime ideals. Use `\mathfrak` uppercase for a prime ideal that is over a given prime ideal.

Notation (24.2.32.3) [Integral Rings]. For $R \in \mathcal{CR}\mathrm{ing}$,
- Use "let (R, K) be an integral ring to indicate that R is an integral ring with fraction field K.
- $R^\times$ is the commutative monoid of non-zero elements in R.
- R^* is the commutative group of units of R.

Notation (24.2.32.4) [Local Rings].
- Use "let $(R, K, \mathfrak{m}, k)$ be an integral local ring" to indicate that R is a local ring with maximal ideal $\mathfrak{m}$, $\kappa(\mathfrak{m}) = k$, and $\mathrm{Frac}(R) = K$.
- DVR is the synonym for "discrete valuation ring".
- CDVR is the synonym for "complete discrete valuation ring".

Notation (24.2.32.5) [Dedekind Domains].
- Use `\mathcal` uppercase for symbols representing a Dedekind domain.?
- Use $\mathfrak{D}$ to denote differents of extensions of Dedekind domains.
- Use $\mathfrak{d}$ instead of δ to denote discriminants of extensions of Dedekind domains.

33 Algebraic Geometry

Notation (24.2.33.1) [Sheaves].
- Use `\mathcal` capital for symbols representing a sheaf of sets or a complex of sheaves of sets.
- Use `\mathscr` capital for symbols representing a sheaf of ∞-categories.

Notation (24.2.33.2) [Schemes]. Let $(X, \mathcal{O}_X) \in \mathcal{S}\mathrm{ch}$,
- For brevity, we can use X to denote the the scheme $(X, \mathcal{O}_X)$, and use $|X|$ to denote the underlying topological space.
- Use `\mathbf` capital for a relative scheme.
- Use `\mathcal` capital for symbols representing an integral model.
- Use $\kappa(x)$ to denote the residue field of a point $x \in X$ instead of $k(x)$.
- Use $R(x)$ instead of $K(X)$ to denote the function field of an integral scheme X.
- Use $\mathcal{O}_X(D)$ instead of $\mathcal{L}(D)$ to denote the line bundle associated to a Cartier divisor D.

Notation (24.2.33.3) [Categories of Schemes]. Let $X \in \mathcal{S}\mathrm{ch}$,

- $\mathcal{S}\mathrm{ch}$ is the category of schemes.
- $\mathrm{N}\mathcal{S}\mathrm{ch}$ is the category of locally Noetherian schemes.
- For $R \in \mathcal{CA}\mathrm{lg}$, use $\mathcal{S}\mathrm{ch}\,/R$ to denote $\mathcal{S}\mathrm{ch}\,/\,\mathrm{Spec}\,R$.
- $\mathcal{S}\mathrm{ch}_{\mathrm{int}}$ is the category of integral schetmes.
- $\mathcal{S}\mathrm{ch}^{\mathrm{ft}}\,/X$ is the category of schemes of f.t. over X.
- $\mathcal{S}\mathrm{ch}^{\mathrm{loc.ft}}\,/X$ is the category of schemes locally of f.t. over X.
- $\mathcal{S}\mathrm{ch}^{\mathrm{loc.ft}}\,/X$ is the category of schemes locally of f.t. over X.
- $\mathcal{S}\mathrm{ch}^{\mathrm{fét}}\,/X$ is the category of schemes finite étale over X. In general, use superscript to denote relative properties w.r.t. X, and superscript to denote absolute properties.
- Use `\underline` for a functor on the category $\mathcal{S}\mathrm{ch}\,/X$.

Notation (24.2.33.4) [Morphisms of Schemes].

- Use i for a closed immersion and j for an open immersion.
- For $R \in \mathcal{CA}\mathrm{lg}, S \in \mathcal{CA}\mathrm{lg}_R, X \in \mathcal{S}\mathrm{ch}\,/R$, $X_R S$ denotes $X_{\mathrm{Spec}\,R}\,\mathrm{Spec}\,S$.

Notation (24.2.33.5) [Modules on Schemes]. Let $(X, \mathcal{O}_X) \in \mathcal{S}\mathrm{ch}$,

- $\mathcal{M}\mathrm{od}(\mathcal{O}_X)$ is the category of $\mathcal{O}_X$-modules.
- $\mathcal{QC}\mathrm{oh}(X)$ is the category of Qco $\mathcal{O}_X$-modules.
- $\mathcal{C}\mathrm{oh}(X)$ is the category of coherent $\mathcal{O}_X$-modules.
- For $k \in \mathbb{N}$, $\mathcal{C}\mathrm{oh}^{\leq k}(X)$ is the category of coherent $\mathcal{O}_X$-modules with $\dim \mathrm{Supp}(\mathcal{F}) \leq k$.
- $D(X) = D(\mathcal{O}_X) = D(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $D_{\mathcal{QC}\mathrm{oh}}(X) = D_{\mathcal{QC}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $D_{\mathcal{C}\mathrm{oh}}(X) = D_{\mathcal{C}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $\mathcal{D}(X) = \mathcal{D}(\mathcal{O}_X) = \mathcal{M}\mathrm{od}_{\mathcal{O}_X}(\mathcal{S}\mathrm{h}(X; \mathcal{D}(\mathbb{Z}))$.
- $\mathcal{D}_{\mathcal{QC}\mathrm{oh}}(X) = \mathcal{D}_{\mathcal{QC}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.
- $\mathcal{D}_{\mathcal{C}\mathrm{oh}}(X) = \mathcal{D}_{\mathcal{C}\mathrm{oh}(X)}(\mathcal{M}\mathrm{od}(\mathcal{O}_X))$.

Notation (24.2.33.6) [Group Schemes].

- μ is the group scheme $X \mapsto \mu(\Gamma(X, \mathcal{O}_X))$.

Notation (24.2.33.7) [Formal Schemes].

- Use mathfrak uppercase(aka. `\mfk`) for symbols representing a formal scheme that is usually not representable.

34 Analysis

Notation (24.2.34.1) [Functions].

- for any positive-valued function $f : S \to \mathbb{R}_+$, I use $O(f)$ in an equation to denote that the difference of the other part of the equation is bounded by Cf, where C is a constant that doesn't depend on any variables appearing in this equation.

- For any functions $f, g : S \to \mathbb{C}$, we use $f \sim g$ or $f = \Theta(g)$ to denote $\{f = O(|g|)$ and $g = O(|f|)\}$.

Notation (24.2.34.2) [Real Analysis].

- $\sqrt{\ } : \mathbb{R}_+ \to \mathbb{R}_+$ is inverse of the function $\mathbb{R}_+ \to \mathbb{R}_+ : x \mapsto x^2$.
- For a differentiable function f, write $f^{\backprime}$ instead of f' to denote the derivative of f. For $p \in \mathbb{Z}_+$ and a p-th differentiable function f, write $f^{(p)}$ to denote the p-th derivative of f.

Notation (24.2.34.3) [Complex Analysis].

- For $\alpha \in \mathbb{D}$, denote $\psi_\alpha(z) = \psi_\alpha(z) = \frac{\alpha - z}{1 - \overline{\alpha} z} \in \mathcal{M}(\mathbb{C})$.

Notation (24.2.34.4) [Numbers].

- π represents the smallest $x \in \mathbb{R}_+$ s.t. $e^{\mathrm{i}\, x} + 1 = 0$.
- γ is the Euler's constant.

Notation (24.2.34.5) [Special Functions].

- $\Gamma(s) \in \mathcal{M}(\mathbb{C})$ is the Gamma function.
- $\zeta(s) \in \mathcal{M}(\mathbb{C})$ is the Riemann zeta function.
- $\wp(\tau) \in \mathcal{M}(\mathbb{C})$ is the Weierstrass $\wp$ function.

Notation (24.2.34.6) [Fourier Transforms].

- Use $\widehat{f}$ to denote the Fourier transform of a function f on a locally compact Abelian group.

Notation (24.2.34.7) [Functional Analysis].

- Use `dutchcal` capital to denote a subset of the space of continuous functions on a topological space.

35 Differential Geometry

Notation (24.2.35.1) [Manifolds].

-

Notation (24.2.35.2) [Lie Groups].

- For $\theta \in \mathbb{R}/(2\pi)$, denote $\kappa_\theta = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$.

36 Algebraic Number Theory

Notation (24.2.36.1) [Numbers].

- For $X \in \mathbb{N}$, $[X]$ is the set of non-negative integers no greater than X.
- For $X \in \mathbb{Z}_+$, $\{X\}$ is the set of positive integers no greater than X.
- $\mathbf{P}$ is the set of rational primes.
- $\mathbb{P}$ is the algebra consisting of periods.
- Don't use "#" as an abbreviation of "number" or "numbers".
- $\square$ is an abbreviation of "square" or "a square number". This is obsolete and I strongly suggest not using this notation, for one reason it doesn't specify square of what numbers, and for the other reason it may be confused with unrecognizable codes.

- For $n \in \mathbb{Z}^{\times}$, use $\mathbb{Z}/(n)$ instead of $\mathbb{Z}/n$ or $\mathbb{Z}/n\mathbb{Z}$.
- Use p to denote a prime number.
- Use ℓ instead of l or q to denote a second prime number when p is present.

Notation (24.2.36.2) [Common Functions]. For $n \in \mathbb{Z}_+$,

- $\phi(n) = \#(\mathbb{Z}/(n))^*$.

Notation (24.2.36.3) [Number Theory].

- Use ϖ instead of π to denote a uniformizer in a valuation ring to avoid confusion with the frequently used π.
- In number theory/arithmetic geometry, try to use F to denote a global field, K a CDVR and k a finite field or general field.
- For $p \in \mathbf{P}$, use $\overline{\mathbb{Q}}_p$ instead of $\overline{\mathbb{Q}_p}$ to denote the fixed p-adic completion of $\overline{\mathbb{Q}}$.
- For $p \in \mathbf{P}$, $\mathbb{Q}_{p^n}$ is the unique unramified extension of $\mathbb{Q}_p$ of the degree n contained in $\overline{\mathbb{Q}}_p$, $\mathbb{Z}_{p^r} = \mathcal{O}_{\mathbb{Q}_{p^n}}$.
- $\{\zeta_n, n \in \mathbb{Z}_+\}$ is a compatible system of roots of unity in $\overline{\mathbb{Q}}$, and $\zeta_4 = \mathrm{i}$.

Notation (24.2.36.4) [Global Fields]. For an extension of global fields E/F,

- F_0 is the constant field of F.
- Use `GField` to denote the set of global fields. Use `FField` to denote the set of global function fields, use `NField` to denote the set of global number fields. `GField` $/F$ is the set of global fields over F.
- $\mathcal{O}_F$ is the ring of integers of F.
- Σ_F is the set of places of F. Σ_F^{fin} is the set of finite places of F. Σ_F^{∞} is the set of infinite places of F. $\Sigma_F^{\mathbb{R}}$ is the set of real places of F, $\Sigma_F^{\mathbb{C}}$ is the set of complex places of F.
- For a finite extension L/F and $v \in \Sigma_F^{\mathrm{fin}}$, Σ_L^v is the set of finite places over v.
- For $x \in \mathcal{O}_F$, let $\Sigma_F^x \subset \Sigma_F^{\mathrm{fin}}$ denote the set of finite places dividing x.
- For $v \in \Sigma_F^{\mathrm{fin}}$, $(R_v, \mathfrak{m}_v, k_v)$ is the valuation ring of v, and $||v|| = \#k_v$.
- $\mathrm{Unr}_{E/F}, \mathrm{Ram}_{E/F}, \mathrm{Spl}_{E/F}$ is the set of finite places of F unramified, ramified, splitting in E resp.. $\mathrm{Spl}_{E/F/F_0}$ is the set of finite places of F_0 s.t. every place of F^+ over p splits in F.

Notation (24.2.36.5) [Local Fields].

- Use `LField` to denote the set of local fields. Use p-`LField` to denote the set of p-adic local fields. Use p-`FField` to denote the set of p-adic number fields. Use p-`NField` to denote the set of p-adic number fields. Use `ArchField` to denote the set $\{\mathbb{R}, \mathbb{C}\}$.

Notation (24.2.36.6) [Analysis on Adeles and Ideles].

- For a local field K, $V \in \mathcal{V}\mathrm{ect}/K$, $\mathcal{S}(V)$ is the space of Bruhat-Schwartz Functions on V.
- For a global field F, V a finite free module over $\mathbf{A}_F$, $\mathcal{S}(V)$ is the space of Bruhat-Schwartz functions on V.

37 Arithmetic Geometry

Notation (24.2.37.1) [Perfectoid Spaces].

- Use old `\mathcal`(aka. `\mrs`) to denote adic spaces.

38 Representation Theory

Notation (24.2.38.1) [Representations]. Let $G \in \mathcal{T}\mathrm{op}\,\mathcal{G}\mathrm{rp}$, $L \in \mathcal{T}\mathrm{op}\,\mathcal{CR}\mathrm{ing}$,

- $\mathrm{Rep}_L(G)$ is the category of continuous representations of G with coefficients in L. $\mathrm{Rep}_{\mathbb{C}}(G)$ is also denoted by $\mathrm{Rep}(G)$.
- $\mathrm{Irr}_L(G)$ is the category of irreducible representations of G with coefficients in L. $\mathrm{Irr}_{\mathbb{C}}(G)$ is also denoted by $\mathrm{Irr}(G)$.
- $\mathrm{Rep}^{\mathrm{alg}}(G)$ is the category of smooth complex representations of G. $\mathrm{Irr}^{\mathrm{alg}}(G)$ is the category of irreducible smooth complex representations of G.
- For $(\rho, V) \in \mathrm{Rep}_L^{\mathrm{alg}}(G)$, let $(\rho^\vee, V^\vee)$ denote the contragradient representation: $\rho^\vee(g) = \rho(g)^{-t}$.

39 L-Functions

Notation (24.2.39.1) [L-Functions].

- Use ζ for a zata-function, i.e. a function that is usually a rational function in the indeterminant T.
- Use L for an L-function, i.e. a function that is usually a meromorphic function for s with Euler products.

40 Combinatorics

Notation (24.2.40.1) [Combinatorics Numbers].

- For $n, m \in \mathbb{N}, m \leq n$,

$$n! = \begin{cases} 1 & , n = 0 \\ \prod_{k=1}^{n} k & , n > 0 \end{cases}, \quad \binom{n}{m} = \frac{n!}{(n-m)!m!}$$

- For $n, m \in \mathbb{N}, m \leq n$ and $p \in \mathbf{P}, q \in p^{\mathbb{Z}_+}$,

$$[n]_p = \begin{cases} 1 & , n = 0 \\ \frac{q^n - 1}{q - 1} & , n > 0 \end{cases}, \quad [n]!_q = \begin{cases} 1 & , n = 0 \\ \prod_{k=1}^{n} [k]_q & , n > 0 \end{cases}, \quad \begin{bmatrix} n \\ m \end{bmatrix} = \frac{[n]!_q}{[n-m]!_q [m]!_q}$$
